By the wild alarms which culminated in the Popish Terror Russell was apparently deeply affected. He threw himself into the party which looked to Monmouth as the representative of Protestant interests, a grave political blunder, though he afterwards was in confidential communication with Orange. On Nov. 4, 1678, he moved an address to the king to remove the duke of York from his person and councils. At the dissolution of the pensionary parliament, he was, in the new elections, returned for Bedfordshire. Danby was at once overthrown, and in April 1679 Russell was one of the new privy council formed by Charles on the advice of Temple. Only six days after this we find him moving for a committee to draw up a bill to secure religion and property in case of a popish successor. He does not, however, appear to have taken part in the exclusion debates at this time. In June, on the occasion of the Covenanters' rising in Scotland, he attacked Lauderdale personally in full council.

In January 1680 Russell, along with Cavendish, Capell, Powell, Essex and Lyttelton, tendered his resignation to the king, which was received by Charles "with all my heart." On June 16, he accompanied Shaftesbury, when the latter indicted James at Westminster as a popish recusant; and on Oct. 26 he took the extreme step of moving "how to suppress popery and prevent a popish successor"; on Nov. 2, now at the height of his influence, he seconded the motion for exclusion in its most emphatic shape, and on the 19th carried the bill to the House of Lords for their concurrence. The limitation scheme he opposed, on the ground that monarchy under the conditions expressed in it would be an absurdity. On December 18 he moved to refuse supplies until the king passed the Exclusion Bill. The prince of Orange having come over at this time, there was a tendency on the part of the opposition leaders to accept his endeavours to secure a compromise on the exclusion question. Russell, however, refused to give way a hair's-breadth.

On March 26, 1681, in the parliament held at Oxford, Russell again seconded the Exclusion Bill. Upon the dissolution he retired into privacy at his country seat of Stratton in Hampshire. In the wild schemes of Shaftesbury after the election of Tory sheriffs for London in 1682 he had no share; upon the violation of the charters, however, in 1683, he began seriously to consider as to the best means of resisting the government, and on one occasion attended a meeting at which treason, or what might be construed as treason, was talked. Monmouth, Essex, Hampden, Sidney and Howard of Escrick were the principal of those who met to consult. On the breaking out of the Rye House Plot, of which neither he, Essex, nor Sidney had the slightest knowledge, he was accused by informers of promising his assistance to raise an insurrection and compass the death of the king. Refusing to attempt to escape, he was brought before the council, when his attendance at the meeting referred to was charged against him. He was sent on June 26, 1683, to the Tower. Monmouth offered to appear to take his trial, if thereby he could help Russell, and Essex refused to abscond for fear of injuring his friend's chance of escape. Before a committee of the council Russell, on June 28, acknowledged his presence at the meeting, but denied all knowledge of the proposed insurrection. He reserved his defence, however, until his trial. He would probably have saved his life but for the perjury of Lord Howard, who expressly declared that Russell had urged the entering into communications with Argyll in Scotland. Howard's perjury is clear from other witnesses, but the evidence was accepted. Russell spoke with spirit and dignity in his own defence, and, in especial, vehemently denied that he had ever been party to a design so wicked and so foolish as that of the murder of the king or of rebellion. The legality of the

trial, in so far as the jurors were not properly qualified and the law of treason was shamefully strained, was denied in the act of 1 William & Mary which annulled the attainder. Hallam maintains that the only overt act of treason proved against Russell was his concurrence in the project of a rising at Taunton, which he denied, and which, Ramsay being the only witness, was not sufficient to warrant a conviction.

Russell was sentenced to die. Many attempts were made to save his life. The old earl of Bedford offered £50,000 or £100,000, and Monmouth, Legge, Lady Ranelagh, and Rochester added their intercessions. Russell himself, in petitions to Charles and James, offered to live abroad if his life were spared, and never again to meddle in the affairs of England. He refused, however, to yield to the influence of Burnet and Tillotson, who endeavoured to make him grant the unlawfulness of resistance, although it is more than probable that compliance in this would have saved his life. He drew up, with Burnet's assistance, a paper containing his apology, and he wrote to the king a letter, to be delivered after his death, in which he asked Charles's pardon for any wrong he had done him. A suggestion of escape from Lord Cavendish he refused. He behaved with his usual quiet cheerfulness during his stay in the Tower, and spent the last morning in devotion with Burnet. He was executed at Lincoln's Inn Fields on July 21, 1683.

A true and moderate summing-up of his character will be found in his *Life*, by Lord John Russell (1820).

RUSSELL, SIR WILLIAM HOWARD (1821-1907), English war correspondent, was born at Lilyvale, near Tallaght, Co. Dublin, on March 28, 1821, being one of the Russells of Limerick, whose settlement in Ireland dates from the time of Richard II. He entered Trinity college in 1838. Three years later he was thrown very much on his own resources, but a relative, R. W. Russell, who had been sent to Ireland by *The Times*, deputed him to report the Irish elections at Longford, and his success definitely turned his attention to journalism. Coming to London in 1842, he went to Cambridge, but left before taking a degree. He was special correspondent for *The Times* in Ireland in 1845, in Denmark in the war of 1849-50, and in the Crimean War. His letters written from the Crimea were published in book form as *The War, 1855-56*. The exposure made by Russell of the mismanagement in the Crimea contributed to the fall of the Aberdeen ministry. Russell also served as correspondent in India in 1858, in America in 1861-3, in the Seven Weeks' War of 1866, in the Franco-German war of 1870; and he was with Wolsey in South Africa in 1879 and in Egypt in 1882. In 1860 he founded the *Army and Navy Gazette*. Russell was knighted in May 1895, and was the recipient of numerous war medals and various foreign orders. He died on Feb. 11, 1907.

His works include: *My Diary in India in 1858-59* (1860); *My Diary, North and South, during the Civil War in America, 1862* (1862); *My Diary during the Last Great War* (the Franco-Prussian War of 1870) (1873); *Hesperotheren*, a description of a tour in the United States and Canada (1882); and *The Great War with Russia* (1895).

RUSSELL OF KILLOWEN, CHARLES RUSSELL, BARON (1832-1900), lord chief justice of England, was born at Newry, county Down, on Nov. 10, 1832, the son of Arthur Russell. The family was Roman Catholic. Educated first at Belfast, afterwards in Newry, and finally at St. Vincent's College, Castleknock, Dublin, in 1849, he was articled to a firm of solicitors in Newry. In 1854 he was admitted, and began to practise his profession. In the legal proceedings arising out of Catholic and Orange disturbances young Russell distinguished himself in the cause of his co-religionists. After practising for two years, he determined to seek a wider field for his abilities. He went to London in 1856, and entered Lincoln's Inn. In 1858 he married Ellen, daughter of Dr. Mulholland of Belfast, and in 1859 he was called to the bar, and joined the Northern Circuit. He had to rely upon himself. But the equipment was sufficient. A well-built frame; a strong, striking face, with broad forehead, keen grey eyes, and a full and sensitive mouth; a voice which, though not musical, was rich, and responded well to strong emotions, whether of indignation, or scorn, or pity; an amazing power of concentrating thought; an intellectual grasp, promptly seizing the real points of the most entangled case, and rejecting all that

was secondary, or petty, or irrelevant; a faculty of lucid and forcible expression, which, without literary ornateness or grace of style, could on fit occasions rise to impassioned eloquence—all these things Russell had. But beyond and above all these was his immense personality, an embodiment of energetic will which riveted attention, dominated his audience, and bore down opposition. In his early years Russell's practice was mostly at the Passage Court at Liverpool, and he published a book on its procedure in 1862.

In 1872 Russell "took silk," and from that date for some time he divided the best leading work of the circuit with Holker, Herschell and Pope. Holker became solicitor general in 1874, Herschell in 1880, and about that time Pope left the circuit. Russell's success as a Q.C. during this period of his career was prodigious. He excelled in the conduct alike of commercial cases and of those involving, as he used to say, "a human interest," although undoubtedly it was the latter which more attracted him. He was seen to the least advantage in cases which involved technical or scientific detail. If his advocacy suffered a defeat, however, it was never an inglorious defeat. Those who were on the Northern Circuit at the time could not easily forget the case of *Dixon v. Pimmsell*—a libel action brought by a Liverpool shipowner against Pimmsell—in which Holker won a notable victory for the defendant; or *Nuttall v. Wilde*, a breach of promise action, in which Pope led brilliantly for the successful plaintiff, and Russell's speech for the defence was one of the finest in point of passion and pathos that was ever heard upon the Northern Circuit.

In 1880 Russell was returned to parliament as an independent Liberal member for Dundalk. From that time forward until 1894, he sat in the House of Commons: for Dundalk until 1885, and afterwards for South Hackney. During the whole of this epoch, in home affairs, Irish business almost monopolized the political stage; and Russell was Irish to the core. From 1880 to 1886, as a private member, and as the attorney-general in Gladstone's administrations of 1886 and 1892, he worked in and out of parliament for the Liberal policy in regard to the treatment of Ireland as few men except Russell could or would work. His position throughout was clear and consistent. Before 1886 on several occasions he supported the action of the Irish Nationalist party. He opposed coercion, voted for compensation for disturbance, advocated the release of political prisoners and voted for the Maamtrasna inquiry. But he never became a member of the Irish Home Rule or of the Parnellite party; he was elected at Dundalk as an independent Liberal, and such he remained. When, as attorney-general in the Gladstone administration, he warmly advocated the establishment of a subordinate parliament in Ireland, he did so because he sought the amelioration and not the destruction of Ireland's relations with the rest of the kingdom.

Russell rapidly became in London what he was already in Lancashire, a favourite leader in *missis prius* actions. The list of *causes célèbres* in the period 1880-94 is really a record of Russell's cases, and, for a great part, of Russell's victories. The best known of the exceptions was the libel action *Belt v. Lawes* in 1882, which, after a trial lasting more than 40 days, resulted in a verdict for the plaintiff, for whom Sir Hardinge Giffard (afterwards Lord Chancellor Halsbury) appeared as leading counsel. The triumph of his client in the Colin Campbell divorce suit in 1886 afforded perhaps the most brilliant instance of Russell's forensic capacity in private litigation. More important, however, as well as more famous, than any of his successes in the ordinary courts of law during this period were his performances as an advocate in two public transactions of mark in British history. The first of these in point of date was the Parnell Commission of 1888-90, in which Sir Charles Russell appeared as leading counsel for Parnell. In April 1889, after 63 sittings of the commission, in the course of which 340 witnesses had been examined, Sir Charles Russell, who had already destroyed the chief personal charge against Parnell by a brilliant cross-examination, in which he proved it to have been based upon a forgery, made his great opening speech for the defence. It lasted several days, and concluded on April 12. This speech, besides its merit as a wonderful piece of advocacy, possesses permanent value as an historical survey

of the Irish question during the last century, from the point of view of an Irish Liberal. The second was the Bering Sea Arbitration, held in Paris in 1893. Russell, then attorney-general, with Sir Richard Webster (afterwards Lord Alverstone, L.C.J.), was the leading counsel for Great Britain. Russell maintained the proposition, which he again handled in his Saratoga address to the American Bar Association in 1896, that "international law is neither more nor less than what civilized nations have agreed shall be binding on one another as international law." The award was, substantially, in favour of Great Britain.

In 1894, on the death of Lord Bowen, Russell accepted the position of a lord of appeal. A month later he was appointed lord chief justice of England in succession to Lord Coleridge. Brief as was his tenure of the office, he proved himself well worthy of it. He was dignified without pomposity, quick without being irritable, and masterful without tyranny. In 1896 Lord Russell (Pollock and Hawkins being on this occasion his colleagues on the bench) presided at the trial at bar of the leaders of the Jameson Raid. Russell's conduct of this trial, in the midst of much popular excitement, was by itself sufficient to establish his reputation as a great judge. One other event at least in his career while lord chief justice deserves a record, namely, his share in the Venezuela Arbitration in 1899. Lord Herschell, a British representative on the Commission, died somewhat suddenly in America before the beginning of the proceedings, and Russell took his place.

Russell contributed to the reform of the law by his advocacy of improvement in the system of legal education, and in promoting measures against corruption and secret commissions, though the bills he introduced did not become law. He died on Aug. 10, 1900. Few English lawyers have ever excited the admiration abroad that Lord Russell did, both on the Continent of Europe and in America.

See R. B. O'Brien, *Life of Lord Russell of Killowen* (1909).

RUSSELL SAGE FOUNDATION, an institution established by Mrs. Russell Sage in memory of her husband. The initial endowment was \$10,000,000, to which \$5,000,000 was added by her will. It was incorporated by an act of the legislature of New York in April 1907, "for the improvement of social and living conditions in the United States of America." The charter further states: "It shall be within the purposes of said corporation to use any means to that end which from time to time shall seem expedient to its members or trustees, including research, publication, education, the establishment and maintenance of charitable or benevolent activities, agencies and institutions, and the aid of any such activities, agencies or institutions already established." The income may only be spent.

The management of the foundation is vested in a board of twelve trustees, which is self-perpetuating. The staff of the foundation study social conditions and methods of social work, interpret the findings, make the information available by publications, conferences and other means of public education, and seek in various ways to stimulate action for social betterment. Departments exist for dealing with charity organization, industrial relations, consumer credit, family welfare, social statistics, etc. The foundation does not relieve individual need and it avoids duplicating the work of existing agencies. In 1922 the foundation organized the Committee on Regional Plan of New York and its environs, providing the funds and office space and some staff assistance in preparing a plan for the future development of the New York region, an undertaking which took about seven years to complete.

RUSSIA is the general name given to those territories of the Eurasian continent which are comprised within the Union of Soviet Socialist Republics (U.S.S.R.) or, more shortly, the Soviet Union. The 11 republics within the union in 1939 were the Russian Soviet Federated Socialist Republic and the Ukrainian, Byelorussian, Azerbaijanian, Georgian, Armenian, Turkmen, Uzbek, Tadzhik, Kazakh and Kirghiz Soviet Socialist Republics. The first three of the above, together with the former Transcaucasian Soviet Federated Republic, were original members of the U.S.S.R.; the Uzbek and Turkmen republics were added in 1924,

the Tadzhik republic in 1929; the Kazakh and Kirghiz republics were admitted in 1936, when also the Transcaucasian S.F.S.R. was split into the Azerbaijanian, Georgian and Armenian Soviet Socialist Republics. To the above 11 republics were later added the Karelo-Finnish Soviet Socialist Republic (admitted to the union by the supreme soviet in March 1940) and the Moldavian, Latvian, Lithuanian and Estonian Soviet Socialist Republics (all admitted in Aug. 1940), thus bringing the total number of the republics of the union to 16. (See Table I.)

TABLE I.—Union of Soviet Socialist Republics after World War II

Republic	Capital	Area (sq. mi.)	Population (1946 est.)
Russian S.F.S.R.	Moscow	6,531,000	106,000,000
Ukrainian S.S.R.	Kyiv (Kiev)	222,700	40,548,310
Byelorussian S.S.R.	Minsk	80,300	6,000,000
Uzbek S.S.R.	Tashkent	157,300	6,282,450
Kazakh S.S.R.	Alma-Ata	1,053,700	6,145,000
Georgian S.S.R.	Tbilisi (Tiflis)	29,400	3,577,700
Azerbaijanian S.S.R.	Baku	13,100	3,209,730
Lithuanian S.S.R.	Vilnius (Wilno)	25,300	3,023,000
Moldavian S.S.R.	Chişinău (Kishinev)	15,000	2,400,000
Latvian S.S.R.	Riga	24,000	1,765,510
Tadzhik S.S.R.	Stalinabad (Dushanbe)	51,700	1,485,000
Kirghiz S.S.R.	Frunze	76,000	1,450,000
Armenian S.S.R.	Yerevan	11,500	2,150,000
Turkmen S.S.R.	Ashkhabad	187,300	1,553,000
Estonian S.S.R.	Tallinn (Reval)	17,400	968,080
Karelo-Finnish S.S.R.	Petrozavodsk	68,000	500,000
Total		8,508,700	103,214,730

Source: Areas are taken from the *Boislova Sovetskaya Enziklopediya. Sovyetskiye Sotsialisticheskiye Respubliki* (Moscow, 1948). All the areas are post-World War II (that is, including territorial aggrandizements in the west and east). Population figures are from *Geographical Review* (April 1949).

By 1952 the Russian S.F.S.R. included 47 regions or *oblasti*; 12 autonomous republics (Bashkir, Buriat Mongol, Chuvash, Dagestan, Kabardinian, Komi, Mari, Mordovian, North Ossetian, Tatar, Udmurt and Yakut); 6 autonomous regions (Adigei, Cherkess, Birobidzhan, Khakass, Gorno-Altai and Tuva); 6 territories or *krai* (Altai, Khabarovsk, Krasnodar, Krasnoyarsk, Primorsky and Stavropol); and 10 small national districts or *okrugii* (Aghinsk, Chukot, Evenki, Khanty-Mansi, Komi-Permyak, Koryak, Nenets, Taimyr, Ust-Orda and Yamalo-Nenets).

The four autonomous republics outside the R.S.F.S.R. are Kara-Kalpak, Abkhazia, Adzharia and Nakhichevan, of which the first is part of Uzbekia, the last is part of Azerbaijan and the remaining two are parts of Georgia.

The three autonomous regions outside the R.S.F.S.R. are the Nagorno-Karabakh (part of Azerbaijan), the South Ossetian (part of Georgia) and Gorno-Badakhshan (Tadzhikistan).

The name "Russia" (*Rossiia*) comes from the Slavonic *Rus*, possibly derived from *Ruotsi* (a Finnish name for the Swedes), which seems to be a corruption of the Swedish *rothsmenn*, "rowers" or "seafarers."

The total area of the Soviet Union in Sept. 1939 was 8,173,666 sq. mi. This, because certain non-Russian lands had been lost after the revolution of 1917, was smaller than the area of the former Russian empire. Between 1939 and 1945 the Soviet Union annexed the following territories: Estonia, Latvia, Lithuania, the northeastern part of East Prussia (renamed the Kaliningrad region

and part of the R.S.F.S.R.), the formerly Polish western Ukraine and western Byelorussia, the formerly Finnish Karelian isthmus and Pechenga region (Petsamo), the formerly Rumanian Bessarabia and northern Bukovina, the formerly Czechoslovakian Sub-Carpathian Ruthenia, the formerly Japanese Karafuto (southern Sakhalin) and Kurile (Kurilskiy) Islands and the formerly "independent" republic of Tannu Tuva. (See Table II.) The total area of the Soviet Union including these new territories was 8,598,700 sq. mi.

The Soviet Union extends over the eastern part of Europe and the northern and central parts of Asia, stretching north and south from Cape Chelyuskin (77° 43' N. lat.) to Kushka on the Afghan frontier (35° 08' N. lat.). East and west the country extends approximately from a point on the Gulf of Danzig near 19° 38' E. long. to Cape Dezhnev (East cape) on the Chukchi (Chukotski) peninsula near 169° 40' W. long. Occupying one-seventh of the land surface of the world the Soviet Union is exceeded in area only by the British Commonwealth, but while the latter is scattered, the Soviet Union forms a single geographical and political unit.

The northern frontier of the U.S.S.R. extends along the shores of the Arctic ocean, from the Rybachy peninsula on the Murman coast in the west to the Bering strait in the east. The western frontier runs from the shores of the Barents sea down to the shores of the Black sea. On the west the Soviet Union borders on Norway, Finland, Poland, Czechoslovakia, Hungary and Rumania. Since June 1940, when Rumania had to cede Bessarabia to the Soviet Union, the southern frontier runs from the Kiliya mouth of the Danube and proceeds along the shores of the Black sea. Thence it extends eastward along the southern limit of the Armenian highland to Nakhichevan, along the Araks river, south along the Talysh range and across the Caspian sea. The frontier from the eastern shore of the Caspian sea follows approximately along the crest of the Kopet-dagh range and east onto the Pamir highland. Thence it extends along the Tien-shan, the Altai, the Tannu Ola and the Trans-Baikal mountains. From the Manchurian frontier the boundary runs along the Argun river to its confluence with the Shilka and thence along the Amur river to its junction with the Ussuri, where it turns south to follow the Ussuri river to Lake Khanka whence it runs to the shore of the Sea of Japan. On the south the Soviet Union borders on Turkey, Iran, Afghanistan, China (Sinkiang), Mongolia, China again (Manchuria) and Korea. The eastern frontier is entirely a sea border.

More than two-thirds of the Soviet borders are maritime. The northern frontier on the Arctic ocean is maritime in its entire length, but apart from Murmansk, which is washed by the warm Atlantic drift, this frontier is frozen for nearly ten months of the year. The northern sea route, providing a direct connection with the far east, was considerably developed as part of the third five-year plan, and by means of icebreakers the route is kept open during much of the winter, but only with great difficulty. On the eastern coast Vladivostok, the southernmost Soviet port, also requires icebreakers to keep it open during the winter, while the Sea of Okhotsk is frequently closed to shipping by dense fogs and floating ice. The Black sea ports are ice-free but the only outlet from this sea is through the narrow straits of the Bosphorus. Leningrad is the most important port on the Baltic sea and is kept open by icebreakers for much of the winter.

The island possessions of the Soviet Union are numerous, but the majority are in the Arctic ocean and are of little use. The Aleutian archipelago and Alaska were sold to the United States in 1867. The Kurile Islands,

TABLE II.—Areas Annexed by the U.S.S.R., 1939-45

Area	Date and form of incorporation	Area (sq. mi.)	Population (1939 est.)
In Europe.			
Estonia	Decision of the supreme soviet of the U.S.S.R. (Aug. 6, 1940)	18,357	1,131,000
Latvia	" (Aug. 5, 1940)	25,375	1,994,000
Lithuania (including both Klaipeda and Vilnius)	" (Aug. 3, 1940)	25,773	3,012,000
From Finland (Karelia and Petsamo-Pechenga)	Soviet-Finnish treaty of March 12, 1940	77,508	54,000*
From Poland (excluding the Vilnius area)	German-Soviet agreement of Sept. 28, 1939; Polish-Soviet treaty of Aug. 16, 1945	64,824	10,315,000
From Rumania (Bessarabia and northern Bukovina)	Soviet ultimatum of June 28, 1940; Paris peace treaty of Feb. 10, 1947	139,459	3,706,000
From Czechoslovakia (Sub-Carpathian Ruthenia)	Soviet ultimatum of June 28, 1940; Soviet-Czechoslovakian treaty of June 29, 1945	4,571	798,000
From Germany (northeast part of East Prussia)	Decision of the Potsdam conference, Aug. 4, 1945	4,247	1,075,000
Total (Europe)		170,925	22,102,000

Grand total		252,155	22,561,000

*About 423,800 Karelians left in 1944 to resettle in Finland.

ceded to Japan in 1875, were recovered by the Soviet Union in Sept. 1945. The Baltic islands, which were given up after the revolution of 1917, were recovered from Finland. The Komandorskiye Islands off Kamchatka, the Shantar Islands near the Pacific coast and, from Aug. 1945, the whole of the island of Sakhalin are Soviet possessions. The chief Soviet islands off the arctic coast are Kolguev Island, Novaya Zemlya and Valaigah Island, the Severnaya Zemlya (formerly Nicholas II Land) north of the Taimyr peninsula, the New Siberian Islands (north of Laptev sound) and Wrangel Island. Franz Josef Land is Soviet territory, but Spitsbergen and Bear Island were recognized in 1920 as being under Norwegian sovereignty. (I. Gv.; X.)

PHYSIOGRAPHY

In very general terms Russia as considered in this article may be described as a wide amphitheatre open to the arctic but bordered to the south, to the west and to the east by high mountain regions. The great inner lowland can be divided into four regions; viz., European Russia, the plain of western Siberia, the Turkistan basin and the central Siberian plateau. The first two of these regions, both plains of low relief, are similar in most of their geographical features but are separated by the Ural mountains; the former drains mainly southward to the Black and Caspian seas, the latter to the Arctic ocean. The Turkistan basin is essentially the drainage area of the Sea of Aral; between it and the Siberian plain to the north is a belt of low hills. The central Siberian region, between the Yenisei and the Lena, is an ancient, eroded plateau, much dissected by river valleys but otherwise gently undulating.

The mountain border, with its vast and lofty chains and deep valleys, is in marked contrast to the lands it encircles. Eastern Siberia has a most irregular surface. It is a complex of great blocks and rifts, of plateaus separated from one another by steep scarps as they rise in tiers toward ridges crowned with snowclad peaks. Side by side are features obviously of great age and others, such as the gorges and rapids of many of its rivers, indicative of recent changes. To the southwest rise the Altai ranges, alpine in their height and character and forming a barrier difficult to surmount between the Siberian lowland and Mongolia. Still farther south and west, across the Dzungarian Gate, are the loftier and abrupt ridges of the Tien-shan and the Trans Alai, between Turkistan and the Tarim basin. From the Pamirs the frontier with Iran is marked by lesser ranges, not much easier to cross in spite of their lower altitude. Between the Caspian and the Black seas lies the great wall of the Caucasus, with a dozen peaks higher than any in the Alps and only a few usable passes. The low Yaila mountains of the Crimea are a reminder that this vast mountain system was once continuous into the Balkans.

The great contrast of relief between the plains and the mountain border reflects a similar contrast in structure. Underlying the plains is a relatively undisturbed floor or platform of Archaean and Palaeozoic rocks. Though usually buried beneath later deposits, this platform is exposed in Karelia, the Ukraine (where it contains the iron ores of Krivoi Rog and the manganese ores of Nikopol), the Timan mountains and the central Siberian plateau. Its surface is no longer horizontal throughout the whole area of course, for it suffered warping and some dislocation as a result of Euronian and Caledonian earth movements. Still more important deformations resulted from the pressures set up by Hercynian folding. The Valdai plateau, the Volga heights, the Urals, the Altai, the Sayan mountains and the ranges east of Lake Baikal were all formed during this period. The more recent Tertiary folding, which produced such striking effects in mountain building further south, affected little more than the highland borders of Russia.

Much more important in the geological history of the country than these violent crustal movements were the alternating advances and retreats of the surrounding seas over the land. In the wide shallow basins so formed were laid down, age after age, the sedimentary rocks which now cover most of the platform. In general these surface rocks are of decreasing age from northwest to southeast, and they are still almost as horizontally disposed as

when they were first laid down.

Tertiary movements in the border country had very marked effects along its whole extent from Kamchatka to the Carpathians. Old ranges, such as the Altai, were further uplifted and new ones, such as the Caucasus, formed. Under the pressures then experienced the whole of eastern and much of central Siberia was shattered by faults and rifts (e.g. the great Baikal rift).

Though the major surface features are thus seen to be of ancient origin, the minor ones are nearly everywhere the results of more recent happenings. Morainic deposits form low hills on the northern lowlands, while many of the flattest areas of the plains are covered by deposits laid down on the floors of postglacial lakes. The separation of the Aralo-Caspian depression from the Arctic has been completed only since Oligocene times. The shrinkage of the inland seas exposed wide expanses covered by Quaternary and recent deposits.

Glaciation.—Russia was profoundly affected by glaciation during the Pleistocene ice age, and the details of its topography over large areas resulted from the events of that period. These are best known and most marked in European Russia. There the ice sheets, issuing mainly from the Scandinavian highlands but also in part from areas near the northern end of the Urals, moved southeastward. Their maximum extension may be regarded as having been marked, roughly, by a line from Nijni-Novgorod (now Gorki) to Smolensk, though two great lobes pushed forward far into the Dnieper and the Don basins.

Over Finland and extending into Karelia the main effects of the glaciation were erosive, removing surface soils and leaving bare rock surfaces with many lakes in irregular, shallow hollows. Long, low, sandy ridges (eskers) cross this region, and near its margin is a great end moraine marking a pause in the final retreat of the ice. Beyond this region to the limit of the ice sheets is the accumulation belt now covered mainly with boulder clays as far as the main end moraine. There was here much interference with river drainage, and many wide valleys were eroded along the edges of the ice sheet. The two great headwaters of the Northern Dvina occupy such a channel. The most important of the moraines, marked by a belt of hilly country northeast and southwest from the Valdai hills, forms the chief watershed of European Russia. The main highways to the west follow the crests of moraines through the marshy country toward Poland. The boulder clays extend southward where the ice lobes penetrated the Dnieper and Don basins.

Beyond the edge of the last ice sheet is the zone of deposition. There much of the surface is covered by loess or *limon*, a fine-grained deposit of material carried by winds from the drying surfaces left after the retreat of the ice sheets. The northwestern belt of the zone has many sandy tracts of outwash left by streams flowing from the surface of the melting ice.

Little is known in detail of the glaciation of Asiatic Russia. Local glaciers were certainly developed (some still exist) in the mountain borders and in the far northeast. In the central Siberian plateau no drift deposits have been found. The northern portions of the lowland were certainly ice-covered, but drift deposits were largely removed or covered by the marine transgression which followed the ice age in the far north. Asiatic loess deposits follow the foothills of the central ranges but are not certainly related to the glaciation. (T. Hsa.)

STRUCTURAL DIVISIONS

For a more detailed description of structure the following division of the land is convenient:

1. Northward-draining areas: (a) northern European Russia; (b) the Urals; (c) the Ob lowland; and (d) the Yenisei-Lena plateau.
2. Southward-draining areas: (a) southern European Russia; (b) the Moscow basin; and (c) the Aralo-Caspian basin.
3. The mountain border: (a) eastern Siberia; (b) the central Asiatic ranges; and (c) the Caucasus.

Northward-Draining Areas.—Northern European Russia.—This division possesses large areas of unfolded Palaeozoic rocks lying on an ancient (Archaean) floor of granites, gneisses and

syenites which emerges on the west in Finland, the Kola peninsula and Scandinavia. Along the line from the White sea to the Gulf of Finland (via lakes Ladoga and Onega) the ancient floor is covered by Palaeozoic rocks, Devonian, Carboniferous and Permian succeeding one another eastward toward the Northern Dvina. The Upper Permian beds have yielded *Glossopteris* and other plants characteristic of "Gondwanaland" and animal remains like those of the corresponding formation in South Africa. Beyond that river the lower levels are mainly alluvial but there are glacial Pleistocene deposits between the river lines. The basin of the Pechora is divided from the land farther west by a minor fold belt bringing up Devonian and some crystalline schist along the line of the Timan hills that may be traceable as a branching of the mid-Urals northwestward to Cape Kanin. The whole region has a very low relief and is consequently unprotected from arctic cold. Apart from the Timan hills this region is below the 600-ft. contour. Its lakes are discussed in the article on Europe (*q.v.*). Its chief rivers are the Pechora (1,000 mi.), the Mezen (500 mi.) and the Northern Dvina (400 mi.). The upper waters of the Pechora and the Northern Dvina interlace with those of the feeders of the Kama, a tributary of the Volga. As a consequence of the low relief the Pechora is navigable for 770 mi., the Mezen for 450 mi. and the Northern Dvina for 330 mi., while the Vychegda, a large tributary of this river, is navigable for 500 mi. The Onega river has rapids.

The Urals.—In the Urals the Palaeozoic strata are folded on the west of a longitudinal axis which exhibits crystalline rocks and is faulted on a large scale. The Devonian rocks in this area are of marine origin. Its greatest heights are chiefly in the regions of folded Palaeozoic rocks and the folds die away into the Russian platform westward in small parallel chains known as *Parma*. Though there is much copper in the Permian rocks on the west the main metalliferous veins of the area are in the faulted zone of crystalline rocks to the east. The greatest height reached in the Urals is 5,545 ft. in the northern Urals (at Tel Pos-iz or Mura-Chakhl). The passes are often low, that on the way from Molotov (Perm) to Sverdlovsk being only 1,245 ft. above sea level. The range is continued to the Arctic coast, Vaigach Island and Novaya Zemlya. (See further *NOVAYA ZEMLYA*; *URAL MOUNTAINS*.) On the south the Urals finger out in a plateau region dissected by feeders of the Ural and a few feeders of the Volga. The Ural river drains the southern Ural mountains, turns west and then south to the Caspian sea, which it reaches after a course of 1,477 mi.

The Ob Lowland.—Eastward the Urals fall rapidly down to the Ob basin, which is one of the largest areas of unbroken lowland on the earth. The floor material is almost entirely alluvial with a little Tertiary here and there. The river rises in the westward prolongations of the Sayan mountains and is 2,260 mi. long, but its very large tributary the Irtysh comes from the Dzungarian Gate and adds enormously to the area of the basin, which is bounded southward by the Turgai and the hills of Semipalatinsk. The Tobol, another large tributary, flows to the Ob from the north of the Turgai. It is generally accepted that under the alluvial floor lies a continuation of the platform of north European Russia let down through the dislocation of the eastern border of the Urals. The lowland extends without an appreciable break to the Yenisei, and only at some places near that river do the older rocks help to form the surface.

The Yenisei Area.—East of the Yenisei the character of the land changes abruptly: a sharp edge rises rapidly to more than 600 ft. and in one place to about 3,300 ft. above sea level, and east of this edge is a great dissected plateau of ancient rocks. Archæan rocks with granites, etc., are exposed near the Yenisei and away to the northeast, but there are larger areas of Cambrian and Silurian rocks and these are covered over a vast stretch of country by Permo-Carboniferous rocks. The plateau extends eastward to the Lena along the valley of which is found evidence of an invasion of the sea in Cretaceous times. The plateau is an ancient block to which E. Suess gave the name of Angara land. Large areas on this plateau rise somewhat above the 1,600-ft. contour, and the diversities of surface are largely the result of river dissection. There is evidence in the Taimyr peninsula of a fold

axis with a general direction from west-southwest to east-northeast but apparently no heights reaching above the 1,500-ft. contour.

The Yenisei is the collecting stream beneath the western edge of this old block, and it rises in the Sayan mountains receiving nearly all its tributaries from the eastern side. Of these the Upper Tunguska or Angara comes from Lake Baikal, the Middle or Stony Tunguska and the Lower Tunguska from the block itself. The river is 2,800 mi. long.

Southward-Draining Areas.—These regions are those which drain to the enclosed seas, the Black sea, Caspian sea, Aral sea and Lake Balkash. Considered structurally they reveal on the west a succession of very slight undulations, anticlines and synclines with axes northwest to southeast from the vicinity of the Carpathians to the borders of the arctic region; on the east the subdued features result mainly from the great virgations of the Tien-shan range.

Southern European Russia.—From the Sea of Azov west-northwestward to beyond Kiev stretches an anticlinal zone in which appear granites and gneisses, some of which are thought to be Archæan. The Dnieper from Kiev to Dnepropetrovsk (Ekaterinoslav) follows the northern border of this zone of hard rock through which the river cuts its way below the latter town. Next follows a syncline in which early Tertiary deposits are widespread, whereas farther south they only cap parts of the old rocks. The syncline is named after the river Donets which follows its axis. Toward the Sea of Azov Palaeozoic rocks are brought to the surface and the land stands somewhat higher. In this region is the Donets coal field, the coal belonging to upper Carboniferous strata as in western Europe. The next zone is the central anticline which is parallel with the two structural zones described and which is thought to die away toward the Caspian. The axis of this anticline is marked to some extent by the Don river where it flows south-eastward below Pavlovsk while, much further northwest, the course of the Southern Dvina is clearly related to it. Along it in the Don region the Cretaceous deposits, capped interfluviably by early Tertiary here and there, form the most important outcrops, but on the northwest there is a great area of Devonian (*v. inf.*).

The Moscow Basin.—Northeast of this anticlinal zone is the immense "Moscow basin," floored mainly by Palaeozoic rocks mainly still horizontal, with some Triassic deposits; but there are patches of Jurassic and Cretaceous strata as, for example, around Moscow and in the great bend of the Volga and also farther north from Kostroma to Syktyvkar (Ust-Sysolsk) on a tributary of the Vychegda. There was an intrusion of the sea in Jurassic times which became much more extensive in the Cretaceous period; no upper Cretaceous is known, however, in northern Russia. Around the Moscow basin in the southwest and west the Lower Carboniferous system (with poor coal at Tula, etc.), outcrops in a great curved belt from the region of Tula almost to the White sea. Beyond this belt northwestward is the area of Devonian rocks toward Latvia and Estonia and across to the White sea. They rest unconformably on Silurian rocks which outcrop along the southern shore of the Gulf of Finland and of Lake Ladoga. The Devonian rocks are partly lacustrine (old red sandstone) and partly marine in origin, and the two types are often interstratified: a basal red sandstone is covered by a dolomitic limestone which in turn has a sandstone over it. The Timan hills (*see above*) which on the northeast may be said to be an upfold bordering the Moscow basin.

The main axis of the basin is parallel to the course of the Volga above Gorki (Nijni-Novgorod), continued northwestward by the Mologa; *i.e.*, rivers running broadly parallel to the sections of the Dnieper, Donets and Don already noted. Permian rocks outcrop over large areas on the north. The dips of the strata are small, and anticlines and synclines there are really slight undulations which might be followed right across Russia from the Dniester to the Timan hills, always with lines roughly northwest to southeast (or west-northwest to east-southeast) well marked in geology and drainage, though not much indicated in relief save that there is a marked low line of the Dnieper valley above Dnepropetrovsk, the Pripiet marshes or Rokitno swamps and the upper Bug, where it continues the line of the Dnieper and Pripiet into Poland. This

belt of lowlands is of special importance because of the great marshes just named; they form the historic barrier between Russia and peninsular Europe.

The Aralo-Caspian Basin.—Turning now to the east one notes the virgations of the Tien-shan, orographically very subdued in the Aralo-Caspian lowland. One stretches northwestward parallel to and north of the Syr-darya and apparently re-emerges from the lowland in one of the southern branches of the Urals, which are at first a plateau and rise to any considerable height only north of lat. 52° N. Another virgation stretches parallel to the first, this time just north-northeast of the Amu-darya or Oxus river, and is continued into the Mangishlak peninsula that projects into the northeast of the Caspian sea. Farther south still are the hills of the Iranian border reaching the Caspian sea between the Gulf of Kara Bogaz and the town of Krasnovodsk and continued on the west of that sea by the mighty Caucasus. In the Aralo-Caspian lowland the rocks of these virgations are masked by a Quaternary covering with Tertiary deposits south of the lower Oxus and on the Ust Urt plateau between Aral and Caspian. Between the Aralo-Caspian-Balkash area and the Arctic drainage area of the Ob and its feeders is the higher land of Karaganda, related structurally to the Altai and floored by Palaeozoic and igneous rocks. West of this the land continues to be somewhat above the level of the lowlands on either side and is floored by Tertiary deposits, but the higher land narrows down in the Turgai region, which according to general opinion until Oligocene times had a sea communication directly to the Arctic ocean on the north. The two great rivers of the region are the Amu-darya (Oxus), 1,500 mi. long, and the Syr-darya, 1,500 mi. long, both reaching the Aral sea.

Structural geologists have spread familiarity with the idea of a great sea called Tethys reaching in Mesozoic and Eocene times from the present Mediterranean area eastward through the region occupied later by the young folded ranges of Asia Minor, Armenia, the Hindu Kush and Himalaya, etc., to Malaya. Without venturing into details of advances and retreats of the sea, it may be said that the uprise of the fold mountains of Asia Minor, Armenia, the Elburz range and the Hindu Kush left the part of that sea to the north of this more or less isolated as the brackish Pontic lake, losing its former connection via the Turgai low line with the Arctic ocean probably in Oligocene times and becoming much modified by the sinking of the southern parts of the Black and Caspian seas, which are both deep. Apart from these two depressions the land shelves easily from land to sea around the northern parts of the Black and Caspian seas, while the shallow Aral sea is a shrunken part of the Pontic lake, now cut off by lowland from the northeast of the Caspian sea. Balkash is a fresh-water lake on higher land farther east—now at any rate without outlet, whatever may have been the condition of things in the past.

We thus have a series of enclosed seas and lakes of which Balkash, the Aral and the Caspian have no outlet, and the two latter are salt, while the Sea of Azov communicates with the Black sea through a break in the mountain line between the Caucasus and the Yalta mountains of the Crimea, and the Black sea has communicated with the Aegean and the Mediterranean since the sinking of the former. The rivers Dnieper (1,400 mi.) and Don (1,100 mi.) both flow southeastward for a considerable distance and then turn sharply southwestward to the Black sea, probably as a consequence of the recent dominance of flow toward the Aegean following the sinking of the latter. Before that sinking the Danube may for a time have made its way eastward across the lowland to the Caspian area via the curious Manych depression. The Volga (2,300 mi.) is the longest river of Europe, flowing broadly east-southeast parallel to the axis of the Moscow basin and meeting the Kama as it turns south below Kazan. On its course southward it has a sharp eastward loop with Kuybyshev (Samara) at the head opposite the southward bend of the Don. Below Stalingrad the Volga bends southeast, thus continuing the previous line of the Don, and so reaches its delta on the Caspian sea. The great rivers of the Aral basin, the Amu-darya and the Syr-darya, have already been mentioned.

The Mountain Border.—The fold ranges which border the Russian lands on the south were uplifted at various periods, those in the western sections being generally younger than those to the east, though in Kamchatka they are of approximately the same age as the Caucasus. In central Asia they show a characteristic arrangement: range after range runs, more or less, east and west, each successive one tending to extend farther west than that to the north of it. As these are discussed in the general article on Asia (*q.v.*) they will be mentioned only briefly here.

Eastern Siberia.—Beyond the Angara block eastward stands an important series of mountain ranges. The Stanovoi mountains and the Kolymski (Kolyma) mountains are more or less parallel to the coasts of the Sea of Okhotsk; but the former are also roughly parallel to the edge of the Angara block on the other side of the Lena and, 100 mi. or so north of Okhotsk, are linked not only with the Kolymski mountains to the east but with the Verkhoyansk mountains which go westward and northward, keeping more or less parallel to the edge of the Angara block with the Lena between them and it. Like the other great rivers mentioned above, this one is formed of a pair, the upper Lena and the Vitim. The length of the Lena is estimated at 2,860 mi. The Verkhoyansk and the Kolymski mountains thus form a great semicircle of mountains apparently determined in the west by the Angara block and in the east by the depression of the Sea of Okhotsk. Within this semicircle other ranges are disposed in more or less parallel curves.

The Tas Kistabit mountains come next to the western Kolymski. The Cherski mountains are a longer range parallel to the whole curve of the Verkhoyansk-Kolymski line and stretching from the east of the Yana river to the west of the Omolon river. Within this again is a smaller range. The Cherski mountains are named after a Russian explorer who died in this region in 1892. The river Indigirka traverses them by a winding gorge often less than a mile wide, and the tributaries of this river also make gorges in the range, in which an altitude of about 3,300 m. (10,727 ft.) is reached. These high mountains are apparently almost without glaciers because of the aridity of the region. A geological traverse going northward between the Kolyma and the Indigirka shows an east-west axis of igneous material alternating with Permian and Triassic rocks.

East of the mouth of the Omolon river a great axis of crystalline rock, flanked on both sides by Permian, runs parallel to the coast as far as Cape Dezhnev (East cape). The Kolymski mountains curving from the south come northeastward as the Anadyr mountains and end in the Chukchi (Chukotski) peninsula. This latter high line is flanked on the southeast by the Ponzhina and Anadyr valleys, forming an almost continuous low line from the Sea of Okhotsk across the base of the Kamchatka peninsula to the Gulf of Anadyr north of the Bering sea. (See *KAMCHATKA*.) Northward from Cape Lopatka along the east coast as far north as the curve of the Aleutian Islands is a belt of volcanoes, part of the "girdle of fire" of the Pacific. The central longitudinal range of the peninsula is continued northeastward, south of the Anadyr valley to Cape Navarin. There thus seem to be three great structural lines abutting upon the neighbourhood of the Bering strait and the northern coast of the Bering sea.

The main curve of the Stanovoi mountains, supposedly fold mountains, continues westward on the south and apparently approaches the Yablonoi mountains, really the eastern edge of the Malkan horst, at an angle. To the west-northwest lies the Vitim plateau. To the southeast is found a type of topography analogous to that of Kamchatka and extreme northeast Asia. There are successive ranges more or less parallel to the coast, imbricating to some extent and separated by lines of lowland fairly parallel with their axes. The Liao, Sungari and lower Amur valleys form a continuous lowland from the Gulf of Pohai (Pechili) to the strait between the mainland and Sakhalin. The Ussuri and lower Amur valleys form a low line from Vladivostok northward with the high range of the Sikhote Alin on its eastern flank. The Sea of Japan and the Gulf of Tatary, narrow waters separating Sakhalin from the mainland, form still another low line with the Sikhote Alin on the west and the high axis of Sakhalin, Hokkaido, etc., on the east. As in the case of Kamchatka, so also here the high axis

is met on the east at a considerable angle by the Kurile Islands, of volcanic type; and south of this junction (that is, in Japan) the high axis is volcanic, just as eastern Kamchatka is volcanic south of its link with the Aleutians. The great river of this eastern region is the Amur, which has a very large tributary, the Sungari, on the south; the Amur's course is governed mainly by the mountain lines of the region; its length is 2,900 mi.

The Central Asiatic Ranges.—These mountains, extending from the Pamirs to the river Aldan, are sometimes grouped together as the Sayanid system. They are mainly the products of folding and faulting in Caledonian times but have in many places been further uplifted by later movements. Thus the Sayan ranges after heavy denudation appear to have been lifted again en masse. This is clearly shown by the relatively flat surfaces of many of the highest areas. The northern ranges of the Tien-shan and the Altai mountains show a similar history. The middle ranges of the Tien-shan are of Hercynian age. The mighty southern ranges, with their vast glaciers and peaks of more than 20,000 ft., and the equally lofty Pamirs are the products of Tertiary movements. The border ranges of Turkistan and Iran consist mainly of folded beds of Cretaceous and Tertiary age.

The Caucasus and Transcaucasia.—These regions are distinct structurally and physically, the Armenian mountain knot being separated from the Caucasus by a relatively low, narrow line occupied by the river Rion on the west and the river Kur on the east, but a long stretch of this low line is well over 1,500 ft. above sea level. This line has to the east the deep basin of the southern Caspian and westward the deep basin of the southern Black sea. (See CAUCASUS.)

(R. M. F.; T. HÉR.)

CLIMATE

The climate of the U.S.S.R. has two outstanding characteristics: its uniformity and its continentality. They are results of its low relief and compact form. Its great plains present over immense distances the same monotony of climate as of level. It is possible, of course, to recognize areas whose climates differ significantly one from another, but the transition from one such province to its neighbours is, practically everywhere, accomplished by almost imperceptible gradations.

Maritime influences are extremely feeble, which is not surprising because 75% of the area is more than 250 mi. from the surrounding seas, several of which, moreover (the Baltic, the Black and the Caspian), are land-enclosed. The frozen Arctic ocean obviously can have little effect; the mountain barrier shuts out monsoonal winds from the south; and offshore winds and high coastal ranges limit Pacific influences to a narrow coastal belt on the east. Hence the Russian lands almost everywhere show to a high degree the features of a continental climate: great extremes of temperature, both diurnal and annual; abrupt change from winter to summer and vice versa; low rainfall with summer maximum and largely convectional in character; violent windstorms. The south coast of the Crimea and Transcaucasia (both sheltered by high ground on the north and with winter rains drawn from the Black sea) and the area between the lower Amur and the Pacific (feebly monsoonal in character) are the only areas to which this general description does not apply.

The climate of the U.S.S.R. is dominated by the polar continental air mass which extends over the whole land for the greater part of the year. In the summer it shrinks to a narrow belt along the arctic coasts of Asiatic Russia. It is characterized by its low temperature and low humidity. Disturbances are infrequent and local. Thus, still, dry days with clear skies, very low temperatures and slight snowfall are characteristic of the nine months or so during which it covers the land—conditions which though harsh are by no means unhealthful but do severely limit human activities.

In winter, pressures are high over the whole of Siberia, especially so near Lake Baikal where in January they exceed 30.5 in. Outblowing winds are therefore normal over Asiatic Russia. A narrow extension of this high-pressure area spreads westward, roughly along lat. 50° N., as far as central Europe. On its northern side southwest and west winds blow, while to the south the winds are generally between north and east. The feeble low pres-

ures experienced during the brief summer give a much more irregular air circulation.

Rainfall is generally less than 20 in except in coastal and mountainous areas and the middle and western areas of European Russia. It is almost entirely derived from Atlantic sources, being brought by cyclonic disturbances, more frequent in summer. The total precipitation decreases eastward along a middle zone from Moscow to Lake Baikal and, much more rapidly, both to the northeast and to the southwest of this zone. The arctic northeast has a rainfall as low as that of the desert Aral basin.

The summer isotherms follow the latitudinal lines with remarkable regularity. In January their direction is rather from northwest to southeast, with the pole of cold in the region of Verkhoyansk (January mean -59° F., minimum recorded near -100°). Temperature ranges thus increase toward the east, from 31° at Batum to more than 100° northeast of Yakutsk. In the Siberian arctic only 60 days, on the average, are frost-free, and even in European Russia it is only in the Ukraine that the surface is snow-covered for fewer than 100 days. Both the Sea of Azov and the northern half of the Caspian are frozen over in January.

Siberian Climates.—All the features of the Russian climate already outlined are particularly sharply shown in Siberia. Its northerly situation, its isolation from Atlantic and Pacific, the increasing altitude of the land toward the south (offsetting in part the decreasing latitude) and its openness toward the arctic all tend to bring down its temperatures. By reason of its winter high pressures, bitterly cold winds blow out from it over the surrounding lands. Its low atmospheric pressure in summer draws in warmer and more humid air from beyond its borders, thus producing its summer maximum rainfall. Snow lies long, but the depth of fall is slight—in the northeast so slight in many parts that the sledge is not usable. On the whole the weather is dry, the sky generally cloudless. Temperature ranges are unequalled in any other land. Verkhoyansk is generally credited with the lowest recorded temperature (about -100° F.), but it has also recorded 100° F. The Siberian summer, though short, is hot rather than warm.

Winter is clearly the dominant season, as much by its unchangeableness during many weeks as by its severity. The general absence of wind alone makes the cold bearable. When the buran (Siberian blizzard) blows, only shelter from its blast will save the life of the traveller. In the absence of heavy snow the soil and subsoil are deeply frozen. Over nearly all Siberia east of the Yenisei "permafrost" obtains: the subsoil is frozen all the year and the surface soil thaws only for a brief period and only to shallow depths in summer. The depth of this thaw has important effects in determining the nature of the vegetation.

Spring arrives in April. The ice on the rivers breaks up rapidly and, as the thaw begins in the south, the flowing waters cause floods over the still frozen northern channels. As the snow melts, village streets become apparently bottomless seas of mud. For several days outdoor movement of man or beast becomes almost impossible. The surface soon dries, however, and a brief period of delightful spring weather is experienced, though often interrupted by the return of severe cold for a short time. Summer follows quickly. The days are warm or hot and the hours of daylight long. Its monotony is broken by sudden storms, sometimes accompanied by hail, or there may be short burning spells with dust storms. In any case one can be sure of the return of clouds of voracious mosquitoes. By August, however, or by early September in the south, night frosts are experienced and in two or three weeks winter has returned.

Over such a vast expanse there are naturally variations in climatic conditions, and these make possible a division into climate provinces or regions.

The polar or tundra province includes a narrow belt along the Arctic shores from the Kola peninsula to the Bering strait. Its southern limit may be taken at the 50° July isotherm, which is also near the limit of tree growth. The chief characteristics are its very long winters (about ten months), short summers (temperatures as high as 80° F. have been recorded), low precipitation and strong winds. Both temperature and precipitation decrease

eastward, the latter falling as low as four inches near the Lena delta. Winter temperatures are higher near the coast than in the interior.

The far eastern province is characterized by a monsoonal reversal of wind direction—land to sea in winter, sea to land in summer. Winter conditions are severe (even Vladivostok, in the extreme south, has 110 days of frost and a January mean temperature of 5° F.). It is sharply distinguished from other Siberian regions by its humidity. Fogs are frequent, snowfall heavy (particularly near the Sea of Okhotsk) and rainy days numerous in summer.

Eastern Siberia is notably dry and cold. Precipitation varies from 14 in. near Lake Baikal to 4 in. in the north. Days with snow are few (nine at Blagoveshchensk, none in some years and in some sections). Immense areas have mean annual temperatures below freezing point. On the other hand, the July isotherm of 68° F. does not reach so far north in any other part of the world.

Central Siberia is also very dry. The number of snowy days is higher, though the total fall is still slight. Temperatures remain very low (Irkutsk January mean -5° F.). Lake Baikal reduces temperature ranges very considerably in its immediate vicinity.

In **western Siberia** the winters are still harsh (Tomsk January mean -3° F.). Heavy snow is often brought by violent storms and piled in great drifts. Tomsk has an average of about 120 snowy days. The snow cover limits the depth to which the soil is frozen, so that it is quickly fit for cultivation after the spring thaw. Its thorough soaking at this time is also favourable to seed germination. During the warm-to-hot summer, rain falls in heavy showers, though the total precipitation is still only moderate (Tomsk 20 in., Omsk 12 in.).

Russian Climate.—The climate of European Russia is controlled by the same major influences as that of Siberia: its northerly latitude and openness toward the arctic, the absence of any barrier on the Asiatic side and the shutting out of marine influences (except to a limited degree) by the Scandinavian highlands, the Carpathians and the Balkans. It is accordingly both continental and uniform, in marked contrast to that of the rest of Europe. Nevertheless, the Baltic depression and the north German plain do permit, if only in attenuated form, the penetration of Atlantic influences.

As has been seen, the Siberian anticyclone in winter throws west across central Russia an arm of high pressure bringing cold Asiatic winds to the east, centre and south of the country. The lower pressures to the northwest permit the entry of humid and relatively mild air from the west. In summer, while the east and south still receive hot, dry continental winds, the north, northwest and centre experience cooler and moister oceanic air. Precipitation therefore decreases from northwest to southeast (Riga 22 in., Moscow 21, Saratov 15, Astrakhan 6). Snowfall, fairly heavy in the lake region, becomes quite light toward the Black sea and the lower Volga, a reminder that winter is the season of least precipitation (Moscow 16%). The summer, though it has often long periods of drought interrupted by brief but heavy rainstorms, is the season of greatest precipitation (Moscow 36%, Kaluga 40%).

Latitude has a marked effect on summer temperatures (Archangel July mean 60° F., Astrakhan 78° F.) but has less effect in winter when distance from the sea becomes a more important factor (Leningrad January mean 15°, Moscow 12°, Orenburg 3° F.). But it is the length of the seasons rather than their mean temperatures that has most influence on Russian life. In the far north at least six and one-half months of frost can be expected, Leningrad, Nijni-Novgorod (Gorki) and Orenburg (Chkalov) from five to six, Moscow and Kuybyshev from four to five, Odessa and Kherson from one to three. Unlike the Siberian winter, however, conditions are liable to violent changes: blizzards, sudden falls in already low temperatures, or brief thaws (*otstepeli*).

Spring, coming in April or May, sets free the frozen rivers and puts an end to all outdoor movement. In a couple of months, except in the far north, summer has arrived, bringing hot days everywhere. Evaporation is then intense, the soils dry quickly and river levels fall considerably. Dry winds from the east bring

dust storms that may cover and often scorch the growing crops. Harvest follows seedtime with but a brief interval for festival between. By early October the first snow showers have fallen in Moscow. From mid-November winter tightens its grip on the whole country once more.

The southern shores of the Crimea and the northeastern coast of the Black sea have a Mediterranean climate. There the winters are generally mild and rainy, the summers dry and rainless. Frosts are experienced only in a few days in January and February. High ground to the north provides shelter in each case.

Transcaucasia has a subtropical climate. The Kolkhiz lowland, open on the west to the Black sea, has a milder winter than even the Crimea and a cooler summer. Precipitation is heavy with a slight winter maximum. Winds from the Caucasus produce foehn effects.

Turkistan.—Across the lower Volga, in Kazakhstan, the climate becomes yet drier and more extreme. Wild blizzards sweep it in winter, though the total snowfall is slight. Autumn and spring are virtually nonexistent, a grilling summer (July mean 77°) following immediately on a bitterly cold winter (January mean 5°).

Further south, in the Aralo-Caspian basin, conditions are still more severe. Precipitation varies between 3 in. and 8 in. a year, except along the mountain margins (Tashkent 14 in.). Most of it falls in spring and the rest near the end of the year. Temperature ranges, both annual and diurnal, are large. Cold waves from the north sweep across the basin in winter, while the cloudless summer skies and dry air give full play to a burning sun. The Aral sea is frozen for five months; three months later eggs can be cooked in the sands near its shores.

SOILS AND THEIR INFLUENCE

The science of pedology or soil study owes much of its modern position to the work of Russian investigators. This might perhaps have been expected in a land for so long almost wholly dependent on agriculture. Uniformity of level and of climate over wide areas naturally emphasized the importance of soil variations in the choice of crops and in their productivity. The derivation of the soil from the underlying surface rocks by processes of denudation which varied with climatic conditions and the later addition of products of organic decomposition was of course widely recognized. The main value of Russian work arose from the emphasis that it placed on regarding the soil as a living, or at least an evolving, thing.

Among the first of Russian workers in this field was V. V. Dokuchayev (1846-1903), after whom was named the Institute of Soils responsible for continuing his researches and for the publication of important papers and maps on the subject. K. D. Glinka was an important early follower; it was the publication in 1928 by the department of agriculture of the United States of a translation of his classic *The Great Soil Groups of the World and Their Development* that first made the work of the Russian school known to English-speaking students.

From the standpoint of their origin, the soils of Russia fall into three main groups, each covering a wide area. Those of the north are derived from the drift left on the final recession of the ice sheets, mainly their ground moraine and the outwash from it. To the south lies the belt of loessic soils produced by wind action on the drying surface of the newly uncovered glacial deposits. Over the areas formerly covered by the Aralo-Caspian sea the surface consists of marine deposits left behind as these waters shrank. Since their formation all have been changed by the action of the weather, especially by fluctuations of temperature and by rain and soil water. The growth and decay of the vegetation that covered them and the action of burrowing animals, of cultivators and especially of bacteria all helped in varying degree to determine the nature of the present soil cover and are still controlling its development. The great importance of climate in this respect is suggested by the zoning. The rise of temperature, decrease of rainfall and increase of evaporation from northwest to southeast are evidently largely responsible for the soil changes.

The soil is clearly "alive" in the sense that it is still developing,

though that development may be, and is in many districts, extremely slow. The humus produced from decaying vegetation largely determines soil colour and is of great importance because of its water-holding property. In suitable conditions of temperature and water, bacteria rapidly reduce the organic content of the soil to inorganic forms (the "mineral stage" of Russian authors), which then become available for new plant growth. These salts are normally dissolved in the soil water and so carried to the lower soil layers. In this way is produced the soil profile, which in a well-developed soil consists of three horizons: the upper or A horizon, usually loose in texture and being robbed of its mineral content by the soil water; the B horizon, more compact and containing most of the salts leached from A; and the C horizon, consisting mainly of fragments of the underlying mother rock.

In arid regions the soils contain little humus since lack of moisture limits the growth of vegetation. Excessive evaporation brings soil water to the surface where it leaves behind its dissolved mineral contents. Thus carbonates especially are found at or near the surface, sometimes forming a clearly marked layer. Frost, with the check that it places on plant growth and on bacterial activity, prevents development. The steepness of mountain slopes, producing constant downward movement of rock fragments, also checks development.

Glinka classified soils into about two dozen types, not all represented in the U.S.S.R. Only the major groups are distinguished in the following survey.

Tundra Soils.—This most northerly group of soils is found over nearly one-sixth of the total area of the U.S.S.R., extending beyond the tree line (the word "tundra" implies the absence of trees) to the shores of the Arctic ocean. The outstanding characteristics of these soils are due to the rigorous climate. In the brief summer only the upper layers are thawed, the subsoil remaining permanently frozen and therefore impervious. Neither surface water nor burrowing animals can penetrate the frozen layers. Marsh conditions are widespread over all the lower areas in the warmer period. Vegetation is shallow-rooted and scanty. Its decay remains lie on the surface and accumulate there to form a black acid layer. This bog soil is, almost entirely, partially decomposed vegetable matter. The subsoil, on the other hand, is almost wholly inorganic. Low temperatures limit bacterial activity and the frozen subsoil prevents earthworms from carrying on their beneficent work of conveying organic material underground and bringing mineral fragments to the surface.

Where the subsoil is sandy there is some leaching from the surface soil, and tundra soils approach the podsol type. On drier mounds uplifted by the action of frost peat may develop, but this is less common than is generally believed. In the tundra of the far northeast of Siberia the very low precipitation is accompanied by an almost total absence of vegetation, and the land surfaces are often of bare rock or pebble-covered, with little soil of any kind.

Under such conditions agriculture is clearly impossible. The few inhabitants are pastoral nomads dependent on their reindeer herds, on summer fishing and on winter hunting in the forest fringe. There is some reindeer breeding to provide animals for winter haulage in the forest zone to the south. Transition from tundra to forest gives rise to a narrow belt where scattered examples of dwarf species of birch and spruce are typical. These, like the forest trees themselves, first become evident in the river valleys, where there is some shelter from winds and the subsoil ice lies at a deeper level.

Forest Soils.—Soils of this group cover more than half the U.S.S.R. All are podsoles or modified podsoles; that is to say, soils of an ash-gray colour (soi = "ash") typical of cool, humid climates. They are best developed in the taiga or coniferous forest region. There surface water can reach deeper than in the tundra, since temperatures are high enough to prevent the permanent freezing of the subsoil and, in dry periods, to cause some rise of water in the soil to replace the slight loss from the surface by evaporation. These conditions are evidently favoured by the forest cover, for it prevents heavy leaching by rain while maintaining fairly constant humidity of the soil. The shelter it gives from

winds also reduces losses by evaporation. On the other hand, leaf transpiration keeps the subsoil fairly dry.

Coniferous Forest Type.—The decay of the needle leaves of the conifers proceeds very slowly by reason of their resinous nature and gives rise to a thin and rather peaty surface layer. It produces a very acid type of humus and the soil water passing through it is therefore capable of bringing about almost complete decomposition of the mineral constituents of the underlying layer. Iron and aluminum hydroxides are thus carried downward, leaving behind little but silica or fine clay. The A horizon in a typical podsol is thus frequently sandy, grayish where a proportion of humus remains but sometimes almost white where it has been removed, and strongly acid. Since almost all the plant food it contained has been removed, these soils are agriculturally of little value. This is evidently of great importance, since they cover about two-fifths of European Russia. Horizon B shows two distinct layers. The upper of these is brownish yellow or coffee coloured and contains most of the products of humus decomposition. In texture it is usually clayey, the finer mineral fragments being cemented by gummy substances resulting from this decomposition. Sometimes a hardpan layer is produced at this level. The lower section is usually rusty brown in colour and heavily impregnated with iron hydroxide. When this layer is sufficiently thick and consolidated it is often a factor in the production of the marshes common throughout the taiga belt. Red-brown patches, due either to humus or ferrous hydroxide concentrations, are sometimes seen in the subsoil below the B horizon.

Coniferous trees form the major part of the vegetation except on the northern edge of the forest; there a belt of birch occurs, at first dwarf and lichen-covered but increasing in size and number southward. Where the A horizon is sandy the Scotch pine is prevalent, on the clays some variety of spruce. In Siberia the silver fir and Siberian larch are the commonest trees. Economically the forests are important as sources of softwood timbers and of furs.

Bog and Marsh Types.—This is common north of about the 60th parallel of latitude in Europe, in the wide, ill-drained northern parts of the west Siberian lowland and in the Pripet area of western Russia. It is especially common on surfaces of glacial clay. The water table is high, and hence there is little downward movement of soil water. Decomposition of vegetation is incomplete because of lack of aeration, so that peaty surface layers are common. The remains of dwarf birch and alder and of marsh plants and mosses accumulate slowly, giving an acid surface soil. Dissolved iron is often precipitated in nodular form, as bog iron ore, has been worked in some regions for several centuries (e.g., in the Vychedga valley).

The marsh areas have been of great strategical importance in Russian history. In the earlier days of invasion from the Asiatic steppe they were often places of refuge. The great Pripet marshes formed an important barrier across the European plain, giving a natural western frontier toward Poland. Peat is worked extensively and is used for power production in some areas.

Mixed Forest Types.—From central Europe across European Russia to the Urals near Molotov (Perm) there extends a wedge of mixed forest where deciduous trees mingle with and ultimately almost replace the northern conifers. Beyond the Urals this forest occurs again in a narrow belt as far as the Ob. As has been seen, this is the area in which Atlantic influences upon the Russian climate are most effective and are particularly evident in the heavier precipitation. The soils of the region vary in character in accordance with differences in local climate and in the mother rock from which they are derived, but in general they show a transition from the podsolized soils of the coniferous forest to the black earth of the steppe.

Heavier precipitation causes a continuance of the leaching of the A horizon, but the surface layers are less acid than farther north. Higher temperatures encourage more complete decomposition with greater activity of earthworms and bacteria. The horizon is darker in colour, gray rather than white, as the humus content of the upper layer rises to from 3% to 6%. This upper layer, seven to nine inches in depth, accounts for the greater agricultural productivity of this zone as compared with the region to the north,

In texture the layer is said to be nutlike. In the lower layers of the horizon this structure becomes coarser and the colour grayer. The A horizon may be as thick as 30 in. The change is gradual to the B horizon which may reach to a depth as great as nine feet in the southern areas. The colour of this horizon is generally brown, grayish in the upper layers but reddish in the lower. Very fine clay particles and some calcareous material occur at the lower levels. The origin of these grayish soils is still disputed. Some hold that they represent a degraded form of the black earth, caused by a southward spread of tree growth over the steppe. In support of this view it is noted that where patches of woodland occur in the steppe valleys they are accompanied by gray soils. Another opinion sees in them mainly the result of forest clearing and the improvement by long-continued cultivation of a formerly podzolized soil.

The gray soils occur in a narrow but irregular band across European Russia and in the still narrower zone of the wooded steppe of western Siberia. Though still essentially forested, this country allowed its early inhabitants to maintain themselves by agriculture in the clearings. As settlement increased these could be and were extended by cutting and burning. The longer frost-free period makes possible the growth of deciduous trees except in eastern Siberia, where this type of forest is completely absent. The heavier leaf fall from this type of tree increases the supply of humus to the surface layer of soil. The richer undergrowth, which consists mainly of perennial grasses, contributes to the same result and also encourages the rearing of farm animals.

In the narrow west Siberian area the trees are mainly aspen and birch. West of the Urals the forest is much richer in species. The most important of these are the oak, especially common on the glacial clays, the lime, the maple and the ash. The last-named is most abundant in the more southerly areas. Conifers are still common, more particularly on the sandy outwash soils and alluvial areas along the rivers.

The mixed forest zone has played a great part in the history of Russia for within it the Russian nation was born. Groups fleeing from the Asiatic invaders of the steppes there found shelter. Under the influence of a settled agricultural life they were welded into groups which later coalesced to form the first Russian state. All the suitable land has long been cultivated and the harder cereals—barley, rye and oats—grown. Flax and hemp provided fibres for early industrial use, and the potato was soon widely grown after its first introduction. Forage crops—hay and lucerne—also do well and support the growing dairying and cattle-breeding industry, especially in parts of Siberia.

Black Earth.—Soils of the black earth type (chernozems) underlie about 12% of the U.S.S.R. and form in European Russia the largest continuous area of the type anywhere. They occur south of the forest soils and north of the arid and mountain areas. Their essential characteristics are the high humus content and the presence of calcium salts, especially the carbonate. They evidently represent a modification of an earlier soil enriched by the decay of animal and plant remains. Because of their wide development in loess areas, it was at one time thought that they were simply loess with an addition of humus; this is not now accepted, as they are found to occur in quite characteristic form on mother rocks of varied kinds. At the same time there seems little reason to doubt that loess and the *limons* found over calcareous rocks are particularly favourable to their development. Sandy subsoils, too, carry thicker coverings of chernozem than do clayey subsoils. The better drainage afforded by loess and sands is probably the reason in each case.

The humus content of the black earth varies from 6% to about 16%. It is lowest in the north and west and increases to the south and east. Thus the percentage varies from 6 to 10 in the Ukraine, where it occurs over the widest area, but increases to 15 or 16 east of the Volga, where it forms but a narrow belt, and in western Siberia, where its distribution is patchy. The black earth is thickest in the Ukraine.

It is clear that the principal factor leading to the development of chernozem is climate. It occurs in regions with a long and severe winter but with summer conditions of high evaporation

leading to a virtual desiccation of the surface soils. Snow accumulates during the winter, and the spring thaw provides the moisture necessary for a quick and abundant growth of grass. This water supply, however, is exhausted by late May or early June. Rain falls during the summer months but only at considerable intervals, and the total amount is small. The intervening periods of drought stop the growth of the steppe grasses, the decay of whose roots is the chief source of humus. It also prevents the growth of trees, and this also may be of some importance in the development of chernozems since tree roots encourage oxidation. The blackness of the surface layer which gives the soil its name is due to the long-accumulated products of the decomposition of grass roots. The droughts of summer and the frosts of winter both slow down the rate of decomposition. Leaching of the A horizon is largely prevented by the low summer precipitation and rapid evaporation, which moreover produce a strong upward movement of the soil water that leads to a concentration of mineral salts just below the humus level. This is another factor inimical to the growth of trees and explains their restriction to valley areas in the steppelands. Layers of gypsum and of calcium carbonate at different levels are often produced by this movement of soil water.

The typical soil profile in a black earth region shows two major horizons. The upper portion of the A horizon is normally neutral or acid. The surface soil is crumbly, granular in structure and black or deep chocolate in colour because of the high humus content. The lower portions of the horizon, which has a total thickness of 18–40 in., is grayish black to yellowish brown and has a nutlike structure. It is in this portion of the profile that calcareous concretions occur, the carbonates formed in the humus horizon being carried down by leaching.

The black earth lands practically coincide with what are sometimes called the tillable steppes. These have produced grain for many centuries without any great loss of fertility. The main handicaps to their utilization are climatic, as they require not manure so much as moisture. Recurrent drought has given rise to terrible famines. The dry soils in the summer months are particularly liable to wind erosion and to loss of topsoil in heavy rain showers. Modern cultivation by machines on a large scale, as in the United States, tended to accentuate these difficulties. Increased diversification of crops, the construction of vast tree belts as windscreens and the utilization of Volga waters for irrigation were developed to offset them. In earlier times the Slav cultivators occupied the wooded valleys and left the bare plateaus of the steppes to the nomadic pastoralists. The modern tendency has been the reverse of this, the open plateau lands being more suited to working by machines. For further information on the region see UKRAINE and BLACK EARTH AREA.

Arid Soils.—Beyond the black earth zone to the southeast, climatic conditions rapidly approach desert character. The decrease in total rainfall, its increasing uncertainty and the rapid rise in the evaporation rate produce marked changes in the soils and their development. The cultivation of the steppe becomes more and more risky, though it is perhaps no longer true to speak of the whole region as untillable steppe. The chestnut soils are fertile when, or where, sufficient moisture is available, the brown soils less so and the gray desert soils only occasionally and then with great difficulty. The humus content decreases rapidly and salinity increases as the chernozems are left behind. A fertile belt, however, lies along the foot of the bordering ranges.

Chestnut and Brown Soils.—These extend from the Crimean steppes across the Volga delta and through Kazakhstan and the extreme south of western Siberia. The chestnut soils are the result of extreme temperatures accompanied by a low rainfall and high summer evaporation. The grass cover is much less rich and less continuous than on the chernozem, with the result that the humus content of the surface soils falls to 5%. Increasing aridity produces the brown soils with only 3% humus. Insufficient leaching of the surface soils causes an increase of their soluble salt content, and this adds to the effect of the growing aridity in limiting vegetation. The A horizon in the chestnut soils seldom exceeds 25 in. (with a humus zone 12–18 in. thick) and in the brown soils falls to 12 or 15 in. Both types show a prismatic structure. The rising

soil waters, consequent on heavy evaporation, cause the concentration of soluble salts in the upper layers. Thus, calcareous concretions often form an almost continuous layer quite near the surface. Because of the poverty of vegetation the nature of the mother rock has more influence on the soil character than is usual. On the other hand, the dryness of the surface reduces the rate of decomposition of mineral fragments.

All arid soils show a tendency toward salinity. This is particularly evident in surface depressions or where there is poor drainage or a high water table. Under such conditions the ground water is often brackish. This is most marked in soils resting on argillaceous rocks. Saline soils, lightly impregnated with soluble salts of potassium, magnesium or calcium and constituting the type known as *solonchak*, are found in these areas. Their salinity is harmful to vegetation. A white crust sometimes appears on the surface if the concentration of soluble salts is excessive. An alkaline soil known as *solonets* is produced by the leaching of *solonchak*; e.g., if it is irrigated or if its drainage is improved in any way. The removal of most of the soluble salts leads to both chemical and physical change. Thus the flocculated clay particles of the *solonchak* are dispersed and its loose texture is replaced by a closer texture, so that the *solonets* is sticky and plastic when wet but sets into hard clods when dry. It is thus practically unworkable.

The chestnut soils are very fertile when supplied with enough water, but their irrigation must be carefully controlled. Raising of the water table is always liable to produce alkalinity at the surface and thus bring about the formation of *solonchak* or *solonets* and the defoliation of their clay particles.

Gray Soils.—These are found chiefly in the inland drainage areas of Asiatic Russia. They underlie the shifting sands of the deserts and cover the loessic deposits of their southern mountain margins. Under desert conditions neither water nor vegetation is sufficient to play much part in soil production and the evolution of the soil has not proceeded far. In the areas where drifting sand forms the surface one can say it has not begun. Along the northern edge of the basins occur *solonets* clays, poor in carbonate and with a very low humus content. These increase in salinity southward.

The gray soils are alkaline and clayey with a humus content seldom more than 1%. Their colour results from the presence of sodium salts and their bleaching effect. Where the gray soils cover the southern loess they are rich in calcium carbonate, the content being sometimes as high as 15% at the surface and increasing to 25% at lower levels. Where they are well watered, as where mountain streams emerge, they may be very fertile. Cotton and Mediterranean fruits are important products where the problems that the gray soils present to the cultivator can be solved.

Mountain Soils.—In general these vary with altitude wherever the slopes are gentle enough to permit their development and stream or ice erosion does not remove them. As temperatures fall and humidity increases with height, the succession of soils closely parallels that seen in travelling from southeast to northwest across the plains. Thus, in the Altai, chestnut soils at the foot pass into black soils and then to podzolized forest soils at higher levels. The gray desert soils of the Turkistan lowlands similarly pass into chestnut and then into black earths on the mountain slopes. In eastern Siberia, where the soil generally is of the coniferous forest podzol type, the mountain ranges are capped with tundra-type soils.

(T. HEE.)

HISTORY

The great east European plain which was united, together with Siberia, under the Russian tsars, presents in spite of its general

uniformity two contrasting geographic aspects which profoundly influenced the trend of its historical development: the northern and the southern. A primitive forest extending over the northern part of Russia reminds one of that described by Tacitus in his *Germania*. It was indeed its continuation and connected Russia with the western part of the European plain. It was comparatively late that this part of Europe was set free from its prehistoric ice cover. It is still full of lakes and great rivers which for long remained the only ways of communication for a scanty population scattered in distant glades. The primitive settlers added a few patches of cultivated land to their habitual means of livelihood—river fish, wild beehives and fur-bearing animals in the forests.

Quite different is the southern Russian landscape. It is the steppe, the prehistoric seat of nomad hordes which inhabited it from time immemorial until quite recently. These lived on horseback and in tents, used mare's milk as their food and thrived on the booty taken in regular incursions against northern sedentary tribes. There the most ancient traces of aborigines are found, of the Palaeolithic stage, followed by the Neolithic, with traces of Aegean culture in its primitive form. There also we learn, by the intermediary of ancient Greek colonies on the northern Black sea shore, the names of ancient peoples of southern Russia; we are unable, however, to identify their nationality. The most ancient of them, the Cimmerians, are said to have been replaced by the Scythians (see SCYTHIA) and these by Sarmatians (see SARMATAE). Some patriotic Russian historians (I. V. Zabelin, D. I. Ilovaisky, D. Y. Samokvasov) tried to prove that these populations were Slavs, but later research pointed to an Iranian origin; for instance, the modern representatives of the Sarmatae-Alani are found to be the Ossetes, who are not Slavs but a Caucasian people.

The original home of all Slavs is not to be sought in the steppe, but in the forest. Lubor Niederle stated that, originating in the marshy land between the Vistula and Dnieper, the southern Slavs (Serbs and Bulgarians) descended to the Danube as early as the 1st century A.D. The first federation of eastern Slav tribes (Russians) appears in the 3rd–4th centuries A.D. as a powerful and numerous people called Antae, living between the Dnieper and Dniester. They were involved in the wars of the Goths and Huns and were defeated by the Avars in the 6th–7th centuries. In the 7th century appears a new conquering nomad nationality in the steppe, the Khazars (*q.v.*) possessing a certain degree of civilization. They brought under their subjection some eastern Slav tribes whose names are given in the ancient Russian annals (Severyane, Radimichi, Vyatichi, Polyané). Khazar domination lasted until the beginning of the 10th century, when other nomads of Turkish descent and wilder habits—Hungarians (middle 9th century) and Petchenegs (end of 9th century)—overran the steppe and broke for long the connection between Slav settlements and the Black sea shore.

Origin of the Rus.—The Slav forest tribes were now obliged to adapt themselves to the new situation. As a reply to the invasion of the steppe by the Turkish hordes there appears a new organization of defense from the north. The defenders are the "Rus"—a Varangian tribe, in ancient annals considered as related to the Swedes, Angles and Northmen. Both Rus and Varangians are also known to Byzantine chroniclers ('Ρος, Βαράγγιοι), first as Norse pirates, then as warriors serving in the imperial guard and finally (10th century) as chiefs of the caravans of traders coming yearly to Constantinople by the "Great Waterway," the *Austrvege* of northern sagas, through the waterfalls of the Dnieper, whose names are given by the emperor Constantine Porphyrogenitus both in "Russian" (Scandinavian) and in "Slavish" ('Ρωσιστρί and Σλαβιστρί). Arabian writers represent the original seat of the Rus as an island covered with woods and marshes; this brings us to the source of the waterway mentioned—Lake Ilmen, near the ancient town of Novgorod, and Lake Ladoga, where the river Neva has its origin. Excavations of 9th–10th century tumuli confirm the presence of Norse warriors, buried (or burned) with their horses and arms, in that very tableland where four chief waterways of Russia, the Neva basin, Volga, Dnieper and Dvina, converge and form outlets to the Baltic, the Caspian and the Black seas and thus determine the direction of ancient

trade routes. Numerous finds of Arabian, Byzantine and Anglo-Saxon coins (9th-11th centuries) along all these routes testify to a flourishing trade which corresponds exactly to the foundation of new states by Vikings at the one end and the florescence of Arabian and Persian caliphates before the Mongol invasion at the other end of these trade routes.

KIEV

Russian legend says that the Rus were first asked to come to Novgorod by the local population to put an end to their internal feuds. Rurik (Hrōrekr) was the first (semilegendary) *knyaz* (king, prince) of Novgorod, but his companions wished to descend the *Austrvegr*, nearer to Byzantium, and Oleg (Helgi) settled in Kiev. The Russian annals date the arrival of Rurik in Novgorod A.D. 862. But the first reliable datum is Oleg's commercial treaty with the Byzantines (911). A subsequent treaty was concluded in A.D. 945 by Oleg's successor, Igor (Ingvar), together with his companions, whose signatures contain only 3 Slav names among 50 Norse. Constantine Porphyrogenitus gave a very picturesque description of this trade which still remained the chief business of the Rus dynasty. During winter the princes and their *gesiths*, who distributed among themselves the towns in the basin of the Dnieper, were busy making circuits among neighbouring tribes in order to force them to pay annual tribute. Their booty consisted of furs, money and slaves. As spring came they loaded their small boats "made of one single tree" (*μωδῆυλος*) and conveyed their caravans down the Dnieper ready to ward off the attacks of nomad steppe tribes. In the treaties mentioned their rights of trading in the capital were strictly defined. The *konings* extended their power over local tribes and, to defend the land from nomad incursions, they constructed earthen walls on the frontiers of the steppe. The local aristocracy joined the ranks of their *drushina* (*gesith, comitatus*) and the process of assimilation began. The term "Rus" was now used to designate the southern outpost of the whole system of defense; i.e., Kiev with the surrounding country. The son of Igor and his wife Olga (Helga) had already a Slav name, Svyatoslav. However, he still remained part northern Viking as well as part southern nomad. Svyatoslav did not yet feel at home in Kiev. He wanted to come still nearer to Byzantium and chose Pereyaslavets on the Danube in the Bulgarian land, because, he said "there was the centre where all goods gather from all parts: gold, clothes, wine, furs from the Greeks, silver and horses from the Czechs and Hungarians, furs, wax, honey and slaves from the Rus." Svyatoslav also defeated the Khazars and the Volga Bulgars, but he was defeated by the emperor John I Tzimiskes and slain on his way back home by the Petchenegs (972). With him died the Scandinavian tradition of the Kiev dynasty.

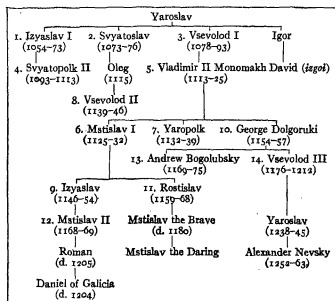

From the reign of Svyatoslav's youngest son, Vladimir, the Norman dynasty was definitely settled in Kiev. It still preserved its connections with other parts of Europe, attempted distant military expeditions against its Slav neighbours and ruled the large territory from the northern lakes to the steppe and from the then uncertain Polish frontier to the river Volga and the Caucasus. This was the most brilliant period of southern Russian history, but its brilliance rested on an extremely unsafe base, as the connection between the newly built state and the country inhabitants remained very loose. The only link which unified the subdued tribes was the power of the grand duke of Kiev. The people paid their tribute to the prince's tax collectors, but otherwise they were left to themselves and preserved their ancient tribal organization and habits.

Another element of union of enormous importance was added by the acceptance of Christian faith in 988 by Vladimir the Saint. He took his religion from Byzantium, but the service was in the vernacular as the prayer books and Bible had already been translated into Slavonic by the "Slav apostles" Cyril and Methodius in the 9th century. From 1037 the Russian church was subject to the Constantinopolitan patriarchate; for two centuries nearly all metropolitans and most of the bishops were Greeks. Eventually the Slav and Russian element prevailed. After Vladimir's death (1015), his son Svyatopolk the Damned assassinated his brothers

(Boris and Gleb, canonized as saints) but was defeated by another brother, Yaroslav, elective prince of Novgorod, who reunited all territory under the grand duchy of Kiev and embellished his capital with a cathedral in Byzantine style. He also founded the monastery at Pechersk, which became a famous seat of faith and learning; he collected books and had them translated. Under Yaroslav the earliest document of Russian law was revised under the name of *Russkaya pravda* ("Russian right"). He gave refuge to two sons of Edmund of England who fled from Canute, to Olaf II of Norway and also to Harald III Haardraade, who married his daughter; he gave his other daughter to Andrew I of Hungary; his third daughter married Henry I of France. His sons married Polish, Greek and German wives.

Yaroslav died in 1054. In order to prevent feuds among his numerous descendants he introduced an order of succession to the grand duchy of Kiev which was based on the principle that all territory as a whole belonged to the family, and different parts of it were distributed among them in temporary possession according to seniority and to the profitability of the seat of administration. The most profitable towns on the main trade route were Kiev, Pereyaslavl (on the steppe frontier), Novgorod (the first Norman residence), then Smolensk (on the upper Dnieper) and Chernigov (on its affluent, the Desna). All brothers of the first generation were considered as senior to the following generation. As soon as Kiev passed to another brother all the members of the family changed their seats and approached one step nearer to Kiev. If one died before reaching Kiev, his descendants were called *izgoi* and excluded from "mounting the scale." In the accompanying chart are numbered the successive reigns in Kiev during seven generations after Yaroslav.

The order of succession from brother to brother was kept only in the two first generations (1 to 5). Numbers 9 and 12 show preference given to nephews over uncles. And indeed, as early as 1097, at a conference held by the dukes at Lyubech it was decided that the sons should keep their fathers' heritages. The di-

rect succession from father to son prevailed in all dukedoms. Kiev was seen to be losing its former significance. Its great importance was based on trade; but southern trade was destroyed by the appearance in the steppe (1054) of the Polovtsy (Cumans), nomads far more dangerous than the Petchenegs. It will also be seen that of all Yaroslav's sons only one line survived: that of Vsevolod and his brilliant son Vladimir Monomakh. Monomakh's line was then divided into two: the elder one (6, 9, 12) remained in Kiev and in its turn it was subdivided in two—Roman and Daniel preferred to move west from the then unsafe Kiev to Halicz (Galich; see GALICIA), while two Mstislavs, the Brave and the Daring, as their nicknames show, remained to the end the knights errant of the chivalrous south. The cadet branch of

Vladimir Monomakh (10, 13, 14) opened a new period of Russian history. The centre of influence changed then to northern woodland, far from the steppe. It was a far poorer but safer and, in the long run, more profitable settlement. In 1169 Andrew's troops stormed Kiev. This was the end of southern brilliance, though Kiev was not definitely destroyed till 1240 by a last and most terrible invader, the Mongol Batu, Jenghis Khan's nephew.

The title of grand duke of Kiev thus lost its importance and with it broke down the unity of Russia. Ducal appanages became independent dukedoms; Russian territory was split in a dozen separate units which waged endless wars against each other. The old Kiev centre suffered the most from these internal dissensions and from incursions from the steppe. The frontier population was nearly exterminated and mixed with Turkish ethnic elements. However, the ancient tribes remained untouched to the west and north of the river Dnieper. In their midst, about the 14th century, appeared new branches of Russian people, speaking their separate dialects, the Little Russians and the White Russians (the old Krivichi).

NOVGOROD AND MOSCOW

By and by three distinct centres emerged from the chaos: Halicz, Novgorod and Moscow. Each was characterized by the prevalence of one of three main features of the political life of Russia during the Kiev period. These three features are: (1) the popular assembly (*veche*), which represented the ancient tribal organization and which met in towns thus consisting chiefly of townfolk; (2) the princes; (3) the boyars and the *druzhina* (*comitatus*), a landed aristocracy, partly of ancient tribal descent, partly the military companions of the prince at the conquest. This aristocracy developed especially in Halicz, where the social structure approximated to western feudalism. On the northwestern frontier it was, on the contrary, the democratic element that prevailed. The chief city, Novgorod, became a republic. "Lord Novgorod the Great" was ruled by a popular assembly (*veche*) which elected its mayor (*posadnik*) and its commandant (*vyvatsky*) and concluded treaties with the dukes who were invited only to watch over the defense. Novgorod had a largely developed trade and large dominions extending from its gates and from the mouth of the Neva over the whole Russian north up to the White sea and the Urals. That country was rich in furs, the chief export. The higher class of citizens was here formed of capitalists and rich merchants, who were to form the aristocratic element in Novgorod.

Another element existed in the political structure of central Russia: the backwoods of the Oka and upper Volga. This country was cut off from all European connections. Its population consisted exclusively of agricultural colonists settled on ducal land. Thus, the duke appeared there as a proprietor and as the organizer of social life. Towns were scarce and the population scattered in clearings. The few *veches* in the chief towns had no influence; noble landed proprietors were completely absent. Thus, the power of the duke was there practically unlimited. Ducal psychology was framed accordingly; unlike the valiant knights of the south, they formed a dynasty of great appropriators, stingy and acquisitive, ruling their dukedoms as private estates. They thus accumulated elements of strength which as time went on aided them to become masters of the whole of Russia.

After the conquest of Kiev by Andrew Bogolubsky the title of grand duke passed from Kiev to a northern town, Suzdal, and from there to Vladimir on the Klyazma. But as early as 1147 Moscow is mentioned in the annals. Its situation was exactly at the centre of Russia between the Oka and the upper Volga. It had long been a great centre of continental river trade, far from the southern area of Tatar devastation. The line of dukes of Moscow starts from Alexander-Nevsky's younger son Daniel.

His genealogy during the domination of the Golden Horde (1240-1480) is shown in the accompanying table.

All these princes had to ingratiate themselves with the khans of the Golden Horde to receive from them the *yarlyk* (investiture) as grand dukes. They regularly journeyed to Sarai, the capital of the khans at the mouth of the Volga, and underwent every kind of humiliation. But they returned as chief collectors of the Tatar

tribute, which gave them power over neighbouring dukedoms. Only the dukedom of Tver competed with them very stubbornly.

The dukes themselves involved the Tatars in their feuds and brought punitive expeditions on Russia. The khan's protection gave the Muscovite dukes the upper hand over their enemies. They soon succeeded in increasing their possessions. Ivan I extended his domains, by purchase and by violence, over the whole province of Moscow. Demetrius (Dmitry) added to it the upper Volga region (excepting Tver and Yaroslavl), Tula and Kasimov; Basil (Vasily) I the remaining part of Oka and Suzdal, Vladimir, Murom and Nijni-Novgorod; Basil II Elets in the south, Volodga and Ustyug in the north. A religious sanction was given to Muscovite unionist tendencies by the metropolitans of the Russian church who in the persons of Peter, Theognost and Alexius settled in Moscow. Accordingly, the grand dukes of Moscow added to their title: "of all Russia." Demetrius won a great name by his brilliant victory over the Tatars of the Golden Horde led by Mamai in a bloody battle on Kulikovo plain (1380). He thus appeared as a leader of all the national forces (excepting the grand duke of Ryazan) against the oppressors, and he received the blessings of the church at the hand of St. Sergius of Radonezh, the prior of the convent of the Holy Trinity. However, two years later Moscow was sacked and burned by another conqueror, Toktamish, who in his turn was defeated by Timur, his former protector. The Mongolian yoke lasted for another hundred years, although in milder forms. While Moscow was steadily growing in importance in comparison with the rival grand dukedoms of Tver and Ryazan, the boyars and other "men of service" came in crowds to serve the grand duke of all Russia. The institutions of Moscow, which up to then resembled very much those of a large private estate, began to evolve into a system of state administration.

Ivan III and Basil III.—Ivan III's acquisitions of Novgorod and Tver (1471 and 1485) enlarged Russian territory up to the limits of settlement of the Great Russian branch of the nation and brought Russia into direct contact with other countries. Livonia, Lithuania and the Tatar khanate of Crimea. The title "of all Russia" became a reality, and systematic foreign relations were started. The all-Russian potentate proffered historical claims against Lithuania, which possessed a part of formerly Russian territories. The successful wars which followed extended the western frontier to Smolensk and Novgorod-Seversk, while leaving further claims for Moscow, Kiev "and all Russian patrimony" to Ivan's successors. Ivan also built the fortress Ivankovo close to the Gulf of Finland, thus opening the chapter of Russian pretensions on the Baltic. The Crimean Khan Mengli Ghirai accepted his friendship and helped him to put an end to the Golden Horde. As early as 1480 Ivan refused the Tatar tribute and threw off the yoke.

The title of grand duke seemed inadequate after all these successes; more pretentious claims were based on a new theory suggested by southern Slav and Greek divines. According to this theory the Muscovite duke was a successor of the Byzantine emperors and the only representative of the Orthodox Church in the world. Indeed, the Greek Orthodox Church had accepted the "union" with the Catholics as early as 1439, at the council of Florence, while Constantinople, "the second Rome," had been taken

by the Turks in 1453. Obviously, the Greeks had been punished by God for their apostasy, and their succession had to pass to the third Rome, which was Moscow, and to the Russian grand duke, who remained the only faithful and really Christian prince in the world.

The realization of this new scheme began with the marriage of Ivan III with Zoë (in Russia, Sophia), the only niece of the last Byzantine emperor, Constantine Palaeologus (1472). With her arrival new habits appeared at the Muscovite court intended to magnify the new autocrat (a title used by Ivan in foreign relations). The church that gave its sanction to that change claimed a reward: the prince had to help it against all heresies and internal dissensions. The prior of Volokolamsk convent, Joseph, insisted on burning some rationalistic heretics in Novgorod. He also defended the principle that wealth gives power to the church, and he mercilessly crushed monastic and ascetic tendencies of the reformer Nil Sorsky, the "abstainer from property." Thus, the official theory on Russian church and state was formed as early as the end of the 15th century. Under Basil III the unification of Russian territory was consummated by the acquisition of another republic, Pskov (1510); by the final annexation of Ryazan, the last independent grand dukedom; and by a new extension at the expense of Lithuania—the acquisition of the frontier city of Smolensk (1514). The minority of Basil's son Ivan, who was three years old when his father died (1533), and subsequent disputes over the regency between rival factions, lasting 14 years, did not interrupt the growth of the Muscovite state. The reign of Ivan the Terrible marks the beginning of a new period of Russian history.

Ivan IV the Terrible (1533-84).—The reign of Ivan IV the Terrible was an epoch of great and systematic reform. It gave its final shape to the Muscovite tsardom which it preserved until the epoch of Peter the Great. At the age of 17 Ivan demanded to be crowned as tsar (shortened from Latin Caesar), and he connected this official assumption of title with a legend according to which the imperial regalia had been handed over to his predecessor Vladimir Monomakh by a Byzantine *basileus*. The Constantinopolitan patriarch was induced to confirm that legend, but he substituted Vladimir the Saint for Vladimir Monomakh in order to make good a chronological error. Popular songs preserved the memory of Ivan IV as a democratic tsar, who "ferreted out treason [*i.e.*, the boyars] from Russian land." And, indeed, he definitely deprived the "little dukes" who gathered at his court of their remaining sovereign rights and forced them to exchange their hereditary possessions for other landed estates, while their service to Moscow was made obligatory. To pass over to foreign countries was qualified as treason. The same measures were extended to boyars. Both dukes and boyars tried to recompense themselves by assuming political power in the *duma* of the tsar, and the most powerful of them formed a "selected rada" (a sort of privy council) through which they ruled the state. They summoned the first Russian *zemsky sobor* or "assembly of the country" in 1550, at which representatives of the people revised the criminal code of Ivan III. They also took part in a church council of 1551, where this code was signed and certain traditional rites in church and private life were sanctioned as specifically national. At two previous synods of 1547 and 1549 about 40 new Russian saints were canonized.

However, the regime of the selected rada did not last long. Ivan IV resented it as an interference with his own power, and he broke with the counsels of his youth. He grew nervous and suspicious and began systematically to extirpate dual and boyars' families. To show his wrath against his enemies he left Moscow (1564) and settled in Alexandrovskaya Sloboda. He then divided the kingdom into two parts: his private *oprichnina* which he ruled personally, and the remaining "land" (*zemshchina*) which he handed over to a christened Tatar, Prince Simeon Bekbulatovich. Far from suspending reconstruction, this curious division helped to reorganize the Russian ruling class—the men of service—on more democratic lines. Ivan IV imitated for this purpose Byzantine patterns. He strictly regulated the connection between possession of landed estates and military obligations. His foreign

policy—his long and successful war with Poland, Lithuania and Sweden in order to break through to the Baltic—also forced him to adopt reforms in the army and the financial system. Russian *fussiliers* (*streltsy*) and foreign mercenaries first appeared under Ivan IV. He also introduced new military taxation and ordered a first general description of taxable land (*pishtoviya knizh*) in order to make the levies proportionate to the record of lots of taxed land; here too he borrowed his system from Byzantium. At the same time he centralized the receipts of the state in a "great treasury" while separating them from his own income, which was concentrated in the "great palace." Through its four boards (the fourths) the great treasury collected taxes chiefly from the north, while the peasants of the Muscovite centre had to work for men of (military) service. The nobles received the honorary title of "courtiers" (*dvoryane*), to distinguish their upper section—the tsar's guard—from the "sons of boyars," who formed the lower section—the provincial gentry. Both courtiers and sons of boyars were yearly sent to defend the western and the southern frontiers—especially the latter, which was fortified by walls and hedge-rows (*zaseki*)—against the Tatar incursions. The posts of commanders for each campaign were distributed by the central board called *razryadny prikaz*.

Theodore (1584-98).—The son and heir of Ivan IV, Theodore (Fedor, Fyodor), was a weak man whom Ivan called more fit to be a bell ringer in a convent than a tsar. The direction of affairs fell to his brother-in-law Boris Godunov, an able man who continued Ivan's policy. The Church of Russia received its independence and equality with other Orthodox churches by the granting to its head, the metropolitan Job, of the title of patriarch at the hands of Jeremiah, patriarch of Constantinople (1589). Another important measure was intended to strengthen economically the middle landlord class created by Ivan IV as against the boyars. Peasant labourers were forbidden to leave their estates or migrate to other landowners. All such fugitives who fled from their masters after 1592 (the time of the completion of government registers) were ordered back in 1597. This was the origin of legal serfdom.

Boris Godunov and Basil Shuisky.—In 1598 Theodore died; after some hesitation Boris had himself elected tsar by a *zemsky sobor*. He pursued Ivan IV's policy of weakening the boyars, but he met with opposition on their part. The only legal heir of Theodore, Demetrius, had been killed in Uglich, the place of his exile, in 1591. But the boyars with the help of the Poles opposed to Boris a "Pseudo-Demetrius," a young and well-educated man of obscure origin. Boris died (April 1605) soon after the appearance of this pretender (autumn, 1604), who was accompanied by Polish volunteers and aided by the Cossacks. On June 19, 1605, the impostor entered Moscow. On May 17, 1606, he was killed in a popular outbreak caused by the boyars, who took advantage of the popular dislike of Pseudo-Demetrius' free habits of life and the Catholic tendencies of his Polish protectors. The old dynasty was completely extinguished. The throne of the tsar passed to an influential boyar, Basil Shuisky (1606-10). He gave a formal promise to the boyars "not to repeat the policy of Ivan IV" against them; *i.e.*, not to exterminate them by capital punishment or by exile and the confiscation of estates, without resorting to their court. However, the power of the boyars could not be restored; much more influential now was the rising class of small landlords, men of service. Still more dangerous for Basil were the Cossacks and the fugitive serfs in the newly colonized south of Russia. A real social uprising was started in the south by a former serf, Bolotnikov. The ferment was rife over the south and the east. A second false Demetrius appeared and in the spring of 1608 marched on Moscow. He established his camp at Tushino, near Moscow. The boyars wavered between the tsar Basil and the "thief of Tushino"; there were many flittings. Basil turned to Sweden for help, but as soon as he received aid from Charles IX of Sweden Charles's rival, Sigismund III of Poland, also entered Russia as Basil's adversary and as pretender also to the Russian throne. In Sept. 1609 Sigismund appeared before Smolensk. In July 1610 Basil was dethroned by the boyars and the men of service. The throne remained empty through internal dissensions and

a real time of troubles set in which lasted for three more years (1610-13).

"The Time of Troubles."—The boyars preferred a Polish candidate, and together with the men of service they offered the throne to Sigismund's son Władysław (Wladislaus). A delegation was sent to Smolensk, and Moscow voluntarily received Polish troops under Stanisław Żółkiewski. A treaty was concluded with Władysław which secured the rights of the duma and the privileges of the landed gentry. A Polish dynasty might have settled in Moscow but for Sigismund's desire to keep the throne for himself. Sigismund's pretension woke up the spirit of national opposition. The second Pseudo-Demetrius at once won popularity, especially among the Cossacks and the lower classes. But in Dec. 1610 the impostor was killed by a Tatar of his suite. The middle landlord class then took action on the urging of the patriarch Hermogen. The men of service under Prokopy Petrovich Lyapunov and the Cossacks under Prince Dmitry Timofeyevich Trubetskoy and the ataman Ivan Martynovich Zarutsky blockaded Moscow; inside the town a popular uprising forced the Poles to retreat to the Kremlin. But here again dissensions arose among the besiegers. Lyapunov was killed by the Cossacks, and the men of service returned to their homes. The south of Russia was in complete disorder; crowds of Cossacks and Polish marauders dispersed all over the north. This finally decided the gentry to make a new effort and to gather a new national army which would "exclude the Cossacks and stand firm until a new sovereign is elected by all the land." Prince Dmitry Mikhailovich Pozharsky was made commander in chief of the army and Kuzma Minin, a butcher from Nijni-Novgorod, the treasurer. All northern towns and districts sent their detachments and their representatives to the army as it advanced up the Volga. In April 1612 it stopped at Yaroslavl. As Novgorod had been taken by the Swedes, Pozharsky offered the throne to Charles Philip, brother of Gustavus Adolphus. In August Pozharsky's army moved southward to Moscow. On Nov. 27 the Poles capitulated in the Kremlin, and a national candidate was set free: the young Michael Romanov, whose father, the metropolitan Philaret (Theodore Nikitich Romanov), a nephew of the first wife of Ivan IV, was at that moment a prisoner in Poland. All votes were at the disposal of a national tsar, more acceptable to the gentry as he did not belong to an old princely family and was young enough (he was 17) to secure the boyars against overbearing conduct. Michael was unanimously elected by a regular *zemsky sobor* on Feb. 21, 1613.

THE ROMANOV (ROMANOFF) DYNASTY

Michael and Alexius.—The *zemsky sobor* which elected Michael (1613-45) continued its session for three years, helping the new tsar to restore the disorganized and ravaged country. A second *zemsky sobor* was then summoned, which pursued for three more years the work of pacification. The co-operation of the tsar with the representatives of different social groups was becoming a regular system. But as the third year's session began (1619), Michael's father Philaret, now patriarch, came back from Polish captivity, and until his death in 1633 he ruled Russia as the "second lord" at the side of his weak son. Peace was concluded with the Swedes, who gained the Finnish seashore, at Stolbova in 1617 and with the Poles, who gained Smolensk, at Deulino (1618). But the struggle on the western as well as on the southern frontier was far from being finished. Anticipating new conflicts the government entirely reconstructed the army; it invited foreign commanders and hired whole regiments of mercenary infantry. To cover the increased expenses it had to introduce new heavy taxation. New registers of lots of cultivated land which had survived the devastation of the troubled times were established. However, an attempt to take back Smolensk from the Poles (1632-34) proved unsuccessful and the government did not feel strong enough to wage war with the Turks to retain Azov, which had been taken by a Cossack raid in 1642. The Russian colonization at that time went no farther than the lines of Belgorod and those of Simbirsk and Zakamsk, which were fortified in the period 1636-56. To the south of the Belgorod line there developed at that very time a crosscurrent of Little Russian (Ukrainian) colonization from

the western bank of the Dnieper. The new Cossack settlers (Poltava, Kharkov) felt the more independent from the Poles the farther they went east, and in 1654 their hetman Bogdan Chmielnicki (Khmelintsky) voluntarily surrendered the Ukraine to the protectorate of the Eastern Orthodox tsar. A large autonomy of the Ukraine was acknowledged by Alexius (Aleksey), Michael's son, and successor (1645-76). A war with the Poles ensued in which the Russians finally took Smolensk, occupied Vilnius and Kaunas and forced Lublin to surrender. But before finishing with the Poles Moscow was implicated in a war with Sweden. By the peace of Kardis (1661) Russia gave Livonia to Sweden; by the peace of Andrusovo it resigned Lithuania to Poland but kept for itself Smolensk, the eastern Dnieper bank and Kiev (1667).

European Influences.—The reigns of the tsars Michael and Alexius are closely connected in home as well as foreign policy. Moral and intellectual development was steadily influenced by the increasing intercourse with western Europe. Since the time of troubles foreigners had come in crowds to Moscow. The clergy objected to too-close relations with these foreigners as having their reflection in a change of habits and even of religion. Consequently, about 1652, foreigners were relegated to a suburb called "the German suburb." However, this proved still worse for the old Russian tradition, as the European culture now formed a single and undiluted unit which strongly influenced the court and the upper social classes. Russian boyars—such as A. L. Orдын-Nashchokin, A. S. Matveyev and Prince Vasily Vasilievich Golitsyn—began to learn foreign languages, to acquire foreign books, to wear foreign clothes and to furnish their apartments with foreign household goods. Translations of foreign books increased in number from 24 in the first half of the 17th century to 94 in the second half. Alexius was especially accessible to the allurements of foreign comfort and pastime, going so far as to enjoy in private "English comedy" in German adaptations.

The Rascol.—The national religious tradition of the 16th century appeared antiquated. The patriarch Nikon found that certain rites of the national church which distinguished it from Greek orthodoxy, far from proving Russian superiority in faith, were based on ignorant distortion of ancient Greek originals of the books of service. He asked some scholars of the theological academy of Kiev (founded by Peter Moghila about 1625) to prepare a revised edition. The majority of the clergy declared this attempt sacrilegious, as the old Russian saints had saved their souls according to the old books and rites. Nikon insisted on his corrections. He invited two patriarchs (of Alexandria and Antioch) to come to Moscow, and at a council of 1667 the schismatics were excommunicated. A long struggle began between the faith of the Old Believers and the Nikonianism, as the official church was now generally called. Masses of the people followed the schism (*raskol*), and as hopes for reconciliation passed they began to believe that the end of the world was approaching.

Peter I the Great (1682-1725).—The reign of Alexius' invalid son Theodore (1676-82) was a sort of prologue to Peter the Great's reform. The leading part fell, under Theodore as well as during the minority of Peter (1682-89), to a well-educated boyar, Prince Vasily Vasilievich Golitsyn. He was the favourite of Theodore's energetic sister Sophia, who broke the tradition of seclusion of Russian women. After Theodore's death Sophia, with the help of the *streltsy*, made her brother Ivan a second tsar as Ivan V (reigned 1689) at the side of Peter and assumed the regency. Peter (ten years old) was left to himself and amused himself in the neighbouring village of Preobrazhenskoye with technical and mechanical arts as applied to military games. He surrounded himself with boys of his age who soon became his first regular soldiers. The ill success of Golitsyn's much-vaunted expeditions to Crimea (1687 and 1689) gave Peter the chance to overthrow Sophia, to send her to a convent and to exile Golitsyn. However, as tsar, Peter continued his free life of sport. He now became a habitué of the German suburb, where he made acquaintance with many foreign specialists. A Swiss adventurer, François Lefort, initiated him into the pleasures of debauchery and became his best friend. He also encouraged Peter to extend his playing at soldiers to a real campaign against Azov. During two difficult

campaigns (1695-96) Peter learned chiefly the insufficiency of his knowledge, and Lefort urged him to complete his military and naval education abroad. Peter followed the advice; he joined his embassy in the capacity of a private workman and visited Germany, Holland and England (1697-98). He was forced to return speedily to Russia to stifle the new rebellion of the *streltsy* fostered by Sophia's agents.

He then made peace with the Porte (1699) and on the following day declared war on Sweden and invaded Livonia. This Northern War lasted until 1721, and it proved to be the chief factor in Peter's military, financial and administrative reforms. Independently from these reforms made necessary by the war, Peter directly after his return from western Europe forced his subjects to shave their beards (which was felt as an unbearable religious offense) and to dress as foreigners. The Old Believers (schismatics) especially saw in it a proof that Peter was the expected Antichrist.

Peter's army was crushed by Charles XII at Narva (1700). But while Charles was engaged in defeating Peter's allies, Denmark and Poland, Peter called up the yearly levies, created a new standing infantry, cavalry and artillery, and occupied Livonia, Estonia and the mouth of the Neva, where he founded his new capital, St. Petersburg, on May 1, 1703. The "window to Europe" was thus opened. To cover his new and enormous expenses, he acquired the habit of taking money wherever he found it. He thus completely destroyed the old system of central administration, the *prukazy*; instead, he distributed the financial resources of Russia directly among his generals by dividing Russian territory into eight "governments." Each government (*gubernia*) had to pay for the upkeep of a certain number of regiments. Russia thus received in 1708-12 its first regular division into provinces.

Charles XII made the mistake of advancing from Poland to the south of Russia, instead of proceeding straight against Moscow. The Cossack hetman Mazepa (Ivan Stepanovich Mazepa-Koledinsky) promised to help him, but was unable to raise the Ukraine. He joined Charles with an insignificant force. At Poltava (June 27, 1709) Charles was defeated by Peter and fled to Turkey. The Poltava battle produced a strong impression abroad; Russia was becoming a European state. Russian soldiers restored (Aug. 11) the Polish throne, drove the Swedes from Pomerania and appeared in the middle of Germany. The young Russian fleet won a naval victory over the Swedes at Hango Head. Peter married his niece, Anne, to the duke of Courland (1710) and another niece, Catherine, to the duke of Mecklenburg (1716). He favoured Prussia at the expense of Denmark and Hanover. A Russian army landed near Stockholm (1719 and 1720). In 1721 peace was concluded at Nystad; Russia received Ingermanland, Estonia and Livonia, and parts of Karelia and Finland. After that Peter accepted the title "emperor" (*imperator*), which gave him a claim to equality with the Holy Roman emperor.

Peter was now free to pay more attention to internal reforms. He had to restore the central administration which he had destroyed and to bring it in harmony with his new provincial organization. In the absence of Peter, who only once a year, at Christmas, appeared in his capital (since 1715 in Petersburg), the only central institution which ruled Russia was the senate. From 1711 Peter engaged foreign advisers (Baron Johann Ludwig Lüberas and Heinrich Fick) to introduce into Russia the colleges on Swedish pattern (1718-22). Three colleges managed finance: *Kammer-, Staats- and Revision-collegia*. Three others were to increase the productive forces of Russia: *Kommer-, Manufactur- and Berg-collegia*. Three chief colleges stood above the others, on an equal footing with the senate, as they represented the tsar's prerogatives: foreign affairs, army and navy. In the provinces all the colleges were supposed to be represented, but as this proved too expensive the whole government of a *gubernia* was reduced to the single *voyevoda* of former times and to his office.

Peter was not a social reformer, but his reforms brought about great changes in the social composition of Russian society. All strata of men of service now melted definitely into one unified class of *dvoryanstvo* (gentry), which had to pass a uniform time (the 14 ranks of the "Table" of 1722) of obligatory service. Possession of landed estates lost all trace of being a remuneration

for service. At the same time the different groups of land labourers, half-free and unfree, on the gentry's estates became a unified class of serfs, subject to the poll tax, introduced by Peter in 1718-22 and collected by the landlords. Peter also tried unsuccessfully to differentiate the burghers from other classes by organizing them in merchant guilds and introducing a kind of municipal self-government under the German name of *Rathaus* and burgomaster (1699-1721).

Peter's educational reforms proved premature. There had been already founded, under Sophia, a Slavo-Greek-Latin theological academy in Moscow (1685-87), where the influence of Kiev amalgamated with the more orthodox Greek tendencies. Peter added a navigation school, led by an English mathematician, Farquharson (1701; transferred to Petersburg as the naval academy, 1715). Both academies soon became centres of two sets of lower schools, clerical and lay, in the provinces. But they were few—about 40 of each for the whole of Russia—and they had to secure their pupils almost by force. A few hundred pupils only finished their studies there. Peter also ordered the publication of useful books—mostly translations—and he introduced the Russian lay alphabet that remained in use till the Soviet reform. But Peter's books proved too specialized for Russian readers and the language of the translations was nearly unreadable; a literary language had first to be created.

Peter's reforms did not leave untouched the sphere of religion. As the clergy was mostly opposed to his reforms, he deprived the Russian church of its spiritual head—the patriarch, a second monarch. Aided by an educated bishop, Theofan Prokopovich, Peter abolished the patriarchate and put in its place the holy synod (1721). The beheaded church was thus deprived, in the opinion of adversaries of that reform, like Stepan Yavorsky, of its legislative authority in questions of dogma.

From Peter I to Catherine II (1725-62).—Peter met with opposition in his own family; his son Alexius (Aleksey Petrovich) grew up under the influence of the clergy and obviously disapproved of Peter's reform. He fled abroad from Peter's menaces, was brought back by fraud and imprisoned on suspicion of a conspiracy against his father's life and died by torture (1718). There remained only two daughters, Anne and Elizabeth, from the second marriage of Peter with a Livonian prisoner, Martha Skavronskaya, renamed Catherine. In 1722 Peter reserved for the monarch the right to designate his successor. But at the moment of death on Jan. 28, 1725, he failed to do so. Peter's creatures, like Alexander Danilovich Menshikov (q.v.), who had everything to fear from the survivors of old nobility, resorted to the guards and with their help proclaimed Catherine. The legitimate heir, the son of Alexius, Peter, was thus put aside. The Russian throne became "not hereditary and not elective, but *occupative*." The period from Peter's death to Catherine II's accession (1725-62) was an eclipse. Male members of the Romanov dynasty (that is to say, Peter's grandsons Peter II and Peter III, the sons of his son Alexius and of his daughter Anne of Holstein, respectively) were frail and feeble of mind. The women—both Peter's niece Anne (Ivan V's daughter) and his daughter Elizabeth—were stronger in mind and body. But they shared their power with favourites, and their choices were not always happy. Court life flourished under these women's reigns and it became very luxurious and expensive. A special school was founded by Anne (the corps of nobles) to teach the noble guards foreign languages, dances and good manners. Balls, theatrical plays, musical entertainments—chiefly by foreign artists—became regular pastimes. The country was badly ruled; foreign policy was venal. Russia took part in European wars with little benefit for itself. From reign to reign the noble guards gained in influence, as they practically disposed of the throne. Catherine I (1725-27) was followed by the rightful heir Peter II (1727-30), thanks to a compromise between Menshikov and the representatives of the old nobility. His reign was fraught with struggle between the two. But Anne, the widowed duchess of Courland, possessed a bad title. The aristocrats offered her the throne on the condition of limiting her power by the supreme council (created under Catherine I) in questions of her marriage, succession, war and

peace, taxation, military appointments, etc. Anne signed, but profiting by the guards' dissensions tore up the signed charter and reigned as an autocrat (1730-40), aided by her favourite, Ernst Johann Biren (*q.v.*). She tried to secure the succession in the lineage of her sister, the deceased Catherine of Mecklenburg, by designating as successor under the regency of Biren the baby Ivan VI, just born to her niece, Anna Leopoldovna, duchess of Brunswick. Anna Leopoldovna herself succeeded Biren as regent, but after a few months the guards showed their hatred of the rule of the "Germans" by overthrowing her regency and enthroning Elizabeth, Peter the Great's daughter, who was expected to return to Peter's national policy (1741-62). Indeed, the first fruits of Peter's reforms ripened during Elizabeth's reign: national poetry, a theatre and the first Russian university (Moscow, 1755), all auguring a deeper culture and knowledge for the next generation.

Elizabeth wished to secure the throne for the lineage of her sister Anne of Holstein, and she invited her nephew Peter, educated in the Lutheran religion and in the ideas of Prussian drill, to come to St. Petersburg to learn Orthodoxy and Russian habits. He came and was married (1745) to princess Sophia of Anhalt-Zerbst, the future Catherine II. He was no mate for her. As fast as he lost Russian sympathy by his open aversion to everything Russian, Catherine ingratiated herself by exactly opposite behaviour. After half a year of the reign of Peter III, Catherine was raised by the guards officers to the throne. The brother of her favourite Count Gregory Orlov, Alexis, assassinated Peter as soon as he was banished to Ropsha by Catherine.

For a representation of the succession to the throne of Peter the Great see the genealogical table in the article ROMANOFF DYNASTY. Consult also the articles on the several emperors, empresses and regents just mentioned: ANNA LEOPOLDOVNA; ANNE; BIREN, ERNST JOHANN; CATHERINE I; ELIZABETH (PETROVNA); IVAN VI; PETER II; and PETER III.

Catherine II (1762-96).—The long reign of Catherine II was a turning point in Russian history. She received the fruit of half a century's evolution since Peter the Great's reforms. A prolific writer herself, in regular correspondence with the foremost men of her age, with Voltaire, Diderot, Jean le Rond d'Alembert, Friedrich, baron von Grimm, etc., not to speak of fellow potentates such as Frederick II, Maria Theresa and Joseph II, she wished to make her reign brilliant and herself an ideal enlightened monarch. She began her reforms by compiling from Montesquieu and Cesare Bonesana, marchese de Beccaria, an instruction (*nakaz*) on the basis of which a new code of laws was to be composed. In order to discuss it she gathered an elective assembly of 564 deputies chosen from all classes except the clergy and the serfs, and from all parts of the empire. However, she met with opposition on the part of the gentry to her schemes to fix within definite limits their power over the serfs. Far from engaging in a struggle with the ruling class she yielded to their desires, their power was increased and a number of crown estates were distributed among the ranks of her favourites, thus turning their peasant population into serfs.

Catherine then began to search for glory in foreign politics. She conceived a bold scheme: (1) to recover from Poland the western provinces with an Orthodox White Russian and Little Russian population and (2) to take possession of the Black sea shore, drive the Turks from Europe and found in their place a series of new states in Moldavia and Walachia, in the Balkans and in Greece. She wished to take Constantinople and to place there her second grandson, Constantine, as the emperor of a new Greek empire. His very name was chosen to symbolize this project. Catherine was favoured in accomplishing at least a part of these designs by discords between two German states, Prussia (under Frederick II and Frederick William II) and Austria (under Joseph II, Leopold II and Francis II). In her first Turkish war (1768-74) she had Prussia on her side and Austria against her; after P. A. Rumyantsev's victories she concluded a peace at Kuchuk Kainarji, the beginning of the Eastern Question (*q.v.*), as by it Russia received the right to protect Turkish Christians. Moreover, in 1772 she took part in the first partition of Poland, pro-

posed by Frederick II in order to consolidate his territory and to compensate Russia for its war expenditure. In the second Turkish war (1787-91) Catherine had Austria on her side and Prussia against her. She had to content herself, after the victories of Suvorov (Alexander Vasilievich, Count Suvorov Rimniksky) and Prince N. V. Repnin, with the acquisition of Ochakov and the steppe between the Dniester and the Bug. But she consoled herself with new annexations from Poland (the second partition, 1793, and the third partition, 1795; see POLAND), while Prussia and Austria were busy fighting against the French Revolution. Catherine also annexed Courland (1795). Her numerous lovers flattered her imperial ambitions, the bold Gregory Orlov in her early years (1762-74), the ingenious Prince Grigory Potemkin in the midst of her reign (1775-91) and the young Platon Zubov, handsome but insignificant, in her declining years (1791-96).

Between her two Turkish wars (1775-85) Catherine returned to the legislative mania of her early years. Made wise by her experience with the commission of the code of 1767, she turned from Montesquieu to Blackstone and profited by the administrative knowledge of J. Sievers, a skilful adviser of German Baltic origin. She then published in 1775 her statute of provinces, a good piece of organic legislation. Here for the first time in Russian history a local unit of administration, judiciary and self-government was created. The statute introduced a regular system of courts of justice, separate financial and administrative offices and—last but not least—corporations of local gentry meeting every three years to discuss their affairs and to elect their marshals. This system lasted until the reforms of Alexander II. The reform of 1775 was completed by two charters granted in 1785 to nobility and to burghesses. The charter of nobility served to perpetuate the power of the ruling class until the liberation of the serfs in 1861, while the burghesses' charter laid the basis for real municipal self-government.

The protection extended to the gentry inevitably created a growing disaffection on the part of the serfs, who impatiently awaited their turn for emancipation. In 1773 the Yailk (Ural) Cossacks revolted under E. I. Pugachev, who called himself Peter III. He roused the Bashkirs and the serfs allotted to the factories in the Urals, assailed Kazan on the Volga and sacked it. Through the whole empire the peasants only awaited his coming to rise, but he did not feel equal to the task, nor could his bands stand against regular troops. He therefore suddenly returned to Cossack country, where he lost his army; he was extradited by his associates, tried and beheaded in Moscow.

Catherine definitely turned her back on the liberal ideas of her youth after the beginning of the French Revolution. She began to persecute representatives of the advanced opinion which she herself had helped to create. A. N. Radishchev, the author of a spirited book, *A Journey from Petersburg to Moscow*, was sentenced to death as a Jacobin in 1790, but the sentence was commuted to ten years' exile in Siberia. N. I. Novikov, a freemason who accomplished admirable educational and editorial work, was sent to Schlüsselburg prison in 1792.

Paul I (1796-1801).—Catherine's son and successor, Paul, mounted the throne when he was 42, barely sane and with a bitter feeling of having been deprived by his mother of his right to succeed his assassinated father Peter III. He hated Catherine's favourites and her policy, both internal and external. He stabilized the succession of the Russian throne by his imperial family statute (1797; in force until 1917). He sent Suvorov to Italy to fight against the French Revolution, and he ended his reign while preparing with Napoleon an expedition to India against England. In social questions Paul's policy was also inconsistent: he alleviated the serf's obligatory work for his landlord by reducing it to three days in a week, but he gave away the peasants of the crown to noble proprietors as serfs in an even larger number than Catherine (120,000 yearly). This did not make him, however, popular among the nobility, as his exalted idea of the divine right of the tsars caused him to treat them in a purely oriental way. He used to say that a person could be reputed of importance only as long as he was permitted to converse with his majesty. His ill-balanced mind and tyrannical proclivities inspired fear in his asso-

ciates, and in the sixth year of his reign he was assassinated by court conspirators.

Alexander I (1801-25).—Paul's son and successor began his reign, as had Catherine (whom he professed to imitate), with attempts at liberal legislation (1801-05), which gave place to active foreign policy and wars (1806-09). There followed a new attempt at a constitutional reform (1809), hampered by the nationalist opposition, which urged and approved the annexation of Finland (1809) and of Bessarabia (1812). The invasion of Napoleon (1812) brought the national feeling to extreme tension. The following years (1813-18) were devoted to the assertion of Russia's influence in Europe. The last years of the reign (1819-25) were marked by a reactionary policy, which provoked the first revolutionary movement in Russia.

Alexander received a careful education at the hand of his grandmother, who wished him to inherit the throne instead of Paul, his father. The Swiss republican F. C. de la Harpe had a strong influence on him in his early years (1784-95). But this education was interrupted by Alexander's marriage (at 16) and did not go beyond imparting to him some general ideas unsustained by exact knowledge. His sentimental feelings were cooled by the court intrigues, by the hidden enmity between his grandmother and father and finally by the harsh system of Paul's reign, which Alexander was expected to approve and obliged to share in. The consequence was that he grew up a past master in dissimulation and self-restraint. His evasiveness in face of other people's strong opinions was often taken for weakness. But he knew how to promote his own views and if impeded in his designs he was capable of violent explosions of wrath.

Initial Liberalism.—In the first year of his reign Alexander surrounded himself with a few friends of his youth—N. N. Novosiltsev, P. A. Stroganov, Prince Adam Czartoryski, Prince V. P. Kochubei—a "private committee" whom he wished to help him in drafting large schemes of reforms. He at once cancelled a series of reactionary measures of Paul and declared his desire to abolish arbitrariness and to inaugurate a reign of law. Public opinion received him with enthusiasm. But the private committee, which met regularly for about a year, found dangerous and untimely both a formal declaration limiting the autocrat's power and the abolition of serfdom. The most important fruit of these good intentions was the introduction of ministries instead of the colleges of Peter the Great, which had been practically abolished by Catherine. A new senate statute was intended to make this institution the highest legal authority (1802). A very cautious ukase of 1803 permitted noble landowners to liberate their serfs, granting them at the same time lots of land. Only 47,000 serfs were thus liberated and became "free agriculturists." Somewhat larger measures limited the power of landowners over the serfs in Livonia and Estonia (1804-05). A new and important impulse was given to public education, which was considered to be a preliminary condition to all substantial reforms. Three new universities were created.

Since 1801 Alexander had feared the consequences of Napoleon's ambition, and he took upon himself, although it had no relation to Russian national interest, to organize a new coalition against France. In 1805 and 1806 he was involved in wars which ended in crushing defeats at Austerlitz and Friedland. He then changed his policy and concluded an accord with Napoleon directed against England, whose commerce with the continent had to be forbidden in all countries which adhered to this continental system. At his personal meeting with Napoleon at Tilsit (1807) Alexander played a part which made Napoleon call him a "northern Talma" (a renowned actor) and a "Byzantine Greek." But he was in part genuinely under Napoleon's influence and was entangled into new wars: with Sweden, which finished with the annexation of Finland (1809), and with Turkey, which lasted for six full years (1806-12) and ended with the annexation of Bessarabia. A year later (1808) Alexander again met Napoleon at Erfurt, but Napoleon's intention to raise the Polish question did not please Alexander, while Napoleon was offended by the refusal of the tsar to give him his sister in marriage. Relations were very strained by the end of 1810.

Conservative opinion was very much incensed against Alexander's alliance with the "Corsican usurper," especially as at that very time another and more serious attempt was made to introduce in Russia a constitutional government. Mikhail Mikhailovich Speransky, a prominent statesman, whose views were favoured by the emperor at that time, prepared a scheme based on the introduction of self-government in four stages, beginning with electoral assemblies (dumas) in the cantons and ending at the top with the duma of the state. Each lower duma elected deputies to the upper one: cantonal dumas to district dumas, district dumas to provincial ones; these latter sent all their members to the state duma, a legislative assembly, deprived of legislative initiative but enjoying the right to make motions concerning the interest of the state, the responsibility of functionaries and the violation of fundamental laws. The senate retained only judicial power, while the newly reformed ministries remained organs of the executive. The council of state, composed of high dignitaries and presided over by the tsar, was to prepare drafts of laws. In fact nothing except the council of state and the reformed ministries was realized (1810). Conservative opinion, as represented by nobility and bureaucracy, was furious with Speransky, and the tsar did not choose to defend him. On a futile pretext Speransky was dismissed from his office of imperial secretary and sent to exile (1812). His successor was an extreme nationalist and conservative, Adm. A. S. Shishkov.

Nationalism and Reaction.—When the war of 1812 began, the nationalist feeling reached its pitch. It was to be a Scythian war—a war of retreat. Time and space were to be the chief allies of Russia, whose military forces were one-half or one-third the size of Napoleon's. And, indeed, the deeper Napoleon penetrated into Russia's endless plain the more equal the chances became. Alexander named another conservative, M. Kutusov, commander in chief in the place of M. Barclay de Tolly (Aug. 29), and a third conservative, Count Feodor Vassilievich Rostopchin, general governor of Moscow, which was the final aim of Napoleon's strategy. After the bloody but undecided battle at Borodino (Sept. 7) Moscow surrendered to Napoleon. For five weeks of his stay in Moscow he waited in vain for a peace proposal. Moscow was burned by the inhabitants. His army was in process of dissolution, and winter was approaching. Then followed the famous retreat, during which the Grand army was nearly annihilated, and the wars of liberation of 1813 and 1814, which brought Alexander and his army to the walls of Paris. At the Congress of Vienna (1815) he figured as a saviour of Europe, and he continued to play a leading part at Aix-la-Chapelle (1818), Troppau and Laibach (1820) and Verona (1822). All these events produced an enormous impression on the sensitive temperament of Alexander. "The fire of Moscow," he said later to the German pastor R. F. Eylert, "lit up my soul, I then got to know God and became another man." Alexander now found in the Bible the proofs of his mission and proposed to his allies to establish a Holy alliance, a monarchs' league based on the precepts of the Scriptures. His intention was liberal, but Metternich made use of the idea for his policy of repressing all liberal movements in Europe.

The Revolutionary Movement.—Quite different were the impressions which the younger generation of officers who took part in the Napoleonic wars brought with them back to Russia. Many of them while abroad read political newspapers and were present at the debates of representative assemblies. They learned to quote the books of J. L. Delolme, Count Destutt de Tracy, Benjamin Constant, Gaetano Filangieri, Baron Bignon, etc. After their return to Russia they were shocked by the contrast of arbitrary rule, the abuses of bureaucracy, the venality and secrecy of the courts, the sufferings of the serfs and the indifference to popular education. Two secret political societies were formed by the most active of these officers in 1816-18: one by Pavel Ivanovich Pestel in the southern army and the second by a group of guard officers in Petersburg headed by N. M. Muraviev and Nikolay Ivanovich Turgenev. The former society—more radical—imitated the organization of the Carbonari; the latter borrowed its principles from the Tugendbund. Later on Pestel drafted a repub-

lican and strongly centralized constitution, while Muraviev composed a monarchical and federal constitution on the basis of those of Spain of 1812 and of the United States. Pestel's tactics were revolutionary, while the Petersburg group intended to help the government openly in questions of education, philanthropy, economics and improvement of justice, thus preparing Russia for a constitutional regime. They expected Alexander to sympathize with them, as in 1815 he gave a constitution to Poland and mentioned at the opening of the *sejm* that he was preparing one for Russia. He also acknowledged the old institutions of Finland. However, Alexander soon ceased to distinguish between "the holy principles of liberal institutions" and "destructive teaching which threatens a calamitous attack on the social order" (his expressions in the speech mentioned). He entirely agreed with Metternich (in 1820) that the liberal principles themselves were destructive. A period of reaction began in Russia. The transition to it was marked by an attempt to impart to Russia Alexander's religious enlightenment. The ministry of public education was united, for that purpose, with a new ministry of spiritual affairs, where all religions including the Russian Orthodox were treated equally (1817). Prince A. N. Golitsyn, the procurator of the holy synod and the president of the Russian branch of the Bible society founded in 1812, was made the chief of the united ministries. The consequence was that in 1819-21 the young universities recently opened were entirely destroyed—especially by the curators of Kazan and Petersburg circuits, M. L. Magnitskiy and D. P. Runich. They removed the best professors and prohibited good textbooks on natural law, morals and logic, on the ground that the teaching must be based exclusively on Holy Scripture. For Russian church dignitaries even their mystical pietism was heresy: Golitsyn was forced to leave his office, after he had been anathematized by the archimandrite Photius, a fanatic protected by Alexander's favourite Aleksyey Andreyevich Arakcheyev. During the last part of the reign Arakcheyev, an ignorant and brutal man, enjoyed the power of prime minister.

Under these conditions secret societies changed their character. The measures of Alexander convinced them that monarchs' promises are not to be relied upon. They were also impressed by military pronunciamentos in Spain and Naples (1820). Nikolay Turgenyev recorded in his diary in 1820: "We formerly asked, every time we met the readers of newspapers in the club, whether there was a new constitution. Now we ask whether there is a new revolution." One may judge of the impression produced on the officers of the guard when they learned that they had to stifle the Neapolitan uprising, by orders of the Laibach congress.

The former secret society of welfare, imitating the Tugendbund, was officially closed in 1821, as being too moderate. Two societies appeared instead: the northern and the southern constitutionalists and republicans. The constitutionalists were losing ground; radical elements even among them (like the poet K. F. Ryleyev) began to prevail. Proposals of regicide were heard from P. G. Kakhovsky and A. I. Yakubovich but were rejected or indefinitely postponed. In any case, revolutionary tactics were considered inevitable, but no definite scheme was in preparation. Suggestions were made for forcing the tsar, at some favourable opportunity, to nominate a liberal ministry under Speransky and N. S. Mordvinov, who would convoke a great council (later, Russian revolutionaries called it a constituent assembly) which should decide on the form of the government.

A favourable occasion presented itself quite unexpectedly. Alexander died in Taganrog on Nov. 19 (Dec. 1), 1825. The order of succession happened to be undecided. Constantine, the elder of Alexander's surviving brothers, had renounced the throne in 1823, but Nicholas, the younger, did not wish to acknowledge this and swore allegiance to his brother. Constantine would not accept the throne. Nicholas threatened to leave Russia. The correspondence between Warsaw and Petersburg was thus protracted for about two weeks. The Decembrists, as they were called later, decided finally to raise the guard regiments for Constantine against Nicholas and to force Nicholas—in case he survived that day—to appoint a liberal ministry which would do the rest. The rising was a failure (see NICHOLAS I). The last of Russian palace

revolutions was spoiled by too much idealism, but it served as an ominous prognostication of the coming democratic revolutionary movement.

Nicholas I (1825-55).—Nicholas was quite unlike Alexander. With a rough nature of limited understanding, he was conscious of his inferiority and sincerely disliked the idea of becoming tsar. But once tsar, he was sure that he would be enlightened from above for the accomplishment of his divine mission, and he conceived an exalted idea of his personal dignity and infallibility. But he was no mystic. Cold and reserved, he inspired fear and hatred and he consciously made use of these feelings as the instrument of his power. His aim was to freeze every germ of free thought and independent moral feeling, as disturbing agents of the order of things entrusted by God to his personal care.

Nicholas' reign is divided into three parts by two European sets of revolutions: those of 1830 and those of 1848. During the first five years (1825-30) he did not feel quite sure of himself and he appealed for help to advisers of Alexander's liberal period such as Kochubev, Speransky and E. F. Kankrin (Count Georg Cancrin). He even instructed a special committee of Dec. 6 (18), 1826, to collect for him all useful hints about necessary reforms. While punishing severely the Decembrists (five of them were hanged, others sent to Siberia), he wished to make use of all their good ideas. But he reserved for himself the control over public opinion and confided to Count A. K. Benckendorff the organization of a new secret police of gendarmes controlled by the "third section" of his personal chancery. He adopted Alexander's policy of protecting the kings from their peoples, but he made an exception for Christian Turkish subjects (in the first place the Greeks). He thus carried on a war against Turkey (1827-29). By the treaty of Adrianople Greece was liberated; the hospodars of the Danubian principalities were to be appointed for life and free from Turkish interference in internal affairs. The straits and the Black sea were to be open.

Nicholas especially attended to education; he wished to clear it of everything politically dangerous and confine it to the upper class. He abolished the liberal university statutes of Alexander (1804); by the new statutes of 1835 he detached the primary education intended for the lower classes from the gymnasiums and universities, where only children of gentry and of officials were to be admitted.

The expulsion of Charles X from France and the Polish insurrection of 1830-31 determined the legitimist tendency of Nicholas' foreign policy; he wished to become a real "policeman" of Europe, and at Münchengrätz he renewed relations with Metternich. But his excessive interest in the "sick man" in Constantinople finished by rousing Europe against him. In 1833 Nicholas saved the sultan from the Egyptian rebel Mohammed Ali, and by the treaty of Unkar-Skelessi received for that service free passage for Russian ships to the Mediterranean, while to all other powers the Dardanelles were to be closed during wartime. This concession drew the attention of the European powers, and in 1841 all the five great powers agreed that the Dardanelles should be closed to warships of all nations.

Slavophiles and Westernisers.—In sharp contrast with Nicholas' educational policy, a new generation grew up which was bred by Russian universities, especially Moscow university, between 1830 and 1848. They were not politicians or liberals of a Franco-English type. They were idealists and students of the philosophy of F. W. J. von Schelling, J. G. Fichte and G. W. F. Hegel. In Moscow literary salons they did not discuss the form of the government, but dug deep into the very foundations of Russian history and the Russian national mind. Most of them declared that Russia was unlike Europe and its type of civilization potentially far higher than the European one. They thought to discover Russia's peculiarity in its old peasants' commune (*mir*), which, they said, revealed the socialistic soul of Russia as unlike the individualistic western soul. They execrated Peter the Great's Europeanization of Russia as a fatal deviation from the genuine course of Russian history, and they wanted Russia to come back to the forsaken principles of the Eastern Church and state—to orthodoxy and autocracy. The majority of public opinion, led by A. I. Her-

zen, V. G. Belinsky, Mikhail Bakunin, T. N. Granovsky and others, revolted against this Slavophil doctrine. They opposed to it their own doctrine of the western origin of Russian civilization. Herzen and Bakunin emigrated from Russia on the approach of the revolutions of 1848. They became the originators of Russian socialism, which however did not frighten Nicholas so much as Russian liberalism—an applied doctrine whose dangers he had experienced at the hands of the Decembrists.

Nicholas was not insensible to the chief social question in Russia—that of serfdom. How could he be when peasants' uprisings were steadily growing in frequency? They numbered about 41 in the first four years of his reign, and there were 378 between 1830 and 1849 and 137 during the last five years. Nicholas formed a series of secret committees which, after many failures, prepared the law of 1842 on voluntary accords, which abolished personal serfdom and fixed the amount of peasant lots and payments. Through P. D. Kiselev's energy, the same changes were obligatorily introduced in Poland (1846) and in some western provinces (1847). A real persecution of intellectuals began after the revolutions of 1848. A secret committee, presided over by D. P. Buturlin, was founded to punish press offenses. S. S. Uvarov himself was found too liberal and resigned. His successor, Prince P. A. Shirovskii-Shikhmatov, wished to "base all teaching on religious truth." The university chairs of history and philosophy were closed, the number of students limited; many writers were arrested, exiled or otherwise punished. The private circle of followers of M. V. Butashevich-Petrashkevich, a young socialist, was sent to forced labour in Siberia (including Theodore Dostoevsky) for having read and discussed prohibited literature.

The Crimean War.—Nicholas also wished to dictate his will to Europe. "Submit yourselves, ye peoples, for God is with us": thus ended his manifesto published on March 27, 1848. He sent a Russian army to subdue Hungary when it had revolted against the Habsburgs. A few years later he inadvertently provoked a conflict with Turkey, because of a special question on the distribution of holy places in Jerusalem between Catholic and Orthodox priests, which he involved with the question of the general protectorate of Russia over Christian subjects of the sultan. European powers would not admit this protectorate, and Nicholas found against himself not only Napoleon III and England but also "thankless Austria." Turkish forces attacked the advanced Russian troops in the Danubian principalities on Nov. 4, 1853; France and England declared war on Russia on March 28, 1854. The courage displayed in the defense of Sevastopol proved useless, as the whole fabric of Russian bureaucratic and autocratic government appeared incapable of competing with European technique. Corruption and lack of communication, feeble development of industry and financial deficiency deprived the valiant soldiers of the most necessary means of defense. (See CRIMEAN WAR; TURKEY: History.) Nicholas died on March 2, 1855, feeling that all his system was doomed to destruction. A wholesale change of regime was indicated to his son and successor, Alexander II.

Alexander II (1855-81).—Alexander, a man of weak character but good-natured, possessed no steadfast views on politics. During the reign of his father he had sometimes surpassed Nicholas in reactionary intentions. But the Crimean War proved too clearly the danger of Nicholas' martinet system, and public opinion was too impetuous for Alexander to resist. He swam with the current, and this period coincides with the great reforms which made his reign a turning point in Russian history. But Alexander was always conscious of his power as unlimited monarch, and his liberalism ended as soon as his reforms brought with them a revival of political or autonomous tendencies. He then began to waver; the reforms were left unachieved or curtailed. Public opinion grew impatient, extremist tendencies won the ground, and the gap between the government and advanced opinion finally became insuperable. As a consequence, the original impulse for reform was exhausted as early as 1865. There followed a period of faltering which turned into a sheer reaction as the revolutionary movement grew.

Emancipation of the Serfs.—The greatest achievement of the era was the liberation of peasants. It paved the way for all other

reforms and made them necessary. It also determined the line of future development of Russia. The chief motive which decided Alexander is clearly expressed in his words to the Moscow gentry: "The present position cannot last, and it is better to abolish serfdom from above than to wait till it begins to be abolished from below." However, Alexander met with passive opposition from the majority of the gentry; their very existence as a class was menaced. The preparatory discussion lasted from 1857 to March 1859 when the drafting commissions of the main committee were formed, composed of young officials—such as N. A. Milyutin and Y. A. Soloviev and their Slavophil friends Y. F. Samarin and Prince V. A. Cherkasski—enthusiastically devoted to the work of liberation. Y. I. Rostovtsev, an honest but unskilled negotiator enjoying the full confidence of the emperor, was mediator. The program of emancipation was very moderate at the beginning, but was gradually extended under the influence of the radical press and especially Herzen's *Bell*. But Alexander wished that the initiative should belong to the gentry and exerted his personal influence to persuade reluctant landowners to open committees in all the provinces, while promising to admit their delegates to discussion of the draft law in Petersburg. No fewer than 46 provincial committees containing 1,366 representatives of noble proprietors were at work during 18 months preparing their own drafts for emancipation. But they held to the initial program, which was in contradiction with the more developed one. The delegates from the provincial committees were only permitted—each separately—to offer their opinions before the drafting committees. Unfortunately, Rostovtsev died in Feb. 1860. Alexander, who already feared that he had gone too far in his concessions, appointed as his successor Count V. N. Panin, a reactionary. Under his influence the proposed allotments of land to peasants were diminished and the rents were increased. However, it was impossible to change the main lines of the draft. By the law of Feb. 19 (March 3), 1861, the peasant became personally free at once, without any payment, and his landlord was obliged to grant him his plot for a fixed rent with the possibility of redeeming it at a price to be mutually agreed upon. If the peasant desired to redeem his plot, the government paid at once to the landowner the whole price (in 5% bonds), which the peasant had to repay to the exchequer in 49 years. Although the government bonds fell to 77% and purchase was made voluntary, the great majority of landowners—often in debt—preferred to get the money at once and to end relations which had become insupportable. By 1880 only 15% of the peasants had not made use of the redemption scheme, and in 1881 it was declared obligatory. The landowners tried, but in vain, to keep their power in local administration. The liberated peasants were organized in village communities governed by elected elders.

Administrative Reform.—After the emancipation of the peasants, the complete reform of local government was necessary. It was accomplished by the law of Jan. 1 (13), 1864, which introduced the district and provincial *zemstva* (county councils). Land proprietors had a relative majority in these assemblies. They were given (in all Russia) 6,204 seats (48%) while the peasants were entitled to choose only 5,171 delegates and the town inhabitants 1,649 (12%). The competence of *zemstva* included roads, hospitals, food, education, medical and veterinary service and public welfare in general. Before the end of the century services in provinces with *zemstva* government were far ahead of those in provinces without.

A third capital reform touched the law courts. The law of Nov. 20 (Dec. 2), 1864, put an end to secret procedure, venality, dependence on the government, etc. Russia received an independent court and trial by jury. The judges were irremovable; trials were held in public with oral procedure and trained advocates. Appeals to the senate could take place only in case of irregularities in procedure.

A little later came the reforms of municipal self-government (1870) and of the army (1874). Gen. D. A. Milyutin (the brother of N. A. Milyutin) reduced the years of active service from 25 to 16 and made military service obligatory for all classes. The only exemptions admitted were for reasons of education. Military

courts and military schools were humanized.

The Revolutionary Movements.—The only branch of public life exempted from reform was the press. The press profited indeed by the new spirit of Alexander's reign. While in the last ten years of Nicholas' reign only 6 newspapers and 19 (mostly specialist) monthlies were permitted, during the first ten years of Alexander's there were 66 newspapers and 156 monthlies. The general tendency of the press, very moderate at the beginning, soon became very radical. The leading spirits were the nihilists N. G. Chernyshevsky, N. A. Dobrolyubov and D. I. Pisarev, the last of whom preached extreme individualism. As early as 1862 temporary measures were applied against radical periodicals. Instead of a law on the liberty of the press there appeared in 1865 new temporary rules (which remained in force for fully 40 years) compiled from Napoleon III's law of 1852. They set free from "previous censure" books of more than ten sheets, but the censors continued to seize printed books before their issue.

A new wave of revolutionary movement set in. It proceeded from the young generation of university students, who expected an agrarian revolution directly after the liberation of peasants. They were busy preparing for it workmen, soldiers and peasants through popular education. Secret circles were formed, proclamations issued and even a revolutionary movement was attempted in connection with the Polish uprising of 1863. Finally, an attempt was made by a student, D. Karakozov, to assassinate the tsar in April 1866. All these attempts were extremely naïve; a few young revolutionaries were executed or sent to Siberia and the whole movement was stifled in its primary stage. But Alexander was frightened. Gradually he dismissed his liberal advisers, and conservatives took their place. The home office was given (1861) to P. A. Valuyev, who tried to paralyze the introduction of the emancipation law and formally prosecuted its faithful adherents. University troubles brought about the removal of the liberal minister of public instruction, A. V. Golovnin, the author of a model university statute of 1863. His successor was a reactionary, Count Dmitry Andreyevich Tolstoy, who found the means of salvation in the classics. The old chief of gendarmes, Prince V. A. Dolgorukov, had to give place, after Karakozov's attack, to Count Peter Shuvalov, who became the soul of reaction. The government-general of St. Petersburg was abolished and the martinet Gen. F. F. Trepov made grand master of the police. D. N. Zamyatin, minister of justice, under whom the reform of tribunals was carried through, fell a victim to his defense of this reform against an imperial whim; he had to yield to an ignorant reactionary, Count K. I. Pahlen (1867), who nearly annihilated the reform. The same was done for the press by A. Timashev who superseded Valuyev as home minister in 1868. Two radical monthlies, the *Contemporary* and the *Russian Word*, were closed (1866). M. N. Katkov, a former European liberal who now inclined to extreme nationalism and reaction, became the most influential journalist.

All this contributed to uphold and to increase the disaffection of educated public opinion. About 1869 a new young generation appeared which gave expression to that state of mind. Russian emigrants in Switzerland discussed at that time a new revolutionary doctrine later called populism (*narodnichestvo*). P. L. Lavrov was giving it a scientific basis, but Mikhail Bakunin found this too learned and plainly invited the youth to give up the study and go straight to the people with the aim of inducing disorder. He found this easy, since Russian peasants with their communes were born socialists. The youth of Russia, chiefly the young girls who went to study abroad as there were no female institutes of learning in Russia, listened to these discussions in Zürich and, of course, mostly preferred Bakunin's active optimism to Lavrov's learning. In 1873 they were all ordered back to Russia by the government, and they met, when at home, with many student circles which were busy distributing books and revolutionary pamphlets among their provincial branches and workmen. N. V. Tchaikovsky, Prince P. A. Kropotkin and Sergius Stepniak (S. M. Kravchinsky) were among the leaders of that educational and (later on) revolutionary work. They decided, in the spring of 1874, to go to the people—a naïve crusade by inexperienced youth, hardly out of their teens—in order both to teach the people and to learn from

them their socialistic wisdom. Of course they were not acknowledged by the people, in spite of their peasant attire, and were easily ferreted out by the police; 770 were arrested and 215 sent to prison. They then decided to change their tactics. A regular secret society was founded in 1876 under the name of Land and Liberty (or "Will"). They still hoped to provoke a mass uprising according to the ideals of the people, but their village settlements proved useless for revolution while in the towns they soon got engaged in a lively conflict with the police. As a result the terrorist side of their activity came to the forefront. In the autumn of 1879 the terrorist group formed a separate party, the People's Will, while the remaining members led by G. V. Plekhanov—under the name of Black Partition (*i.e.*, agrarian revolution)—remained inactive. A series of terrorist acts then followed, beginning with that of Vera Ivanovna Zaslulich, who fired on Trepov for his having flogged a prisoner and was acquitted by the jury (1878). In 1879 A. Solovyev fired five shots at the tsar. On Feb. 17, 1880, a workman, S. N. Khalturin, blew up the imperial dining room at the Winter palace. The police seemed powerless against the famous executive committee which directed the blows, and the government asked the loyal elements of public opinion for support. The answer was given, in the name of the Chernigov *zemstvo*, by Ivan Petrunkevich: he said that no co-operation was possible with the government as long as public opinion was stifled. The Tver *zemstvo*, led by F. I. Rodichev, asked the tsar to "give us what he gave to Bulgaria" (*i.e.*, constitution and political freedom). After the Winter palace explosion a supreme commission was appointed under the chairmanship of M. T. Loris-Melikov, who was given a sort of dictatorial power. Loris-Melikov's design was to isolate revolutionary elements by concessions to the liberals and, after exterminating the revolutionaries, to summon a sort of consultative assembly, thus renewing certain projects of aristocratic landowners in 1861-63. He submitted to the tsar, on Feb. 9, 1881, a proposal to appoint two drafting committees for administrative and financial reforms and to submit their drafts to a general commission, where experts chosen by the *zemstva* and municipalities should also be heard (two from each of them). The respective laws would be issued in the ordinary way by the council of state, but 15 delegates should be admitted to its session. It did not at all look like a constitution, but it might have served as an introduction to it. Fate decided otherwise: on the very day when Alexander signed Loris-Melikov's project, on March 1 (13), 1881, he was assassinated by revolutionaries, led by Sophia Lvovna Perovskaya, on his way back home.

Foreign Policy.—Alexander II was more successful in his foreign policy. He ascended the throne at a moment of great exhaustion and humiliation for Russia. The Paris treaty (1856) substituted European control for a Russian protectorate over Turkish Christians; the Russian fleet in the Black sea ceased to exist; the portion of Bessarabia nearest to the Black sea was given to the Danubian principalities. However, Russia did not permit Napoleon III to make an international question of the Polish uprising of 1863; Alexander then approached his relative William of Prussia and helped him against France in the foundation of the German empire. Russia made use of the Franco-German War to repudiate the provisions of the Paris treaty forbidding Russia to construct naval arsenals and to keep a fleet in the Black sea (1870). In 1872 the German, Austrian and Russian emperors met at Berlin and concluded the Three Emperors' league (without any formal treaty being signed; *see EUROPE*). However, Russia did not wish to strengthen Germany too much at the expense of France. In 1875 thanks to Russia's insistence a Franco-German conflict was averted, to the great dissatisfaction of Bismarck, who threatened the Russian foreign minister, Prince A. M. Gorchakov, with revenge. In the same year the Eastern Question was reopened by a rising of Christian Slavs in Bosnia and Herzegovina (*see EUROPE AND TURKEY*). In 1876 (summer) began the Bulgarian uprising. Russia proposed co-operative action to the powers, but, meeting with hidden aid to Turkey from Disraeli, Alexander decided to act alone. When Serbia and Montenegro declared war on Turkey he met Francis Joseph at Reichstadt and on July 8, 1876, con-

cluded an agreement in which all possibilities of defeat, victory or the collapse of Turkey were anticipated. Austria was to receive Bosnia and Herzegovina for occupation and administration; Russia was permitted to take back the lost portion of Bessarabia. A last attempt to formulate a European program of pacification of the Balkans was made by the powers at the Constantinople conference (Dec. 1876). After its failure Count Nicholas Pavlovich Ignatiev visited the European capitals to discuss the possibility of war. Austria and England put as conditions of their neutrality, no attack on Constantinople; no Russian territorial acquisitions; no thrusting Serbia into war; Bulgaria, in case of its liberation, not to be under direct Russian control. Thus, Russia was in advance deprived of possible gains in case of victory; as a matter of fact, Disraeli looked for its defeat. Nevertheless, Alexander went to war (see RUSSO-TURKISH WARS). Close to the walls of Constantinople the Russian army was stopped by the British fleet, and the treaty of San Stefano (March 3, 1878), favourable to the Bulgarians, was emasculated at the Congress of Berlin (q.v.). Russian public opinion, ignorant of the agreements concluded before the war, was much incensed against Bismarck, "the honest broker." Russia received the lost part of Bessarabia and Kars, Ardahan and Batum in Transcaucasia. Far more important were the acquisitions of Alexander in central Asia. From 1864 his generals were active against Kirghiz and Turkoman tribesmen who raided the unprotected frontier of Siberia. Russian soldiers marched up the Syr-darya, subjugated Bukhara and from there, through the desert of Khiva, reached the Caspian shore. In 1867 the territory between Issyk-Kul and the Aral sea was constituted into a province called Turkistan, and in 1874 another province under the title of Transcasia was formed of territories between the Amu-darya and the Caspian sea. Russia reached the frontiers of Afghanistan and Chinese Turkistan, while in the far east by the treaty of Aigun (1858) it obtained from China territory running east from the rivers Amur and Ussuri to the Pacific seaboard, and the naval base of Vladivostok was founded. Japan ceded Sakhalin in 1875 in exchange for two Kurile islands. In 1867 Alaska was sold to the United States for \$7,200,000.

Industrial Progress.—Under Alexander II Russia made decisive steps toward industrialization. The length of railway increased from 644 mi. (1857) to 2,260 (1867) and to 11,070 (1876). Factory production grew from 352,000,000 (1863) to 909,000,000 roubles (1879); the number of workmen from 419,000 to 769,000; the export of grain from 52,800 bu. (1860-62) to 125,600 (1872-74). In 1850 and 1857 Russia (for the second time since 1879) tried the experiment of free trade, but as it brought with it an excess of imports—a thing unusual in Russia—M. K. Reutern, the minister of finance in 1862-78, returned to the protectionist system of Kankrin (1823-44). He also favoured the organization, for the first time in Russia, of private credit institutions. The 10 land banks which were in existence at the end of the 19th century were all founded in 1871-73; there were also 28 commercial banks (founded 1864-73), 222 municipal banks (1862-73) and 71 societies of mutual credit (1877).

Alexander III (1881-94).—Alexander III succeeded his father and was at first expected to continue his tradition. But the quasi-constitutional scheme of Loris-Melikov, discussed on March 8 in the Winter palace, met with the opposition of Constantine Petrovich Pobedonostsev, the former tutor of Alexander and his most trusted adviser. On April 29, 1881, appeared a manifesto written by Pobedonostsev without the ministers' knowledge, in which the tsar described himself as "chosen to defend" autocratic power. At the same time a promise was made to continue Alexander II's reforms. Loris-Melikov, with D. A. Milyutin, at once resigned and was replaced by N. P. Ignatiev, a friend of the Slavophiles, who promised to leave untouched the powers of the *zemstvo* and municipalities and to alleviate the burdens of the peasants. And indeed, in June and September 1881, Ignatiev summoned the experts selected by the government among liberal *zemstvo* men. With their help he drafted a scheme for lowering the redemption prices, abolishing the poll tax and regulating internal colonization and land rents. The new minister of finance, N. K. Bunge, assisted by opening a peasants' bank and also enacted

the first factory acts (1882) and appointed special factory inspectors to enforce their application. A special commission under M. S. Kakhnov (1881-84) prepared a reform of peasant self-government based on the principle of the equality of peasants with other social classes. In May 1882 Ignatiev proposed to Alexander to summon a *zemsky sobor* in Moscow of about 3,000 representatives from all classes, on the day of the coronation.

Here Katkov and Pobedonostsev won their victory. Ignatiev resigned; the reactionary Count Dmitri Tolstoy took his place as home minister. His tool I. D. Delyanov enacted in his former ministry a new reactionary statute for the universities (1884). He now became the mouthpiece of the nobility and gentry, a decaying class that tried to preserve as much as possible of their vanishing power and property. In 1885 a special Bank for the Nobility was opened with the aim of preserving the landed property of the gentry from final liquidation (for debt). Then Tolstoy proposed to A. D. Pazukhin—a sworn defender of noble privileges—to revise the *zemstvo* institution with the avowed aim of making the nobles' influence paramount in the countryside. As a result two important laws were published, on July 12, 1889, on land captains and on June 12, 1890, on *zemstvo*. The composition of district assemblies was changed from the figures given above to 5,433 representatives of landed owners (57%), 1,273 municipal representatives (13%) and 2,817 representatives of village communities. However, the chief aim of the government was, rather than to favour the gentry, to incorporate both the land captains and the executive boards of the *zemstvo* in its civil service by making them subordinate to the provincial governors and destroying their representative character.

An outstanding feature of Alexander III's reign was an increased persecution of everything dissimilar to the officially accepted national type. Dissenting sects, the Uniates and the Lutherans in the western provinces, Lamaists, Kalmucks and Burjats and especially Jews suffered a systematic persecution. The press was definitely muzzled, revolutionary organizations were destroyed and revolutionary movement was stifled. Public opinion was silent until the great famine of 1891; from that year symptoms of a revival appeared. The new movement was entirely different from the populism of the '60s and '70s. The Russian socialists became Marxists. Russia, they argued, was becoming an industrial country and the numbers of the industrial proletariat were speedily increasing. In fact, I. A. Vyshnegradsky, minister of finance since 1887, not only continued Reutern's policy in developing the railway (14,900 mi. at the beginning, 24,000 mi. at the end of Alexander's reign) and in protecting industry (prohibitive tariff, 1891), but tried to influence the foreign market and to stabilize the rate of exchange of the Russian rouble. He also resorted to foreign capital. In 1889-94 its influx was 5,300,000 roubles, as compared with 1,500,000 of 37 years before (1851-88). However, the position of the Russian consumer who had to pay about 34% ad valorem for imported goods, instead of 13% as before the tariff of 1891, was much worsened. The peasants especially suffered, as the price of grain, their only article for sale, fell from 1.19 roubles per *put* (1881) to 0.59 in 1894, while their allotments, which had been insufficient at the moment of liberation, further diminished (1861-1900) to 54.2%. As a result, their arrears of taxes increased more than five times compared with 1871-80. Vyshnegradsky tried to relieve the treasury by increasing enormously the customs and excise. In the decade 1883-92 taxation increased 29% while the population increased only 16%. Thus, elements of an agrarian crisis were increasing as the 19th century was nearing its end.

Alexander III's foreign policy was peaceful. He wished to be his own foreign minister; Gorchakov gave place to a submissive Germanophil, N. K. de Giers. Bismarck profited by this and, in spite of his alliance with Austria (1879) which was avowedly concluded against Russia, contrived to renew, as early as 1881, the Three Emperors' league of 1872. In 1884 it was renewed for three following years and in 1887, as Austria seceded, Bismarck concluded his famous "reinsurance" treaty with Russia. All these treaties fettered Russia in its Balkan policy but secured the country against the opening of the straits to England and even per-

mitted to it, by a secret protocol, the military occupation of the straits in case of necessity. As at the same time the Triple alliance with Italy was concluded (1882), Bismarck's policy proved too complicated for his successor, and in 1890 a Russian proposal to prolong the treaty for the next six years was rejected by Count Caprivi. Thus the way was opened to a Franco-Russian *rapprochement*, while Germany was courting England, Russia's competitor in Asia (where Alexander in 1885 took Merv, thus establishing Russia on the frontiers of Afghanistan). France opened to Russia its market for loans and its factories for armaments in 1890; a French squadron was enthusiastically received in Kronstadt in 1891; and the subsequent *rapprochement* culminated in a military convention worked out in Aug. 1892 and definitely ratified by the tsar in March 1894.

Alexander III died on Nov. 1, 1894, in Livadia, 50 years old. His robust constitution had been sapped by constant fear of the revolutionaries, which made him live at Gatchina like a prisoner, surrounded by a cordon of police agents.

Nicholas II, to 1917.—There can hardly be imagined a more tragic contrast than that of the extremely complicated situation inherited by Nicholas II and the complete nullity of the man who had to solve the problem. Like his father, Nicholas was not prepared to reign; like Alexander III, he would have preferred to live as a private man in his family circle, and he hated his exalted position which clashed with his modesty and bashfulness. However, like Alexander III, he felt it a duty to bear the burden of autocratic power and, moreover, to preserve autocracy untouched for his successor. He had to wait long for this heir, as his marriage (1894) with Princess Alix of Hesse, known as the empress Alexandra Fedorovna, brought him first four daughters, and when finally a son (Alexius) was born (1904), the parents had constantly to tremble for his life, as he inherited through his mother the dangerous disease of haemophilia. In their wish to save him at any cost they put their confidence in every kind of quack, beginning with M. Philippe, the spiritist from Lyons, and ending with the famous Gregory Rasputin. Her relations with them finally brought the nervous Alexandra to a state of religious exaltation and mystic faith in her predestined mission to save the tsar and her son from evil by obeying the precepts of God's elect.

The initial hopes of the liberals that the "leaden coffin lid" of Alexander III's reign would be raised by the new tsar were soon dispelled. When messages of congratulation on his marriage were brought to the tsar by innumerable deputations at a reception (Jan. 17 [29], 1895) the delegates asked the tsar "that the voice of the people should be heard" and "that the law should henceforth be respected and obeyed not only by the nation but also by the ruling authorities." The tsar, instructed by Pobedonostsev, answered: "I am aware that in certain *zemstvo* meeting voices have been lately raised by persons carried away by senseless dreams of the participation of *zemstvo* representatives in internal government. Let all know that I intend to defend the principle of autocracy as unswervingly as did my father." The liberals answered next day in an open letter: "Senseless dreams' concerning yourself are no longer possible. If autocracy proclaims itself identical with the omnipotence of bureaucracy, its cause is lost. . . . It digs its own grave. . . . You first began the struggle, and the struggle will come."

The struggle had come. In June 1896 St. Petersburg saw the first strike of 30,000 workmen. The revolutionary wing of the Marxist socialists triumphed; here at last the masses had come forward with purely economic demands. In 1898 the Russian Social Democratic Labour party was formed. However, the old leaders did not approve of this peaceful and legal economism of the young generation. In their "orthodox" organ *Iskra* (Spark), published abroad, they defended the political and revolutionary side of Marxism. In 1903, at a conference in London, their tendency, represented by V. I. U. (Nicolai) Lenin, obtained the majority and bolshevism (*Bolsheviki*=majoritarians) was created. On the other hand, the People's Will party was revived under the name of Social Revolutionaries with a new program in 1898. They remained true to their two leading ideas, agrarian revolution and terrorism. Agrarian riots began two years later in southern Rus-

sia. In 1899 began also student disorders which were answered by the minister of public instruction, N. P. Bogolepov, by the menace of military service for delinquents. On Feb. 27, 1901, Bogolepov was killed by the student P. V. Karpovich. On April 15, 1902, the home minister, D. S. Sipyagin, was killed by S. V. Balmashov. Pobedonostsev recommended V. K. Plehve for his successor. Plehve had to struggle not only against the agrarian uprisings but also against moderate elements—the *zemstvo* liberals and the radicals of the liberal professions (professors, lawyers, journalists, engineers, the so-called third element, officials of the *zemstva*, etc.). They formed a secret Union for Liberation and from July 1902 published their weekly, *Liberation*, abroad. The number of persons accused of political crime rose from 919 (1894) to 1,884 (1899) and 5,590 (1903). The minister of finance, Sergei Iulievich Witte, tried to oppose Plehve's policy but was dismissed in Aug. 1903.

The Russo-Japanese War.—Witte's removal proved especially fatal for Russian policy in the far east. William II of Germany suggested to Nicholas the idea that Russia's true mission was in Asia, not in Europe. The Trans-Siberian railway (begun 1891) presented new facilities for penetration, especially when a treaty with Li Hung-chang (May 1896) secured its extension by the East China railway; and in May 1898 a new lease was received to construct a branch through Mukden to Port Arthur, which six months before had been occupied by the Russian fleet. A chauvinistic guard officer, A. M. Bezobrazov, profited by Nicholas' confidence to cover with the tsar's protection his concession for cutting wood on the Yalu river. Many "patriotic" courtiers, grand dukes and the tsar himself acquired the bonds of the Eastern Asiatic Industrial society. Japan objected to the occupation of the left bank of the Yalu. As Prince Hirobumi Ito received no satisfaction in Petersburg, he went to London and concluded (1902) a five-year alliance with England. Russia was then obliged to withdraw its troops from Manchuria and promised to do so before Oct. 8, 1903. The promise was not fulfilled. The war party, led by Bezobrazov and Plehve, decided against Witte for war. They knew nothing of Japan's readiness for war and were stupefied by the famous night attack of Feb. 8, 1904, on the Russian fleet in Port Arthur (see RUSSO-JAPANESE WAR).

The Revolution of 1905.—The revolutionary movement found new substance in Russian military defeats. Patriotic feeling began to turn against the government. The war grew extremely unpopular. Plehve, who had wished to divert public attention from the internal situation by war, was blown up with his carriage in July 1904. After much wavering Nicholas appointed on Sept. 8, 1904, Prince P. D. Svyatopolk-Mirsky as successor to Plehve. Public opinion was delighted. The liberal *zemstvo* men met in Petersburg, on Nov. 19–22, 1904, in private and worked out a petition to Nicholas asking for inviolability of the person, freedom of conscience, of speech, of meeting, of press, of association and equal civil rights. The majority also asked for a regular popular representation in a separate elective body which should participate in legislation, in working out the budget and in controlling the administration. The professional groups organized banquets to support the *zemstvo* program. Nicholas still wavered. His *ukase* of Dec. 12 (25) did not go beyond general promises and kept silence over the representative assembly. The chance of peaceful compromise with moderate constitutionalists was passing by. The revolution began.

On Sunday, Jan. 9 (22), 1905, many thousand workmen, led by the priest Georgii Gapon, marched with icons, singing religious songs, to the Winter palace to speak to "their tsar." But the tsar was absent; the troops fired on the defenseless crowd and killed about 1,000 people. Svyatopolk-Mirsky resigned. A. G. Bulyghin, a bureaucrat, was appointed his successor. As a reply, Grand Duke Sergei was blown up in the Kremlin of Moscow by the Social Revolutionary Ivan Kalayev. The tsar still wavered. He issued a promise merely to summon "the worthiest persons" to share in the drafting and discussing of laws.

Meanwhile, public excitement was growing, fanned by the news of Tsushima (May 27–28). The constitutional and the revolutionary movements began to separate. Constitutionalists (*zemstvo*

men and Liberation union; held their congresses and prepared drafts of constitutional laws. After Tushima they sent to Nicholas a deputation which repeated the demands of the November petition of 1904 and received (June 6 [19]) the answer that the "tsar's will was unshakable." Two weeks later Nicholas promised to another delegation of the nobility that he would keep the tradition of the past. On Aug. 6 (19) a law conceded a *duma* of the empire. But it was to be a consultative chamber, composed of class delegates, representing peasants (43%), landed proprietors (34%) and bourgeois (23%). This *duma* was entitled only to prepare drafts of laws for the council of state. This, "Bulygin's constitution," provoked general indignation. Its only result was to give the upper hand to revolutionary elements (the Socialist parties). There was now no end to meetings, workmen's and students' strikes, agrarian uprisings, which finally, on Oct. 10-14, united in one general strike all over Russia. From railway employees it spread to post and telegraph personnel, factories, shops, business offices and even children in primary schools. Communication with the provinces was interrupted; Nicholas was isolated in his summer residence at Peterhof. On Oct. 14 (27) a soviet (council) of workmen's delegates was formed whose vice-chairman was L. D. Trotsky. On Oct. 15 (28) the Constitutional Democratic (Kadet) party was founded, which included the radical wing of the *semstvo* men and the moderate elements from the Liberation union and other professional unions. The common aim of the left wing of public opinion was a constituent assembly elected on universal suffrage and leading to parliamentary government.

Nicholas thought of abdication. But he was saved by Witte, who had just concluded (Sept. 5) peace with Japan at Portsmouth, N.H., and was generally expected to become a peacemaker inside Russia. On Oct. 17 (30) Nicholas signed the famous manifesto prepared by Witte (now a count) and published it together with Witte's report, in which the necessity of concession was laid down. The manifesto promised a real inalienability of person, freedom of thought, speech, meetings and associations. No law was to be enacted without consent of the *duma*. But the word "constitution" was not used; the tsar retained his title of autocrat (*samoderzhets*). He openly favoured the newly formed reactionary organization, the Union of the Russian People. Then a wave of absolutist demonstrations and Jewish pogroms organized by the police followed, in a few days, the short-lived outbreak of enthusiasm elicited by the tsar's concessions.

Witte was made prime minister of a unified cabinet. But he could not persuade liberal leaders to enter his cabinet as the situation remained extremely uncertain. His minister of the interior, P. N. Durnovo, was a reactionary. Pobedonostsev resigned (Nov. 1), but Gen. D. F. Trepov was retained in proximity to the tsar. Agrarian troubles further heightened in November, and Count Witte proposed to his minister of agriculture, N. N. Kutler, to prepare a draft of law on the basis of the expropriation of the landowners. It roused against Witte the nobility, who also founded a union. On the other hand, Witte had to fight against the revolutionary movement which found its headquarters in the Petersburg soviet of workmen's delegates. The soviet published decrees and tried to play the part of a second government. Trotsky, backed by Lenin, preached a permanent revolution. However, the policy of the Socialist parties definitely alienated the sympathy of the possessing class. On Dec. 3 (16) the soviet with all its members present was arrested. Its substitutes replied by an armed uprising in Moscow (Dec. 7 [20]). Until Dec. 13 (26) there was shooting in the streets; then the guard regiments came down from Petersburg and the rebels were dispersed. There followed the so-called punitive expeditions led by Generals G. A. Min, Paul Rennenkampf and A. N. Möller-Zakomelsky which exterminated with ruthless cruelty what remained of the revolutionary movement in Russia and Siberia.

This decisive blow at the revolution weakened also the constitutional movement. Witte was losing ground. A certain extension of electoral right, especially in the towns (Dec. 11 [24]) was his last success. The predominance of peasant deputies remained untouched as the peasantry was considered more conservative and

reliable than the nobility. Witte promised to the tsar a pliant *duma*. He dismissed Kutler, but he refused to promise to dissolve the *duma* if it raised the agrarian question, a measure proposed by his competitor, the former home minister I. L. Goremykin. Nicholas was encouraged to resistance by the repression of the revolutionary movement. He assured the deputations of the Union of Russian People that "the sun of Truth will shine bright over the Russian land" (Jan. 1906) and that his "autocracy will remain unchanged as it had been of old" (March).

The First Duma.—Witte's fate was sealed when the elections, which he left comparatively free, gave the majority to the Constitutional Democrats (the Kadets) together with peasants who wanted a radical agrarian reform. The Socialists, who still hoped for a revolution resulting in a real constituent assembly, decided to boycott the elections. Witte resigned after having rendered the tsar his last service: he concluded a loan in France, which made the tsar free to deal with the *duma* as he liked. Just before the *duma* met (April 27, 1906) new fundamental laws were published which curtailed its power (*see DUMA*) while leaving to the tsar an extensive prerogative and to the council of empire equal rights in legislation and the budget. The government preserved the right of extraordinary legislation, without the *duma*, in emergency.

Under these conditions the struggle was unequal. The dissolution of the *duma* was assured when in its address to the throne it proposed its own program of embodying into laws and enlarging the liberal promises of the October manifesto. After much delay Goremykin declared the program inadmissible. He received a vote of censure, which was, however, of no consequence. There was an avalanche of questions and interpellations in order to expose and to restrain the arbitrary rule of the bureaucracy—but all in vain. The government answered by practically boycotting the *duma*. Then a long debate began on the agrarian project introduced by the Kadets, on the basis of partial expropriation of big landed estates. The government published a sort of counterproject and warned the country not to believe in the *duma's* promises. The *duma* replied by a declaration which was interpreted by the government as an illegal appeal to the country and served as a pretext for dissolution. On July 9 (22) the delegates found the Taurida palace locked and surrounded by army detachments and artillery. About 200 of them moved to Viipuri in Finland in order to protest and to invite the people to passive resistance should no new *duma* be convoked. On the other hand, the congress of the United Nobility demanded the changing for their benefit of the electoral law by the mere will of the tsar, in violation of the fundamental laws. P. A. Stolypin, who had dissolved the first *duma* and taken the succession of Goremykin, did not dare to do so. But he tried instead to solve the agrarian question by means of emergency legislation. His scheme was to increase the lots of the well-to-do peasants at the expense of the poorer ones by dividing the communal land at the first request of the former and thus to avert the danger of expropriating the estates of the nobles (edicts of Oct. 2 and Nov. 22). He also set up field courts-martial to pronounce death sentences against the remaining revolutionaries (Sept. 1).

The Second Duma.—The second *duma*, convoked Feb. 20 (March 5), 1907, in spite of all pressure on electors proved much more radical than the first. The Kadets' representation sank from 187 to 123, while the Socialists, who this time took part in the elections, rose from 26 to 83 and the Labour group (mostly peasants) rose from 85 to 97. Both extremist groups of urban and agrarian socialism thus nearly formed the majority, while on the right wing there were only 34 Octobrists (a party of landlords and rich merchants, formed soon after the Kadets with the government's connivance; they professed to be constitutionalists) and 63 nationalists and avowed autocrats. However, the new majority was not so confident as had been the first *duma* and shared the cautious tactics of the Kadets. The United Nobility was afraid of that moderation. They now induced Stolypin to prepare a new electoral law and only sought for a pretext to dissolve the *duma*. They found it in the *duma's* lack of desire to denounce revolutionary terrorism and in the propaganda of the Social Democratic party. On June 3 (16) the *duma* was dissolved and at the

same time a new electoral law was published which partly disfranchised the nationalities (especially the Poles) and gave pre-dominance to the representatives of the gentry.

The Third and Fourth Dumas.—Extreme pressure was used during the elections to the third duma (1907–12), as well as to the fourth (1912–17). However, the government did not succeed entirely in stifling the opposition groups. The party composition of the two last dumas was as shown in the accompanying table.

TABLE III.—Party Composition of Third and Fourth Dumas

Parties	Third	Fourth
Right wing		
Extreme right	52	66
Nationalists	91	83
Total	145	153
Centre		
New (Nationalist) centre		
Octobrists	133	39
Total	133	58
Left wing (opposition)		
Poles and Moslems	26	21
Progressives	30	48
Constitutional Democrats (Kadets)	55	50
Labour group	24	9
Social Democrats	14	25
Total	140	158

At the beginning of the decade of duma activity Stolypin worked with the leading group of Octobrists and their leader Alexander Guchkov. By that co-operation Stolypin was able to pass his agrarian laws and the nationalist bills depriving Finland of the last remains of autonomy. It was the consummation of Nicholas' policy against Finland which had cost the life of his general governor, N. I. Bobrikov, in 1904. Poland was deprived of a part of Kholm territory. Measures were taken against the Ukrainian national movement and against the Jews, with the acquiescence of the duma. However, on the questions of the reconstruction of the army and navy Guchkov took a sharp line against the government and the grand dukes, which incensed the tsar and seemed an attack on his prerogative. It made Stolypin go to the side of the Nationalists—a party newly created with the pecuniary aid of the government and thus very submissive, led by Count Vladimir Bobrinsky and Pavel Krupensky. On the other hand, the Octobrists approached somewhat the Kadets and worked together on questions of foreign policy and the budget. An open conflict with Stolypin took place in 1911 over his reckless use of emergency legislation in order to break the opposition of the legislative institutions, including the upper house. As soon as Stolypin lost his credit with the duma he was no more needed by the tsar, who still cherished the hope of complete freedom from the duma. The assassination of Stolypin (Sept. 14, 1911) by a revolutionary, Dmitry Grigorevich (Mordka) Bogrov, did not elicit any expression of regret from the tsar and was ascribed by rumour to a police plot.

The elections of the fourth duma were so arranged by the government as to give an overwhelming majority of Nationalists, who would then ask for the transformation of the duma into a consultative chamber. At the court Rasputin enjoyed already a paramount influence, and the tsarina began to meddle in politics with the aim of strengthening the weak tsar against all risk of concessions to constitutionalism and also preserving autocracy unimpaired for her son. However, the results of the elections were a disappointment: the opposition increased in number and authority; the right wing of autocrats was merely equal to it; and there was no strong centre to lead the duma.

The beginning of World War I brought nearly all parties together in a patriotic cry for a sacred union. But the government did not know how to make use of this disposition of mind. It continued its exasperating internal policy and tried to do without the duma. The situation was so much the worse when the Russian retreat began and the army proved unprepared. The war minister, V. A. Sukhomlinov, and other reactionary ministers were then dismissed and the duma was summoned for Aug. 1, 1915. The duma was empowered to control the supply of munitions through its members in a special committee together with the Union of the *Zemstva* led by Prince G. E. Lvov. The duma found finally its majority, but it was the majority of a Progressive bloc which proposed to the tsar a national coalition government "pos-

sessing the confidence of the country" and a program of reforms necessary to appease the country (Aug.-Sept. 1915). Unhappily there was no Witte to advise the tsar. Goremynkin was only a courtier and he made the tsar answer by a prorogation of the duma and by the expulsion of all liberal ministers who favoured the idea of a national cabinet (Sept. 16).

Thus the last chance of a peaceful solution was lost. The duma could no more lead public opinion, which turned to revolution. The chiefs of the army were this time on the side of the duma and public opinion, as they did not believe in the possibility of victory as long as the regime lasted. The universally hated Goremynkin had to resign when the duma met (Feb. 2, 1916); but his successor—the old master of ceremonies of the court, B. V. Sturmer, an ignorant and comic figure, especially when he was made successor of S. D. Sazonov in foreign affairs (July)—only helped to discredit the whole system and to demonstrate its weakness. As the tsar had made himself commander in chief instead of the grand duke Nicholas and was absent at headquarters, the tsarina took the lead in Petrograd (the new wartime name of the capital). She surrounded herself with an adventurous crowd of irresponsible advisers, the friends of her great confidant Rasputin. The duma was at last summoned on Nov. 14. She poured her wrath on Sturmer, who had to go, and on A. D. Protopopov, her former vice-president, who passed through the antechamber of Rasputin to get the post of home minister. Sturmer's successor, A. F. Trepov, was hissed by the duma. Warning on warning came to the tsar even from grand dukes and foreign diplomats, insisting on serious concessions to the people in order to prevent revolution. But the tsar, profoundly influenced by the tsarina, would not listen. On Dec. 17 (30) Rasputin was assassinated by Prince F. F. Yusupov, husband of the emperor's niece, and V. M. Furishkevich, the leader of the extreme absolutists in the duma. Not even that blow could change the obstinacy of Alexandra Fedorovna. Protopopov seemed to wish to provoke an outbreak. In certain circles a scheme for the tsarina's arrest and the tsar's abdication was being discussed. The meeting of the duma had been postponed until Feb. 14 (27), 1917. Disorders began in Petrograd during its session and on Feb. 26 (March 11) the duma was prorogued. The following day was the first day of the revolution. (P. M.; X.)

THE REVOLUTION, 1917

The Russian Revolution of 1917 had two sharply contrasted phases. There were, indeed, two revolutions, those of February and of October in the old Russian calendar (which is preserved in the traditional historiography of the period), or of March and of November in the western calendar (which the Russians adopted on Feb. 1 [14], 1918). The former was the product of the discontent of the democratic forces with the conduct of war, the latter exploited war weariness in the interests of the international revolutionary doctrines of Marxism. The former revolution overthrew Russian tsardom and, through its liberalism, gave scope to those who were preparing for the latter.

The attack made by the Progressive bloc of the duma on the autocracy was in fact animated by its conviction of the double danger in which the country stood from defeat in the field and from revolution following on such defeat. It demanded the establishment of a government "invested with the people's confidence," and an underlying aim was to forestall more radical changes. Its members were indeed so opposed to any semblance of revolutionary activity on the part of the masses that again and again they refused to countenance strikes or demonstrations which had been organized with the very intention of supporting the duma's demands.

By the end of 1916 the attempt to bring down the government by constitutional means had obviously failed. This failure compelled the more active and impetuous of the liberal patriots to consider whether it was possible to realize their aims by a military coup d'état and a court revolution. The initiative in this matter was notoriously taken by prominent officers at the front who were in close touch with the headquarters staff. The propaganda in favour of a court revolution was started by Gen. A. I. Krymov, the officer who subsequently commanded the army sent by Gen.

L. G. Kornilov in Aug. 1917 to suppress the government of Alexander Feodorovich Kerensky and to establish a military dictatorship. Only a few of the Liberal leaders seem to have been personally associated with Krymov's scheme; but sufficient documentary evidence exists to prove that the Progressives in the duma were at least taken into the confidence of the conspirators and were considering the formation of a cabinet in case the plot succeeded. The complete scheme of the Krymov conspiracy was revealed by Guchkov, the war minister in the provisional government, in the evidence which he gave before the tribunal set up for investigating the criminal record of the ministers of the old regime. The idea according to Guchkov was to seize the tsar as his train was proceeding from headquarters to Tsarskoye Selo, to compel him to abdicate in favour of the tsarevich with the grand duke Michael as regent, to arrest the tsar's ministers with the help of the Preobrazhensky guards and then to proclaim the abdication simultaneously with the names of the new duma ministers. This court revolution, planned to take place in the early months of 1917, was first postponed by the strikes and unrest which prevailed at that time in the capital and was finally rendered abortive by the success of the March Revolution.

The Bolshevik party, which had been consistently against the war from the beginning, took no part in the preparations for the March Revolution. Lenin and other leaders, who were at that time abroad, were formulating views as to the possibilities of revolution which were subsequently acclaimed as prophetic. But the international antiwar conferences organized by Lenin at Zimmerwald and Kienthal had no obvious effects, and as late as Jan. 1917 Lenin, then aged 46, told a Swiss audience that it was doubtful whether "we the old would live to see the decisive battles of the coming Revolution." Anyhow, views expressed in exile could not easily be propagated in Russia, since the Bolshevik members of the duma and almost all the minor leaders had been arrested and banished to Siberia. Indeed what these statements prove is that the few Bolshevik agitators remaining in Petrograd (including G. A. Shlyapnikov, the representative of the central committee of the party) were as little aware as the Mensheviks or the Liberals that the strikes, started early in March 1917, were likely to bring about the revolution. On the contrary, as far as they could, they discouraged the idea of a revolution as premature and likely to lead to disaster and gave it their official support only after it had actually broken out.

The March Revolution and First Provisional Government.—Strikes for higher wages at some of the factories had been occurring sporadically for some time, and on March 8 no fewer than 130,000 men are said to have been out. To this number must be added a considerable figure to account for the women workers who were demonstrating on that day (the Women's day). But though the number of the strikers and of their sympathizers was large, and though several bakers' shops were demolished by the mob, neither the leaders of the duma on the one hand nor the government and the police on the other gave the matter any particular attention. The only precaution taken by the authorities was to prevent the demonstrators from reaching the centre of the city. The next day the strikers were still more numerous and probably amounted to 30% of all the workers in Petrograd. Some sections of the crowd succeeded in reaching the centre of the city and their mood soon became sinister and threatening. On that day, too, the university students joined the movement, and though the catchword of the strikers remained "bread," it is asserted that a few cries were raised denouncing the autocracy and the war.

The third day (March 10) proved the critical day. The strike became general and the strikers assumed an aggressive demeanour, raiding the police stations in the Viborg (factory) districts and disarming the police. In this quarter the police practically disappeared and the political demonstration began to assume the character of an armed rising. Meanwhile, the Cossacks, who had in the traditional way been patrolling the streets as the bulwark of the autocracy, had begun to manifest neutrality and even friendliness toward the strikers. That night Gen. S. K. Shabalov, military governor of the capital, received a telegram from the tsar, then at the front, ordering him to suppress the strike movement.

N. D. Golitsyn, the prime minister, had already decided to prorogue the duma in the hope, shared by most of the ministers, that the tsar would return to the capital, accept their resignations and form a more popular government.

The attempt to use force to put down the disorders in the capital was temporarily successful, but one regiment after another mutinied on March 11 and 12 and the situation became clearly untenable. The duma refused to disperse on March 11 when it received the prorogation order, and there were discussions among the Progressive and Labour leaders about the possibility of forming a new government. On the same day M. V. Rodzianko, the speaker of the duma, sent an urgent telegram to the tsar ending with the words "May the blame not fall on the wearer of the crown." But the tsar put it aside. Rodzianko also got into touch with the generals holding the main field commands, asking for their support.

When the tsar and his advisers at last learned that the revolt of the Petrograd troops had endangered the existence of the monarchy they immediately ordered a number of regiments from various parts of the front to proceed to the capital. The first detachments under Gen. N. Ivanov were prevented by the railways from approaching Petrograd, while the picked regiments were never sent because before they could actually be moved the revolution had developed such impetus and had gained such support even at the front that the attempt to crush it by military force was recognized as hopeless. The army indeed could no longer be relied on, and it may plausibly be assumed that even if the troops had been dispatched they would probably have mutinied and fraternized with the revolutionists.

The critical day was March 12. While the city was largely in the hands of the mutinous regiments and the mob, news came to the duma that elections were in progress by show of hands for a new soviet or council of workers' delegates such as had seized power in the capital during the revolution of 1905. The leaders of the different political groups meeting in the duma building were informed that a large crowd was on its way there and that decisive action was necessary. On the initiative of V. V. Shulgin a provisional committee was set up with the leaders of all the parties presented upon it except those of the right. Kerensky largely took charge of events and improvised some kind of guard. The cabinet met during the evening and, failing to get a definite reply from the tsar to a suggestion for the appointment of a new prime minister, simply dispersed. By that night most of the ministers were in hiding. It was only on March 14, after prolonged discussions and with considerable reluctance, that the members of the duma committee made up their minds to constitute a government. It was set up on March 15. Three considerations were obviously instrumental in leading them to this decision: first, a clear consciousness of the elemental force of the revolution; second, the apprehension that the Petrograd soviet might be tempted to assume power; and, third, the hope that by constituting themselves the ruling authority they might be able to cope with the increasing anarchy and to save the monarchy and even the dynasty.

The Soviet.—Meanwhile, the revolutionary workers had succeeded in setting up a soviet. Its first session opened in the evening of March 12, with an attendance of approximately 250 members consisting of Socialist deputies of the duma, the Worker group of the munition committee, a number of prominent worker leaders representing the various shades of revolutionary opinion, and members of strike committees who had been active during the few previous days. It managed to appoint a strong executive committee which immediately took over the business of food supplies and the strategical defense of Petrograd against any possible attack from the autocracy. It also came to the decision to change its constitution by including along with worker deputies army deputies. In this way the soviet made a palpable bid for real power.

From this very moment, enlisting as it did the support of the workers and of the Petrograd garrison, the soviet executive committee was the depository of real power. It had its headquarters in the duma building, and one of its vice-presidents was Kerensky, who constituted a link with the duma, committee and subsequently

with the provisional government. Its members had been conscious of this power and probably overestimated rather than underestimated their authority. But they made no overt or covert attempt to constitute a revolutionary government, and when the duma committee decided at last to assume the responsibility of forming the new government its decision was unanimously welcomed by the leaders of the soviet. Why the Petrograd soviet refused immediately to proclaim itself the government of revolutionary Russia can only be a matter of surmise. Speaking in the first All-Russian Conference of Soviets, which was held early in April 1917, G. Steklov, one of the prominent members of its first executive committee, ascribed the refusal to the prevailing uncertainty as to the attitude of the army. But this explanation scarcely covers the whole of the ground. An orderly government, representing a compromise between the insurgent masses and the bourgeois classes, was obviously the sole bulwark against counterrevolution, and the desire for the establishment of such a government must undoubtedly have constituted the main factor in the unopposed assumption of power by the duma. Still, fear of the outbreak of a counterrevolution cannot be regarded as an adequate explanation of the willingness of the soviet's leaders to delegate power to the duma. Their decision to step aside and to leave the formation of a government to the *bourgeoisie*, the class determined to arrest the onrush of the revolution, would be unintelligible unless the fact is recalled that most of them accepted the Menshevik view that the aim of the revolution was solely to establish a democratic regime and that any attempt to associate the movement with socialist experiments or the dictatorship of the proletariat would ruin it and so repeat the disastrous failure of 1905.

Among the members of the soviet's first executive committee were a few Bolsheviks who accepted Lenin's dictum that the Russian Revolution was the vanguard of the world socialist revolution. But so unprepared were they for taking action that when Lenin arrived in Petrograd three weeks later he found that his most difficult task was to inspire his own party with the necessary enthusiasm for deepening the revolution. The Bolsheviks, however, were in such an insignificant minority both in the Petrograd soviet and outside that their views could not possibly carry much weight. In fact, most members of the executive committee of the soviet expected and welcomed the advent of the world revolution and believed in the missionary character of their own. They refused to accept the national victory over the autocracy as the sole aim of the revolution, and they may have regarded it as merely the first step. What they never denied was that the *bourgeoisie* had a part to play in the revolution and a rightful claim to form the first national government. But, while they were prepared to stand aside and to delegate the power to the *bourgeoisie* they reserved to themselves the right to keep a steady watch on the activities of the new government, for they made no secret of their suspicion that, left to their own devices, these "bourgeois" ministers might be tempted to abuse their authority by favouring the interests of their own class.

The First Provisional Government.—The members of the duma committee, on the other hand, were not only willing to form a government with the consent of the soviet but insisted on the latter's issuing an open proclamation of support. The program of the provisional government published on March 16 was indeed largely dictated by the soviet leaders and was accepted in full by the members of the duma committee. The status of the government created as a result of this compromise was necessarily precarious in the extreme. Nominally invested with full powers and sovereign authority, the provisional government—whose principal figures were Prince Lvov (prime minister), P. N. Milyukov (foreign affairs), M. I. Tereshchenko (finance), Alexander Guchkov (war) and A. F. Kerensky (justice)—was in reality powerless and the mere creature of the soviet. Its position was bound to be unstable because the basis of the compromise which established it was vague and uncertain. But the revolutionary impetus of the masses and the constant changes in the constitution of the soviet and hence in the point of view of its leaders soon combined to render this basis even more unstable. Every day fresh groups joined the soviet and new leaders replaced old ones, with the con-

sequence that new adjustments had constantly to be made and even relative stability became difficult to maintain.

Arrest of the Imperial Family.—While negotiations between the soviet and the duma were still proceeding and before the provisional government formally took over the administration (March 16), the extremely delicate question of the position of the tsar and of the dynasty came up for settlement. That the tsar Nicholas could no longer remain autocrat was a foregone conclusion, but the leaders of the duma, dreading the idea of Russia's becoming a republic, were determined to save the monarchy and even the dynasty. They accordingly dispatched Guchkov and Shulgín, two Conservative members of the duma, to the tsar's headquarters at Pskov with the mission of obtaining the tsar's abdication in favour of the tsarevich and the appointment of his brother the grand duke Michael as regent. But the tsar declared that the illness of his son made it impossible for him to contemplate being separated from him and changed the instrument of abdication so as to provide for the succession of his brother as tsar. Such a solution was by now widely unacceptable, and, when the members of the duma committee visited the grand duke on March 16, Kerensky strongly appealed to him not to accept in the name of national unity. Despite Milyukov's strong pleas that he should ascend the throne on the ground that the monarchy was the only axle of the country, the grand duke refused. The Romanov dynasty that had ruled Russia for three centuries came to an end.

A few days later the question of the dynasty came up again in a dramatic fashion which incidentally demonstrated both the strength of the soviet and its determination when necessary to use it in defiance of the government. The tsar had requested the new ministers to arrange for the departure of himself and his family to Great Britain, a request which the leaders of the soviet heard of by mere accident. At once they called on the government to put the tsar and his family under arrest and gave orders to the railwaymen to stop the imperial train. The actual usurpation of power in this instance, however, proved unnecessary: the new ministers themselves proceeded to put the tsar Nicholas and his family under arrest.

The Army and the War, March-May.—The struggle for support that took place between the duma and the soviet was the paramount business of the next few weeks. The battle was fought out in the main on two planes, one the question of the new status of the army, the other the question of continuing or terminating the war. The leaders of the soviet championed the civil rights now claimed by the soldiers, while the duma appealed to them in the name of national safety. That the harsh conditions which had hitherto prevailed in the barracks had now to be modified was obvious enough, and Guchkov was preparing an official declaration to this effect. But, while he was for confining the liberties of the soldiers within the strict limits of discipline, the leaders of the soviet declared that these liberties must be vindicated unconditionally. This resolve to gain the adherence of the soldiers by supporting their claims at all costs was responsible for the issue on March 14 of the notorious *priказ* (order) number 1, which helped in the disintegration of the already badly shaken Russian army.

But despite all the privileges which the Petrograd soviet had granted to the soldiers, the devotion of the army at the front and even at the capital had to be secured. At first the provisional government seemed to be the body which had won the support of the army. When the ministers proclaimed the necessity of a more vigorous prosecution of the war, the army seemed to be rallying to their support. For about a fortnight regiments stationed at Petrograd as well as delegations sent by those in the provinces and

¹*Priказ* number 1 was composed by a commission of the Petrograd soviet headed by N. D. Sokolov. In the name of the Soviet of Workers' and Soldiers' Deputies it ordered that committees of soldiers were to be formed in all military and naval units in Petrograd and to send one representative each to the Taurida palace next morning. In their political actions units were to be subject to their committees and to the soviet. Orders of the military commission of the duma were to be obeyed only when they did not contradict those of the soviet. Arms were to be under the control of the committees and on no account to be given up if demanded by the officers. Strict discipline was to be preserved when on duty. Salutes, etc., when off duty were abolished. Special titles used in addressing officers, "Your excellency" and references to the officer's noble birth, were abolished. Officers were forbidden to use the second person singular in addressing soldiers.

demonstration in favour of the transference of power to the soviet, it was in essence an attempt to stampee that assembly, a fact which its leaders were prompt to recognize. For nearly two days the gunmen were in occupation of the capital, but their lack of objective and of leadership perplexed them and paralyzed their efforts. The Bolshevik leaders in the capital (Lenin did not return from a convalescence in Finland until July 17) were forced to assume some kind of control of the movement and to channel it toward bringing pressure on the Petrograd soviet and the central executive committee to take power. But the soviet did not respond to the mob's demands.

During the two days that the rising lasted the coalition government was absolutely quiescent. But Kerensky on the very first day proceeded to the front and procured picked troops, which arrived in the capital on the day after the movement had fizzled out. Meantime, any attempt to renew disturbances was rendered hopeless by the publication of documents which purported to prove that Lenin was a spy and a paid agent of the German general staff. The result of the disturbances was the practical suppression of the Bolshevik party. L. B. Kamenev was arrested. Lenin and G. E. Zinoviev went into hiding, to the considerable dismay of their friends.

Kerensky's Provisional Government.—These events coincided with the failure of the Galician offensive and made yet another change of government inevitable. Prince Lvov was presented by the soviet members of the government with an ultimatum which required him, in accordance with the decisions of the Congress of Soviets, to declare Russia a republic without waiting for the convocation of a constituent assembly, to suppress finally the duma and the council of state and to accept the congress's policy of forbidding any sale of land before the meeting of the constituent assembly. The prince refused to comply with these demands, regarding them as a usurpation of the rights of the constituent assembly, and promptly sent in his resignation. The ministry was reconstructed on July 21, Kerensky becoming prime minister as well as minister of war and Tseretelli succeeding Prince Lvov as minister of the interior. With the formation of the new ministry, not completed until Aug. 6, the Russian Revolution entered on a new phase—a phase of inaction. The record of Kerensky is indeed singularly barren. He failed to put new vigour into the prosecution of the war. He left the question of concluding peace just as he found it. He made no attempt to settle the various difficulties involved in the labour question. And he was so incapable of handling the agrarian problem that he allowed the peasants to settle it as best they could by local initiative.

In fact, the only achievements of Kerensky's administration were the declaration of Russia as a republic and the convocation in August of a spectacular state assembly representing all classes in the country and all political groups. The actual purpose which this assembly was meant to serve is obscure, but its composition and the choice of Moscow for its sittings seem to show that it was convoked with some vague hope of investing Kerensky's government with that moral authority and sanction which it had hitherto conspicuously lacked. Nothing remarkable, however, resulted from its three meetings save a series of hysterical speeches in which the prime minister announced his determination strenuously to support the revolution and ruthlessly to suppress its enemies, whether they came from the right or from the left.

After the failure of the July rising, Trotsky, who had been taking an independent line since his return to Russia on May 17, joined the Bolsheviks with his supporters. On Aug. 6 he and A. V. Lunacharsky were arrested. The Bolsheviks themselves had recast their tactics. Lenin had decided that the soviets had proved themselves unsuitable for the task allotted to them, and the slogan "All power to the soviets" was replaced at the sixth party congress (held in the second week of August) by a recognition that it was the task of the proletariat and of the poorer peasantry to liquidate the dictatorship of the counterrevolutionary *bourgeoisie*, as the provisional government was now styled by the Bolsheviks.

Meanwhile, the generals at the front and the members of the general staff in the capital began to think that their time had come. Taking stock of the anarchy prevailing in the country and of the

disorganization of the army, they began to be more and more inclined to favour the creation of a military dictatorship. Kerensky, supported Gen. L. G. Kornilov, the commander in chief, in the preliminary steps for establishing one. He quarrelled with him only when he realized that the general himself was aspiring to become dictator. Suspecting Kornilov's designs, he promptly declared him a traitor and an enemy of the revolution; to which the general replied by sending on Sept. 9 picked Cossack regiments under the command of Gen. A. I. Krymov against Petrograd with the object of intimidating Kerensky and forcibly suppressing the soviet. Thereupon Kerensky, turning his back on the right, appealed to the left for support, and the central executive committee of the soviets appealed in its turn to the workers to fight the threatened counterrevolution. The Bolshevik leaders, now released from prison, took up the challenge with enthusiasm and, recognizing that their opportunity had arisen, proceeded to arm the workers, in anticipation of the arrival of Krymov's troops. Deputies from the Petrograd workers and soldiers went to meet the Cossacks and persuaded them that they had been sent on a false errand. Kornilov, A. I. Denikin (his close colleague at the front) and three other generals were arrested and imprisoned, and Krymov shot himself after being interrogated by the prime minister.

Just as the failure of the Bolshevik rising in July proved to be the opportunity of the right, so now the collapse of Kornilov's raid gave the extreme left its chance. The first result of this revival of revolutionary fervour was a renewal of the hatred of the officer class; a new wave of massacre swept over the country, taking peculiarly ugly form in Finland, where sailors killed their admirals and officers by throwing them overboard and beating them to death in the water. The central executive committee was reduced to sending emissaries to stop these outrages; another sign of the times was that these emissaries had to be chosen from the Bolshevik ranks. The moderates were speedily losing their hold on the masses. Lenin's supporters, indeed, were now rapidly increasing their forces, so much so that by the middle of September both the Petrograd and the Moscow soviets passed for the first time Bolshevik resolutions; while the moderate leaders, who had presided over them since their creation, were soon replaced by Trotsky at the new and by V. P. Nogin at the old capital. It now became possible for Lenin to revive the slogan "All power to the soviets."

For it became increasingly evident that the next Congress of Soviets, which was summoned for the end of October, was likely to elect an all-Russian central executive committee on which the Bolsheviks would have a majority and that this majority would declare in favour of assuming the supreme power in the state. Kerensky's last improvisation was a democratic conference, which met in Petrograd on Sept. 27. Unlike the state assembly, this was confined to left-wing parties and organizations. The Bolsheviks took part against Lenin's wishes; but the impunity with which they were allowed to shout Kerensky down showed the weakness of their opponents, as did the failure of the latter to agree on the continuation of a coalition including non-Socialist elements. The existing central executive committee, though it continued to support Kerensky, who formed a new cabinet including the Kadets on Oct. 6, withdrew its representatives from his government. The united front of soviet democracy, which had seemingly been re-established by the challenge thrown out by Kornilov, was now finally broken. The Bolsheviks proceeded to declare the members of the central executive committee traitors to the revolution and at last worked openly for their overthrow and for that of the bourgeois government.

The provisional government was formally invested with full and sovereign power and was responsible neither to the Petrograd soviet nor to the recently convoked council of the republic or preparliament, which was a consultative body representing all the main parties. But actually it possessed no power at all. The real authority, then more than at another time in the revolution, was held by the soviets in the capitals and in numerous provincial towns, which openly defied the government and exercised, each in its area, legislative as well as executive powers. In many of the

provincial soviets as well as in those of Petrograd and Moscow the Bolsheviks now counted on solid majorities; and in most cases the Bolshevik provincial soviets constituted themselves quasi-independent republics.

The various nationalities, which had long been clamouring for autonomy, now began openly to secede from the state and to organize their own armies by withdrawing their nationals from the army under the plea of defending their newly created frontiers and their national flags. The whole country, town and village alike, was in a state of feverish unrest which soon developed into riots and anarchy. In the towns bread riots broke out; but the most destructive of these revolts were those of the peasants, who began to solve the land problem in their own way by expropriating the land, driving off the cattle, burning down the landowners' dwellings and barns, demolishing agricultural machinery, felling wood in the forests and wantonly destroying trees in the orchards. Landowners who delayed their flight were captured, tortured and murdered. Yet the ministers were inactive and helpless. They lacked the necessary military backing to obey orders, remembering how they had been repudiated by Kerensky in the Kornilov episode. Reprisals would in any case have proved ineffective; the only measure which might possibly have tranquillized the countryside would have been the speedy convocation of the constituent assembly with a guarantee that it would be invested with full power to solve the land question. But the government repeatedly postponed the convocation of the assembly. Closely connected with the peasants' revolt and with the general anarchy prevailing everywhere were the crimes committed by bands of armed soldiers.

At the front the army still preserved on the surface a certain degree of discipline; but the mutual distrust and hatred of soldiers and officers was so profound that at any time an open clash might be expected, especially as a shortage of food and supplies, and in some cases actually famine, made the preservation of military subordination increasingly difficult. It became obvious that the army was likely to withdraw from the field either in the autumn or at any rate before the winter had passed. The soldiers discussed this possibility openly, declaring that they cared neither for freedom nor for land but only for peace. Even leading generals such as V. A. Cheremisov (who held the northern command) advised the government that the army was unreliable and might withdraw from the field at any time.

Meantime, the Germans had been penetrating further and further into the Baltic provinces. On Oct. 12, with the support of their fleet, they occupied the island of Oesel and so secured the command of the Baltic. Petrograd was now obviously menaced, and ministers declared their intention of transferring the seat of government to Moscow. To dream of continuing the war after abandoning Petrograd, the biggest arsenal in the country, was denounced as sheer treason, and the proposal furnished the Bolsheviks with an admirable lever for stirring up the masses. Another mistake which ministers made, an attempt to replace the Petrograd garrison by more reliable troops from the front, was used by their enemies as a pretext for openly organizing military forces for an attack on them. The Petrograd soviet accordingly, under Trotsky's command, promptly came forward and countermanded the movement of troops. On Oct. 26 the leaders of the soviet constituted a military revolutionary committee which declared itself the highest military authority in the capital and province of Petrograd. This step was ostensibly taken for the defense of the capital against the enemy, but actually it was a movement for the creation of a general staff for the Bolshevik revolution. Three days earlier, after much debate, the central committee of the Bolshevik party had pronounced in favour of an armed uprising. Trotsky openly organized his forces without meeting with the slightest interference from the government.

The November (Bolshevik) Revolution.—The Bolshevik revolution was inseparably connected with the convocation of the second Congress of Soviets. The central executive committee, which consisted entirely of Mensheviks and Social Revolutionaries, supporters of Kerensky, was reluctant to convene a second congress and postponed doing so from day to day. But when

finally the Petrograd soviet threatened to convene the congress itself the committee fixed Nov. 7 as the date of convocation. It was obvious that the congress would have a Bolshevik majority. The convocation of the All-Russian Congress of Soviets was preceded by the holding of a number of regional congresses, all of which declared for a termination of the coalition and for the establishment of a Soviet government, the aim of which would be immediately to propose terms of peace, to give the land to the peasants, to establish a complete workers' control of the factories and to deal with the famine by expropriating the hoards of foodstuffs supposed to have been accumulated by the capitalists and landlords.

Meanwhile, ministers waited patiently on events, believing that nothing could happen till Nov. 7. But Trotsky gave battle two or three days before the appointed date. On Nov. 3 he confronted the general staff with a demand that all its orders should be countersigned by the military revolutionary committee. When the general staff refused this demand he ordered the Petrograd garrison to stand at arms in defense of the committee. On Nov. 4 a meeting attended by delegates from all the troops passed a resolution refusing obedience to commands of the general staff and recognizing the committee as the sole organ of power. This resolution was immediately circulated over the government telephones to all the regiments in the capital.

To these proceedings Kerensky replied on the following day by issuing an ultimatum to the committee requiring it to withdraw the resolution. The ultimatum was ignored by the committee, which promptly called out parts of the garrison and organized worker detachments (Red guards) for the defense of the Smolny palace, headquarters of the soviet and of the committee. Kerensky tried to counteract these measures by adopting the traditional method of defense, the raising of the bridges, to prevent communication between the left and right banks of Neva. He then proceeded to the Marinsky palace, where the prearrangement was holding its sessions, and demanded that it should invest him with dictatorial powers to cope with the Bolshevik revolt. They debated all night before refusing. Meanwhile, the Bolsheviks quietly and systematically took over, without firing a shot, the telegraph, the telephone and all government offices with the exception of the Winter palace and the offices of the general staff. The same night Lenin, who had been in hiding since July, appeared at the meeting of the Petrograd soviet and in glowing language congratulated the delegates on inaugurating a new era. The new regime, which established the soviet as the embodiment of supreme power in the state, was thus established one day in advance of the meeting of that soviet congress which had been proclaimed by the Bolsheviks as the sole authority competent to make such a decision. But nobody present at the meeting of the soviet seemed to care, for Lenin announced that the first step taken by the new government would be to offer belligerents a just peace.

Early in the morning of Nov. 7 Kerensky left for the front, in order to bring back troops to crush the revolt. The other members of the government decided to await his return at the Winter palace. But when they were informed that the guns of both the cruiser "Aurora" and the Peter and Paul fortress were trained on the palace, they decided to surrender. When next day the Congress of Soviets formally opened, the non-Bolshevik members and the old executive committee registered a vigorous protest against the unconstitutional methods of the Bolsheviks and withdrew from the congress to join the committee of public defense which had its headquarters at the municipal buildings.

Kerensky meantime made frantic efforts to move the troops from the front to the capital. He succeeded only in persuading the Cossack Gen. P. M. Krasnov to move. On Nov. 11 Krasnov's troops were reported outside Gatchina, about 10 mi. from the capital. Encouraged by this news and definitely expecting a crushing defeat of Trotsky's Red guards, the committee of public defense gave orders to the cadets of the military schools to arrest the military revolutionary committee and to make a general attack on all the soviet strongholds. The attack was made in the morning; but by three o'clock in the afternoon the Bolsheviks, supported by some of the cruisers of the Kronstadt fleet, decisively

repelled it and occupied the military schools. In the report of the events of the day which he sent to the Petrograd soviet Trotsky made the following declaration: "We hoped to establish a compromise without bloodshed. But now when blood has been shed there is only one way left, a ruthless fight." With these words Trotsky proclaimed the approaching civil war. The same night he proceeded to the Gatchina front. Next day he reported the repulse of Krasnov's advanced detachments, and a day later he announced that the Cossack forces had been completely defeated. Kerensky fled, and the Bolshevik regime was now for a time immune from military menace. (M. F.; M. B.)

CIVIL WAR AND INTERVENTION, 1917-21

The Petrograd Revolution of Nov. 7 swept Russia. There were a few days of street fighting in Moscow and sporadic resistance elsewhere, but by the end of the month the soviets held power throughout the country. In the urban centres the victory was won under the red flag of class warfare, with the watchword "All power to the workers' soviets." The words "land," "bread" and "peace" gave the Bolsheviks the support of the soviets of peasants and soldiers.

The soviets were the only strong political force in a social structure whose disintegration was nearly complete. They were the organs of the proletariat, upon which the Bolsheviks, taught by the Marxist doctrine of revolution, were resolved to build their state. They challenged not only the weakened capitalism of Russia but the capitalist system throughout the world. In the first days of success they exaggerated the effect of war weariness upon the masses of western Europe and underestimated the effect of war hatred. Their dream of a new proletarian utopia and their appeals to fellow workers of the world to throw off the burdens of capital and war prepared the way for the conflict that was soon to plunge the new state into a three-year fight for life.

In an all-night session on Nov. 7-8 the Congress of Soviets in Petrograd declared the power of government to be vested in the council of people's commissars, appointed mainly from the ranks of the Bolshevik central committee, with Lenin as premier and Trotsky as commissar of foreign affairs. The first act of the Soviet government on Nov. 8 was to decree that all land belonged to those who worked it, without rent or other payment. This satisfied the peasants, who had been expropriating landlords' estates for several months, and their chief political organization, the Left Social Revolutionary party, decided to collaborate with the Bolsheviks. Vigorous measures were taken to ensure a supply of food for Petrograd and other urban and industrial centres. To reinforce the victory of the industrial proletariat a universal eight-hour day was instituted on Nov. 11, and the control of the factory soviets over industry was established by successive decrees in the next two months.

The peace campaign began on Nov. 9, when Trotsky sent out a wireless invitation to all the belligerent powers to conclude an immediate armistice. The Allied governments at once protested, and their representatives in Russia tried to enlist the commander in chief of the army, Gen. N. N. Dukhonin, against the council of commissars. Dukhonin was replaced by N. V. Krylenko, a member of the Bolshevik central committee, by a soviet decree of Nov. 22. Soon afterward, the former commander was torn to pieces by a mob of soldiers. This deed showed that Lenin had gauged the temper of the army and that the Allied insistence that Russia should go on fighting would be fruitless.

The German government accepted the armistice proposal. After brief negotiations within the German lines a ten-day truce was signed on Dec. 5, 1917. The Central Powers agreed not to transfer troops from the eastern front to the western, but they moved several divisions to France before the end of the year.

Meanwhile the Soviet government was facing serious internal difficulties. The bourgeois classes, at first stunned by the success of the revolution, began to rally. Instead of armed resistance they used the more dangerous weapon of sabotage, hoping to paralyze the Bolshevik regime. With no civil service, no personnel trained in finance, transport and the management of industry, the new government was suddenly called upon to undertake the ad-

ministration.

Lenin met the bourgeois offensive with characteristic energy. Banks and some factories were nationalized, and a supreme economic council was created to manage the latter. Other decrees followed in rapid succession. Some of these were measures of immediate necessity rather than a part of the Bolsheviks' deliberate program. In a sense they were the beginnings of the later War Communism, but all the responsibility for their adoption cannot be laid upon Bolshevik shoulders. Some form of centralization was necessary to prevent economic collapse, and Lenin had previously published a pamphlet demanding nationalization of transport and state control of the means of production to save the country from chaos.

The nationalization of industries was legalized in Dec. 1917. At first it was applied haphazardly. No entire industry was nationalized until May 1918, when a department of the supreme economic council was organized to supervise the monopoly production of sugar. The following month oil production was centralized in the same way, and various other commodities were declared state monopolies. It was not until June 28, 1918, that all industrial and commercial enterprises of more than 1,000,000 roubles' capital were declared the property of the state.

The Treaty of Brest-Litovsk.—While the Soviet government was trying to cope with sabotage and weld local soviets into an administrative machine, relations with Germany were still unsettled. Peace negotiations began on Dec. 22, 1917, at Brest-Litovsk. On behalf of the soviet, Trotsky put forward the principles of no annexation or indemnity and self-determination of subject races. At first the Germans seemed willing to accept, with certain reservations. They demanded the independence from Russia of Poland, Finland and the Baltic states on Dec. 28 and the independence of the Ukraine Jan. 8, 1918. On Feb. 10 Trotsky announced the Soviet refusal to sign a "peace of annexation," but declared the war between Russia and the Central Powers at an end—the celebrated formula "No war: no peace." A week later the German general staff ordered an immediate advance.

When the Germans advanced, Lenin at once decided for peace, but acceptance of the German terms was not reached without a struggle in the central committee. Lenin still believed that a general European revolution, as the result of war exhaustion, was not far distant. His prime object, therefore, was to gain time, a breathing space, as he called it. His associates argued that to yield was to betray the revolution. It was only by a threat of resignation that Lenin beat down the adverse majority. On March 3 a new Soviet delegation accepted the German terms on behalf of the Soviet government. The so-called Independent Government of the Ukraine had already signed a separate treaty, which meant virtual German control, and this the Russians were forced to confirm. The Soviet government further agreed to pay a large indemnity or its equivalent in raw materials. Poland and the Baltic states were left in the hands of the Germans, and the armies of Count Rüdiger von der Goltz and Baron Karl Mannerheim soon crushed the revolutionaries in Finland.

Lenin had won his breathing space, but the agricultural and mineral resources of the Ukraine and the oil of the Caucasus were at the disposal of the Germans, and the German general staff was now free to concentrate its forces against the Allied front in France. Two days after the signature of the Brest-Litovsk treaty Trotsky approached Raymond Robins of the American Red Cross and the British high commissioner R. H. Bruce Lockhart as to the attitude of the Allied governments should the soviets not ratify the treaty or the German advance continue for any other reason. But nothing came of these feelers. The Congress of Soviets ratified the treaty on March 16 by a majority of 53.

Lenin used his breathing space to patch up the administrative and economic machine and to drill an army to defend the revolution. The fight against sabotage was not yet won, and the adversaries of the new regime were growing bolder. Trouble was brewing in the Cossack provinces and in Manchuria, where a hostile army was assembling on Chinese soil. The German threat against Petrograd had driven the Soviet government in flight to

Moscow. The fact that the Allied ambassadors, instead of accompanying the government, had preferred to go to Vologda, junction of the trunk lines of escape eastward to Siberia and northwest to the coast, was no good omen for future relations with the powers they represented.

In the field of foreign affairs the Soviet government had two severe handicaps. From the first the Allies suspected complicity with Germany and were inclined to regard the peace of Brest-Litovsk as a betrayal of the Allied cause. Second, neither they nor the Central Powers believed that a Soviet government in Russia could endure. The Allies declined to recognize the treaty of Brest-Litovsk, which they held responsible for Gen. Erich Ludendorff's victory in March. Their missions in Russia reported that trainloads of war supplies, leather, copper, oil and food were being shipped into Germany. Although the Bolsheviks claimed that this was part of the indemnity imposed by the treaty, the Allies saw it as aid to the enemy, to be prevented if possible. It was suspected that some of their representatives in Russia co-operated with anti-Bolshevik elements to hamper the transfer of supplies.

The Social Revolutionary Revolt.—The breach between the other political parties in Russia and the Bolsheviks had been widened by the suppression of the long-awaited constituent assembly, which met in Moscow on Jan. 18, 1918. About 62% of the votes were cast for moderate Socialists of all kinds. Most of these had gone to the Social Revolutionaries, whose lists had been made up before the Left Social Revolutionaries broke away to collaborate with the Bolsheviks in Lenin's government. The Bolsheviks had got 25% of the votes and the Kadets and other "bourgeois" parties about 13%. The election of a Right Social Revolutionary, Victor Tchernov, as president convinced the Bolsheviks that they had nothing to gain from the assembly, and it was closed by Red soldiers on Jan. 19.

The Left Social Revolutionaries continued for a time to collaborate with the Soviet government, but broke away completely after unsuccessful opposition to the ratification of the Brest-Litovsk treaty. The strength of the Social Revolutionary party was mainly drawn from the villages, which were growing increasingly restive as the Bolsheviks developed their basic program of a workers' government, class warfare and socialism. The peasants had thought that the revolution gave the land to them. They now found it was the property of the state and that its surplus produce over their needs was required for state purposes. The bourgeois groups had become more hostile still, as they realized that their very existence was menaced by the new regime.

Led by Boris Savinkov, Kerensky's former war minister, the Right Social Revolutionaries became the pivot of patriotic and anti-Bolshevik sentiment, eager to co-operate with military representatives of the Allies to nullify the effects of the treaty of Brest-Litovsk. From attempts to blow up depots of stores, railway bridges and trains carrying supplies westward, the Social Revolutionaries proceeded to the desperate coup of assassinating the German ambassador in Moscow, Count Wilhelm von Mirbach-Harff, on July 6, 1918, in the vain hope of provoking Germany to break with the Soviets. The Social Revolutionaries then tried to incite the country to rebellion.

Savinkov captured the town of Yaroslavl, 180 mi. N. of Moscow on the railway to Vologda and Archangel, with a disciplined force which he had hoped to make the nucleus of an army of insurrection. The Red troops from Moscow and Petrograd converged on Yaroslavl too swiftly, however, and retook the town after two weeks. Savinkov escaped, but the possibility of overt resistance by the Social Revolutionaries vanished.

The Czechs.—Forty-five thousand Czech deserters from the Austrian forces had been formed into an army to fight for their country's freedom beside the Russians on the Austrian front. When the Russians collapsed they remained a fighting force, and plans were made in Paris to move them round the world to the western front. In early March 1918 the Soviet government agreed to provide transport across Russia, but the Czech legionaries had continual trouble with local soviets over food supplies and right of way for their trains.

By the middle of May the entire force, moving eastward to the Pacific, was strung out in detachments across 5,000 mi. of railway from Kazan to Vladivostok, a natural prey to anxiety and rumour. On May 14 one of their detachments met a trainload of Austro-German prisoners being repatriated in accordance with the treaty of Brest-Litovsk. A fracas ensued, with bloodshed which involved the local Red forces.

Moscow at once demanded that the Czechs fulfil their pledge to surrender their arms. They refused and, on May 29, forcibly resisted attempts to carry out the disarmament order. In June they fought the Bolsheviks openly throughout Siberia, and the local soviets were powerless against their disciplined troops. At the end of the month their Vladivostok contingent overthrew the soviet there and set up an anti-Bolshevik government with the approval of the Allies. By July 31 almost all Siberia was changed from Red to White and the Czech forces were moving westward to attack the Soviet state.

Death of the Tsar.—The advance of the Czech and White Russian armies brought death to the former Tsar Nicholas II, who with his family had been held for several months at Ekaterinburg. The local soviet professed to believe that the imperial family planned to escape to Omsk, where the White Adm. A. V. Kolchak had established a counterrevolutionary government. Without a trial the soviet voted to execute "Citizen and Citizeness Romano" and their family and did so on the night of July 16-17, 1918.

Intervention.—The month of August saw intervention in full swing. On Aug. 2 the British, who had already landed forces at Murmansk to prevent war supplies from falling into German hands, disembarked several thousand Allied troops at Archangel; they overthrew the local soviet and set up a provisional government of the north. A few days later British and French contingents landed at Vladivostok, followed by a Japanese division on Aug. 12 and by two U.S. regiments on Aug. 15 and 16. Western Siberia was already in the hands of the Czechs and a number of anti-Soviet governments. On Aug. 24 Anglo-Japanese troops crushed Red resistance in the maritime provinces in a battle on the Ussuri river. Chita was captured on Sept. 6, and organized soviet government beyond the Urals disappeared. The Czechs had seized the chief cities of the north. The White and an anti-Soviet army was marching from the Cossack provinces of the Don.

At the beginning of the autumn the tide turned. The Bolsheviks threw back the Czechs at the end of Sept. 1918 and halted the White advance from the Don. As Germany weakened on the western front, the Baltic provinces, Finland and the Ukraine lost its support. Turkey was on the verge of capitulation, and Turkish and German control over the Caucasus was vanishing. Lenin's prediction was coming true; the Central Powers and the treaty of Brest-Litovsk were crumbling together, and the European revolution appeared to be at hand. When the German sailors in Kiel raised the red flag on Nov. 9, 1918, the Soviet government saluted the event with triumph.

The Bolsheviks had still to reckon with the Allies. The autumn of 1918 saw the reinforcement of foreign forces on Russian soil. By the end of the year there were approximately 15,000 British and U.S. troops occupying a fan-shaped area in northern Russia, at least 70,000 Japanese holding the important strategic points of eastern Siberia and the maritime provinces, 7,000 Americans protecting the Trans-Siberian and Chinese Eastern railways, and about the same number of British supporting and instructing the armies of Admiral Kolchak, who had become dictator of the so-called anti-Russian government of Siberia by a coup d'état at Omsk on Nov. 18. The French had captured Odesa with a powerful fleet and a mixed force from Salonika.

The abandonment of the campaign by the Czechs, eager for home, counterbalanced the accession of foreign anti-Soviet forces, and the Whites were not yet in a position to strike an effective blow. When the new year began neither side could show much gain, except that the revolution had reached the Baltic by the establishment of a Soviet government at Riga on Dec. 26.

The Red Terror.—During these months of pressure the Bolsheviks had hardened. Troops were called up, grain and cattle

requisitioned, property confiscated. In the summer of 1918 to external dangers was added a deadlier enemy in their midst. After his defeat at Yaroslavl, Boris Savinkov revived against the Soviet the Social Revolutionary terrorist centre which he had formed years before to combat tsardom by assassination. On Aug. 30, 1918, one of his agents, a girl named Fanny (Anna) Kaplan, shot and wounded Lenin as he left a workers' meeting in Moscow. The following day M. S. Uritsky, chief of the Petrograd Cheka, was shot dead by Social Revolutionaries. The Bolsheviks met Savinkov's terrorism with their own Red terror. The Cheka had been organized in Dec. 1917 to deal with sabotage and other counter-revolutionary manifestations. (The word "Cheka" was formed from the initials of the Russian words meaning "extraordinary commission.") Its power grew to include summary arrest, judgment and execution. In revenge for the wounding of Lenin 500 of the most prominent figures of the old regime were shot that night in Moscow. The killing of Uritsky led to similar reprisals in Petrograd. A veritable reign of terror began.

War Communism.—The effects of this period were momentous. On the one hand it stamped deep into the minds of western countries the belief that Russia had relapsed into Mongol savagery. On the other it confirmed the Soviet leaders in their hatred of the non-Bolshevik world.

Intervention gave impetus and coherence to the work of nationalization, which had been proceeding sporadically. In some cases factories had been nationalized in order to fight sabotage by their owners or managers, in others to legalize confiscation already accomplished by the workers. Under the pressure of war the important industries were given control boards. The attempt to fix prices in a period of acute currency inflation had produced the inevitable flight of commodities from the market. As the situation grew more difficult it became necessary to control not only industry and transport but the supply and distribution of food. From that stage the step to the control of all production and distribution was not a long one for a government of Marxian Socialists.

At first, in the early summer of 1918, restrictions were not so harsh as to prevent much private trade and speculation. It happened that the beginning of the Red terror coincided with the period of greatest food shortage, before the harvest. The extraordinary powers given to the Cheka to suppress internal enemies were quickly directed against speculators seeking for profits.

From the outset an influential section of the central committee of the Bolshevik party had been advocating a full Communist program rather than Lenin's more cautious policy. Circumstances were now on their side, and by Aug. 1918 the period of War Communism which lasted nearly three years may be said to have begun. Private buying and selling were prohibited by law and offenders were severely punished. Cash wages lost their importance. Workers and other employees were given cards for food, clothing and other necessities, free lodging and free transport on trams and railways. All nonworking elements of the population were disfranchised. The peasants were subjected to requisitions of all their crops save what was needed for their households. They obtained nothing but promises in exchange, and the breakdown of distribution and the difficulties of transport in a country ravaged by war progressively diminished their return from their labour. Extreme Communists declared that money would soon be wholly abolished. This hope was perhaps a screen for the conventional motives for inflation and the unavoidable fall in the value of the currency.

Money did not become wholly worthless, and a host of bagmen and hucksters, too numerous and unimportant to be imprisoned, continued private trade. The government tried to eliminate them by entrusting distribution to the co-operatives, which had had an extensive network in Russia for many years. In spite of these efforts much of the lesser retail trade remained in private hands.

Attempts at Peace.—Representatives of every section of anti-Bolshevik Russians, from the Social Revolutionaries Kerensky and Savinkov to the grand duke Nicholas (Nikolay Nikolayevich), former commander in chief and uncle of the former tsar, went to Paris to enlist the support of the peace conference. But the Allies

were chiefly concerned with Germany. They feared that circumstances might induce Germany and Russia to make common cause, and their first impulse was to neutralize the Bolshevik danger.

On Jan. 12, 1919, the commissar for foreign affairs, G. V. Chicherin, asked the U.S. state department to open peace negotiations. On Jan. 16 the representatives in Paris of Great Britain, France, Italy and the United States discussed a general truce plan for Russia put forward by David Lloyd George. Pres. Woodrow Wilson suggested that representatives of all Russian groups including the Bolsheviks should hold a meeting on the island of Prinkipo in the Sea of Marmora under the auspices of the Allies. The anti-Bolshevik governments in Russia refused to participate and the project was dropped.

In spite of continued hostility on the part of the French another attempt was made to reach a peaceful settlement. William C. Bullitt, attached to the U.S. delegation in Paris, was sent to Petrograd in March 1919. After a week's discussion he brought back peace terms which the Soviet government pledged itself to accept if the Allies agreed not later than April 10. The most important features of this document were a plan for the pacification of Russia on the basis of its several existing governments, a willingness by the said governments, including the Soviet, to recognize responsibility for the financial obligations of the former Russian empire, an exchange of official representatives between the Soviet government and the foreign powers and an immediate withdrawal of foreign troops. In spite of warm support by Col. Edward House and the approval of Lloyd George and V. E. Orlando this project also was shelved, perhaps because of the rapid advance of Kolchak's army, which once more strengthened the belief that the Soviet government was doomed to extinction.

Renewed Intervention.—The White armies of Kolchak in Siberia, of Denikin in southwestern Russia and of Gen. N. N. Yudenich in Estonia had been amply supplied by the Allies with money, equipment and instructors. Kolchak threatened Kazan and Samara, on the Volga, in May and planned to reach Moscow before the end of June, but strategic co-ordination was lacking, neither Denikin nor Yudenich was ready. Kolchak could not withstand the full weight of the Red army, which had now been welded into a competent fighting force. An attempt at diversion by the British in the north came too late to help him.

The next stage of the White campaign was more dangerous. Denikin made rapid progress northward in the summer, and in mid-October had taken Orel, within 200 mi. of Moscow, and was threatening the capital. Simultaneously Yudenich drove at Petrograd. His English tanks broke the weak resistance of the Reds, whose main forces were concentrated against Denikin. Yudenich's advance guard was within 10 mi. of Petrograd before the Soviet troops rallied. Then the tide ebbed. Yudenich was thrown back, and Denikin's offensive, heavily repulsed at Orel, fell to pieces. In December he was making a last stand at Novorossiisk in the Kuban, and by April he had fled to Constantinople. Kolchak lost his capital, Omsk, in November and he finally resigned command a month later. The Czechs betrayed him to the Red army at Irkutsk. He was put on trial as a traitor, condemned to death and shot on Feb. 7, 1920. The bewildering collapse of the White armies was caused by the hostility of the masses in the territory they controlled no less than by military defeat.

Kolchak's execution marked the end of the intervention period; nearly all the Allied troops had been withdrawn late in 1919. Japanese troops were still in occupation of Vladivostok, however, and the maritime provinces, and Gen. P. N. Wrangel was reforming the shattered army of Denikin in the Crimea. Later, during the war with Poland, Wrangel had some successes on the mainland, but the armistice released overwhelming forces against him, and in Nov. 1920 the remnants of his army were transported by the Allied fleet to Constantinople.

The Soviet army had been progressively demobilized as the enemy weakened, but the internal economy of the country was in a chaotic state. The peasants, irritated by requisitions, had reduced the production of grain, and industry, which had been harnessed everywhere to war, had to be reconstructed on a peace basis. Trotsky, the commissar of war, proposed that the army

should be utilized directly for production. The "labour army" helped to reorganize transport and some sections of heavy industry, but discontent was generated among the workers.

War with Poland.—Before the situation became critical an emergency, war with Poland, settled the problem. The Soviet government proposed peace to Poland in Jan. 1920 on terms similar to those offered Finland and Estonia. The Poles at first seemed willing to agree, but their circumstances improved as supplies of war material from France and a food loan of \$50,000,000 from the United States strengthened their country. At the end of March they demanded all the territory west of the Polish frontier of 1772, a large cash indemnity and the occupation of the Russian town of Smolensk as guarantee. The Bolsheviks refused, and the Polish army occupied Kiev early in May. Within a month the Bolsheviks struck back. The Soviet cavalry retook Kiev in June, while the main force advanced from Smolensk through Vilnius and along the German border. The Red armies, marching forward almost without combat, converged upon Warsaw. The Polish retreat became a rout, and by the middle of August the Russians had reached the outskirts of the city.

France and England were appalled; a sovietized Poland would mean bolshevism in the heart of Europe. The French therefore sent Gen. Maxime Weygand, with a small group of officers, to Warsaw. The counterattacks beginning on Aug. 14 were completely successful, almost overnight, with little fighting, the Red armies were in retreat. A great part of the troops on the German border gave up their arms. On Oct. 11, after Polish territory had been entirely cleared, an armistice agreement was concluded at Riga. On March 18, 1921, peace was signed on terms favourable to Poland, with a new frontier which placed 4,000,000 Ukrainians and White Russians under the Polish flag. Again the Soviet government had paid a heavy price for peace. (See RUSSO-POLISH CAMPAIGN.)

De Facto Recognition.—An improvement of relations with the new Baltic states followed the collapse of Denikin and Yudenich. In the autumn of 1919 Maxim Maksimovich Litvinov was sent by the Soviet to Tartu (Dorpat) in Estonia to negotiate peace with Estonia and Finland. Peace treaties with both states were signed early in the following year on reasonable terms. A settlement with Latvia was delayed by the Lettish claim to the province of Lettgau. The Letts refused to negotiate and in a three-week campaign, Jan. 3-24, 1920, drove the Red troops from the province. Peace with Latvia was signed on Aug. 11, 1920. In the previous January the Allied blockade had been lifted. Anglo-Russian negotiations began in the winter of 1919-20 but were interrupted by the Polish war, and it was not until March 16, 1921, that a trade agreement according to *de facto* recognition to the Soviet was signed in London. In the same year similar agreements were made with Germany (May 6), Norway (Sept. 2), Austria (Dec. 7) and Italy (Dec. 26).

SOVIET AFFAIRS TO 1941

The new regime was faced with the constitutional problem of blending together the real authority of the council of people's commissars with the nominal sovereignty of the soviets. This was possible because of the prominence, in both council and soviets, of the Bolsheviks, who took the title of All-Russian Communist party (of Bolsheviks) in March 1918. The task of constitution making was fulfilled in the constitution of July 10, 1918, which remained the fundamental document of Soviet constitutionalism. It applied only to the Russian Socialist Federal Soviet Republic, which consisted essentially of the Great Russian core of the old empire together with Siberia; its federative form reflected the exploitation by the Communists of the national grievances of the non-Russian peoples embedded within it. In addition, the course of the civil war had finally resulted in the setting up of Soviet governments in the Ukraine and in White Russia and also in Georgia, Armenia and Azerbaijan—which were formed into a Transcaucasian federation in Dec. 1922. In form, the Ukraine, White Russia and Transcaucasia were independent states, linked with the R.S.F.S.R. only by treaties of a peculiarly intimate kind; but their governments owed their existence to the Red army and

were firmly under the control of the Communist party, which remained a single centralized unit.

Early in 1922 Joseph Vissarionovich Stalin (*q.v.*), the general secretary of the Communist party, was instructed as commissar of nationalities to draw up a plan of federation between these governments. In Dec. 1922 the first Congress of Soviets of the U.S.S.R. met at Moscow and confirmed the pact for the formation of a union. The Far Eastern Republic, a semi-independent buffer state closely affiliated to the R.S.F.S.R., had been merged with the latter in the preceding November.

The constitution of the new state, the Union of Soviet Socialist Republics, was accepted by the central executive committee on July 6, 1923, and became effective from that date. To the four allied republics two others were added in 1925 by the inclusion of two central Asian republics, Turkmenistan and Uzbekistan. These were formed partly of Turkistan (an area hitherto within the R.S.F.S.R.) and partly of the old amirates of Khiva and Bukhara (which had been gradually sovietized after their subjection to Soviet power in 1919-20).

As in other federal constitutions, the powers of government in the U.S.S.R. were nominally divided between the centre and the constituent republics. But the division of functions left to the central power not only the usual ones relating to external relations and defense but most of the major economic ones.

The centre's overriding authority was guaranteed in a number of ways. Indeed the whole process was little more than an extension of the R.S.F.S.R. constitution to cover the whole area under sovereign control. No real importance could be attached to the affirmation of the right of the republics to secede from the federation. Those states of the old empire which had successfully seceded and maintained their independence—Poland, Finland, Estonia, Latvia and Lithuania—had done so because non-Soviet regimes with foreign support had finally established themselves against Russian-backed Soviet movements.

The most important unifying force of the new state, which contained so many races, creeds and languages, was not mentioned in the constitution. The Communist party, with its rigid discipline and centralized authority, was destined to control each of the constituent states and to cement them more firmly together.

The Peasants and the Famine, 1921-22.—War Communism pressed heavily upon the peasants. Difficulties of transport and distribution prevented them from receiving manufactured goods in exchange for their requisitioned food products, and although their contribution to the national budget decreased proportionately as the currency emission to cover deficits grew greater, their position showed no corresponding improvement. Administrative confusion, red tape and contradictory instructions made the requisitions more onerous. Gradually the peasants reduced the area sown and concealed the harvested grain. The total harvest in 1921 was only about 40% of the average yearly harvest in 1909-13, while the area sown had decreased by almost one-half and the yield per *desyatina* had decreased by more than one-third. The decline was progressive from 1916 to 1921, except that the yield per *desyatina* improved slightly in 1921.

The Bolsheviks tried to counter this passive resistance by an extension of class warfare to the villages. They divided the rural population into three groups: rich peasants ("kulaks" or exploiters), middle peasants and poor peasants. The poor were their protégés, they said, the middle their friends and the rich their enemies. In 1918 "committees of village poor" were organized to supervise the grain requisitions and to take the part in village management which had hitherto belonged to the prosperous peasants. These were soon replaced by the village soviets, over which the Bolsheviks had established control. It was hoped that by this means kulak opposition would be overcome without antagonizing the middle peasants.

Events showed that the rural communities were no favourable terrain for class warfare. The ties of family and religion, a common dislike of tax collectors, towns and townsmen, and a sullen distrust of any central authority which took their young men as soldiers and requisitioned their grain and cattle proved stronger than arbitrary distinctions. Many of the middle peasants were

the young relatives of kulaks, whose chief aim was to become kulaks themselves; many of the poor were dependent, ignorant and shiftless. Bolshevik orators and newspapers spoke only of kulak opposition, but the attempts to apply class warfare and communism to the villages were resented by the middle peasants also.

Peasant delegates to the eighth and ninth congresses of the Communist party in 1919 and 1920 had expressed the murmurs of the villages, and there were signs that the army, largely recruited from the middle peasant class, was growing restive. The Polish war brought a new *elan* of patriotic ardour in which this sentiment was for a time forgotten, but early in 1921 it burst forth. In February the garrison of the naval fortress of Kronstadt, near Petrograd, demanded the abolition of the grain monopoly, and a mutiny followed which was suppressed only after heavy fighting. Almost simultaneously the peasants of Tambov, one of the central provinces of Russia, refused to yield their grain to requisition. Troops sent to enforce obedience made common cause with the peasants. Resentment had become revolt.

Lenin realized the danger and induced the tenth Communist congress in March 1921 to sanction a decree substituting a graduated food tax for the system of requisitions. Commodities demanded by the peasants, kerosene, salt, tools and leather, were rushed to Tambov, to be sold or bartered on a free trading basis. Those measures quickly ended the revolt. The source of trouble had been economic discontent rather than political unrest or counterrevolutionary agitation.

It is significant that both these outbreaks occurred at the end of winter, when climatic conditions had caused a failure of the autumn-sown grain and the peasants, whose reserves were depleted by requisitions, were beginning to fear one of the famines that had devastated Russia periodically. Their anxiety was well founded. A prolonged drought in the early summer ruined the spring-sown grain throughout the black earth districts of the Volga, north Caucasus and Ukraine. By the middle of July 1,000,000 peasants were in flight from their parched fields toward the centres of urban and river transport, where they were huddled in refugee camps infested with cholera and the epidemics caused by malnutrition. The crop failure was reckoned to have affected an area inhabited by 20,000,000 to 30,000,000 people. Unless help was forthcoming, at least 10,000,000 seemed doomed to die from starvation before spring.

In July the Soviet government permitted an appeal by the writer Maxim Gorky to Herbert Hoover, then chairman of the American Relief administration (A.R.A.), which had kept alive millions of hungry children in Belgium and northern France during the war and had been at work later in central and eastern Europe. Hoover agreed to help, and a *modus operandi* was soon arranged between the A.R.A. and the Soviet authorities. This example was followed by a number of European charitable organizations, but the brunt of the work was done by the A.R.A., which at the peak of its activity, in March 1922, was giving daily rations to 10,000,000 children and adults. Altogether foreign aid fed probably 12,000,000 persons, and the Soviet Relief administration maintained at least an equal number.

It was difficult to estimate the famine death toll because of the confusion between disease and starvation in the vital statistics. Deaths from actual hunger probably did not exceed 500,000. Foreign relief for the famine rendered two other important services. It allayed much of the xenophobia provoked by intervention and thus paved the way for a renewal of normal relations between Russia and the outer world. It also helped the Soviet cope with the problem of disease, especially cholera and typhus, which had been epidemic in Russia for centuries; after 1922 there was no widespread recurrence of either pest.

The New Economic Policy.—It is customary to regard the New Economic Policy instituted by Lenin in the spring of 1921 as a more or less temporary abandonment of communism to mollify the peasants. There is no question that an influential section of the Communist party saw it in that light. Lenin himself may not have shared this view. He was above all a realist, alive to the practical necessities of the moment. He had shown that he was well aware of the anarchy of an industrial proletarian revo-

lution in a country 85% of whose people were backward peasants. By force of circumstance and the exigencies of war he had been compelled to adopt a program of socialist centralization which many of his followers welcomed as the correct and natural policy of a socialist state.

Before the Communist party reached a new decision in its protracted discussion of agrarian policy in 1920 and 1921, Lenin found himself advocating not merely a change with regard to requisitions and the grain monopoly but also a general readjustment of the economic framework. The reform of industry for peace purposes would require effort and expenditure which the state was unable to provide, and finance and transport were also in a desperate position.

Lenin's influence and insistence won. His critics had no valid alternative to offer. The New Economic Policy (called N.E.P.) was confirmed by a decree published Aug. 9, 1921. It permitted freedom of trading within the country, sanctioned overtime and piecework payment for workers, offered encouragement to foreign capitalists and concessionaires and recognized by implication the rights of private property which had been abolished under War Communism. The state continued its monopoly of foreign trade into the N.E.P. period, but later a number of the more important trusts into which Soviet industry was divided were allowed to trade abroad directly.

During the period of civil war and War Communism the financial tools of capitalist states had been laid aside. Private banks, cheques, securities—all had gone. Money had depreciated rapidly as more and more of the national budget was covered by inflation; 85% of the 1920 budget was provided by the emission of notes.

If the New Economic Policy was to succeed it clearly had to have banking facilities and a more convenient medium of exchange. The shift of policy was quickly made. The state bank was established in the autumn of 1921 and given the authority to issue bank notes as well as to serve as a credit institution. On Nov. 16, 1921, it began credit operations. By a year from that time the essentials of currency reform had been prepared, and the bank began to issue notes. The monetary unit chosen for the new bank notes was the chevronets, with a gold value of 10 pre-war roubles; that is, 119,486 gr. of fine gold or \$5.146 in United States currency. The rouble was thus given its prewar gold equivalent. The law provided that the new bank notes should be secured to 25% by precious metals and foreign currencies. For a time the chevronets circulated side by side with the earlier *sovznaki* (government or "Soviet" notes), whose value was adjusted to the chevronets from day to day. In March 1924 the emission of *sovznaki* was stopped and in May they passed out of circulation. Henceforth the currency system of the Soviet government was on the same general basis as that of western countries.

The reform of the currency required in turn the establishment of the state budget on a solid foundation, since the government could no longer print notes to meet the deficits. Agricultural taxation, which had been substituted for requisitions early in 1921, was again revised. In May 1922 a single tax in kind was established by decree, and the peasants were permitted to pay in specified commodities the graduated taxes imposed. In May 1923 a more extensive reform was made. Cumbersome miscellaneous taxes were swept aside, a single agricultural tax was substituted and money payments gradually replaced commodity payments. Meanwhile, urban taxation had been developed by indirect taxes and income and property taxes, so that the peasants, instead of forming the principal taxpaying body of the state, came to furnish only a small fraction of the national income.

The most radical change involved in the New Economic Policy was the restoration of the whole internal economy of the country, industry, commerce, transport, housing and employment, to a straight money basis. Instead of the vague system of accounting prevalent under War Communism, every state enterprise was compelled to issue a regular balance sheet and to show profit and loss in the old-fashioned way. Employees received a regular wage paid in cash. Housing committees were entitled to charge rent on a graduated scale in accordance with the social position and earnings of the tenant. The railways and tram companies were al-

lowed to charge fares for passengers and freight.

Communist critics of the New Economic Policy were perhaps justified in declaring it a reversion to capitalist methods. In any case, the Soviet government could not avoid the process of decentralization which was a phase of postwar reconstruction in all the belligerent countries of World War I. For them, no doubt, wartime centralization and control boards were matters of necessity rather than choice. For the Bolsheviks, choice and necessity coincided. But if centralization proved unwieldy in the advanced industrial countries of the west, it was a yet heavier burden upon the backward economy of Russia. Under the New Economic Policy a great many nationalized enterprises were released, not to former proprietors or private owners, but to face competition in the open market. The financing of such corporations was carried out by the Industrial and Commercial bank and by other new banking establishments.

As the New Economic Policy developed, industry was divided into "trusts," as they were called, such as the Oil trust, the Coal trust and the Flax trust, at first horizontal in character, but gradually becoming vertical also. With the trusts, which were organs of production, were associated syndicates, organs of sale and purchase, handling both foreign and internal trade. The trusts were later divided into sections; for example, the Oil trust subdivided into *Azneft* (Azerbaijan Oil), *Grozneft* (Grozny Oil) and *Embanefit* (Emba Oil). United action and governmental control were secured by an expansion of the supreme economic council to include representatives of the trust sections, so as to form a kind of industrial general staff.

The New Economic Policy stimulated the foreign trend toward commercial *rapprochement* with the Soviet, and in the spring of 1922 an international conference was held at Genoa, It., where the Soviet envoys for the first time met foreign statesmen on equal terms. The atmosphere was at first cordial and a proposal was made to provide financial assistance to the Soviet on condition that the debts of the tsarist government were recognized. A period of haggling followed, but on April 16, 1922, Germany and the Soviet government privately signed an agreement at Rapallo, It., shelving the debt question, affirming mutual friendship and re-establishing full diplomatic relations. This unexpected event revived fears of a Russo-German combination to upset the treaty of Versailles, and the Genoa conference ended without reaching a solution. There were obvious limits to Soviet-German co-operation in the political field; but there was henceforth a silent collaboration in military matters by which the Russians received help for the reorganization of the Red army and gave Germany facilities for circumventing the disarmament clauses of the Versailles treaty. Although a meeting of experts to discuss financial matters was held in the summer at The Hague, Neth., prospects of a settlement were never bright and little was accomplished.

The Soviet government took the position that the western powers had tried to enforce a humiliating abandonment of the principle of the repudiation of tsarist debts and of the monopoly of foreign trade, which it had now come to regard as one of the main pillars of its economic system. If the stability of the new currency was to be maintained, rigid control over exports and imports was imperative. But in the first years of the New Economic Policy foreign trade was somewhat hampered by the attempt to force it all through the bottleneck of an untrained bureaucratic department. With growing experience there was a tendency to transfer the placing of orders and sales abroad to the trusts directly concerned, while the foreign trade department continued to act as control. Soviet trading corporations were established in London, Berlin, New York city and other centres. French and U.S. businessmen hesitated to allow long-term credits, but the English and Germans found them possible, and the volume of trade steadily increased. Some trade was still carried on by the Russian co-operatives, which, since they were a pre-Soviet organization, had been allowed by some western countries to trade with them in the pre-N.E.P. period. But it was much less important. The policy of industrial and mining concessions to foreign business was unproductive and not of long duration.

The growth of exports was the most striking change after the

introduction of the New Economic Policy. Total trade expanded, and imports, following the Soviet policy of rigid control, fluctuated widely; but exports were multiplied two and one-half times between 1922 and 1923 and were nearly doubled again in the newly established fiscal year ending Sept. 30, 1924.

The first years of N.E.P. showed a corresponding improvement in internal trade and production. Indications that turnover was multiplied by four between the summer of 1922 and the spring of 1924 were probably not far wrong. In the autumn of 1923 prices of agricultural products fell to 60% of the prewar level. Meanwhile, stimulated by the necessity for showing profits which the New Economic Policy required, the trusts and other industrial enterprises had raised the prices of manufactured goods to 80% above that level. The disproportion was so great that the peasants refused to sell grain or buy goods. Warehouses were glutted and industrial stagnation was threatened. Trotsky used the word "scissors" to describe the crisis which followed, because the graph illustrating the ratio of industrial and agricultural prices to the prewar average had the form of opened scissors, with industrial prices forming the upper blade.

To close the scissors was imperative. It was done in six months, by the sale of goods below cost price, which swept away most of the paper profits of the trusts but removed the danger of industrial stagnation, and by the progressive increase in the price of food products. Although this serious crisis was past, the task of keeping the scissors closed remained one of the major problems of the Soviet state.

The comparative liberty given to private trade under the New Economic Policy had produced a host of prosperous *nepmen*, as they were called. They were largely middlemen, retail traders and small manufacturers, for the state continued to hold the principal sources of production and wholesale business in its own hands. They doubtless served their purpose in getting the commercial machine back into running order and furnishing new accumulations of capital; but they were peculiarly repugnant to the extreme Communists and to the organized workers.

By the beginning of 1924 the New Economic Policy may be said to have justified itself as a practical measure. Currency had been restored to a gold basis, production was approaching prewar standards and agriculture had recovered from the effects of the famine and civil war. Much of the improvement had been caused by the *nepmen* and the kulaks. For a further discussion of the New Economic Policy see *Economic and Financial Conditions*, below.

Foreign Relations, 1924-28.—The outer world seemed ready by 1924 to believe that Russia had now entered upon an evolutionary process similar to that which followed the French Revolution under the Directory and was eager to share in the development of the country's vast resources. But it misunderstood the determination of the Soviet leaders to retain their position and their conviction that the regime could not afford to allow the growth of bourgeois elements or the survival of a landowning peasantry. Nor was the ultimate expectation of the world revolution absent at any time from the calculations of Soviet leaders of any group. Such differences of policy as emerged were concerned with means rather than ends. During Lenin's lifetime his authority served to settle most issues that arose; but already during his long last illness important fissures in the Communist party revealed themselves, and his death on Jan. 21, 1924, precipitated a struggle for the succession which lasted for several years and in the course of which the remnants of democracy in the party vanished as they had already long vanished in the organs of the state.

The effect of Lenin's death had been discounted abroad because of his long illness and absence from public affairs. The growing prosperity of the Soviet state had stimulated the interest of foreign businessmen, who were beginning to feel that trade would be improved by the establishment of regular diplomatic and consular relations with Russia. Germany had taken this step two years before. The new Labour government in England had promised to do the same as one of the means of diminishing unemployment, and the Fascist government of Italy was seeking new fields for commercial expansion. France was still preoccupied

with the memory of its lost loans to the tsarist government and with its own reconstruction problems, but French hostility to the Soviet had to some extent diminished.

On Feb. 1, 1924, the British government recognized the Soviet *de jure*. Other countries followed in rapid succession, and by the beginning of 1925 all the great powers except the United States had established diplomatic relations with the Soviet Union. The order was as shown in Table IV.

TABLE IV.—Recognition of the Soviet Government

Country	Date	Country	Date
Great Britain	Feb. 1, 1924	Sweden	March 14, 1924
Italy	" 7, "	Denmark	June 18, "
Norway	" 11, "	Mexico	Aug. 18, "
Austria	" 20, "	Hungary	Sept. 18, "
Greece	March 8, "	France	Oct. 28, "
Danish	" 8, "	Japan	Jan. 1, 1925

Japanese recognition had been delayed by their claim to compensation for a massacre of Japanese soldiers by Red partisans in the Siberian town of Novo-Nikolaevsk (later Novosibirsk) in May 1920. Although the Japanese had evacuated Vladivostok and the mainland in Nov. 1922, they retained northern Sakhalin until their claim should be satisfied. After two failures negotiations were resumed in Aug. 1924, and recognition was granted on Jan. 1, 1925. A supplementary agreement on Jan. 20 pledged the Japanese to withdraw from northern Sakhalin before the end of May and gave them important oil and coal concessions in the Russian half of the island.

The establishment of normal diplomatic relations led to an increase of foreign trade, but the absence of a settlement of tsarist debts, war debts and private claims prevented any extension of loans to the Soviet. Nevertheless, short-term credits were soon arranged in many countries, and the regularity with which Soviet bills were met gradually overcame distrust. A number of important English firms gave terms of credit running from three to five years. In 1925 Germany provided a state-assisted credit of 300,000,000 marks for a period of three years. The French and Americans were more cautious, but heavy annual purchases of cotton in the United States on a short-term credit basis were made possible by longer credits elsewhere and by the general improvement of Russia's economic situation.

Another factor, however, hampered not only financial but political relations between the Soviet and the rest of the world. It was interference in the internal affairs of foreign countries by the Third or Communist International, known as the Comintern. Founded by Lenin in March 1919, the Third International was pledged to the cause of world revolution, which had, Lenin declared, been betrayed by the Second International of Amsterdam. Its establishment completed the split which had taken place in the socialist movements of most countries during World War I. The Russians insisted that the choice be made, and almost every advanced country came to have a Communist party looking to Moscow as well as a Socialist party still affiliated to the Second International.

The Comintern was an aggregation of Communist parties, and in theory, at least, the successful Communist party of Russia was no more than *primus inter pares*. The avowed purpose of the Comintern to overthrow their regimes and institutions by violence caused foreign powers to take a different point of view. Declining to regard casuistic distinctions, they considered the Comintern and the Soviet government as vassals of one lord, the Russian Communist party.

Moreover, the Comintern extended its activities to the colonies of foreign powers and to semicolonial countries or spheres of influence, such as China. This caused ill feeling between Russia and the foremost colonial power, Great Britain, and in May 1923 Lord Curzon, as foreign secretary in the Conservative government, addressed to Moscow a note on the subject so sharply worded as to be the equivalent of an ultimatum. There were a number of points at issue, but the question of Communist propaganda in Great Britain and its colonies was the principal grievance. The Soviet government acceded to the British demands, under protest; but the propaganda ghost was not laid, and it continued to

trouble Anglo-Russian relations.

The British Labour government of 1924 took steps toward a friendly settlement with the Soviet Union. An agreement was reached in the autumn of 1924 whereby the Soviet promised to repay old debts over a long term of years in return for immediate financial aid. Before the accord could be signed there was a general election in England, in which no small role was played by a letter said to have been written by G. E. Zinoviev, president of the Communist International, giving instructions about the Communist attitude toward the election and Communist activities in the British army. The Labour party was decisively beaten, the Conservatives returned to power and the agreement with the Soviet was shelved. The stir caused by this incident might have been forgotten but for events in Asia and other colonial regions.

Asiatic Interests.—In 1919 Russia's influence was a negligible factor in Turkey and the near east, Persia, Afghanistan and China. England, on the contrary, had never held so strong a position and seemed on the verge of obtaining permanent control over what had formerly been the buffer states between its empire and the tsar's.

Three years later, however, the Soviet had signed treaties of friendship with Turkey, Persia and Afghanistan, as states independent of external influence, and established a virtual protectorate over Outer Mongolia. The central Asian principalities of Khiva and Bukhara were firmly under Soviet rule, and the new Russian republic was now ready to challenge Britain in China.

The Soviet government and the Comintern achieved this result jointly, under Lenin's guidance. The former disavowed unequal treaties, capitulations, treaty ports, protected areas and unilateral tariffs, while the latter devoted its energies to fostering not Communism but nationalism, by virtue of the Leninist doctrine of colonial slaves. This doctrine was Lenin's answer to the question which had long perplexed orthodox Marxists; namely, why the working masses of western Europe had failed to revolt, as Marx had predicted, against their capitalist masters. Lenin argued that the surplus profits from the exploitation of colonies and semicolonial countries such as China had enabled the European capitalists to maintain their "wage slaves" above the starvation level which would make revolution inevitable. To free such countries from capitalist exploitation would therefore be a long step toward the proletarian world revolution. Lenin thus reconciled three apparently contradictory forces, the nationalist aspirations of colonial and semicolonial countries, the spirit of Marxist Communism and the reborn desire of new Russia for expansion.

The Mongolian treaty of Nov. 1921 caused irritation in Peking and helped delay a full accord between the Soviet and Chinese governments until May 31, 1924. In a manifesto issued in July 1919 and formally repeated in Sept. 1920, the Soviet had affirmed in the most categorical manner its renunciation of previous pacts infringing Chinese sovereignty in any way, its abandonment of all claim to the Boxer indemnity and its willingness to treat with China on terms of full equality.

The treaty of 1924 put a Soviet ambassador, L. M. Karakhan, in the old tsarist embassy in the Legation Quarter of Peking. Meanwhile, the Communist International was at work in south China, where both Russian and Chinese Communists supported the Nationalist slogan, "China for the Chinese!" As the Nationalists advanced northward from Canton, the influence of their Russian advisers, Mikhail Markovich Borodin (Gruzenberg) in political affairs and B. K. Galen (Blücher) in the army, grew stronger. By March 1927 the Nationalists were masters of south China, including the Yangtze valley, and the Chinese section of the greatest treaty port, Shanghai.

At this moment Chang Tso-lin, the anti-Nationalist dictator of Peking, raided the premises of the military attaché in the Soviet embassy there, with the knowledge and permission of the foreign diplomatic corps. A mass of documents was seized and a number of arrests made, including subordinate members of the Russian staff and Chinese Communists who had sought refuge in the embassy compound.

The documents published immediately showed a financial connection between the Soviet embassy in Peking and the Comintern

or unofficial activities of Borodin and Galen in south China. A rupture of relations between Moscow and Peking followed. The foreign powers, especially Great Britain, began to realize the danger of the position. Strong military and naval forces enabled the foreigners to retain the treaty ports and the Legation Quarter of Peking, but they were compelled to abandon their privileges at Hankow on the middle Yangtze, which for a time became the Nationalist headquarters.

In 1927, however, there was a break between the Nationalists and the Russians. The Communists were pressing for a more radical agrarian policy with which the Nationalist leadership had no sympathy. They were also trying to direct the whole force of the Nationalist drive against European and, particularly, British interests in China. By the end of the year, the Russian advisers had left, the Chinese Communists were being vigorously suppressed and relations between the Chinese Nationalists and the Soviet government had been severed.

Relations with the West, 1927-28.—Events in China had increased anti-Soviet feeling in Great Britain, already aggravated by Russian financial contributions to the British coal miners on strike in 1926 and in May 1927 the premises of the Soviet trading corporation in London, Arcos, were raided by the police. In this case no seized documents were made public, but the result was similar to that in Peking. Diplomatic relations between England and the Soviet were severed on May 24, 1927. This caused a reduction of English credits and imports and thus affected the internal economic situation, which had now come to depend in no small measure upon smooth relations with foreign capital and business.

The rupture with England did not, however, prevent the Soviet from taking part in international disarmament conferences at Geneva, Switz., in the autumn of 1927 and the spring of 1928. Disarmament had long been advocated by the Soviet government, which in the winter of 1922-23 had attempted to arrange a scheme of armament limitation in a conference with its neighbours, Poland, Finland and the Baltic states. At Geneva the Soviet government proposed to begin immediately the progressive reduction of land, sea and air forces. The other European powers were distrustful and unprepared for such sweeping action, and the conferences ended without result.

Although the Geneva conferences did little to improve the relations of the Soviet with the leading powers of western Europe, and although the Soviet was excluded from the number of original signatories to the Kellogg World Pact of Non-Aggression signed at Versailles in the summer of 1928, there were signs in the following autumn that the United States, which had become a reservoir of capital for European postwar reconstruction, was beginning to modify its aloof or even hostile attitude toward the Soviet.

In the autumn of 1928 a contract between the Soviet trading corporation in New York city and the General Electric company in the United States, giving the former five years' credit on purchases, was the first real breach in the "credit blockade," as it was called, which had hampered business relations between Russia and the United States.

Internal Politics, 1924-28.—Lenin's death occurred at a time when the growing prosperity of the *nepmen* and the new *bourgeoisie* had begun to raise fears in the minds of many Communists that the New Economic Policy might become a surrender to capitalism. It was felt, moreover, that the state business organizations were now sufficiently strong to take the place of private enterprise and that the restoration of the currency to a sound basis would permit their being financed by the newly created state banking organizations. In the first half of 1924, therefore, private trade was loaded with heavy taxes and other restrictions. The *nepmen* were unpopular with the masses and the measures taken against them were not unwelcome, but the reduction of private enterprise in the towns led the extremist section of the Communist party to demand a similar suppression of "capitalist elements" in the villages. The struggle between the forces of capitalism and socialism thus provoked a sharper struggle within the Communist party itself. In the first part of the controversy, 1925-26, the opposition, led by Trotsky, tried to force the social-

izing process, which was the avowed aim of the Communist party, at too swift a pace.

In the cities the state might now hope to supplant the *nepmen* without economic disorganization, but in the villages it was still dependent upon the kulaks, who produced the grain surplus needed for export and to feed the urban centres. When Trotsky demanded their repression the majority of the Bolshevik leaders did not yet see how they could be replaced, and the Communist party congress of April 1925 confirmed the rights of "individual peasant producers," despite a screen of antikulak phrases to cover this compromise with Marxist principles.

A good crop in the summer of 1926, however, strengthened national food resources and brought forward a demand that the village capitalist be curbed. He was becoming dangerously strong, and the state had begun to feel, as it had about the *nepmen* two years before, that it could do without him. The opposition platform, therefore, was in accord with prevailing Communist sentiment, and by 1927 it had attracted such prominent figures of the Bolshevik regime as Zinoviev, the president of the Third International, and L. B. Kameney, one of Lenin's closest associates. But Trotsky's adherents declared that their arguments were perverted in the official press and that they were not given proper opportunity to state their case. They had recourse to underground methods, which the majority denounced as an attempt to split the party. The adherents of Trotsky refused to abandon their tactics and, after a hot discussion at a joint meeting of the party's central committee and control commission in Nov. 1927, were expelled from the party. At the 15th party congress in December Zinoviev and Kameney capitulated to the majority and asked to be readmitted into the party as rank-and-file members. Trotsky was sent into exile in central Asia in Jan. 1928 (he was later allowed to go abroad). Soon afterward, it became clear that the majority had adopted the opposition's program of repressing the "capitalist elements" in the villages.

The immediate reason for this step was the failure in the summer of 1927 of the state grain collections. This was the name given to the system of state purchases of grain to provide for the needs of the urban population and the army and for export. In the previous year the state had collected approximately 10,000,000 tons of cereals, of which more than 2,000,000 were exported, and it was planned to collect an equal amount in 1927-28. A renewal of the "scissors" disproportion between the prices of grain and manufactured goods caused difficulty. The peasants preferred to keep the grain for themselves and their stock, rather than sell it. Communist sentiment was already prepared for a drive against "anti-socialist forces" in the villages. During the spring and summer of 1928 vigorous measures, reminiscent of the War Communism period, were employed to extract surplus grain from the richer peasants, who were described as class enemies.

The quota was attained, but the growing needs of the towns left only a small margin for export, which fell to less than 500,000 tons. This reacted unfavourably upon the foreign trade balance, which had now become most important because in 1927 the state had embarked upon an ambitious five-year program of industrialization (that is, an attempt to build up a self-sufficient industrial production) which required heavy purchases of machines and raw materials abroad. The enforced collections of grain caused much discontent in the villages, and in July 1928 the central committee of the Communist party announced their abolition and promised that they should not be repeated. Once again Communist insistence upon class warfare in the villages had overemphasized the distinction between kulaks and the rest of the peasants.

For an account of the first five-year plan, introduced in 1928, see *Economic and Financial Conditions*, below.

(W. Dv.; M. Br.)

The Rise of Stalin.—Joseph Vissarionovich Stalin emerged as the outstanding leader of the Soviet regime during this period. Although he held no state office until the spring of 1941, when he succeeded his faithful adherent Vyacheslav Mikhailovich Molotov as premier, after being hitherto simply general secretary of the central committee of the Communist party, his power in every field, political and economic, was absolute and unquestioned. It

became almost a matter of course to ascribe every Soviet achievement, political, military, economic or social, to his genius and initiative.

Stalin's personal power was further confirmed by the political elimination and, in many cases, by the physical execution of most of the leading "Old Bolsheviks," the men who, along with Lenin and Trotsky, had played prominent roles in the first years of the revolution. Trotsky himself had first been banished to Turkistan and then sent into exile, finally taking up residence in Mexico. There he was murdered in the summer of 1940. Meanwhile, there had been three spectacular trials of prominent revolutionaries in Russia, in Aug. 1936, Jan. 1937 and March 1938. The defendants confessed various acts of treason and sabotage, and almost 50 persons were sentenced to death. Among the victims of these trials were some of the most famous names of the revolution and of the early phases of the Soviet regime. They included a former premier, A. I. Rykov; two former presidents of the Communist International, Zinoviev and Nikolay Ivanovich Bukharin; the once-dreaded chief of the O.G.P.U. (successor of the Cheka as political police), G. G. Yagoda; and many former diplomats, cabinet ministers and prominent economic executives. Marshal M. N. Tukhachevsky, one of the most gifted leaders of the Red army in the civil war, and seven generals of the Red army were shot after an alleged secret trial in June 1937. Throughout these years there were many secret executions, some of which were and others were not subsequently reported, and a far greater number of incarcerations in labour camps and administrative banishments.

The trials and the accompanying purge were a dark and debatable subject. Foreign critics emphasized the factual discrepancies in certain details of the trials which were subject to verification in foreign countries; they interpreted the whole purge as a method of ensuring Stalin's personal power and the confessions as the false self-incriminations of exhausted and broken men, who were influenced by threats against their families. Stalin's power certainly remained unshaken, and the regime stood up to the shock of war without the internal disintegration which had been predicted as a result of the purges. It is, of course, quite possible that the masses of the Russian people who were not involved in the purge viewed with relative indifference this ruthless destruction of one part of the ruling class by another.

The Constitution of 1936.—The All-Union Congress of Soviets adopted a new constitution for the U.S.S.R. on Dec. 5, 1936. This instrument provided for direct, instead of the formerly indirect, election to the new bicameral national legislature, the supreme soviet, with representation in one house based on population, in the other on nationality (there were at that time 11 soviet republics in the union).

Politically, the new constitution brought little if any change in practice. Stalin remained a dictator of unlimited powers. Only one political organization, the Communist party, remained legal, and its dominant role was for the first time given constitutional sanction. Nor was any opposition permitted to manifest itself in speech or writing after the promulgation of the constitution.

Socially, however, and in everyday life, there were considerable changes in Russia after the end of the first five-year plan. There was no reversion to private capitalism, but in the overriding interests of productivity there was toleration and even encouragement of much more material inequality than would have been found during the bleak, austere period of the first five-year plan, when the acute shortage of food and consumers' goods almost enforced a kind of equality of privation. The discrepancy between the incomes of the higher members of the bureaucracy, army and O.G.P.U. officers, industrial executives, popular authors, engineers, etc., and those of the masses of workers and peasants became greater, as also did the difference in wages between skilled and unskilled workers.

There were significant changes of emphasis in education, in literature, in cultural life. The state set the tone in all these fields; there was no tolerance for the dissenter. But the Soviet school, experimental and loosely disciplined for more than a decade after the revolution, became much stricter in its methods, with marks

and examinations, uniforms for students and more authority for teachers. Middle and higher education, formerly free, was paid for from 1940.

Up to the middle 1930s it was fashionable and, indeed, almost compulsory to deprecate the Russian past extravagantly and uncritically. But subsequently the nationalist note was often struck in newspapers and literature: tsars of outstanding personality such as Peter the Great and Ivan the Terrible were referred to with respect, instead of being indiscriminately abused.

There was an important change of attitude toward family life. Early Soviet legislation practically eliminated all restrictions on intercourse between the sexes. Divorce could be had immediately for the asking by either partner, and there was no distinction between legitimate and illegitimate children. Abortions were frequent and permitted. In the middle '30s there was a severe tightening of restrictions on divorce; the performance of abortions was made illegal and women were urged and encouraged to bear many children.

During the period from 1929 to 1933 there was a good deal of persecution of children whose class origin was suspect. Sons and daughters of priests, former aristocrats and well-to-do families were barred from universities and found it hard to get employment. After 1933 there was more social equality, more feeling that class lines within the state had been ironed out. It was perhaps not accidental that these changes of a moderate and conservative character coincided with the decimation of the ranks of the veteran revolutionaries who were identified with the more active destructive period of the revolution.

Foreign Relations, 1928-41.—Between 1928 and 1941 the U.S.S.R. passed through three fairly well-differentiated stages of foreign policy, as follows:

1. Collaboration to some extent with Germany, antagonism to Great Britain and France. This had been the general course of Soviet foreign policy after the revolution, and it continued until Adolf Hitler's rise to power in Germany in 1933. There were occasional variations in this policy, periods of coolness between Moscow and Berlin. But Soviet policy in the main was to support the German demand for disarmament, as opposed to the French thesis of security, to abstain from co-operation with the League of Nations, to depict Great Britain and France as the chief potential enemies. Soviet support of the British general strike and of the Nationalist revolutionary movement in China aggravated relations with Great Britain, and there was a suspension of British-Soviet diplomatic relations from 1927 until 1929.

2. Collective security, antifascism, united front. Hitler's rise to power on an outspokenly anticommunist program and the obviously militarist, aggressive character of the Nazi regime caused a change of orientation. Karl Radek, the well-known publicist, who was often an unofficial spokesman for the government until his arrest in connection with the treason and sabotage trials, heralded this shift in the spring of 1933 when he wrote a series of articles about the undesirability of violent change in the territorial settlement. The U.S.S.R. joined the League of Nations on Sept. 18, 1934, the year when Germany left it. Military alliances were concluded with France and Czechoslovakia and pacts of nonaggression, elaborately worded so as to exclude every form of disguised aggression, were concluded with Russia's western neighbours—Poland, Latvia, Lithuania, Estonia and Finland. The regular Soviet representative at important sessions of the League of Nations, Maxim Maximovich Litvinov, repeatedly advocated the ideas that peace was indivisible and that security must be organized on a collective basis.

The Communist International, fully in the service of Soviet policy, changed strikingly the character of its propaganda. Extreme revolutionary demands were pushed into the background, and political alliances were sought not only with Socialists but with Liberal and Radical parties and in China with Chiang Kai-shek. One result of this policy was the formation in 1936 of left-wing popular front governments in France and Spain. During the Spanish Civil War which broke out in 1936, the Soviet government, although represented on the "nonintervention committee" in the beginning, sent a considerable amount of aid in tanks, planes

and military specialists to the Republicans.

3. Abandonment of the west, aggression. A tremendous change in foreign policy occurred on Aug. 23, 1939, when Stalin and Hitler signed a pact of nonaggression. There had been signs earlier in the year that the Soviet government, which had been rebuffed and cold-shouldered at the time of the Munich conference in Sept. 1938, was considering a change of policy. Stalin in his important speech to the 18th party congress in March 1939 had spoken of unwillingness to pull foreign chestnuts out of the fire. Litvinov, apostle of collective security, had been summarily dropped from the cabinet on May 3, 1939, and replaced by Molotov. The Soviet-German agreement broke upon the world at a time when the negotiations were still proceeding between the U.S.S.R. and Great Britain and France with the object of bringing the union into a common front against Germany. In the course of these the Soviet government had made demands concerning the Baltic states and Poland which the governments of those countries found unacceptable.

During this third phase, the Soviet government pursued a policy of independent aggression, endeavouring to strengthen its strategic position and to derive benefit from the war in which the other major European powers were involved. By a secret protocol (revised on Sept. 28) to the treaty of August, Germany had agreed not to oppose Russian action in the areas in which the Soviet government declared itself to be interested. Soviet troops crossed the Polish frontier on Sept. 17, 1939, and the partition of that country with Germany was effected. Finland was attacked on Nov. 30. The Finnish resistance was unexpectedly strong, but on March 12, 1940, a peace treaty was concluded which gave the U.S.S.R. the isthmus of Karelia, the naval base of Hangö and other concessions. The Baltic republics, Latvia, Lithuania and Estonia, which had been obliged to accept "mutual aid" treaties with the U.S.S.R. admitting Soviet garrisons in their territory in Sept.-Oct. 1939, were annexed outright and organized as soviet republics in the summer of 1940. At the same time, Rumania was forced to cede Bessarabia, a former Russian province, and northern Bukovina. With some internal reorganization the number of soviet republics was now 16. (W. H. CH.; M. BR.)

By the autumn of 1940 the Soviet Union was becoming anxious at the extent of Germany's successes, and Molotov was sent to Berlin in November to attempt to strike a new bargain. But he failed to get agreement to Russian demands concerning the Balkans and the straits. The Russians had taken part in the Montreux conference of 1936, which had revised the Lausanne straits convention of 1923 much in their favour; but now they wished for physical guarantees of their security in this area. Thereafter, despite various appeasing gestures, the die was cast, and on June 22, 1941, Hitler attacked without warning. Warnings from the west that such an attack was being prepared had apparently been taken lightly.

The major success of Soviet diplomacy in the period immediately before the German attack was a nonaggression treaty with Japan, signed on April 13, 1941. By aggression in Manchuria in 1931, Japan had become a neighbour of the U.S.S.R. and of its satellite Outer Mongolia on a much wider front. The Soviet government, preoccupied by the European threat, had done its best to appease Japan by selling it in 1935 the rights in the Chinese Eastern railway that the Soviet Union had recovered in 1924 and defended against China in 1929. By helping to bring about a temporary united front of the Chinese Nationalists and Communists and by signing a nonaggression treaty with the Chinese Nationalists, it had also helped to stiffen Chinese resistance toward Japan. Nevertheless, there had been some fairly severe fighting—almost an undeclared war—along parts of the Manchurian frontier in 1938 and 1939. The nonaggression pact with Germany's ally thus removed some of the Soviet fear of a war on two fronts.

WORLD WAR II

The first five months of the war were almost fatal to the Russians. The Germans advanced rapidly, encircling great Russian forces and conquering about 500,000 sq. mi. of territory. By November all southern Russia, including the Crimea except the naval

base of Sevastopol, had been overrun, and Rostov had fallen. In the Ukraine Kharkov had fallen, and further north Tula was almost surrounded. The Germans were within 20 or 30 mi. of Moscow, whence much of the administration had been evacuated, with the foreign embassies, to Kuibyshev (Samara). Leningrad was virtually encircled—the beginning of a siege that was to take a heavy toll through famine and to rob Russia of historic monuments of its past.

The winter brought relief; Rostov was retaken and a counter-offensive in December relieved the pressure on Moscow. By the time the spring thaw of 1942 came, the Russians had made deep penetrations into several sections of the German front. The summer of 1942, however, was almost as disastrous as the preceding one. The new offensive in the south carried the Germans to the Don along most of its length and across it to the Volga at Stalingrad. Meanwhile Rostov, Sevastopol, Novorossiisk and the Maikop oil fields as well as the rich agricultural lands north of the Caucasus had all been lost, and the southeastward thrust of the German armies in this sector had almost reached the major oil centre of Grozny. In 15 months it was reckoned that the Red army had sustained 5,000,000 casualties.

The defense of Stalingrad marked the turning of the tide. Again winter came to the rescue of the Russians, and a great counter-offensive cut off a huge German army outside Stalingrad where it eventually surrendered in Feb. 1943. In the summer a new German offensive was defeated and the Soviet armies went over to the offensive, freeing Orel and Belgorod on the central front, liberating Kharkov and the Donets coal field, as well as Novorossiisk and the eastern shore of the Black sea. A sudden advance to the Dnieper cut off large German forces in the Crimea. By the beginning of November, the Red army was back in Smolensk, Gomel and Kiev. This offensive merged without a break into the winter offensive of 1943-44, in which, in addition to further gains in the south and centre, the Russians at last broke out in the north, clearing the Leningrad area and driving on toward the Baltic states. With the reconquest of the Crimea in May, the Russians had cleared most of the pre-1939 Soviet Union.

In the summer of 1944 a series of new offensives began. Finland agreed to an armistice in September, but the Germans refused to leave the country and fighting continued. In the far north the retreating Germans were pursued over the Norwegian border. Farther south big gains were made in the Baltic republics, White Russia and Poland. But the Russians failed in much-debated circumstances to relieve the Polish home army which had risen in Warsaw, and both there and on the Baltic front, where the Red army had suffered a reverse, the advance came to a halt in August. The most spectacular gains were obtained in the south. An offensive against Rumania led to the Rumanian government's accepting armistice terms and declaring war on Germany on Aug. 25; in September war was declared against Bulgaria (hitherto neutral as regards the war on the eastern front), and on Sept. 8 Bulgaria, too, changed sides and declared war against Germany. In their pursuit of the Germans into Yugoslavia, the Russians on Oct. 20 entered Belgrade simultaneously with Tito's (Josip Brozovich or Broz) partisans; in Hungary, Budapest was encircled by the end of the year and a rival Hungarian government was set up in Debrecen under Russian sponsorship. The Russians had also crossed into eastern Czechoslovakia.

A new winter offensive on all fronts began in Jan. 1945, and by the time of Germany's collapse in May, Russian armies were deep into the heart of the reich with Warsaw, Budapest, Vienna and (by inter-Allied agreement) Berlin and Prague among the capitals taken by the Red army.

In the far east the U.S.S.R. entered the war only on Aug. 8, 1945, on the eve of Japan's collapse, and rapidly overran Manchuria and northern Korea.

Internal Affairs, 1941-45.—The war provided the biggest test to date of the capabilities and stability of the Soviet regime. But any opportunity the Germans had to exploit political discontent in the occupied areas was soon thrown away by the ruthless exploitation of their resources and by the brutality which the Germans showed toward their populations. The ill treatment of the

civilian population was completed by large deportations for slave labour in the reich and by massacres of the Jews. Hatred of the invader proved a powerful welding force in adversity.

On June 30, 1941, a new state committee of defense was set up which for the period of the war was the supreme governing body under Stalin's leadership. The general line was to stress even more strongly than in the preceding period the patriotic elements in the Soviet ideology and to call upon the people to resist in the name of Russia's heroic past rather than in that of the revolution. A new measure of toleration for the Orthodox Church was part and parcel of this process. The Communist party itself, on the contrary, was allowed to fall into the background, and its ranks were widely opened to soldiers in the field and outstanding workers in the arms factories. Its membership rose from 3,876,000 in 1941 to 5,700,000 at the end of the war, despite the heavy losses in battle. The nation's gaze was concentrated on the army, of which Stalin (now commissar for defense) was in supreme control; and after the early failures of the survivors of the old guard of Communist generals, K. E. Voroshilov, S. M. Budenny and S. K. Timoshenko, new ones came to the fore: G. K. Zhukov, I. S. Konev, R. Y. Malinovsky, K. K. Rokossovsky, F. I. Tolbukhin, A. M. Vasilevsky. Up till 1943, when illness caused his replacement by Vasilevsky, the chief of staff was the former tsarist officer B. M. Shaposhnikov.

In March 1944 the "Internationale" was replaced as the national anthem by a new patriotic song.

Stern measures were meted out after the German retreat to those minorities that had collaborated with them. The Volga German Autonomous Republic was abolished early in the war and its population deported into Siberia. The same fate now befell the Kalmuck, Chechen-Ingush and Crimean (Tatar) Autonomous Republics and the Karachay Autonomous Region. In 1944 the hitherto nominally independent republic of Tannu Tuva entered the Soviet Union as an autonomous region of the R.S.F.S.R.

By constitutional amendments of Feb. 1944, the republics of the U.S.S.R. were given the right of entering into direct relationships with foreign countries and of having their own defense formations. For this purpose they were to have the right to set up commissariats of foreign affairs and defense. The only practical consequence of these changes seems to have been the seats allotted to the Ukraine and to Byelorussia in the United Nations.

Foreign Relations, 1941-45.—Foreign policy during the war naturally gave the same overwhelming priority to the direct defense of the Soviet Union as was manifest in every other sphere of national life. The Communist parties abroad, which only yesterday had been sabotaging the "imperialist war" against Germany, were ordered to take a patriotic line in all countries fighting the axis and henceforth devoted themselves to trying to influence Allied strategy in such a way that the maximum burden should be lifted from Soviet shoulders. This was the origin of the clamour for the second front, and Soviet diplomacy was largely directed to the same end. In a further effort to reassure foreign opinion, the announcement was made on May 22, 1943, that the Communist International had been formally dissolved on May 15.

The Soviet Union signed a number of treaties with the Allied governments (including a 20-year treaty of alliance with Great Britain on May 26, 1942) and with Allied governments in exile. It entered into diplomatic relations with certain countries for the first time: Canada, South Africa, the Netherlands. But although the prior consideration was the immediate war crisis, the Soviet government was concerned from the beginning to safeguard its own postwar position. Unsuccessful efforts were made to get from Great Britain and the United States formal recognition of its recent annexations in the Baltic. With regard to Poland, the agreement signed with the Polish government in exile on July 30, 1941, recognized the abrogation of the territorial changes resulting from the Soviet-German pact and the rebirth of an independent Polish state. There followed a brief period of apparent Polish-Soviet friendliness during which the surviving Poles who had been deported into the Soviet Union were allowed to form an army. But relations were not cordial, and between March and April 1942 some of the Poles were withdrawn from Soviet territory to the

middle east. The Russians also formed a Communist Polish army which took a part in the later campaigns. Relations with the London Polish government were envenomed by constant controversy over the frontier question, and relations with it were broken off after it had appealed in April 1943 to the International Red Cross to investigate German allegations that the bodies of large numbers of Polish officers who had been interned in Russia but of whom no account had hitherto been given had been found in circumstances that pointed to the Russians' having massacred them. (A subsequent Russian commission naturally retorted that the Germans were responsible for the murders.)

Poland remained the main source of difference between the Allies until the end of the war, particularly when it became clear that the Russians were determined to have the new Poland governed by a regime chosen by themselves and ready to grant the U.S.S.R. its territorial demands in return for compensation at Germany's expense. This question, however, was only part of the general planning of the postwar world carried out by negotiations with the United States and Great Britain, in particular at the tripartite conferences of Tehran (Nov.-Dec. 1943), Yalta (Feb. 1945) and Potsdam (July 1945).

The three main questions involved were the treatment of the defeated countries; the new territorial settlement; and the nature of the new United Nations organization, planned at the Dumbarton Oaks conference in Aug.-Sept. 1944 and brought into being at the San Francisco conference in May-June 1945.

In regard to the first of these, the original Russian point of view was in favour of the partition of Germany into separate states; but this was not maintained at Potsdam, when a decision to treat Germany as a single economic unit was reached despite the quadripartite nature of the occupation. The Russian insistence on the punishment of war criminals was largely met by the Allies, and the Russians co-operated in the Nuremberg trials; but it was soon made clear, both in regard to "denazification" in Germany and "democratization" in Japan, that the Russians meant far greater transformations of the social structure of these countries than had been contemplated. Under Russian occupation, eastern Germany was rapidly sovietized. Of more immediate concern was the difference in the attitude toward reparations from Germany, which manifested itself at Yalta and was bridged neither by the Potsdam agreement nor by the subsequent conference of foreign ministers held in Moscow in Dec. 1945. The Russians held that the restoration of Russia through reparations in kind from Germany should be given absolute priority, whereas the western powers considered that nothing should be done to the German economy that would make the occupation a drain on their own resources. No agreement was reached on Japanese reparations either. On the other hand, the Russian war against Japan, which began only on Aug. 8, 1945, enabled them to seize as war booty much of the industrial wealth that the Japanese had built up in Manchuria. The Soviet Union also made much use of the labour of prisoners of war for reconstruction purposes.

On the territorial side, the Russians achieved their demands in Europe, acquiring part of East Prussia, including Königsberg, as well as the Baltic states, eastern Poland, Bessarabia and Bukovina. To these acquisitions a treaty with Czechoslovakia on June 29, 1945, added Sub-Carpathian Ruthenia. All independent efforts at co-operation between the eastern European states were frowned on during and after the war. In addition, of course, the Russians acquired zones of occupation in Germany and Austria and the right to garrison troops to guard their lines of communication in Poland, Hungary and Rumania. Since Aug. 1939 the effective boundaries of Russian power had shifted about 750 mi. to the west and about 600 mi. to the southwest. Russian troops in the Thuringian forest were within 100 mi. of the Rhine. There was strong pressure against Turkey for territorial concessions and for bases on the straits.

In Asia, the negotiations for Russia's entry into the war against Japan had led to the promise of concessions in Manchuria which had the effect of replacing it in the position from which it had been ousted as a result of the Russo-Japanese war of 1904-05. Port Arthur again became a Russian naval base. By a treaty

revealed Aug. 14, 1945, these positions were confirmed by the Chinese government of Chiang Kai-shek, which also accepted, subject to the formality of a plebiscite, the abandonment of claims over the Soviet satellite Outer Mongolia. Soviet influence in Sinkiang, dominant in the 1930s but relaxed in the war years, was gradually reasserted.

On the side of international organization, the Russian position was that matters should be handled in the postwar world by the continued co-operation of the three great powers, as during the war. The Soviet Union was eventually persuaded to give a formal position of equality to France, with whom a treaty of alliance had been signed on Dec. 10, 1944, and to China. The special position given to the permanent members of the Security Council and the demand for their unanimity on all decisions other than purely procedural ones reflected the Soviet attitude in the drafting of the charter of the United Nations.

POLITICS FROM 1945

There was little change in the political structure of the Soviet Union in the years after World War II. The domination of Stalin and his immediate associates in the Politburo and the council of ministers was beyond question, and apart from the death in Aug. 1948 of A. A. Zhdanov (who had played an important wartime role) and the disappearance of N. Voznesensky there was little change in its composition. From the dozen leading figures, the names of Vyacheslav M. Molotov (whose appointment as vice-premier was announced on March 4, 1949, when he was replaced as foreign minister by A. Y. Vishinsky), of G. M. Malenkov and of L. P. Beria gradually became the most prominent. No new party congress had met by the early 1950s. The supreme soviet and the soviets of the republics resumed the regular elections and sessions that had been abandoned in the war years. The chief task of the former was still the ratification of the annual budget. The chairman of its presidium, the elderly Mikhail Ivanovich Kalinin, died in 1946 and was replaced by N. K. Shvernik, till then head of the trade-union organization.

There was a sharp reversal, beginning even before the end of the war, of the emphasis laid on the state and on the army at the Communist party's expense. The names of the leading Soviet marshals largely disappeared from the foreground and some of them, including Zhukov, the conqueror of Berlin, seem to have been relegated to relative obscurity. This represented, on the top level, part of the process by which the links between east and west, built up perforce during the war, were broken down again. Anxiety was shown as to the effect that contact with the higher standards of living of central Europe might have on the Soviet troops in occupation, and propaganda for their re-education was undertaken. The party itself was subjected to a purging process to get rid of persons who had entered during the war and who did not show sufficient political aptitude for its peacetime tasks; the old standards of indoctrination were demanded once more.

Another process begun during the war involved a modification of the old policy toward the problem of nationalities, with which the name of Stalin was particularly connected. A new emphasis was laid on the Great Russian element in the Soviet Union. It became official doctrine that even pre-revolutionary Russia had been a progressive force in relation to the subordinate nationalities absorbed within the Russian empire, and the histories of the latter were rewritten in accordance with this. The language policy exalting the role of Russian, for which a theoretical basis was given in Stalin's attack on the philological theories connected with the name of Nikolay Marr, must also be noted in this connection.

The most effective antidote to the survivals of "bourgeois nationalism" which were regularly castigated in the Soviet press was biological rather than cultural. The policy of large-scale population movements for economic and political reasons would tend to break up the national homogeneity of all the republics and in the long run to create a single undifferentiated Soviet type.

In cultural matters, the same general trend toward Russian self-sufficiency was seen. Much emphasis was laid on the priority of Russian scientists in discoveries in all important fields.

Zhdanov began a campaign against all signs of "servility" toward western cultural models in 1946, and this continued in subsequent years. "Cosmopolitan" became a general term of abuse directed against all tendencies in literature and the arts which did not have as a direct purpose the support of the national effort. Science also was forced to conform to the dominant ideology, a high light in the process being the formal proscription in 1948 of all theories of genetics other than those of the I. V. Michurin-T. Lysenko school—the repudiation, in fact, of all the accepted views of genetics in favour of theories which gave greater scope to the influence of environment and so seemed better fitted to the Soviet attempt to "remake nature."

Foreign Policy after World War II.—The disagreements between the Soviet government and its wartime allies which had become apparent before the end of the war were soon to assume a shape that made further co-operation impossible. Although the Soviet representatives continued to take part in the work of the United Nations (except for the period Jan.–Aug. 1950 when they absented themselves as a result of the dispute over the membership of Communist China), that organization was in fact little more than a forum where the disagreements between the Soviet Union and its associates on the one hand and the rest of the world on the other could be aired. On the matter of disarmament, both conventional and atomic, no agreement was reached. Although Vishinsky had declared in Nov. 1949 that Soviet work on atomic energy was exclusively directed to peaceful purposes, the fact that the Soviet Union was experimenting with atomic bombs was admitted by Stalin in Oct. 1951.

In Europe, a conference in Paris was held in 1946 for discussion of the draft treaties with Italy, Rumania, Hungary, Bulgaria and Finland; these were finally signed in the following year. But there was no agreement either on Austria or on Germany. Continued friction with the western powers over policy in the occupied countries, particularly in Germany, culminated in the effort to dislodge them from Berlin in 1948 through an economic blockade that was frustrated by the air lift. An attempt to deal with the outstanding issues led to a long, fruitless four-power conference of foreign ministers' deputies at Paris in the spring of 1951.

The U.S. offer of support to Greece and Turkey and of economic aid to Europe in 1947, and the refusal of the Soviet Union to participate in the organization for its distribution or to allow either Poland or Czechoslovakia to do so marked the turning point of the postwar period. The success of the European Recovery program made the triumph of Communism in western Europe unthinkable without direct Soviet aid. In eastern Europe the result was to accelerate the Soviet effort (which had already gone a long way) to convert the whole area into a series of Communist-ruled satellites that would be totally dependent on the Soviet Union economically, politically and militarily as well. The last point was well brought out by the appointment in Nov. 1949 of the Soviet marshal Rokossovsky as Polish defense minister.

The symbol of the new situation was the creation in Sept. 1947 of the Communist Information bureau or Cominform, with its headquarters in Belgrade, Yugos., linking together the Communist parties of Europe and being the successor to some extent to the defunct Comintern. Its formal and overt expression was the series of treaties between the Soviet Union and the eastern European countries; Czechoslovakia, Dec. 12, 1943; Yugoslavia, June 8, 1946; Albania, July 1947; Poland, Jan. 26, 1948; Rumania, Feb. 4, 1948; Hungary, Feb. 18, 1948; Bulgaria, March 18, 1948; Finland, April 6, 1948. Treaties between many of these states were also concluded. The eastern German government set up by the Russians in Oct. 1949 belonged for many purposes to the same grouping, though there was no indication that its creation meant the abandonment of hopes for a Germany united on Russian terms.

In 1948 two crucial developments took place. Czechoslovakia, which (though less independent than Finland) had retained a democratic form of government, was forced in a crisis in February to accept Communist rule and rapidly began to travel the same Soviet path as its neighbours. In June the friction between Marshal Tito of Yugoslavia and the Russians over the methods of control adopted by the latter broke into the open. The Soviet-

Yugoslav treaty was denounced by the Soviet government and Yugoslavia was expelled from the Cominform, which moved its headquarters from Belgrade to Bucharest, Rumania. Thereafter hostility to the Yugoslav regime became a dominant feature of Soviet policy. The breach reduced the representation of the Soviet bloc in the United Nations to five: the U.S.S.R., the Ukraine, Byelorussia, Poland and Czechoslovakia. The veto of the United States kept the other governments of the Soviet sphere outside, while the Soviet veto was exercised against Italy, Ceylon and several other states.

From 1948 relations with the western powers were dominated by the Soviet objections to their rearmament and to all agreements between them on defensive matters, in particular to anything that looked like the remilitarization of a revived western Germany. For the purposes of propaganda in favour of the main thesis of Soviet foreign policy a new organization, the World Peace Movement, was set up in March 1950.

The Far East.—The end of World War II saw Russia entrenched in Manchuria and North Korea facing the United States as the occupying power in Japan and South Korea. Officially, as has been seen, the Soviet government fully accepted the claims of the Nationalist government of Chiang Kai-shek to rule in liberated China. But the presence of Soviet troops in Manchuria was used in such a way as to give certain advantages to the Chinese Communist forces when they advanced into it from their strongholds in the north. For a long time, as the Chinese civil war developed, the Russians gave no outward indication of a change in their formal relations with the Chinese government, perhaps calculating that they could not hope for more than that the Chinese Communists should become strong enough to force Chiang Kai-shek to abandon his alignment with the United States, the country that was increasingly regarded as the Soviet Union's main enemy in the post-war world.

The picture was changed by the Communist victories in 1948-49. On Oct. 2, 1949, the Soviet government broke off relations with the Chinese Nationalists and recognized the government set up at Peking by Mao Tse-tung. The Chinese leader went to Moscow in December, and on Feb. 14, 1950, a series of new agreements was signed, closely linking the two states and making, at least on the face of it considerable concessions to the Chinese in Manchuria.

Elsewhere in Asia the Russians showed full sympathy with all movements against restoring the prewar position of the main colonial powers and, when national independence had been wholly or largely achieved, with the Communist movements. These Communist movements had gained ground particularly in southeastern Asia and took to open violence in Indochina, Burma, the Philippines and Malaya. When North Korea attacked South Korea in June 1950, the Russians took the view that the attack had in fact been launched by the South Koreans at U.S. instigation, and they showed approval of Chinese intervention later in the year. In 1951 it became clear that the Chinese were receiving considerable assistance from the Russians in the shape of aircraft and other weapons.

Death of Stalin and Malenkov's Accession.—After it was officially announced that Joseph Stalin had died on March 5, 1953,

G. M. Malenkov was named head of the Soviet Union. He became chairman of the council of ministers and a member of the presidium of the central committee of the Communist party, which was reorganized as a committee of ten members and four alternates. (In Oct. 1952, after the 19th congress of the Communist party had met in Moscow, a new presidium of 25 members, which absorbed the functions of the former Politburo and Orgburo, had been named.) The ten-member secretariat, also established in Oct. 1952, was replaced by a new one of three members. Other changes included the appointment of L. P. Beria as head of the ministry of internal affairs, which combined the former ministries of internal affairs and state security; V. M. Molotov as foreign minister; N. A. Bulganin as head of the war ministry; and K. E. Voroshilov as president of the presidium of the supreme soviet. L. M. Kaganovich, Beria, Molotov and Bulganin became first deputy chairmen of the council of ministers.

POPULATION

The population of the U.S.S.R. is shown in Table V. Although the third largest of any state in the world, it is small in comparison with the vast area over which it is spread. According to the census of 1939, two-thirds of the country was occupied by only 6% of the population, while 48% of the population was concentrated in 6% of the territory. This is partly explained by the existence of vast areas unsuitable for close settlement; the great belts of tundra and taiga in the north of Russia and the deserts of central Asia, for instance, can never be heavily populated.

TABLE V.—Population of the U.S.S.R. according to the Censuses of Dec. 17, 1926, and Jan. 1939

Republics	Rural population			Urban population			Total population			Area* 1926, up to Sept. (thousand sq. mi.)	Density of population per sq. mi.

*According to an official Soviet computation (1939).

It is partly explained also by the fact that the people were until recently almost wholly devoted to agriculture and, unlike the densely populated monsoon lands of southeast Asia, the Russian agricultural regions, where climatic conditions prevent all-the-year-round production, will not support a dense population. If allowance is made for these factors, however, it must still be noted that except for certain small areas in the black soil belt the Russian agricultural lands are far from having reached saturation point. The obstacles to more intensive settlement in the past were primitive methods of agriculture, uneconomic distribution of land, lack of transport facilities and backwardness in industrial development.

The reasons for Russian backwardness are primarily historical. Lack of natural frontiers encouraged invasion, and the Slav population was engaged in a long struggle with Asiatic invaders. In the 13th century the Tatar hordes overran the country and held it in subjection for nearly 300 years. This long isolation from western Europe was the most important of many factors which caused the people to fall far behind European standards. The history of Russia from this time up to the 20th century had been the history of sporadic endeavours to catch up with Europe in industrial and social development.

The Soviet government's planned resettlement, begun in 1925, led to a striking redistribution of population. But while this resettlement reduced in some small measure the concentration of population in European Russia and was accompanied by a great development of Russian industrial resources and transport facilities, the vast country remained sparsely populated and capable of supporting a far greater population.

Vital Statistics.—The first Russian census was taken in 1897 and recorded a population of 129,200,200. In 1929 the population was 146,980,460 despite the loss of densely populated areas in the west and despite the high death rate which resulted from World War I, the civil war, famine and epidemics. The census of 1939 recorded a population of 170,467,186. In the years 1939-40 Soviet annexations in Europe increased the population by 21,800,000. The official estimate of the population for 1946 was 193,000,000 (E. Davydov in *Bolshevik Sovetskaya Entsiklopediya: S.S.S.R.* [Moscow, 1948]). An estimate published in *Pravda* on Jan. 23, 1946, by G. F. Alexandrov, then propaganda chief of the All-Union Communist party, gave the same figure. This figure, if correct, implied that by 1946 Soviet losses in World War II had been made up by the natural increase in population. The only official estimate of numbers killed in fighting was 7,000,000 (A. A. Zhdanov in a speech on Nov. 6, 1946). Gen. Augustin Guillaume, chief of the French military mission to the Soviet Union during World War II, estimated the number of soldiers killed at 7,500,000, of severely wounded who died later at 3,000,000 and the number of civilians who were killed or died from hunger or exhaustion at 11,000,000.

The rate of increase of the population had been high for many years and was increasing. At the beginning of the 20th century the percentage of births over deaths in the Moscow region was 34. The percentage dropped during the civil war and the famine and epidemics that followed, but rose sharply thereafter. In 1938 there were 195 births to every 100 deaths. In the period 1926-39 the rate of growth of population increased by 15.9% in contrast with the average increase of 8.7% in the countries of western Europe during the same period. One of the results of this high birth rate's being coupled with a fairly high death rate is that the proportion of young people is large. In 1939 more than 45% of the population was under 19 years of age; in England the percentage was less than 30.

In the past the high death rate was the result of harsh living and working conditions, undernourishment, absence of medical services and ignorance of hygiene. The Soviet government effected considerable improvements, particularly through the provision of medical services and of instruction in hygiene; but the unsatisfactory living and working conditions still applying to the majority of the population contribute to making the death rate higher than is common in the countries of western Europe and of North America.

Under the Soviet regime the infant mortality rate was greatly reduced. It was calculated that in the 18th century up to 400 out of every 1,000 children born died before reaching the age of one year. The Soviet government achieved much in town and in country centres in its struggle against this high mortality rate. In Moscow the rate had been 23 per 1,000 in 1913 but was 13 per 1,000 in 1925; this figure declined mainly after 1922, having naturally been high during World War I and the revolution. The mortality rate of children in their first year of life for the whole country fell from 177 per 1,000 in 1924 to 135 per 1,000 in 1925. This was achieved despite poor housing conditions, mainly through the establishment of crèches, clinics and maternity hospitals, through campaigns of pictorial as well as written instruction in hygiene and through financial encouragement given to large families. It was claimed that from 1913 to 1934 the infant mortality rate had been reduced by 44% and that it was later reduced further, but exact figures were not available.

Ethnic Groups.—In ethnographic character the population of the U.S.S.R. is remarkably varied. The Soviet Academy of Sciences represented the country as being inhabited by 160 ethnic groups, divided into ten major divisions as follows: Indo-European 36 groups, Caucasians (Japhetic) 40, Semites 6, Finns 16, Samoyedes 1, Turks 48, Mongols 3, Tungus-Manchurian tribes 6, Palaeo-Asiatics 9 and groups of tribes from the far east with an ancient culture 4. (See Table VI.)

TABLE VI.—U.S.S.R.: Population by Nationality, 1939, Compared with Population by Ethnic Group, 1926

Designation in 1939	Number, 1939, in corresponding group	Number, 1926	Ratio of 1939 to 1926

Source: F. Lotzner, *The Population of the Soviet Union* (1946).

According to the census of 1939, Russians form 58.4% of the population, Ukrainians 16.6%, Byelorussians 3.1%, Uzbeks 3.4%, Tatars 2.5%, Kazakhs 1.8%, Jews 1.8%, Azerbaijanians 1.3%, Georgians 1.33% and Armenians 1.27%. No other nationality numbers 1%. Thus three branches of the Slavs form 78.1% of the total population. To this figure should be added the Slav populations of the territories gained by the Soviet Union in 1939, 1940 and 1945. The Ukrainian areas increased the Ukrainian pop-

ulation by 5,640,000 while the Byelorussian territory brought an additional 1,458,000 Byelorussians into the Soviet Union, thus swelling the large proportion of Slavs.

The distribution of these races varies with the different regions of the country. The Slavs comprise about three-quarters of the population of the R.S.F.S.R. and are most dense in European Russia. In Asiatic Russia they have spread in a dense belt through the cultivable lands lying south of latitude 55° N. as far as the Yenisei river. East of the Yenisei Slavonic colonization has been mainly in ribbons along the rivers or concentrated in mining and industrial districts. In the 20th century Slavonic colonization of Asiatic Russia was intensified, and with the opening up of the mineral resources of this vast area the flow of Slavonic settlers was bound to increase.

After the Slavs the Turki peoples are the most numerous and important. The Turki race (Uzbeks, Turkmen, Kirghiz, Kazakhs etc.) is most continuous in the central Asiatic republics. The Mongol peoples are mainly to be found south and east of Lake Baikal; the Kalmyck (Kalmyk) region on the lower Volga represents a Mongol intrusion far to the west, separated from its original base by a wedge of Turki settlement. The Yakuts of the Lena represent a northeastern spread of the Turki element, now much intermingled with Slavonic blood.

The Finnish aboriginal population, Karelians, Mordvinians, Marii, Votyaks, Permyaks, Komi and the allied Samoyedes, were increasingly pushed outward by the Slavonic settlement. Finns are to be found mainly in the north and west and also in a belt of Finnish settlement in Asiatic Russia, lying north of the main Slavonic belt and extending to the Yenisei, again much intermingled with the incoming Slavonic population. East of the Yenisei the Finns form an insignificant element in the population. Scattered Cossack Ukrainian and trading settlements exist even in the tundra zone and in Kamchatka. These Slavonic settlers have tended to amalgamate to a marked degree with the natives in a region where the difficulties of the environment made unity of human effort essential. An interesting feature of Russian settlement is the greater density of population in high latitudes in comparison with other parts of the world.

Movements of Population.—The institution of serfdom restricted the tendency of the people to wander and to colonize, and after the abolition of serfdom in 1861 movements of the population greatly increased. The existence of large areas that were unsettled or sparsely populated encouraged colonization, but in the 19th and early 20th centuries political discontent was so great that large numbers of non-Russians emigrated abroad. In the period 1891–1900, for instance, 594,000 Russian subjects (mainly Poles and Jews) emigrated to the United States, and between 1900 and 1909 the number of these emigrants rose to 1,400,000. There was also during these years a considerable movement of people inside Russia from the more thickly populated regions of European Russia, in particular from the black earth belt and from the western and southwestern Ukraine, to the south and southeast—and beginning in the last quarter of the 19th century—to the Urals, Siberia and the far east. The government's policy of encouraging migration to the Urals, initiated at the end of the 19th century, resulted in the following increases: 300,000 in 1861–85, 450,000 in 1886–94, 1,440,000 in 1895–1905 and 3,274,000 in 1906–13. In the same period there was a greater flow of people to the towns: between 1863 and 1897 the increase of population in the towns was more than double the increase on the land.

The Soviet policy of planned resettlement, which was a part of the intensive policy of industrialization and of collectivization of agriculture, resulted in considerable movements of population. Between 1926 and 1939 more than 3,000,000 people were resettled in the Urals, Siberia and the far east. In certain areas the population increased by 33%. In the Sverdlovsk and Novosibirsk regions the increase was 53%, while in the Khabarovsk territory the population increased by 136%. World War II accelerated the movement eastward as industrial areas in the west were evacuated in the face of advancing German armies and whole factories were moved beyond the Urals.

Simultaneously with the settlement of the east there was a flow

of people to the industrial regions. In the period 1926–39 about 3,500,000 moved to the Moscow region, 1,300,000 to the Leningrad region and 350,000 to the Gorki region. In the Stalin period the population increased by 91% and in the Voroshilovgrad region by 37%. The republics of central Asia received about 1,700,000 settlers, thus increasing their population by 38%.

The third migratory stream in the Soviet period flowed north. Though on a smaller scale, this settlement of the extreme north—where in the past the population had been negligible—was important. The Murmansk region up to 1917 had a population of about 10,000; in 1928 it was about 22,000 and in 1939 it was 291,300. This growth of the population in the north was accompanied by industrial development, planned as part of the first and second five-year plans.

Following World War II the continued policy of intensive industrialization in the Moscow region, the Ukraine, the Urals and the Kemerovo region undoubtedly led to further increases in the urban population and to further movements of population to industrial areas, particularly in the east. Figures were not, however, available after 1939.

Colonisation of Siberia.—Furs were the prize which drew the Russians beyond the Urals and led to the conquest of Siberia. Siberian furs were in demand not only in Moscow but in Europe and provided Moscow with an important source of revenue. It was not until the 18th century that the fur trade ceased to be the dominating attraction of Siberia and the peasant settler and the miner became important. Peter the Great initiated the official policy of mining development and in particular the exploitation of the rich mineral deposits which in the 19th century gave rise to the Siberian gold rushes.

The conquest of Siberia began late in the 16th century. Kuchum, the last khan of the Siberian Tatars, challenged the Stroganov family, whose members, as the Russian lords of the Ural frontier, were encroaching on Tatar territory. The Stroganovs called on Yermak Timofeyevich, the Cossack leader, to meet this challenge. In 1581, with a small company, Yermak took Sibir, the Khan's chief settlement, from which the name of Siberia is derived. From this start the Russian advance continued rapidly, making full use of the vast web of rivers which covers Siberia. The first settlements were Tyumen (1585) on the Tura river and Tobolsk (1586) on the juncture of the Tobol and Irtysh rivers. From these two bases the Slavs advanced northward and eastward. Early in the 17th century they crossed the Yenisei river and founded Yeniseisk (1618) and Krasnoyarsk (1627). Within a few years they had reached the Lena river and by 1632 they had founded the fortified post of Yakutsk. The first Russian settlement on the Sea of Okhotsk was founded in 1639. This advance had been opposed by the Kazakhs and by the Kalmycks (Kalmyks) but had been halted only in the Amur basin, where it had come against the Chinese empire under the new Manchu Ch'ing dynasty. In 1689 the first treaty between China and Russia was signed.

The task of administering so vast an area was formidable, and for many years the government was able to provide only a rudimentary administration which left nearly all power in the hands of the corrupt local officials. The problem of populating Siberia was equally difficult. Throughout the 17th century colonists were sent beyond the Urals to settle. By the end of the century a policy of exile as a means of colonization had gained acceptance and, like the convicts transported to the British colonies in the 18th and 19th centuries, men were sent to Siberia for trifling offenses. Old Believers, after the great schism in the Russian Orthodox Church, the rebel palace guards under Peter the Great and, after the Northern War, Swedish prisoners of war were sent to Siberia. The Polish confederates under Catherine II, the Decembrists under Nicholas I, nearly 50,000 Poles after the insurrection of 1863 and whole generations of Socialists, including 45,000 political exiles after the 1905 revolution, were also exiled to Siberia. In the early days they were driven in herds from village to village and often left to die of starvation on the road. In the 19th century the conditions were slightly improved, but the hardships of the journey and of climatic and living conditions continued to cause many

deaths. Between 1823 and 1898 no fewer than 700,000 exiles with 216,000 voluntary followers went to Siberia. In 1900 exile as a means of political persecution was abolished, but it was restored again in 1904 because of the increasing political unrest.

The Soviet government continued the policy of sending political and criminal prisoners to Siberia, but on a far greater scale than before. It was officially stated that "forced labour is one of the basic measures of punishment of Soviet Socialist criminal law" (*Bolsheya Sovetskaya Entsiklopediya*, vol. 47, p. 36 [Moscow, 1940]), and the Corrective Labour code of the R.S.F.S.R. of Aug. 1, 1933, provided that political opponents of the regime and "class-hostile elements" be punished by forced labour. In addition to the penal and political motives of Soviet policy there are also the economic motives. Molotov, as chairman of the council of people's commissars, stated in 1931 that forced labour was employed in "highway construction, in the building industry, in peat exploitation, in timber works, in mining, stone quarries, gravel and stone crushing, on transportation projects." These projects resulted in the organization of large forced labour camps in regions, such as the extreme north of Siberia and the Kazakh desert, where the climate is too severe for normal colonization and the work under primitive conditions is too arduous to attract voluntary labour. Evidence on the size of the population of forced labour camps in the Soviet Union is conflicting. The British undersecretary of state for foreign affairs gave on May 3, 1949, an estimate of this population on the basis of evidence in the hands of the British government as between 5,000,000 and 12,000,000.

The notoriety of Siberia as a place of exile has tended to overshadow the role of free settlers in colonizing the vast area. The first settlers were hunters, seeking the furs of the sable, fox, ermine and squirrel. But runaway serfs and fugitives from religious persecution and from conscription, which in the reign of Peter the Great had become particularly severe, were soon the most numerous colonists. Many intermarried with the Yakuts and Buriats; their descendants were called Siberyaks. At the beginning of the 20th century these colonists were rapidly outnumbered by waves of voluntary settlers seeking their fortunes in Siberia. The completion of the Trans-Siberian railway (1891-1903) encouraged and facilitated further settlement. Between 1909 and 1913 more than 350,000 families were settled there, and of these few returned to European Russia. In 1913 the number of settlers was 234,877. During the revolution of 1917 and the civil war colonization virtually ceased, but it quickly revived. In 1925 a special commission of the Soviet government drew up a five-year plan for settling 1,200,000 colonists in Siberia; rebates from taxation and exemption from conscription were offered to encourage suitable settlers. Between 1926 and 1939 nearly 3,000,000 settlers went to Siberia, and after World War II the flow of settlers was no doubt revived, although no figures were available.

The rate of colonization of Siberia is illustrated by the growth of the towns. The population of Novosibirsk, for instance, was 5,000 in 1897 and had grown to 405,589 by 1939; Omsk increased from 37,470 to 280,716 (1939) and Vladivostok from 28,896 to 206,432 (1939). An even more striking illustration was the creation of new towns in the Kuzbas coal basin, some of which had populations of more than 100,000: Stalinsk (Kuznetsk) 169,538, Kemerovo 132,978 and Prokopyevsk 107,227. Karaganda and Magnitogorsk did not exist in 1926, but in 1939 had 165,937 and 145,790 inhabitants, respectively.

Towns and Settlements.—The census of 1926 showed that there were 30 towns with populations of more than 100,000. All these had grown considerably since the census of 1897, with the exception of Odessa, which had declined because of the diminished trade in the Black sea and the loss of Bessarabia to Rumania. Two cities had more than 1,000,000 inhabitants according to the census of 1926; these were Moscow (2,029,425) and Leningrad (1,690,065). Kiev, Baku, Odessa and Kharkov had more than 400,000 inhabitants, while Gorki (Nizhni-Novgorod), Tbilisi (Tiflis), Dnepropetrovsk, Saratov, Tashkent and Rostov-on-Don had more than 200,000 inhabitants.

The census of Jan. 17, 1939, showed that the cities had grown

lation of more than 500,000. It was probable that there was considerable growth in the populations of these cities after 1939, but figures were not available (See Table VII.)

The growth of the town population in Russia after the beginning of the 20th century was striking. Between 1897 and 1914 it increased from 15,825,600 to 24,686,600; i.e., from 14.8% to 17.7% of the total population. From 1926 to 1939 it rose from 26,314,100 to 55,909,900; from 17.9% to 32.8% of the total. This leap in the rate of increase was a result of the Soviet government's policy of intensive industrialization.

The most rapid growth took place during the first two five-year plans (1928-32 and 1933-39). In this period the number of towns with 50,000 inhabitants or more increased almost four and one-half times. The number of towns with a population of 100,000 or more increased almost six times, while 10 new towns with a population of more than 100,000 and 20 with a population of more than 50,000 appeared.

The source of this new urban population between 1926 and 1939 was estimated as follows: from country to town, 18,500,000 (62.5%); natural growth of population, 5,300,000 (17.9%); villages converted into towns, 5,800,000 (19.6%).

In certain areas the growth of the town population was especially noteworthy. The Donets basin in 1926 contained a large number of small mining settlements and only eight towns, of which the largest were: Stalino (Yuzovka), 174,230; Makeyevka, 79,421; and Voroshilovgrad (Lugansk), 71,765. By 1939 the region had about 60 towns, of which 13 had more than 50,000 inhabitants and 5 more than 100,000, including Stalino with 462,395, Makeyevka with 240,145 and Voroshilovgrad 213,007. Similarly, in the Urals the town population in 1926 was 1,251,500, concentrated in 27 towns of which only 3 had more than 50,000 and 2 had more than 100,000 inhabitants. By 1939 the town population had grown to 3,513,200, living in 47 towns of which 11 had more than 50,000 and 5 more than 100,000 inhabitants. The same rapid growth of the towns was to be found in the Kuznetsk basin; whereas in 1926 not one town there had more than 30,000 inhabitants, in 1939 there were five towns with more than 50,000, three of them having more than 100,000.

The pattern of the old Russian towns reflected something of the long struggle against invaders, particularly against Asiatic nomads. This pattern was concentric with radiating streets and at the centre a *kremli*, kremlin or fort, built originally of timber, but later of stone. Another feature of Russian towns was the low wooden house on the outskirts of the same type as the peasant *izba* or hut. The smaller towns were distinguished by a single broad main street which in spring and autumn was a sea of mud. A few of the cities in the west obtained the Magdeburg rights under Polish rule (notably Kiev in 1499), and traces of western influence still remain in some towns. The influence of Byzantium was, however, far stronger throughout European Russia, and evidence of it may be found in all the older towns. The modern Soviet towns were planned with a water supply, electricity and sanitation. In the centre, at least, of these towns roads are laid and the houses no longer follow the old Russian pattern but are of brick and are severely utilitarian in design. But in both new and old towns the overcrowding is serious and the living conditions of the people are often primitive.

Housing.—The housing shortage in the cities and towns is acute. During World War I many towns suffered damage, and in the disastrous period 1920-22 wooden houses were torn down for fuel. The climate limits the building season, and the shortage of building materials and of skilled labour as well as the greater priority given to industrial development all aggravated the housing shortage. The rapid increase in the urban population during the first two five-year plans added further complications to the already serious overcrowding. In 1939 it was estimated that in the cities the average dwelling space per person was approximately five square metres, a figure from one-third to one-fifth below the average in western Europe. Large-scale destruction of housing in European Russia during World War II added to the severity of the problem. It was officially estimated that in the areas afflicted

TABLE VII.—Population of Major Cities in the U.S.S.R. by the Censuses of 1897, 1926 and 1939*

City	Population			Increase, 1926-39
	Jan. 28, 1897	Dec. 17, 1926	Jan. 17, 1939

*Figures for 1897 shown only for cities with more than 25,000 population in that year

Source: S. S. Balak, V. E. Vasyutin and Y. G. Feigin, *Economic Geography of the U.S.S.R.* (1949)

cities and 3,500,000 out of a total of 12,000,000 houses in the rural areas were destroyed. It was further estimated by N. A. Voznesensky that 60,000,000 sq. m. of dwelling space were required for rehabilitation in the urban areas.

Soviet policy after the first five-year plan gave absolute priority to industrial development almost to the exclusion of consumer goods, including housing. Not until the fourth, or first postwar, five-year plan was there provision for an extensive building program, calling for repairs and construction of urban dwellings to a figure of 10,350,000. The plan was reported to have been overfulfilled in urban areas, 100,000,000 sq. m. being constructed; but in rural areas only 2,700,000 houses were built, just one-fifth of the plan's figure. In 1951 there was a further advance in the provision of urban housing, although the construction of rural housing continued to be inadequate. Thus by 1951 reconstruction in urban areas had more than made up for wartime destruction; and in rural areas 90% of the destruction had been made good. The output of building materials, which had seriously slowed up the building program, was stepped up and was considerably higher than before World War II; in 1950 the output of cement was 80% greater than in 1940, of glass 90% greater, of slate 115% greater and of timber 36% greater. There remained however, the serious countereffect of obsolescence and the task of providing housing for a population rise of 5% in the period from 1940 to 1951.

GOVERNMENT AND ADMINISTRATION

The Party.—The constitution of 1936 described the All-Union Communist party as the leading core of all organizations of the working people, both public and state. Stalin referred to the Communist party as the basic guiding force in the system of the dictatorship of the proletariat and stated that not a single important political or organizational question was decided without directions from the party. This indicated the importance of the Communist party in the U.S.S.R., where it acquired a monopoly of political power, all real and potential opposition having been exterminated since the revolution.

The party wields its power through its central committee and through the Politburo, the Orgburo and the secretariat. The central committee is elected at the party congress, which was formerly convened annually but after 1925 met at increasingly longer intervals. This committee from 1927 consisted of 71 full members and 68 candidate members. It meets on an average three times a year when it receives reports from the Politburo and

Orgburo on past and future work. The Politburo is the most important organ of the central committee and exercises enormous power over every aspect of public policy, including foreign affairs. The Orgburo is responsible for the organizational side of the central committee's policy, but is overshadowed by the Politburo and the secretariat. Joseph Stalin, appointed secretary-general of the central committee in May 1922, so increased the importance of this post that it became the control point in the work of the party and thus of the Soviet Union itself. (See Table VIII.)

The Communist party grew greatly in size, although its membership was limited. From 800,000 in 1917 it had grown by 1946 to a membership of more than 6,300,000. To this figure should be added the membership of certain auxiliary bodies such as the Young Communist League (Komsomol) for young people between

*Years of appointment in parentheses, in columns 1 and 2 dates so far as ascertainable.

†Also chairman of the Advtprop (Board for propaganda and agitation) and director of the foreign secretariat providing a link with foreign Communist parties and supervising the activity of the Cominform.

‡Molotov was chairman of the council of people's commissars from 1929 to 1941.

§Also chairman of the V.Ts.S.F.S. (Vsesoyuzny Tsentrallyy Sovetskoy Professionalnykh Soyuzov, or All-Union Central Council of Trade Unions).

||Also secretary-general of the V.L.K.S.M. (Vsesoyuzny Leninitsky Kommunistichesky Soyuz Molodezhi or All-Union Lenin League of Communist Youth).

¶Also chairman of the party control commission, with Shcheryakov as deputy chairman.

the ages of 15 and 26 which, in 1945, had a membership of about 15,000,000, and the Pioneers for children between the ages of 10 and 16, with a membership well over 11,000,000.

The Police.—The task of eliminating political opposition to the Communist party in the Soviet Union was originally in the hands of the All-Russian Extraordinary Commission for Repression of the Counterrevolution and Sabotage (V.Ch.K. or Cheka). On Feb. 6, 1922, the Cheka became the United General Political Administration (O.G.P.U.). On July 10, 1934, the people's commissariat of internal affairs (N.K.V.D.) replaced the O.G.P.U. On Jan. 31, 1941, the N.K.V.D. was itself divided into two commissariats (or ministries from March 1946): the ministry of state security (M.G.B.) and the ministry of internal affairs (M.V.D.). It is thought that the M.G.B. took over the secret police functions of the former N.K.V.D., while the M.V.D. has jurisdiction over the military formations of the interior, the militia or local police, the administration of labour camps and the local registries of births, deaths and marriages.

The first chief of the Cheka and later of the O.G.P.U. was Feliks E. Dzierzynski (Dzerzhinsky); in 1924 he was succeeded by Vyacheslav R. Menzhinsky, who died in 1934; the next chief of the N.K.V.D. was G. G. Yagoda, who was dismissed in Sept. 1936 and shot in April 1937; N. I. Yezhov was the chief of the N.K.V.D. until Dec. 1938 when he, too, was shot and L. P. Beria was appointed his successor.

The Supreme Soviet.—The constitution of 1936 vested all legislative power in the supreme soviet of the U.S.S.R., but this power was so widely delegated that it can only be regarded as nominal. All citizens over the age of 18 years who are not insane and have not been deprived of their civil rights by a responsible tribunal are entitled to vote in the elections of deputies, which take place every four years. Every citizen over the age of 23 years is eligible for election as a deputy.

The supreme soviet consists of two chambers: the council of the union and the council of nationalities. The election of deputies to the council of the union is by electoral districts on the basis of one deputy for every 300,000 citizens. The election of the

TABLE IX.—Elections to the Supreme Soviet of the U.S.S.R.

Item	1950	1946
Number of registered electors	111,116,373	107,717,686
Electors who went to the polls	111,000,010	107,450,637
Percentage of the total electorate	99.8%	99.7%
Electors who voted against the official candidates	300,146	819,699
Percentage of electors who voted	0.27%	0.87%
Number of deputies		
Council of the union	678	682
Council of nationalities	678	687

council of nationalities is by republics, autonomous regions and national districts on the basis of 25 deputies from each union republic, 11 deputies from each autonomous republic, 5 deputies from each autonomous region and 1 deputy from each national

district. The two chambers have equal rights and all acts must be passed by a majority in both chambers—except amendments to the constitution, which require a two-thirds majority in each chamber. The supreme soviet is convened twice yearly by the presidium of the supreme soviet. (See Table IX.)

The Presidium.—At a joint session of the two chambers the supreme soviet elects the presidium, which consists of a chairman, 16 vice-chairmen, a secretary and 15 members. The functions of the presidium, as defined by article 49 of the constitution, are that it

(1) convenes the sessions of the supreme soviet of the U.S.S.R.; (2) issues decrees; (3) gives interpretations of the laws of the U.S.S.R.; (4) dissolves the supreme soviet of the U.S.S.R. in conformity with article 47 of the constitution of the U.S.S.R. and orders new elections; (5) conducts nation-wide referendums on its own initiative or on the demand of one of the union republics; (6) annuls decisions and orders of the soviet of ministers of the U.S.S.R. and of the soviets of ministers of the union republics if they do not conform to law; (7) in the intervals between sessions of the supreme soviet of the U.S.S.R. releases and appoints ministers of the U.S.S.R. on the recommendation of the chairman of the soviet of ministers of the U.S.S.R., subject to subsequent confirmation by the supreme soviet of the U.S.S.R.; (8) institutes orders and medals and titles of honour of the U.S.S.R.; (9) awards orders and medals and confers titles of honour of the U.S.S.R.; (10) exercises the right of pardon; (11) institutes military titles, diplomatic ranks and other special titles; (12) appoints and removes the high command of the armed forces of the U.S.S.R.; (13) in the intervals between sessions of the supreme soviet of the U.S.S.R. proclaims a state of war in the event of military attack on the U.S.S.R. or when necessary to fulfil international treaty obligations concerning mutual defense against aggression; (14) orders general or partial mobilization; (15) ratifies and denounces international treaties of the U.S.S.R.; (16) appoints and recalls plenipotentiary representatives of the U.S.S.R. to foreign states; (17) receives the letters of credence and recall of diplomatic representatives accredited to it by foreign states; (18) proclaims martial law in separate localities or throughout the U.S.S.R. in the interests of the defense of the U.S.S.R. or of the maintenance of public order and the security of the state.

The Soviet of Ministers.—At its first session after election the supreme soviet of the U.S.S.R. appoints the soviet of ministers (Russian abbreviation *Sovmin*), which consists of a chairman, a number of vice-chairmen, the ministers of the U.S.S.R. and the chairmen of a few state committees. Members appointed to the soviet need not necessarily be deputies of the supreme soviet. (See Table VIII.)

The soviet of ministers is the highest executive and administrative organ in the Soviet Union and is answerable only to the supreme soviet or, when it is not in session, to its presidium. The ministries of the Soviet Union are of two types: all-union ministries and the union-republican ministries. The all-union ministries are common to all federal republics. The union-republican ministries function in Moscow and in the capitals of the federal republics. Both types are almost annually merged, divided or suppressed by decrees of the presidium of the supreme soviet, the supreme soviet approving the changes and promulgating the new decrees. The soviet of ministers is the highest executive and administrative organ in the Soviet Union and is answerable only to the supreme soviet or, when it is not in session, to its presidium. The ministries of the Soviet Union are of two types: all-union ministries and the union-republican ministries. The all-union ministries are common to all federal republics. The union-republican ministries function in Moscow and in the capitals of the federal republics. Both types are almost annually merged, divided or suppressed by decrees of the presidium of the supreme soviet, the supreme soviet approving the changes and promulgating the new decrees.

Article 49 of the constitution defines the functions of the soviet of ministries as being that it

(1) co-ordinates and directs the work of the all-union and union-republican ministries of the U.S.S.R. and of other institutions under its

jurisdiction; (2) adopts measures to carry out the national economic plan and the state budget and to strengthen the credit and monetary system; (3) adopts measures for the maintenance of public order, for the protection of the interests of the state and for the safeguarding of the rights of citizens; (4) exercises general guidance in the sphere of relations with foreign states; (5) fixes the annual contingent of citizens to be called up for military service and directs the general organization of the armed forces of the country; (6) sets up, whenever necessary, special committees and central administrations under the soviet of ministers of the U.S.S.R. for economic and cultural affairs and defense.

The federal republics have parallel organs of government and administration. Each republic has a supreme soviet which appoints a presidium and a soviet of ministers. The constitution reserves to each republic the right to secede from the Soviet Union (article 17), but it is doubtful that this right could be exercised. The federal republics, autonomous republics and autonomous regions prepare their own budgets, which are incorporated in the single state budget for the whole Soviet Union. But the soviet of ministers of the U.S.S.R. determines taxes and revenues for the whole union; it can also, if necessary, overrule the decisions of a republican soviet of ministers. (1. Gv.; X.)

The Judicial System.—An early result of the revolution was the decree of Dec. 7, 1917, abolishing all existing general legal institutions and sweeping away the imperial legal system. Two new types of courts were created in their place, the ordinary courts and the revolutionary tribunals. The ordinary courts had jurisdiction in civil and criminal cases. The revolutionary tribunals had special jurisdiction in matters of counterrevolution, sabotage, abuses of officials, etc. This system proved unsatisfactory and was replaced in 1922 by a new hierarchy of courts headed by a supreme court in each republic and with the supreme court of the U.S.S.R. at the apex. Article 104 of the constitution charged the supreme court of the U.S.S.R. "with the supervision of the judicial activities of all the judicial organs of the U.S.S.R. and of the union republics."

The ordinary courts in the new hierarchy fall into four groups: (1) the people's courts; (2) the regional, provincial, territorial courts, the courts of the autonomous regions and the supreme courts of the autonomous republics; (3) the supreme courts of the union republics; (4) the supreme court of the U.S.S.R. The judges in all courts are either permanent judges or people's assessors. Judges of the people's courts are elected by all the citizens within the jurisdiction of that court. The respective soviets of the autonomous republics or other areas appoint the judges to the courts of the second group. The supreme soviets of the union republics and of the Soviet Union appoint the judges to the courts in groups 3 and 4.

Article 112 of the constitution states that "judges are independent and subject only to the law," but this does not mean that

they are independent of government policy; in practice they must follow and seek to enforce that policy whether explicit in published laws or not. Judges may be relieved of their duties if recalled by their electors. An appeal lies from all courts, except from the supreme courts of the U.S.S.R. and of the union republics, to the court next above.

A judicial office of great power is that of the procurator-general, which was established in June 1933. Article 113 of the constitution states that "supreme supervisory power to ensure strict observance of the law by all ministries and institutions subordinated to them, as well as by officials and citizens of the U.S.S.R. generally, is vested in the procurator-general of the U.S.S.R." It is noteworthy that the procurator-general, who is appointed for a term of seven years by the supreme soviet of the U.S.S.R., and the procurators, appointed by him for a five-year period throughout the republics and regions of the Soviet Union, are independent of the supreme court and of other courts.

Certain special courts exist in addition to the ordinary courts referred to above. These include the military tribunals, which have jurisdiction over criminal matters in the Soviet armed forces, and the water-transport courts and railway-transport courts, which deal with crimes involving obstruction of the efficiency of the service or of labour discipline. There are also comrade's courts set up primarily in large industrial undertakings at which fellow workers sit as judges in cases of petty crimes.

EDUCATION AND RELIGION

In tsarist Russia schools were few in number and education was possible for only a small proportion of the population. Illiteracy was widespread: in 1897 about 76% of the people could neither read nor write. Successive governments had paid scant attention to the improvement of education, to the building of schools and universities and to the training of teachers. Their policy was one of inactivity, and they seem to have been content that the mass of their people should remain backward and ignorant. In 1895 there were in Russia only 9 universities with 13,976 students and 29,241 primary schools with 1,937,076 pupils.

During the period of 1895-1904 some development of educational facilities, mainly in the field of technical training, took place. These were years of industrial expansion, and the new industries created a need for technicians who could handle machinery. The plentiful unskilled peasant labour which had served Russian needs in the past was no longer adequate. In this period the numbers of medium and primary technical institutes increased from 51 to 93, of handicraft schools from 91 to 237, of communal schools from 6 to 139. But these and other developments directly concerned the technical needs of the new industries and did not greatly affect the general problem of illiteracy in Russia. The Soviet government found itself confronted with this problem and achieved in many respects remarkable success toward solving it.

By 1951 there were in the U.S.S.R. 220,000 primary and secondary schools with a total of 38,000,000 pupils and 1,250,000 teachers. In 1939, within the frontiers of 1921, there had been 31,517,000 pupils. In 1914, within the same frontiers, there had been 7,260,000 pupils in 93,311 elementary and 764,600 in 459 secondary schools. The totals for 1951 include about 3,700 secondary technical schools with 1,094,000 pupils. In 1914 there had been only 295 schools of this type with a total of 35,800 pupils.

There were, by 1951, 31 universities and 856 other institutions of higher education (V.U.Z.), including 375 teachers' colleges, with 1,356,000 students, including 467,000 taking correspondence courses. In 1938 there had been 23 universities and 727 V.U.Z. with 602,900 students. In 1914 there had been 10 universities and 81 institutions of higher education with a total of 112,000 students. A further illustration of the Soviet government's achievement is to be found in the figures for illiteracy: the percentage of illiterates had been reduced to 48.9% by 1926 and to 18.8% by 1939. This latter figure was further reduced after 1939, universal education at least to the extent of the elementary four-year school being achieved in most of the republics of the Soviet Union.

Early Soviet Measures.—The Bolshevik revolution of 1917

was followed by the destruction of all tsarist institutions and systems. The old ministry of education was replaced by two new bodies, the people's commissariat for education and the state commission for education, the latter being headed by Anatoly V. Lunacharsky. Within a week of the revolution Lunacharsky published an "exhortation to the citizens of Russia on national education" in which the tasks in the field of education were summarized as follows: abolition of illiteracy as quickly as possible; introduction of universal, compulsory and free education; establishment of institutes and seminaries for the training of "people's teachers." A fourth point might have been added concerning the association of the church with education. Militant atheism was proclaimed by the Communist leaders as part of their policy. It was therefore to be expected that the church schools would be taken over by the government and that all forms of religious instruction in schools would be forbidden. In Dec. 1917 the people's commissariat for education issued an ordinance bringing under its authority all church schools, seminaries and academies. This step was followed on Jan. 21, 1918, by a decree of the council of people's commissars disestablishing the church and introducing secular education. Another important innovation of this period was the introduction of coeducation by decree dated May 31, 1918.

A decree issued on Oct. 16, 1918, codified the educational measures introduced after the revolution. The declaration of the state commission for education attached to this decree gave the name "united labour school" to all schools under the people's commissariat for education. The new school was divided into two grades: grade I for children 8 to 13 years of age, and grade II for children 13 to 17 years of age. Education in both grades was free and compulsory, although in practice the great shortage of schools and of qualified teachers made it impossible for more than a small proportion of children to attend. Further innovations were the abolition of the old forms of discipline and punishment, of homework and of examinations. Schools were to be run by school Soviets in which senior pupils took part. Teachers, whose hands were tied by these Soviets, were in future to be known as school workers and were to concentrate on breaking away from the old tsarist methods and on practising Communist methods of teaching.

The "liquidation of illiteracy" was recognized by the new regime as one of its basic tasks, and on Dec. 26, 1919, the council of people's commissars passed a decree directing that "the entire population of the republic between the ages of 8 and 50; unable to read or write, be obliged to become literate in either their native or the Russian language, according to their preference." But the implementation of this decree proved most difficult, particularly in a country rent by civil war. The anxiety of the government over the slow progress made in reducing illiteracy was shown in the series of decrees and exhortations that was issued. Finally on Jan. 26, 1930, the central executive committee of the party and the council of people's commissars issued a joint ordinance setting up special local committees for the liquidation of illiteracy to be attached to each regional and district executive committee.

University education also received close attention in the post-revolutionary period. On Aug. 2, 1918, a decree of the council of people's commissars opened all higher educational establishments, as they were called, to all citizens, without respect to nationality or sex, simply on condition that they should be over the age of 16 years. In Sept. 1919 universities were directed to provide special courses, known as "worker's facilities," to prepare workers and peasants for higher education.

The Educational Reform.—It was soon found that most of these innovations were unsatisfactory. Teachers were unable to enforce discipline, and conditions in schools were chaotic. Nor were the new teaching methods found to equip the young Russian or non-Russian citizen to assist in the reform and development of the country along the lines laid down by the party. The new methods tended to produce undisciplined and untrained youths of little use in industry or otherwise.

An order of the central committee of the party issued on Sept. 5, 1931, contained the first suggestion of change. The order pointed

to "certain serious defects" in soviet education and specified changes to be made in the syllabus for schools. The central committee issued a further and more important order on Aug. 25, 1932, which called for a recasting of the programs of schools and for a revision of the syllabuses. A routine was laid down to be followed in all schools. The brigade system of teaching was abandoned and teachers were directed to give individual instruction. Examinations and discipline were revived although not so strictly as was to be required by subsequent decrees. This order together with the subsequent order of May 16, 1934, abolished the innovations of the postrevolutionary period and established a system of education incorporating many of the principles and practices in force in Europe.

The order of May 16, 1934, replaced the united labour school with the general educational school, divided into three stages. The elementary school contains four classes and is known as the four-year school. Until the publication of the ordinance of the council of people's commissars on Sept. 8, 1943, compulsory education began in the four-year school at the age of eight years, but the ordinance reduced it to seven. The second stage is the seven-year school or the incomplete secondary school, containing seven classes. The third stage is the secondary school proper, known as the ten-year school and containing ten classes. The government in its attempts to achieve universal compulsory education was faced with many difficulties, particularly the shortage of teachers and of school accommodation. It was nevertheless claimed by Stalin at the 16th party congress in 1930 that universal compulsory education had been introduced throughout the U.S.S.R. It would seem, however, that only four-year education, the equivalent of European elementary education, had been introduced. The 18th party congress, held in 1939, proclaimed that the aim must be to achieve universal ten-year or complete secondary education in towns and workers' settlements and universal seven-year education in the country. World War II prevented the realization of this aim and it was made one of the tasks of the fourth five-year plan (1946-50). The Soviet government released little factual information after World War II on the success or failure of these plans, but an announcement on Aug. 17, 1949, stated that the school year 1949-50 would see in the R.S.F.S.R. "seven-year education on a very wide scale." This suggested that even in the towns of the most highly developed of the republics the ten-year school was not common, while in the less well-developed areas even the seven-year school was far from universal.

Introduction of Fees.—An important amendment to the strongly proclaimed Communist principle of free education as a right of all citizens was the introduction of fees in the senior classes of secondary schools and in higher educational establishments of the U.S.S.R. as laid down in the ordinance of Oct. 2, 1940, of the council of people's commissars. The fees are payable in the three senior classes of the complete secondary school and in higher educational establishments at rates specified by the ordinance. Free education and stipends are allowed in these grades only to students of outstanding ability. Three subsequent ordinances exempted from payment of fees students in military faculties and in national theatrical and musical studios and national groups of ballet schools in Moscow and Leningrad. Exemption was also extended to the children of noncommissioned members of the army and navy and in certain circumstances to the children of persons drawing invalid pensions. The reasons for this change in the government's policy were not clear. It has been suggested that it was due to anxiety to divert the younger generation from higher education to factory work and to military training and to meet the urgent need for medium-grade experts. It is probable that this was one of the purposes behind the introduction of fees, which must certainly have restricted the number of students able to enter higher educational establishments.

Mention should also be made of the abolition of coeducation which had been regarded in the early postrevolutionary period as an important innovation. This change was effected by the ordinance of the council of people's commissars issued on July 16, 1943, which called for separation of the sexes in secondary schools as rapidly as facilities would permit.

Higher Education.—The educational system includes the specialized secondary educational establishments and the higher educational establishments. The former serve to train technicians and specialists of the middle grade, which includes elementary school teachers. Pupils who have completed the seven-year school are eligible for these establishments, at which they receive stipends, free training and subsistence allowances.

The higher educational establishments comprise the universities and certain institutes which train top-grade specialists. These institutions are charged with the task of training intellectuals and in particular technicians whom the party can entrust with the carrying out of its policies and above all its policy of intensive industrialization. The two most important pronouncements affecting higher education were the resolution of the party central committee of July 17, 1928, on improving the training of new specialists and the joint ordinance of June 23, 1936, issued by the party central committee and the council of people's commissars on the work of the higher educational establishment. The former devoted considerable attention to the development of new cadres and specified that by 1932 the number of engineering and technical specialists in heavy industry should be doubled. The ordinance of 1936 in many respects produced a reorganization of higher education. Students to be eligible for higher educational establishments had to complete the full ten-year school and also to pass a special entrance examination. The ordinance then laid down the conditions applying to professorial staff, the examining of students and the granting of grade I and II diplomas.

A further change was made by a joint ordinance of Dec. 1935 abolishing the ban against the admission of people of undesirable social origin and of the children of parents with "limited social rights" to higher educational establishments. This reform was part of the general abolition of proletarian class privileges which came with the introduction of the new Stalin constitution of 1936.

The Content of Education.—All education in the Soviet Union is permeated by the ideology and directed by the needs of the Communist party. The following quotation from the editorial of *Pravda* of Sept. 1, 1949, illustrates the nature of this influence:

To bring up active fighters for the cause of Communism, all-round educated people, possessing thorough and firmly-based knowledge, such is the main task of our schools, such is the law of their life. All must be subordinated to this task; the process of education, extra-school occupations, propaganda among parents, the work of the Young Communist and Pioneer organizations in the schools.

Equally plain is the following injunction published in the *Literaturnaya Gazeta* of Sept. 3, 1949:

The country entrusts the school with its most treasured possession, its children, and no one should be allowed to indulge in the slightest deviation from the principles of the Communist materialistic upbringing of the new generation.

The party ideology informs all activities in the general secondary schools, and indeed the daily lives of Russian children and adults, but instruction in Marxism-Leninism and in dialectical and historical materialism is included in the curriculums only of the higher educational establishments, where a considerable amount of attention is devoted to them.

Religion.—Under the tsars the Orthodox Church was the established church to which the vast majority of the people belonged. Other religions were permitted but did not enjoy the same freedom as the established church, and adherents of certain religions, as, for example, the Unite rite of the Roman Catholic Church, Islam and Judaism, were at times actively persecuted. At no time, however, had religion in Russia been subjected to such organized persecution as under the Soviet regime. The reason for this is that the Communist party is based on an ideology materialistic in character and militantly atheistic in action.

The first campaign of persecution lasted from 1917 to 1923. The Orthodox Church was disestablished; church property was seized and confiscated; divine service was allowed only under certain highly restrictive conditions; religious instruction was prohibited in schools and for groups of children under the age of 18 years. In an attempt to weaken the Orthodox Church the government sought to create a schism by supporting a new religious organization, the so-called "Living Church," but this collapsed

through lack of popular support. In May 1922 the patriarch was imprisoned, with a large number of bishops and priests; his release in June 1923, the result of popular protests, marked the end of the first campaign. The second period of persecution lasted from 1923 to 1930. It differed from the first period in that direct attacks on the clergy more or less ceased, and the party concentrated on antireligious propaganda. A special publishing house called Bezbozhnik ("The Godless") had been set up in Feb. 1922 to print and disseminate antireligious material. An antireligious seminary was opened, and the celebration of Christmas and Easter in 1923 was marked by mock processions and services designed to hold religion up to ridicule. The foundation of the League of Militant Atheists on Feb. 7, 1925, which became the centre of violent antireligious propaganda, was the most important step in the government's campaign. In the third period the persecution took the form of a renewal of attacks on churches and on the clergy. Hundreds of priests were arrested and many were sent to the dreaded Solovetsky concentration camp in the White sea. But despite the innumerable restrictions, the imprisonment of the clergy and the wide use of antireligious propaganda, the church retained its large following, and it was apparent that the campaign for atheism had failed. The persecution seems to have been most intense in the years 1937-38, when the church leaders were denounced officially as "the implacable enemies of social reconstruction" and arrested in large numbers.

Signs of a new policy toward religion were noticeable in 1939 and developed into what has been called the government's New Religious Policy. This new policy was confirmed on Sept. 5, 1943, when Stalin received the acting patriarch Serghey and subsequently on Sept. 12, 1943, when Serghey was officially installed as patriarch of Moscow and all-Russia. From this date numerous concessions were made to the church, although its activities continued to be severely circumscribed. In 1946 Karpov, the head of the council of the Russian Orthodox Church, which had been established by the Soviet government as the liaison body between church and state, announced that the Orthodox Church had a patriarch, 3 archbishops and 67 bishops, while 22,000 churches and 89 monasteries and convents were functioning normally.

It was clear that the Soviet government's policy since 1939 had been more lenient toward the Church; at the same time it was to be noted that the party had not in any respect departed from its basic teaching that religion and communism must always be incompatible. The profession of atheism continues to be a condition of membership of the party. Religious instruction continues to be prohibited in schools, although antireligious propaganda informs much of the teaching—a situation in accordance with article 124 of the constitution; namely, "In order to ensure to citizens freedom of conscience, the church in the U.S.S.R. is separated from the state, and the school from the church. Freedom of religious worship and freedom of antireligious propaganda is recognized for all citizens."

It is noteworthy that the party continues to pay particular attention to the promotion of atheism in the Young Communist league. The party's policy is summed up in the injunction published in June 1947 in the *Komsomolskaya Pravda*, the official organ of the league: "Young Communists must be not only convinced atheists and opposed to all superstitions, but must actively combat the spread of superstitions and prejudices amongst youth." (I. Gv.)

DEFENSE

The prerevolutionary Russian army was strong in manpower but otherwise reflected all the weaknesses of the political, social and economic order of the imperial regime. Although traditionally the Russian soldier is a hard fighter, with exceptional powers of endurance, the quality of the recruits was lowered by the fact that four in five were illiterate. Despite some progress in industrialization at the end of the 19th and at the beginning of the 20th century, the country was still backward; in 1913 it produced only 30 kg. of pig iron per head as compared with 254 kg. in Germany; the army had only 60 batteries of artillery against German's 380; the extent of the railway system in European Russia alone was

1 mi of railway to 60 sq.mi of territory, or one-tenth the German figure. Though there was no lack of talented generals and patriotic officers, both alike were helpless under a system undermined by corruption and nepotism. Participation in World War I against Germany and Austria-Hungary led to appalling losses and ultimately to the complete collapse of the old army. Imperial Russia had a peacetime army of 1,100,000 and 42,000 officers; from 1914 to 1917 it mobilized 12,000,000 men, of whom 1,700,000 were killed, 4,950,000 wounded and 2,500,000 taken prisoners of war.

The revolution of March 1917 in the midst of a war for survival resulted in a rapid dissolution of all fundamental institutions and notions. The minister of war in the provisional government, Alexander Guchkov, strove to stop the decline of discipline in the army but in May resigned in despair. He was succeeded by Kerensky, an eloquent speaker who assumed that by personal magnetism he would be able to counteract the progress of defeatist Communist propaganda (see *History*, above). The Communists alone were unequivocally against the continuance of the war, and this attitude greatly contributed to the success of their revolution of Nov. 1917, which ended a short-lived attempt to create a Russian democracy. The conclusion of the oppressive treaty of Brest-Litovsk with the Central Powers, on which Lenin insisted, was necessary because the appeals of the more impatient Communists and left-wing Socialists for "revolutionary war" fell on deaf ears.

Formation of the Red Army.—On Jan. 15, 1918, the council of people's commissars issued a decree creating a Workers' and Peasants' Red army on a voluntary basis. The first units distinguished themselves against the Germans at Narva and Pskov on Feb. 23, 1918, which date became the Soviet Army day. By April 22, 1918, the Soviet government felt strong enough to decree compulsory military training for workers and peasants who did not employ hired labour. This was the beginning of the Red army. Trotsky, from March 1918 people's commissar for war, was its founder and Mikhail Frunze, Mikhail Tukhachevsky and S. M. Budenny were among the most successful of its commanders in the field. It was an army based on the class principle; people who belonged to the *bourgeoisie* were ineligible for combatant service.

The problem confronting every revolutionary army, that of creating a competent and reliable officers' corps, was solved by Trotsky by mobilizing former officers of the imperial army, allowing them tolerable material conditions and warning them that their families would be held as hostages in the event of treason or desertion. Altogether about 50,000 such officers served in the Red army up to 1921 and the overwhelming majority remained loyal to the Soviet regime. To ensure the officers' reliability a political adviser, *politicheskyy rukovoditel* or *politruk*, was attached to every unit. These officials, who were Communists, not only kept the officers under observation but also carried out political propaganda in the ranks to stimulate morale. As the war went on, a more reliable type of young officer began to emerge from the short-term officers' training schools that were set up.

After the Riga peace treaty with Poland the Red army was demobilized and reduced to a more efficient and manageable force. At the end of 1920 it had 5,300,000 effectives; the number was reduced to 1,800,000 by Sept. 1921 and to 825,000 a year later. In 1925 the permanent strength of the Soviet armed forces was 562,000, and for nine years it remained at this level. Trotsky, losing his contest for power with Stalin, had to resign as people's commissar for war in Nov. 1924 and was succeeded by Frunze. On the latter's death Oct. 31, 1925, K. E. Voroshilov, trusted friend of Stalin, became commissar for war, remaining in this post until May 8, 1940.

Between 1925 and 1933 the percentage of All-Union Communist party members among the ranks increased from 19% to 49%; the percentage of party members among the officers was much higher. By this time only a few officers from the imperial army remained on active service. All the commanders were graduates from Soviet military academies and officers' training schools, where only candidates recommended by the Komsomol or Communist Youth League, by the Communist party and by the security services could

be accepted as pupils.

The fight against all who were critical of Stalin's leadership extended also to the army, where a drastic purge took place in May 1937. On June 12 Marshal Tukhachevsky, first deputy people's commissar of war, and seven other prominent generals of the Red army were shot, having been accused of spying to betray the Soviet Union to the Japanese and Germans. Gen. Ian Gamarik, second deputy people's commissar in charge of political education, was said to have committed suicide. Many other generals were either sent to forced labour camps or cashiered.

Gen. B. M. Shaposhnikov, a graduate of the Imperial academy of the general staff, who had served in the Red army from May 1918 and been chief of the general staff in 1929-31, was again appointed to that position in 1937. The Japanese intervention in China and the German rearmament compelled the Soviet Union to increase its peacetime armed forces; it had 940,000 men in 1934, about 1,300,000 in 1936 and about 1,600,000 under arms at the beginning of 1939. The country was then divided into 13 military areas and the army was composed of 87 infantry divisions and 32 cavalry brigades.

The Red Army in World War II.—When the German armies attacked the Soviet Union on June 22, 1941, their early successes caused general surprise. By October they had covered three-quarters of the distance separating Moscow from the German frontier and had taken more than 2,050,000 prisoners of war and a vast haul of war material. A hard winter, as well as Russian heroism, halted them at the gates of Moscow. Nevertheless, in 1942 they were able to push as far as Stalingrad. The epic resistance of Stalingrad should not hide the fact that when the Soviet armies started their counteroffensive there were 800,000 Soviet citizens, former prisoners of war, serving in the German army, the most prominent of them being Lieut. Gen. Andrey Vlasov, one of the two army commanders (the other being K. K. Rokossovsky) who had stopped the Germans before Moscow but who, defeated by the Germans east of Leningrad, had surrendered in Aug. 1942. Although for years Soviet propaganda had denounced them as "fascist beasts," the Germans were welcomed as liberators in many parts of the Soviet Union, especially in those with a non-Russian population. Without underestimating the resilience of the Soviet regime and of the Soviet army, it should be recorded as a historical fact that one cause of the German defeat in Russia was Hitler's blunder in maintaining the *kolkhozes* detested by the peasants, and in discouraging the non-Russian nationalisms, in particular that of the Ukrainians.

By the end of World War II the Soviet armed forces were estimated at 11,000,000 men and 360 divisions. According to Voznesensky, they had 5 times as much artillery, 15 times as many tanks and 5 times as many aircraft as in 1941. Demobilization started by the end of 1945, but by 1952 the postwar armed forces were about three times as strong in numbers as they were in 1939. On Oct. 3, 1946, the word "Red" was officially discarded from the title of the Soviet armed forces.

Allied Aid to the Soviet Union.—The Soviet government was always unready to acknowledge the extent of Allied aid in weapons, munitions of war, strategic raw materials and foodstuffs received from the United States and Great Britain during World War II. Voznesensky maintained that the Allied deliveries were only 4% of the domestic production during the war. Lend-lease to the Soviet Union amounted to \$10,982,089,000 from the United States and to £428,000,000 from Great Britain. From Oct. 1941 to Aug. 1945 the United States delivered 375,883 trucks, 51,503 jeeps, 7,056 tanks, 8,075 tractors, 35,170 motorcycles, 2,328 ordnance service vehicles, 14,795 aircraft, 189,000 field telephones with 670,000 mi. of wire, considerable railway equipment (1,900 steam locomotives, 66 diesel locomotives, 9,920 flatcars, 1,000 dump cars, 120 tank cars and 35 heavy machinery cars), 4,478,116 tons of foodstuffs, 2,670,371 tons of petroleum products and quantities of boots, aluminum, copper, explosives, etc.

Great Britain likewise, between Oct. 1941 and March 1945, shipped 7,410 aircraft, 5,218 tanks, raw materials, machinery, industrial plant, foodstuffs and medical supplies, which were sent to the U.S.S.R. in 40 convoys by the northern route; despite con-

siderable risks and hardships involved, 92.6% of the supplies arrived safely in Russian ports.

The Soviet Forces after World War II.—A British estimate of July 1951 placed the Soviet armed forces at 4,600,000 men. The army comprised 2,100,000, the forces of the interior 1,100,000, the air force and anti-aircraft defense 800,000 and the navy 600,000. There were 175 divisions, excluding 40 artillery and anti-aircraft divisions. In his report published April 2, 1952, Gen. Dwight D. Eisenhower, the North Atlantic Treaty organization supreme commander, gave a similar estimate for the Soviet divisions, and estimated the forces of the European Soviet satellite powers at 60 divisions. Speaking before the U.S. senate's foreign relations committee on March 24, 1952, Gen. Alfred M. Gruenther, chief of staff at supreme headquarters, Allied powers in Europe, added that while the size of the Soviet armed forces had remained static in the postwar years, the high command had concentrated on improving and perfecting them; 65 out of 175 divisions, for instance, had been armoured and mechanized.

The armed forces of the Soviet Union in the early 1950s were divided into the army, the air force, the anti-aircraft defense, the navy and the forces of the interior. The army was composed of four types of division: (1) the infantry division, consisting of three rifle regiments on foot, one horse-drawn artillery regiment of 72 guns and howitzers and one tank regiment (full strength, 11,000 men); (2) the motorized division, that is, an infantry division with lorry (truck)-borne infantry and motorized artillery; (3) the armoured division, designed for short-range combat in co-operation with infantry, consisting of three medium tank regiments of about 200 tanks, one mixed regiment of about 50 heavy tanks and 25 heavy self-propelled guns, and a motorized rifle regiment (full strength, 10,500 men); and (4) the mechanized division, designed for more independent action, comprising three regiments of motorized infantry, two tank regiments (medium and heavy), one howitzer regiment and rocket, anti-aircraft and reconnaissance battalions (full strength, about 13,000 men). There were also mountain and cavalry brigades. The typical Soviet artillery division (150 guns and howitzers, 10,000 men) was controlled directly by army headquarters.

The air force in the Soviet organization was not an independent arm but was divided between the army and the navy, about 90% of the first-line air strength belonging to the former. According to General Gruenther, the Soviet air force had 20,000 operational aircraft in 1952, including 4,000 jet planes. The highest formation was an air army composed of a number of divisions, each containing from three to four regiments of about 50 aircraft each. According to Asher Lee, there were two air armies, each of about 1,000 operational aircraft, attached to each of the army group headquarters of Leningrad, Minsk, Odessa, Tbilisi, Tashkent and Chita. In addition, there were air divisions in eastern Germany and an independent long-range air force. The air force also comprised a certain number of parachute brigades.

The anti-aircraft defense or P.V.O. (Protiv-Vozdushnaya Oborona) was an independent arm composed of anti-aircraft artillery divisions and fighter divisions.

The Workers' and Peasants' navy was created by a decree of the council of people's commissars on Feb. 14, 1917. Until Dec. 31, 1937, the navy was administered by the common people's commissariat for war and navy. On that date a navy commissariat was created; but on Feb. 25, 1946, it disappeared when by a decree of the presidium of the supreme soviet a people's commissariat of the armed forces was organized. (In March 1946 the name "people's commissariat" was dropped in favour of "ministry.") Although *Pravda* commented that this decision emerged from the whole experience of World War II, a navy ministry was restored on Feb. 25, 1950. Adm. I. S. Yumashev, the first minister, was succeeded on July 23, 1951, by Adm. N. G. Kuznetsov, who had been people's navy commissar from 1937 to 1946. According to Adm. William Fechteler, U.S. chief of naval operations, the Soviet navy consisted in 1951 of 3 old battleships, about 15 cruisers, 45 or 50 destroyers and about 300 submarines. Approximately 60 of the submarines were former German U-boats and about 100 were of a small coastal type.

The forces of the interior were divided into frontier guards and security troops administered by the ministry of the interior. They were not intended for the front, although equipped in every way, down to tanks, artillery and aircraft.

Military service extended for two years in the army (three years for noncommissioned officers), three years in the air force and anti-aircraft defense, four in the navy and 27 months in the forces of the interior. Conscription age was 18 for men with secondary education and 19 for all others. From 1946 about 1,200,000 men were conscripted yearly.

Up to Oct. 1946 described as "Red army man" (*krasnoarmeets*), a Soviet soldier was afterward termed a "ranker" (*ryadovoy*). Discipline in the Soviet army was strict and punishments were severe, transgressors being sent to penal battalions, which in World War II were set almost suicidal tasks. Pay and privileges rose rapidly with rank. Thus, while in the U.S. army a general's pay was in the ratio 15 to 1 to a private's, in the Soviet army a marshal's pay was in the ratio of 114 to 1 to a private's. The officer's corps was a separate caste, and the times when a private could address a colonel simply as *tovarishch* were long forgotten; he would now say *tovarishch polkovnik* (comrade colonel) and give the once-outlawed salute not only to officers but also to noncommissioned officers.

Until Sept. 1951 there existed three organizations for pre-military training, one for the army, one for the air force and one for the navy. It was announced on Sept. 26 that the three organizations had merged into one All-Union Association for Voluntary Assistance to the Army, Air Force and Navy (D.O.S.A.A.F.); this provided military training for young men from the age of 15 years onward.

The proportion of the total estimated expenditure allocated to defense rose between 1951 and 1952 from 18.5% to 21.3%. This declared expenditure was, however, not the whole picture; a great proportion of the military expenditure was detectable under the guise of investment in national economy, while the cost of military academies and schools was included in expenditure on education.

The nominal head of the Soviet land and air forces was the minister of war. After K. E. Voroshilov had ceased to be people's commissar in May 1940, this post was occupied by Marshal S. K. Timoshenko (May 8, 1940–July 20, 1941), Marshal Joseph Stalin (July 20, 1941–March 3, 1947), Marshal N. A. Bulganin (March 3, 1947–March 24, 1949) and Marshal A. M. Vasilevsky (from March 24, 1949). The minister had under his command the chief of the general staff. After B. M. Shaposhnikov's resignation in the summer of 1940 on the ground of ill health, the post was occupied for a few months by Marshal Kiril Meretskov, then by Marshal G. K. Zhukov (Feb. 24–Oct. 31, 1941), then again by Shaposhnikov till he was replaced in Nov. 1942 by Marshal Vasilevsky (Shaposhnikov died on March 26, 1945). From Nov. 12, 1948, Gen. Sergey Shtemenko was chief of the general staff.

There were six deputy ministers of war and each was in charge of an arm or a service. The post of commander in chief of the air force was occupied during World War II by Marshal A. A. Novikov, from 1946 by Marshal K. A. Vershinin and from July 1950 by Col. Gen. P. F. Zhigarev. (K. Sm.)

COMMUNICATIONS

Russia is well endowed with navigable waterways and has throughout most of its area a flat surface which lends itself to railway construction, but the country has always lacked an adequate system of communications. The railways were unevenly distributed, being concentrated in the central and southern industrial regions of European Russia. Vast areas remained unserved. In 1913 the whole of Asiatic Russia had only 15% of the country's railways. Another difficulty was the long and uneconomic haul of freight from the south to Moscow, and before the revolution it was cheaper to import coal to St. Petersburg from abroad than to haul it from the Donets basin. The severe continental climate meant a heavy seasonal demand on the railways and other means of transport, and this invariably resulted in congestion and serious delays. Quantities of freight were hauled by wagons drawn

by horses, mules or oxen, but this slow method was further handicapped by the fact that roads were virtually nonexistent. Many rivers have been constantly used to transport freight, but little attempt was made until after the revolution to make full use of the great networks of waterways. The Soviet government gave priority to the construction of railways, canals and roads, and the development of the system of transport went ahead rapidly.

Railways.—The first Russian railway—from St. Petersburg to Tsarskoye Selo—was laid down in 1837, but despite this early start the nation lagged behind in railway construction. It was not until 1851 that the first main line—from St. Petersburg to Moscow—was laid. The two great periods of expansion of the railways were 1868-74 and the 1890s; the Trans-Siberian railway was built in 1891-1903 and had been double-tracked by 1936. In 1913 the length of railways per 10,000 inhabitants was about one-fourth that of England, and in quantity and quality the engines and rolling stock were far inferior to those in use in England.

The main trunk lines were constructed before the revolution, and the Soviet government concentrated on developing and extending them, while modernizing equipment. During the period 1920-40 the total length of Soviet railways increased from 35,700 mi. to 64,200 mi. In 1937 the railways hauled almost four times as much freight as in 1913. Much was done to eliminate long and uneconomic hauls. Imports of coal from distant basins such as the Donbas, Kuzbas and Karaganda were reduced by utilizing local coal deposits near Moscow, in the Urals and in the Caucasus. The creation of a second oil base between the Volga and the Urals meant a considerable decrease in the long hauls of oil. The shipment of lumber from the forests of northern European Russia to the central and southern regions and from Siberia to central Asia also reduced costly hauls.

The construction of the Turkistan-Siberian (Turksib) railway, completed in 1930, linking Novosibirsk with Kazakhstan and central Asia, was by mid-20th century the most important achievement of Soviet railway policy; not only were great difficulties of engineering overcome but also it made possible the direct exchange of cotton from central Asia for grain and timber from western Siberia.

A South Siberian (Yuzhsib) line, branching off from the Trans-Siberian at Kinel (east of Kuybyshev), linked the steelworks of Magnitogorsk with the coal basin of Karaganda. By 1950 the line was extended farther east from Akmolinsk to Barnaul (where it crossed the Turksib), and continued eastward to Stalinsk, in the Kuzbas (already linked to the Trans-Siberian via Kemerovo). From Stalinsk the line was being extended to Abakansk, source of supply in iron ore and manganese for the Kuzbas steelworks, and was expected to join the Trans-Siberian at Tayshet, east of Krasnoyarsk. Before World War II work had been begun on a new railway across eastern Siberia, branching off the main line at Tayshet and passing north of Lake Baikal to Kirensk, Cherkunda, Komsomolsk and Sovetskaya-Gavan (on the Sea of Japan). By 1950, with the exception of the link Kirensk-Cherkunda, this line was believed completed.

The outlets from the Donbas were greatly increased by the laying of new lines or the double-tracking of existing lines. Action was also taken in modernizing rolling stock and equipment. L. M. Kaganovich, appointed people's commissar for transport in 1935, organized a campaign for technical improvement. More powerful engines were brought into service with rolling stock of greater capacity. About 38% of the entire network of rails was relaid to allow for this heavier traffic. In regions where hydroelectric power was available some lines were electrified; for example, Murmansk-Kandalaksha and Tbilisi-Batum. Serious losses of rolling stock were suffered in World War II, but these were later made good.

The following are the chief freight routes in the U.S.S.R.: Donbas to Krivoi Rog; Donbas and the northern Caucasus to Moscow and Leningrad; Donbas to the Volga region; Murmansk to Leningrad; Archangel to Moscow; Leningrad to the Urals; Moscow to the Urals; Moscow to central Asia; the Urals to the Kuzbas; Siberia to the far east; and Siberia to central Asia.

Waterways.—Russia is covered by a dense network of waterways, most of which are navigable. They provide an invaluable means of transport in a country of such vast distances. Before the revolution little was done to develop the waterways, but in 1913 about 48,500,000 tons of freight were hauled by this means, chiefly in the Volga basin. By 1937 this figure had risen to 66,900,000 tons.

The disadvantages of river transport are that all Russian rivers are frozen over and closed to navigation for four or five months of the year and, second, that freight must of necessity follow the natural flow of the rivers. The Soviet government planned to overcome the latter disadvantage by the construction of canals and dams, and it appeared that eventually the European and Asiatic waterways might be linked in this manner. Three canals were completed: (1) the Moscow-Volga canal, opened in 1937, connecting Moscow with the whole Volga basin; (2) the Volga-Baltic water route (Mariinsk system), allowing transport by small vessels from the Volga river to pass through a series of rivers, canals and lakes to Leningrad; (3) the White sea-Baltic canal, opened in 1933 and leading to important developments in the north and, by connecting the White sea through Lake Onega with the Mariinsk system, contributing greatly to the exchange of goods between north and south.

The importance of the Dnieper river for transport had always been reduced by the rapids just south of the great bend in its course. The construction of a dam and canals as part of the "Dneproges" (Dnieper hydroelectric station) made the rapids navigable. By 1952 much was being done to make the Don river navigable, including the construction of the Volga-Don canal. In Siberia and the far east the main rivers—the Ob, the Irtysh, the Yenisei, the Lena and the Amur—are all navigable throughout most of their courses and are chiefly utilized for moving timber. In addition to constructing dams and canals, much was done to deepen and improve the waterways so that they would allow the use of larger barges and more powerful river fleets.

Maritime Transport.—The principal ports are in the White, Barents and Black seas. Of these Murmansk in the north and the ports of the Sea of Azov and the Black sea are ice-free the year round. The southern ports handle more than half the total seaborne cargo destined for foreign or for other Soviet ports. Modern tanker fleets are in commission in the Black and Caspian seas, transporting oil from Batum in the former and from Baku to Astrakhan and Krasnovodsk in the latter sea. After the revolution maritime transport grew in importance, particularly with the development of the northern sea route, which allows the direct shipment of timber from Siberia to European Russia and the more rapid transport of machinery and manufactured goods from the White sea to Siberia and the far east.

Roads.—In Russia transport had always relied primarily on the railways and rivers and in winter on the use of sledges. Lack of stone for road construction, except in the Urals, has been one of the difficulties, and before the revolution such roads as had been built were so primitive as to be often impassable. The real demand for surfaced roads was created by the sharp increase in the number of motor vehicles manufactured in the new Soviet factories. Before the revolution there were about 9,000 motor vehicles in the whole of Russia; the number had grown to 19,000 by 1928 and to 760,000 by 1938. In 1950 the production of motor vehicles was said to amount to 65,000 cars, 6,400 buses and 428,000 trucks.

The roads constructed by the Soviet government proved their value during World War II when, making use of fleets of trucks, mainly provided by the Soviet Union's western allies, they relieved the railways of some of the heavy wartime burden. Before World War II highways were built to link many of the most important centres, as, for example, Moscow-Leningrad, Moscow-Minsk, Moscow-Kiev, Leningrad-Vitebsk-Kiev in the eastern parts of the Soviet Union; the Tashkent highway system in central Asia; and the reconstructed Georgian military highway running from Dzardzhikau (Vladikavkaz) across the Caucasus mountains to Tbilisi and Erivan. These highways are of strategic importance.

Air Transport.—After 1923 air transport became an impor-

tant part of the Soviet transport system. By 1940 more than 88,000 mi. of airways were in regular operation, carrying passengers, mail and freight to all parts of the union. The Moscow-Vladivostok arterial air line crosses the entire country and is of particular importance also for the branch lines which connect it with Magnitogorsk, Karaganda, Alma Ata, Yakutsk, Komsomolsk and Sakhalin. The arterial air lines Moscow-Kharkov-Rostov-Baku-Tbilisi and Moscow-Kyubyshev-Aktubinsk-Tashkent are also of considerable importance. After World War II, in the vast regions where other methods of transport remained undeveloped, new air routes were established.

In 1923 the air lines carried 200 passengers, 1,800 kg. of mail and 100 kg. of freight; in 1939 they carried 307,000 passengers, 11,500 tons of mail and more than 40,000 tons of freight.

(I. Gy.)

ECONOMIC AND FINANCIAL CONDITIONS

In its economy, as in many other aspects of its life, Russia before World War I was a land of contrasts. It was predominantly agricultural, with a small class of wealthy and well-to-do landowners and a majority of peasants, who lived, with few exceptions, in poor and primitive circumstances. The industrial revolution had come late to Russia, but the country was rich in mineral and agricultural resources, in coal, iron, oil, manganese, cereals, cotton, flax and sugar beets, among other products. And, although industry played a less important part in the national economy than was the case in western Europe, about half its industrial workers were employed in large plants with more than 1,000 workers.

This was largely attributable to the fact that foreign capital, French, British, German, Belgian and U.S., in this order of importance, had been flowing into Russia rapidly since the last quarter of the 19th century. The foreign capitalist often found it profitable to put up a big factory, equipped with the latest machinery. So Russian industry was only partially the result of the slow accumulation of capital by pioneer Russian companies. It was the hothouse fruit of foreign investment. About one-third of the capital invested in Russian stock companies in 1914 was of foreign origin.

After the conclusion of the Franco-Russian alliance in 1897, Russian loans, state and municipal, found a ready market in France. French capital was strongly interested in the Russian mining and metallurgical industries. French money was heavily invested in the coal and iron industries of the Donets basin. British capitalists specialized in the Caucasian oil fields and in the textile industries which grew up in the neighbourhood of Moscow. Germans were active in the electrical industry. A number of Russian streetcar lines were built with Belgian capital. There was some British and U.S. mining and engineering development in the Ural mountains and in Siberia.

Partly because of the stimulus of an inflow of foreign capital that averaged 200,000,000 gold roubles (about \$100,000,000) annually during the years before World War I, partly because Russia was a new country, from the industrial standpoint, with great possibilities of development, the pace of industrial advance during the last decades of the 19th century and especially during the first decade of the 20th was very swift.

Russian industry before World War I was located mainly in four areas, Moscow, St. Petersburg, the Donets basin and the Urals. (The Polish industrial basin of Dabrowa-Sosnowiec was a fifth area until Aug. 1914, when it was occupied by the Germans; in Nov. 1918 it became part of Poland.) St. Petersburg and Moscow, the two largest cities in Russia, were natural markets for industrial goods. St. Petersburg developed, in the main, heavy industries, of which the Putilov metalworks was one of the largest. Moscow specialized in textiles and consumers' goods. It was able to draw on the coal field southeast of Moscow for fuel. The Donets basin, with its coal deposits, and the adjacent iron ore of Krivoi Rog formed the natural basis for an iron and steel industry. The Urals possess iron, coal, copper, asbestos and other valuable minerals.

The outbreak of war in 1914 interrupted Russia's industrial

progress and placed a heavy strain on its growing but inadequate economy. Russia was largely isolated from its allies, France and Great Britain, and its industries and its transport system could not measure up to the needs of the huge army that was mobilized. Production for civilian use declined and inflation began to make itself felt in the later years of the struggle. While Russia was normally self-sufficient in staple foodstuffs and exported large quantities of cereals to western Europe, the overloading of the railway system and the tendency of the peasants to hold back their products from the market as they found that they could not buy a normal equivalent in manufactured goods led to food shortage in the towns, where the population had swelled because of the growth of the munitions industry. Food riots in Petrograd were the beginning of the overthrow of the imperial regime in 1917.

The national economy deteriorated rapidly during the eight months which elapsed between the March Revolution of 1917 and the Bolshevik revolution of Nov. 7. The bases of social and economic order were shaken to their foundations. The peasants began to seize the land of the larger owners. There were continual workers' strikes and demonstrations, partly for political reasons, partly because the provisional government proved unable to check the inflationary trend and there was a continual rise in the cost of living. A good deal of class hatred entered into the strikes and in some cases unpopular employers and engineers were driven away from the factories, which the workers undertook to operate themselves. The Bolshevik revolution brought into power the most extreme group of Russian Socialists. It was immediately followed by a decree nationalizing the land and expropriating all large holders. A decree of Nov. 27 subjected industry to a system of workers' control. The banks were nationalized on Dec. 27.

War Communism.—It was not the immediate purpose of the Bolsheviks to nationalize all industry and trade. Lenin recognized Russia's technical backwardness and the difficulties of abruptly instituting full-fledged socialism in a land where the peasants constituted the great majority of the population. For a few months after the conclusion of the treaty of Brest-Litovsk with the Germans in March 1918, Lenin was inclined to emphasize the necessity for labour discipline and skilled management; he asserted that it would be profitable for the new regime to hire bourgeois specialists in order to obtain a smooth flow of production.

But as the civil war became more intense, the Soviet government found itself driven from one measure to another in the direction of establishing complete control over the industrial plant, the manpower and the labour of the country. The factory owners, as a class, were naturally hostile to the new regime; many of them fled, abandoning their enterprises. The sugar industry was nationalized on May 2 and the petroleum industry on June 17, 1918. A decree of June 28 clearly pointed the way to the expropriation of the private industrialist; it provided for the nationalization of the largest undertakings in the mining, metallurgical, metalworking, textile, electrotechnical, pottery, tanning and cement industries. A decree of Nov. 29, 1920, completed the process by declaring nationalized all enterprises that employed more than ten persons, or more than five if motor power were employed.

Foreign trade was nationalized (it practically ceased to exist during the years of civil war and blockade) and on Nov. 21, 1918, private trade within the country was forbidden. In theory, Russia was supposed to live under a gigantic rationing system, with city dwellers receiving food products and manufactured goods on ration cards and the peasants delivering up their surplus produce in exchange for manufactured goods from the towns.

In practice, this system could not and did not work out effectively, because the government lacked both the goods and the technical organization to make it function with even passable efficiency. There was a good deal of surreptitious barter between city and village, and town dwellers obtained about as much food from those theoretically illegal operations as they received on their ration cards.

New organizations came into existence to administer this new system. One of the most important of these was the supreme

economic council, established on Dec. 15, 1917. Originally, it had been conceived as a body which would supervise the whole economic life of Russia, but its functions were gradually restricted to the management of industry.

The council of labour and defense (S.T.O.) assumed considerable powers, it may be described as a kind of war economic cabinet. The food commissariat, which took charge of the distribution not only of food but also of manufactured goods, occupied a key position in the scheme of War Communism. The commissariat for transportation operated the railways and waterways on semimilitary lines; the commissariat for agriculture, especially in the later phases of the War Communism period, tried to direct the peasants as to their selection of crops and their sowing.

Money tended to lose all value under this system. The rouble had declined considerably in buying power when the Bolsheviks came into power. Unchecked use of the printing press and the fact that the distribution of both food and manufactured goods was supposed to be on a rationed basis soon led to an inflation as sweepingly destructive as that of Germany. A new currency had to be built up when a new policy was adopted. Toward the end of the period of War Communism, such things as housing, transport and public services were supposed to be supplied free to all citizens.

Another feature of the period was the attempt of 1920 to use armies, under military discipline, for labour tasks. This was a pet idea of Trotsky, who believed that the terrific jam in production could be broken by the same methods that had led to the defeat of the Whites in the civil war: mobilization of labour under conditions of stern discipline, accompanied by fiery emotional appeals. The labour armies, however, proved a fiasco and were soon discarded.

Considered as an economic experiment, War Communism was a disastrous failure. There are few parallels in history for the collapse that overtook Russia's productive forces. By 1920 the big industries were producing 18%, the small industries 43%, of their prewar output. The prostration was most complete in the heavy industries. Pig iron was down to 2.4%, iron ore to 1.7%, of the prewar figure. The output of copper ceased entirely. The railways, which suffered from the depredations of both sides during the civil war, crawled along with an ever-increasing percentage of damaged and disused locomotives and freight cars. In Jan. 1917 there were 537,328 freight cars in the country, of which 4.2% were out of use; by the end of 1919 the number of freight cars had diminished to 244,443, of which 16.6% were damaged. There were 20,394 locomotives (16.5% out of commission) in Jan. 1917 and 8,955 (47.8% unfit for use) at the end of 1918.

Wages and productivity of labour declined tremendously, while a large part of the city workers dispersed to the villages in search of food. The average wage of the Russian worker during these bleak years was little more than one-third what it has been under the tsars. Productivity of labour in 1920 was only 26% of the average of 1913.

Agriculture was also hard hit by the crisis, although the peasants, until actual famine devastated a great area of the Volga valley and of the Ukraine in 1921-22 (see *History*, above), suffered less from hunger than did the city dwellers. The Russian harvest of cereals, which had averaged about 80,000,000 metric tons in the pre-1914 years, declined to 50,000,000 tons in 1920. The tendency of the peasants was to concentrate on food crops and to cease planting other market crops, or at least to cut down the acreage substantially. By 1920 the area under flax had declined by 50% as compared with the prewar average, that under sugar beets by 74%, that under cotton by 87% and that under tobacco by 90%.

The cities of northern and central Russia lost more than one-third of their population between 1916 and 1920. Many Russian town dwellers, especially among the labouring classes, had friends and relatives in the country, and there was a widespread impulse to go back to the villages, where, in spite of the requisitions, there was more chance of getting food.

The effect of War Communism was temporarily to frustrate the realization of almost every Communist economic ideal. Lenin and his associates believed in a state order based on the industrial proletariat as the ruling class and were eager to see Russia trans-

take and surpass the leading capitalist countries in quantity and efficiency of production. They were also convinced, as Marxists, that large industrial units would supplant small and medium ones. The actual circumstances of life under War Communism tended to contradict all these ideals. The working class was dispersing and a good many of the workers who remained in the factories turned into small speculators, making little objects of daily use which could be sold or exchanged for food. The big factories in many cases stood idle or worked at a fraction of their normal capacity for lack of machinery and raw material. The Communists in theory were worshippers of modern efficiency, of the machine. But the storm of social revolution and civil war had destroyed most of what little efficiency and mechanization had formerly existed in Russia and threatened to throw the country back into extremely primitive forms of economic life.

It would be incorrect to regard War Communism as an experiment undertaken entirely for its own sake. Many of its features were almost inseparably associated with the hard exigencies of civil war. It was impossible, for instance, for the Soviet government to give the peasants any adequate supply of manufactured goods when the factories, often cut off from sources of raw material, were unable to work at normal capacity and when war needs took precedence over everything else. Requisitioning evoked much bitterness in the villages and was accompanied by many abuses. But the army and the cities could not have been given even a minimum food ration without requisitioning.

The New Economic Policy.—An uprising of sailors in the important naval base of Kronstadt in March 1921 sounded the doom of War Communism. There had already been sporadic peasant revolts in the Ukraine, in Tambov province, in Siberia. But the revolt in a fortress so close to Petrograd, a fortress which had always been considered a stronghold of Communism, was interpreted by Lenin as a definite warning that other economic methods must be tried. The tenth congress of the Communist party, which met in Moscow in March 1921 and was strongly affected by the news of the Kronstadt rebellion, adopted without opposition Lenin's proposal that a tax in kind, of about one-tenth of the peasant's produce, should be substituted for the former arbitrary requisitioning of all the peasants' surplus. This was the cornerstone of the New Economic Policy, or N.E.P., as it was generally called; a number of other changes inevitably followed.

Since the peasant was given the right to sell his produce, private trade within the country automatically became legal. A whole new class of so-called *nepmen*, shrewd and cunning speculators who had survived all the rigours and repressions of War Communism, emerged from hiding and commenced to play a conspicuous part in Soviet life. Small private business was again permitted. The slack accounting and financial methods of War Communism were revised, and the trusts or organs of management for the state industries were required to balance their budgets and, if possible, show a profit. Payment of rent and taxes and charges for public services were restored.

The rouble was stabilized at its old value of 51 2 cents (U.S.) and for a short time this new Soviet currency was freely interchangeable for foreign currencies. This situation soon came to an end, however; both the export and the import of roubles into Russia were forbidden and the Soviet currency remained strictly reserved for internal use. There was a vast discrepancy between the official value of the rouble and its quotation on the black market.

The adoption of the New Economic Policy, coinciding as it did with the end of the civil war, broke the many vicious circles in which Soviet economy had become entangled. The curve of industrial production, of agricultural output, of wages and of productivity turned upward. Houses were repaired and made habitable. The cities again filled up. The light industries which produced goods for everyday use were first to recover; but in time the coal and iron mines of the Donets basin and Krivoi Rog, the oil wells of Baku, the metal and machine factories of Leningrad and Kharkov and other industrial centres were again able to set their wheels in motion and to work up to normal productivity.

and the syndicates. A trust, which was entirely state-owned, administered an industry or part of an industry, and in some cases a number of trusts combined and vested selling functions in a syndicate. The supreme economic council continued to function as a general state board of direction for industry. A body that began to acquire more importance in the late '20s was the Gosplan, or State Planning commission. Originating as a commission attached to the council of labour and defense, it assumed the function of endeavouring to plot the graph of the national economic development by publishing so-called control figures, in which the output of the coming year in every branch of national economy was laid down. There were distinct limits to this planning under the N.E.P., because the peasants, the private traders and small businessmen were outside its scope. But it acquired increased significance in the third phase of Soviet economic life, that of planned economy.

It had been a part of the New Economic Policy to grant concessions to foreign capitalists and businessmen. While the Soviet government refused either to restore integrally the properties of foreign business firms which had seized or to pay compensation for the seizures, it professed willingness to lease various mines and factories, which it lacked resources to operate itself, to foreign concessionaires. The two largest concessions which were granted were for the exploitation of gold fields in the Lena river region of Siberia and for the development of manganese mines in the region of Chiatura in Georgia. An Anglo-U.S. group obtained the first concession, the Averell Harriman interests the second. Concessions enjoyed their most flourishing period during the years of the N.E.P. They never, however, played an important role in Soviet economic development. They were practically all wound up and liquidated during the first five-year plan. Russia's industrialization was financed entirely by the sacrifices which were imposed on the Russian people.

Although the New Economic Policy was a period of industrial and agricultural progress and of a rising standard of living after the appalling depression of War Communism, it contained some features that were disquieting to the Communist party. There was a feeling that capitalism was undermining the bases of socialist economy. Elbowed out in the struggle for power that went on behind the scenes after Lenin's death, Trotsky directed criticism against the alleged compromising of socialist principles by Stalin, who emerged more and more as the outstanding leader of the Communist party and, consequently, of the Soviet regime.

While the New Economic Policy was an immense improvement, from the peasants' standpoint, over War Communism, it did not prove able to adjust satisfactorily the relations between city and village. The theoretical buying power of the peasant was considerably increased, for two reasons. With the recent memory of inflation and worthless paper money, he had little incentive or desire to save. He could not use his money, as the thrifty peasant before 1914 would have done, to buy land and enlarge his farm, for the purchase and sale of land remained forbidden. Consequently, the peasant's instinct was to spend his surplus money for consumers' goods, and the light industries were never able to satisfy his needs. Shortage of manufactured goods, high prices and poor quality became constant peasant complaints, and by 1928 there was already a tendency for the peasants to carry out a kind of slowdown strike, to raise less for the city market, which did not seem able to give them a fair equivalent in exchange.

Perhaps the basic cause of the liquidation of the N.E.P. was the fundamental incompatibility between socialist industry for the towns and small peasant proprietorship in the villages. One system or the other had to be greatly modified, and Stalin decided that it would be possible both to cut the ground from under the feet of his critics within the party and to find a way out of the economic crisis by driving toward the double goal of a highly industrialized state and an agriculture that would be mechanized and placed under strong state control. For a political account of the N.E.P. see *History* above.

First Five-Year Plan.—Industrialization and collectivization of agriculture dominated Soviet life during the first five-year plan, which was shortened to four and a quarter years and ran from

Oct. 1928 until the end of 1932. The task which the government had set was a formidable one and could probably only have been realized by a regime which possessed absolute political power and the will to use that power with utter ruthlessness. Labour under the N.E.P. had been free and there were between 1,000,000 and 2,000,000 unemployed who received state and local relief. The effect of the five-year plan, with its many new factories and tremendous demand for labour, was to wipe out unemployment and to create a labour shortage. This led to a growing tendency to attach the worker or the engineer to his job, to forbid him to leave under threat of legal penalties. Forced labour on a large scale was introduced for the classes which were doomed to economic extinction under the new policy, the kulaks and the nepmen. The O.G.P.U., or political police, was constantly carrying out roundups of suspected elements in the cities, a familiar penalty being an administrative sentence to work on one of the new enterprises; and there were mass deportations of kulaks and their families from their native villages to timber camps and new industrial plants, where they were set to work at unskilled labour for bare subsistence rations.

A marked characteristic of Russia throughout the first five-year plan was the acute shortage of foodstuffs and of manufactured goods. There were several reasons. Agriculture was in a state of turmoil and upheaval. The dispossessed kulaks, being the better farmers, had produced a larger than normal share of food and other crops. Their elimination left a vacuum that was not immediately filled. Moreover, everything was subordinated to the needs of the heavy industries. Foodstuffs that were very short in Russia were shipped abroad to obtain foreign exchange to finance the purchases of machinery and equipment for the new industrial plants. Transport was under a heavy strain, and food products were often not brought from places where there was a surplus to places where there was a lack. There was a vast influx of peasants into the cities and new industrial towns, and this meant an increased demand on all sources of supply.

Rationing, unknown since the end of the civil war, was reintroduced. Money to a very considerable extent became devalued. The insufficient supplies in the state and co-operative shops were distributed on a rationed basis and a system grew up under which every institution or factory had its own shop or its own restaurant, exclusively for the use of its own employees. Private trade again became illegal, in fact if not in law, the supply of goods in the private markets diminished and prices soared. The purchasing power of the rouble in free trade shrank by 90% or more. How much money a man earned became less important for his well-being than what type of shop or restaurant he was permitted to patronize.

Some observers, both in Russia and abroad, foresaw disaster in this reversion to some practices of War Communism. But this third phase of the Soviet economy developed under much more favourable auspices than the primitive experiment of 1918-21. There was no distraction by war and all the mobilized energy of the country could find expression in new industrial construction. A younger generation had grown up under the influence of the Soviet schools and the Young Communist league, indoctrinated with the ideas of the new regime and willing to endure hardship and to smash pitilessly any opposition. The Soviet Union was no longer blockaded and cut off from the outside world. It was possible to engage the services of thousands of foreign engineers and technicians, mostly Americans and Germans, to direct the building and the first stages of operation of the factories, mines and electrical power plants which were part of the scheme of industrial development.

So, although the human and material costs of this experiment in planned economy were prodigious (there were millions of deaths from famine and related diseases in the Ukraine and in the northern Caucasus in 1932-33, and the casualties among the deported kulaks and other "class enemies" of the Soviet regime were considerable), the political structure successfully withstood the strain. By the time the plan was completed a considerable stride had been taken toward the goal of making Russia industrially self-sufficient.

Some industries that had been nonexistent or negligible before

the five-year plan, such as the manufacture of tractors, automobiles and motor trucks, were put on a mass production basis. Indeed, the advance of the tractor and agricultural machinery industries was intimately bound up with the Soviet scheme for the collectivization of agriculture. Beginning in 1929, a mass drive was launched to induce the peasants to give up their individual holdings and organize themselves into collective farms (kolkhozes). It was made inconvenient not to join these collective farms; anyone who opposed the change was likely to be denounced and sometimes arrested and deported as a kulak.

Co-operative farming had not been unknown in Russia before this great change in the national agricultural system. While the overwhelming majority of the peasants farmed their allotments on an individual basis, restricted only by the prohibition against buying or selling land, there were a few communes and a somewhat larger number of artels. The members of a commune (mir) usually lived together in a common dwelling and shared equally the produce of their labour. The artel was a looser form of association, in which land and working animals were pooled, the members retained their own homes and the output was shared in proportion to the amount of labour and equipment which each member contributed. It was the artel that furnished the approved model for the collective farm. A typical collective farm included about 100 peasant families as members, with between 1,000 and 1,500 ac. of land. A small village would often be transformed into a single collective farm, while a larger village would be divided into several collective farms.

The collective farms went through several changes of organization. The type of organization that prevailed before World War II was as follows: the collective farm was an inalienable unit; its boundaries could not be changed; the members possessed the right to cultivate individual gardens and to possess cows and keep pigs, fowl, sheep and goats. Their main work, however, was supposed to be for the collective farm and they were paid, partly in kind, partly in cash, on the basis of the quantity and quality of the work performed. The president of the collective farm was elected by the members, but, as in all Soviet elections, the local Communist cell, or group, exercised a good deal of influence in the selection. The larger machines, tractors, harvesting combines, threshing machines, were not sold directly to the collective farms. They were placed in machine-tractor stations, state-controlled organizations which undertook to cultivate the land of the collective farms within a given radius of territory. Payment for this service was made in kind. Receipts from the machine-tractor stations and from the fixed quantities of grain, cotton, sugar beets and other products, which the collective farms were required to sell to the state at a price so low as to be practically nominal, assured the food supply of the cities and of the army. After deductions of the payments in kind for tax and debt obligations, the peasant might sell his share of the crop, so far as this was not required for his own needs, either individually or through a co-operative to which he might belong. He was also free to sell his vegetables, poultry, eggs and small animals.

The unfamiliarity of this system, together with the lack of trained organizers and the excesses of zeal on the part of some local officials, made its first years very difficult and led to a tremendous destruction of livestock that depleted the country's normal output of meat and dairy products for several years to come. The ravages of civil war, which had been generally more than made good by 1929, were repeated on an even larger scale during the stormy first years of collectivization. As the peasants became resigned to the inevitability of the new system, as the supply of machinery increased and managerial capacity improved, collective farming struck firmer roots in the Russian soil.

The degree of realization of the first five-year plan was mixed and spotty. Heavy industry certainly received a powerful impetus and the ground had been prepared for further progress by the erection of such large factories and hydroelectric power installations as the Magnitogorsk iron and steel works, the Kuznetsk iron and steel plant, the tractor factories at Stalingrad and Kharkov, the Moscow and Gorki automobile plants, the agricultural machinery works at Sverdlovsk, the chemical plants at Berezniki and

Stalingorsk and the Dnieper dam and power plants, which were designed to supply power to several newly built factories. On the other hand, the desired figures of agricultural production were not realized and the parts of the plan which had provided for an increased standard of living, even specifying the increased amounts of meat, eggs and butter which should be available, were entirely unfulfilled. General living conditions during the first five-year plan were bleak and hard, more suggestive of war than of peace.

(W. H. CH.; X)

Second and Third Five-Year Plans.—The second five-year plan, covering the years 1933–37, was followed by a third plan for 1938–42 which was interrupted by World War II. During the first five-year plan 17 new blast furnaces, 45 open-hearth furnaces and many rolling mills were built. During the second five-year plan 20 blast furnaces, 86 open-hearth furnaces and 49 rolling mills were built. Compared with the period before World War I (1913=100) the index number of industrial production stood at 380.5 in 1933 and rose to 908.8 in 1938. Reporting to the 18th congress of the All-Union Communist party on March 10, 1939, Stalin stated that as regards the technique of production and the rate of growth of industry the Soviet Union had already "overtaken and outstripped" the principal capitalist countries. He insisted, however, that the economic power of a country's industry was expressed not by the volume of industrial output alone but also by the volume of production per head of population. In this respect, the U.S.S.R. was still lagging behind because in 1938, the first year of the third five-year plan, the country produced only 37 kg. of pig iron per head, as compared with 145 kg. in Great Britain. In order to outstrip the United States, Stalin said, the Soviet Union should aim at a yearly pig-iron production of 50,000,000 or 60,000,000 tons.

As to the collectivization of agriculture, by 1938 there were 242,400 kolkhozes uniting 18,843,000 peasant households, or 93.5% of the total, and holding together a crop area of 289,000,000 ac.; that is, 85.4% of the total. The total crop area, which was 259,500,000 ac. in 1913, had increased by 1938 to 338,300,000 ac., of which 255,000,000 ac. were under grain, 27,200,000 ac. under industrial crops, 23,200,000 ac. under vegetables and 34,800,000 ac. under fodder. The total number of tractors employed increased between 1933 and 1938 from 210,900 to 483,500, of which 394,000 were in 6,350 machine-tractor stations and 85,000 in sovkhoses, or state farms.

The sovkhoses, created under the first five-year plan, were worked by hired labour under a state-appointed management. Through their new techniques they were meant to have a propaganda value among the peasants unwilling to join the kolkhozes; their purpose was also to produce high-quality grain for sowing, to promote the breeding of pedigree livestock and to produce marketable foodstuffs to be sold in state-owned shops. By 1934 the sovkhoses owned a total area of 207,974,000 ac. of land, and their sown area amounted to 35,568,000 ac. In 1936 it was decided to reduce the latter area. By 1938 there were 3,961 sovkhoses with a total cultivated area of 30,628,000 ac.; they were employing 1,300,000 workers. While mixed farming was reserved to kolkhozes, the sovkhoses specialized in certain lines of production. In 1938 they were distributed as follows: grain 478; meat and dairy produce 769; pigs 659; sheep 204; horses 119; poultry 102; other livestock 62; fruit and vegetables 474; market gardening (near the larger cities) 723; industrial crops and other types 371.

World War II and the Soviet Economy.—Russian losses during World War II were staggering, for the German armies rapidly overran the most productive areas of the country. According to figures subsequently given by N. A. Voznesensky, head of the State Planning commission, about 40% of the population of the Soviet Union lived in the areas overrun by the Germans in 1941; these areas also accounted for about 66% of Soviet heavy industries, 38% of its grain and 30% of its cattle. In the following year, the loss of the Maikop area involved an important centre of high-grade fuel extraction, and in general it was estimated that the output of oil fell from 31,000,000 tons to 18,000,000 tons between 1940 and 1942. Between one-fifth and one-quarter of the

capacity of the engineering industry and 40% of the capital equipment of the food industry was also reckoned as lost.

According to Voznesensky the number of workers in the occupied areas was reduced by the end of the war to a mere 1% of the former figure and the number of industrial plants to 13%. Almost two-thirds of the cattle and four-fifths of the horses had been lost. Productive resources destroyed included 31,850 factories employing 4,000,000 persons, 98,000 collective farms, 137,000 tractors, 49,000 combines, 13,000 railway bridges. In addition, the homes of perhaps 25,000,000 people, together with schools, hospitals, cultural and scientific establishments and every form of material wealth had been ground to rubble; in all, about two-thirds of the entire capital of the occupied areas.

The evacuation at high speed of much industrial plant to the eastern regions away from the war fronts was a fundamental factor in the Soviet war achievements. The population evacuated to work in the new and expanded industries, which may even have numbered more than 12,000,000 persons, suffered terrible hardships from the severe climatic conditions and from the lack of housing as well as from food shortages. Such, however, was the lot of the civil population throughout the U.S.S.R. The industrial and agricultural output in the Urals, Siberia, central Asia and the Volga area rose sharply. The coal production of the Kuzbas and at Karaganda was increased to make up for the loss of the Donbas, and, in the actual output of guns, tanks, aircraft and ammunition, Soviet industry seems to have been able to meet the demands of the great offensives of the later years of the fighting.

Postwar Five-Year Plan.—The major task of the Soviet Union in the postwar years was that of reconstructing its internal economy. The advances made in the eastern areas were not abandoned and were indeed extended, much importance being attached particularly after 1950 to new projects for hydroelectric works and irrigation. But the overrun European provinces of the Soviet Union had also to be restored. Reparations were exacted from the former enemy states, and favourable trade treaties with the Soviet Union's western neighbours brought other foreign resources to her aid; but the decision to reject aid from the European Recovery program after the Paris conference in July 1947 meant that the main basis of reconstruction was the work of the Soviet peoples themselves.

†Including the annexed territories in the west.

‡Bread grain and coarse grain together. According to Soviet statistics in 1938, for example, 69% of all grain produced was bread grain (wheat 30.9, rye 24.5, buckwheat 1.1, millet 2.1 and rice 0.3). After 1933 the Soviet grain crops were determined in the field before the harvest. Detailed analysis by Naum Jasny (*The Socialized Agriculture of the USSR* [1949]) shows that from 1947 Soviet official estimates of the grain crops are around 25% higher than the actual crops.

TABLE XIII.—Livestock
(In million head)

* Livestock	1913*	1929	1930	1933	1938	1940†	1950 (plan)	1950 (actual)	1951
Cattle	60.6	45.8	67.2	38.4	63.2	71.0	65.3	57.4	58.8
Pigs	20.0	15.1	20.7	13.1	30.6	35.1	31.2	24.5	25.7
Sheep and goats‡	131.3	91.1	146.8	50.2	102.5	108.5	121.5	99.0	107.5

*Russia before World War I in 1913 frontiers.

†Including the annexed territories in the west.

‡Number of goats (in million head) was 8.2 in 1913, 6.8 in 1929 and 23.5 in 1939.

During the postwar period the methods of economic organization pursued were not substantially different from those of the 1930s. A new five-year plan (1946-50) was adopted by the supreme soviet in March 1946. Apart from electricity and coal the output targets were lower than those which were to have been reached in 1942 but for the German attack.

In a speech of Feb. 9, 1946, Stalin directed that in the shortest possible time the Soviet Union must heal the wounds inflicted by the enemy and not only recover the prewar level but even surpass this level in the near future. "We must," he said, "achieve a situation wherein our industry is able to produce annually up to 50,000,000 metric tons of pig iron, up to 60,000,000 tons of steel, up to 500,000,000 tons of coal, up to 60,000,000 tons of oil. Only under such conditions can we regard ourselves as guaranteed against any accidents. This will require perhaps three five-year plans, if not more. But this task can be accomplished, and we must accomplish it."

On the whole the published figures suggest that the 1946-50 plan was successful, many of the targets originally set being reached by the end of 1949. During the period of the plan, the output of coal rose by roughly 75%, that of oil and electricity by 100%, that of pig iron and ingot steel by more than 100% and that of rolled steel by nearly 150% (indicating the great emphasis placed on machinery). The figures all show the eastward trend in the main centres of output as regards coal, steel and oil, with obvious strategic implications for any would-be attacker of the Soviet Union's western frontiers. In estimating the effect of these achievements on the lives of the people it is necessary to bear in mind the growth in population, the relative neglect of consumer-goods industries, the lag in rehousing and certain marked failures on the agricultural side, particularly as regards livestock. An ambitious scheme of afforestation announced in 1948 and the plans for irrigation were directed clearly toward improving the position, by making more land available for cultivation and by eliminating the periodic droughts.

The war and the destruction of much agricultural machinery had forced some relaxation of agricultural collectivization—a development seemingly welcome to much of the peasant population. Measures were taken to restore the prewar system in full vigour, and in 1950 a campaign was started for amalgamating the kol-

khoses into larger units and for assisting thereby in the ultimate Communist objective of assimilating rural and urban labour conditions.

By the beginning of 1950 a drive was started by N. S. Khrushchev, a member of the Politburo, for building of "agrotowns" (*agrorodny*); that is, barracks for proletarianized peasants working in the "large grain factories" of which Stalin dreamed in 1929. But by April 1951 all propaganda for the vision of agrotowns had ceased, and the project was temporarily abandoned because the building industry could not fulfil its part of the new program.

After World War II collectivization of agriculture was ruthlessly enforced upon the populations of the areas annexed to the Soviet Union. By Jan. 1950 the total number of kolkhoses had increased to 254,000 and that of sovkhoses to 4,540. Many smaller kolkhoses were merged to form bigger ones and by March 1951 their total number was reduced to 123,000. All this

was being done with a triple aim in mind: first, to crush the recalcitrant peasantry, which might undermine socialist agriculture by passive resistance; second, to release more manpower for industry; and, third, to increase agricultural production.

The insufficiency of the agricultural output remained the most striking weakness of the Soviet economy. Between 1940 and 1950 the gross output of Soviet industry was said to have increased by 73%; in the same period agricultural production was said to have increased only by 7%. In 1950 the total sown area was about 360,766,000 ac., which was only 22,485,000 ac. more than in 1938 (that is, before the 1939-45 annexations) and 30,000,000 ac. less than envisaged in the 1946-50 plan. The total grain production in 1950 allegedly amounted to 124,700,000 tons; that is to say, to 2,300,000 tons less than planned but to 5,700,000 more than in 1940. But if the Soviet statistics in general are not reliable, those concerning agricultural production are especially misleading. In 1933 the Soviet Union turned to estimating its grain yields and crops in the fields before harvest. The yields and crops thus established are called "biological." According to the analysis by Naum Jasny, the actual grain yields and crops in the years 1933-39 were thus exaggerated by 20%. After 1947 the only official estimates were those made, in general figures, by the central government; for grain crops they were about 25% higher than the actual crops.

The year 1951 was the last of a special three-year plan for the development of animal husbandry; but from a report published by the Central Statistical administration of the U.S.S.R. it was known that by the end of 1951 the Soviet Union had fewer cattle and fewer sheep than the prerevolutionary Russia, and fewer pigs than in the smaller territory of 1938.

Five major hydroelectric schemes were started in 1950 and 1951, including two power stations on the Volga, at Kuysyshev and Stalingrad, and one near Kakhovka on the Dnieper, with respective capacities of 2,000,000, 1,700,000 and 1,200,000 kw. In connection with these schemes work was begun on two big canals: the Volga-Don canal for ocean-going ships and the South Ukrainian canal which was to continue as a North Crimean canal through Dzhankoy to Kerch. The construction of the main Amu-darya-Krasnovodsk canal was calculated to alter fundamentally the situation in western Turkmenistan. A system of water reservoirs and smaller waterways would irrigate 3,700,000 ac. in the Ukraine and the Crimea; an area equal to that of England between the lower Volga and the Ural rivers; and about 20,000,000 ac. in Turkmenistan. The planting of forest shelter belts along the watershed between the Volga and Ural rivers, west of the Volga from Stalingrad to the Caucasus and across the Don and Donets was also started to protect southern Russian and the Ukraine against the desiccating power of the *sukhovey*, a hot, dry east wind.

For the development of the Soviet Union's industrial and agricultural production and for the numbers of its livestock, both as contrasted with prerevolutionary output and as affected by the five-year plans, see Tables XI, XII and XIII. (K. Sm.)

Fishing and Hunting.—The fishing industry was completely reorganized by state trusts after the revolution and achieved a high degree of efficiency. At all the main fishing centres there are collective stations which supply motorboats, equipment of all kinds, repair facilities and trained mechanics. On the eve of World War II the fishing industry employed about 220,000 fishermen and about 130,000 other workmen, the total annual catch being 1,600,000 metric tons of fish.

The Caspian sea provides rich fishing grounds and yields more than one-third the total annual Soviet catch. Ashtrakan at the mouth of the Volga is the chief centre of the industry, whence pike, bream, perch, roach, herring and sturgeon are dispatched by the Volga waterways to the densely populated regions of European Russia. The sturgeon from which is obtained the renowned Russian black caviar is caught in the lower reaches and delta waters of the Volga.

The far east became the second most important centre of the industry in the union after the revolution. The main fishing grounds are near the mouth of the Amur river and off the shores of Kamchatka, and large catches of herring, salmon and other fish

are landed. The development of these far eastern fisheries was at first delayed by a number of factors, chiefly by the great distance from the areas of consumption in the west, by lack of labour and by the acute shortage of salt (which had to be brought from the Black sea). Rich salt deposits were later discovered in northern Siberia near the Khatanga river, and salt is shipped from Kozhennikov (Nordvik), at the mouth of the Khatanga, to the far east via the Arctic and Pacific oceans. There are large canneries and refrigeration plants, and most of the catch is canned and some of it exported.

The northern fishing industry is centered on Murmansk, which has a large trawl-fishing station and also important canning and refrigeration plant. Cod and herring are the main catch. Archangel and Kandalaksha are also important centres, both possessing large canneries. The rivers and seas of the Soviet Union abound in fish, and fishing is a supplementary occupation in many regions, particularly in the Black sea, the Sea of Azov and at the mouths of the Ob, Yenisei and Lena rivers in Siberia. Breeding ponds for fresh-water fish were constructed near Moscow and Leningrad to supply the large urban markets.

Hunting and fur trading were reorganized by the government on a co-operative basis. At suitable points in the valleys of nearly all the rivers of Siberia fur-trading stations were established. Originally the native tribesmen had been the hunters and had traded their furs to Russian merchants. Gradually the Russians themselves became the main hunters, but the tribesmen were still active; in 1925 a congress of native hunters in the far east met to discuss better methods of hunting and barter. Trading in furs is closely supervised by the government as furs continue to be a valuable export. The furs of greatest importance in order of total value are squirrel, wolf, ermine, hare, fox, skunk, bear, marten, Siberian skunk, lynx, wildcat and sable. Seals and beavers are also hunted, but the sable, once so numerous and important, has been almost exterminated. Hunting normally continues from October to March, and closed seasons are enforced. In the far east and also in Siberia farms have been established for breeding fur-bearing animals, and in the north of Siberia a number of reindeer state farms operate.

Economic Divisions.—The U.S.S.R. may be considered as comprising the following economic areas:

1. **The northwestern area**, comprising the Karelo-Finnish S.S.R. and the Leningrad, Novgorod and Pskov regions, contains extensive forests and valuable mineral resources which were developed greatly after the revolution. The transport facilities include railways, the White sea-Baltic canal and the two well-equipped ports of Murmansk and Leningrad, which made this development possible. The timber industry and pulp, paper and cellulose manufacture are the most important industries of the area, three-quarters of which is covered by dense forests. More than 30% of the Soviet Union's paper is manufactured at Kondopoga, Leningrad, Kandalaksha and other towns in the area, which yields also about 20% of the entire Soviet timber export (and the quantity exported was by 1952 eight times greater than it had been in 1912). In Karelia about 60% of the population is engaged in the timber industry.

The area is studded with lakes into which flow rivers and streams suitable for generating hydroelectric power. A number of these rivers were harnessed, and of the 24 hydroelectric stations operating in 1939 in the Soviet Union seven were in the northwestern area. The development of industries and the working of the mineral resources was formerly restricted by a lack of coal, but the provision of adequate electric power removed this obstacle. Electric power is largely used by the factories of Leningrad, but peat fuel and brown coal mined near by are also used, as well as coal (see below). In the Kola peninsula near Lake Imandra rich deposits of apatite are worked, as also is nepheline, from which aluminum can be produced. Kirovsk, the centre of these mines, is a new town with a population approaching 50,000. Nickel, copper and iron are also mined, while in the east of the peninsula there are deposits of mica. In the southern industrial part of the area the towns of Tikhvin and Zvanka are important, the former as the centre of the valuable bauxite mines and the latter for the manu-

facture of aluminum from the bauxite. Pitkyaranta on the shore of Lake Ladoga was developed as a centre of the metallurgical industries. The deposits of iron ore in this area would, when fully exploited, make the industries of Leningrad independent of the supplies of iron ore which are hauled at heavy cost from the Ural mines.

Leningrad ranks as the third most important industrial centre in the Soviet Union, although it is almost completely lacking in raw materials. Coal, once imported from Great Britain, is hauled by rail or brought by barge from the Donbas and the Urals. Such long hauls are expensive and the industries of Leningrad began to make increasing use of local peat deposits and of hydroelectric power. Leningrad is not only the chief western port of the Soviet Union but also a great engineering centre, producing nearly 25% of the total Soviet industrial output. Machine tools, precision instruments, electrical equipment of all kinds, ships, textiles, paper and fertilizers are among the more important products of the Leningrad region.

Agriculture is restricted by the extreme climate, but much has been done to extend its northern limit. A large state farm near Kirovsk produces vegetables. Extensive use is made of the apatite fertilizers to increase the amount of land under cultivation. In Karelia the cultivated land amounted to no more than 3%, but in the Leningrad region it was more than 25%. Potatoes, oats, rye and flax are grown, and near Leningrad dairying has been developed as part of the policy to reduce the amount of foodstuffs brought long distances.

2. *The Baltic Republics.*—The Estonian republic has moderately fertile lands with rye and barley as the main crops. Dairying is the most important industry, and dairy products are sent to the Leningrad region and to Moscow in the central area. The oil shale industry, developed before World War II, is concentrated in the northeastern part of the republic. It was believed that by 1948 the oil production had reached 358,000 tons; that is, twice as much as before 1939. Tallinn (Reval) is the leading transit port of the republic and is kept open in winter by the use of icebreakers. Pärnu is a centre of woollen mills, and cotton mills are located at Narva. Lumbering is an important occupation and a certain amount of timber is exported through Tallinn and other ports.

The Latvian republic has a rich agriculture, oats, rye, barley and potatoes being the main crops. As in Estonia dairying is an important industry. Riga, Liepaja and Ventspils are the chief ports, being more or less ice-free in winter. It has been part of Soviet policy to develop the industries of Latvia and the production of agricultural machinery and of building materials has grown in importance.

The Lithuanian republic is primarily agricultural, industry having been little developed. The chief crops are wheat, oats, rye, potatoes and sugar beets, while cattle rearing, dairying and lumbering are important occupations. Vilnius, the capital of the republic, is at the junction of railways running from Moscow, Warsaw, Liepaja and Leningrad and is a market for wool, flax, timber and dairy produce. Kaunas and Klaipėda are also noteworthy, the latter being an ice-free port.

3. *The northeastern area* includes the lands within the Pechora basin in the east and the Northern Dvina basin in the west. The whole region suffers from long cold winters (with an average of 200 days of frost yearly) and short hot summers. Navigation on the four main rivers—the Onega, the Northern Dvina, the Mezen and the Pechora—begins in May and ends in September. It is during this period that logs are floated down to the ports whence they are exported or sent to mills for pulping or preparation for other uses. Dense forests cover 77% of the area and lumbering is the most important occupation. The region produces 15% of the total Soviet output of sawn timber and 33% of the timber for export. Archangel is, after Leningrad, the chief Soviet timber exporting port and an important centre of the woodworking industries. Other centres of these industries are Syktyvkar, Mezen, Vologda, Kotlas, Shenskursk, Ukhta and Vorkuta. The tundra zone in the northeast occupies about 20% of the region. Apart from reindeer farms, of which there are several, fishing is the main occupation, and Naryn-Mar at the mouth of the Pechora river is the chief fishing centre in the east. Only 3% of the region is under cultivation, and agriculture tends to be concentrated in the southwest where the climate is slightly less severe. The chief crops are rye, oats, flax and hay, the latter serving as fodder for dairy cattle.

The northwestern section, with Archangel as its centre, is the most important part of the area and contains 95% of the population. In addition to numerous sawmills, it contains pulp, paper and wood chemical industries. The tanning and dressing of hides and the construction of small ships are also carried on. Fish canning and salting are important, salt being obtained from plentiful deposits on the White sea coast to the west of Archangel. Electricity for these industries is generated locally. Coal is either imported by sea from Spitsbergen or transported by railway from the Vorkuta basin to Kotlas. The area is also served by the Archangel-Vologda railway and by another line running from Kotlas to Kirov (Vyatka).

4. *The western area*, bordered in the west until 1939 by Poland and Latvia and in the east by the central area, comprises Byelorussia and the Russian western regions of Smolensk, Bryansk and Vitebsk. Lumbering is an important occupation in the region, although about two-thirds of the forest lands have been cleared for agriculture. The comparatively small forests remaining have the economic advantage of being close to markets and the even greater advantage of growing varieties of timber not found in the vast forest expanses farther to the north. Agriculture is a valuable industry in this area, and the land under cultivation was increased from 6,000,000 ac. in 1913 to 10,000,000 ac. in 1937. On the whole the soil is poor, but through the extensive use of chemical fertilizers and through the mechanization of agriculture the yield per acre was increased. Large crops of hay, grass, potatoes, oats and barley are grown as fodder for the expanding dairying and cattle and pig breeding industries. Hemp and flax are grown extensively and the area provides about 30% of the raw materials for the whole Soviet linen industry.

The industries of the area are numerous and are mainly centred on Minsk, Bryansk, Smolensk, Vitebsk and Gomel. After the revolution the industrial output of these centres increased greatly; the volume of manufactured goods produced in the Byelorussian factories, for example, was by 1939 about 30 times greater than in 1913. The industries include important linen mills as well as the production of alcohol, starch, treacle and acetone from potatoes and the manufacture of shoes, boots, matches, textiles and dairy products. The paper and cellulose mills at Bobruisk are among the largest in the Soviet Union. At Orsha, another important textile-manufacturing centre, a dam was planned to raise the level of the Dnieper river and allow river steamers to dock in Smolensk. In addition to its historical significance as one of the old Russian merchant towns, Smolensk is an important transport and textile centre with one of the largest Soviet linen mills. In the south Bryansk contains the largest locomotive and rolling stock works in the Soviet Union, as well as cement and glass works and sawmills.

The western area has no rich mineral resources, although valuable phosphate deposits are worked at several points in the eastern part. Some brown coal is mined near Sukhobabi, at the southwestern extremity of the Moscow coal basin. Electricity is generated for the various industries by regional power stations which make use of the large quantities of peat found throughout the region. The power stations at Bryansk, Osinovsk, Minsk and Gomel burn peat fuel exclusively.

Western Byelorussia, annexed by the U.S.S.R. in Nov. 1939, is little developed and sparsely populated. It has a damp climate and poor soils. In the north, some rye and potatoes are grown and pig breeding is of importance. In the south, marsh and forest cover large areas and agriculture is restricted. Dairy farming is carried on where possible, and oats, rye and flax are sown. Much of the southern part of this area, extending into the western Ukraine, is covered by the Pripiet marshes, broken only by sandy patches and by pine forests. Marsh and bog account for about 5,000,000 ac. of land in the Byelorussian republic.

5. *The central area* includes Moscow, Vladimir, Ivanovo, Kalinin (Tver), Yaroslavl, Kostroma, Ryazan, Kaluga, Tula, Tambov, Orel, Kursk, Voronezh and Rostov regions. It is a densely populated area with more than 28,000,000 inhabitants by 1939, and is for historical, geographical and economic reasons the heart of the Soviet Union. Moscow, the capital, is the centre of an industrial area which is responsible for one-seventh of the total Soviet industrial output. The growth of the city has been striking, its population having increased from 1,618,000 in 1917 to 4,137,508 inhabitants in 1939.

The area is divided by the river Oka into the northern part which is predominantly industrial and the southern part which is predominantly agricultural. The distribution of population illustrates this division. According to the 1939 census, 50% of the population of the Moscow region and 30% of that of the Ivanovo and Yaroslavl regions was urban; in the Voronezh region 11.5% and in the Orel and Kursk regions only 8.5% of the population was urban. Agriculture is nevertheless important in the north, developed to supply vegetables and, by means of an expanding dairying industry, dairy products to the towns. Potatoes comprise more than 40% of the crop of the Rostov-Yaroslavl region and a large proportion of the crop in the Moscow region. Fodder crops for dairy cattle are widely sown. In the south, where the soils are more fertile and the climate milder, grain is a more important crop and potatoes are grown primarily as fodder for the pig-breeding industry. The Black Earth area to the south of the Oka river is extremely fertile, and the number of crops was increased to include sugar beets, hemp, potatoes, tobacco and sunflowers. A large part of this area has been devoted to fodder crops for pigs, poultry and cattle. The Kursk region became the second most important source of sugar in the Soviet Union.

The oil deposits are located near Grozny and Maikop, Krasnodar and Neftegor'sk and at Makhachkala. The Grozny oil wells have the second largest output in the Soviet Union, and Grozny has become an important manufacturing centre, producing machinery and chemicals. Other important industries are the mining of lead, silver, copper, zinc near Ordinsk (Ozarskiy) and also the manufacture of cement near Novorossiisk.

The Caucasus mountains have valuable forests and their oak, ash and beech are used in industry. Fertile lands in the valleys grow cotton, soybeans and good crops of fruit. Sheep and cattle graze on the mountain slopes. The Sulak and other rivers were harnessed to produce hydroelectric power and a number of new industries were established, notably at Makhachkala and in the Derbent district.

The mountainous country of Transcaucasia supports a great variety of crops, including cotton, tobacco, maize, tea, fruits and vegetables, while dairy farming and cattle and sheep rearing are important occupations. Nearly all the Soviet tea crop comes from this area, in particular from Adzharia and the subtropical districts of Azerbaijan. The area under tea has been greatly expanded; output was 6,400 tons in 1938. Adzharia also produces more than two-thirds of the Soviet citrus fruit crop. Other important crops of this district are silk and tobacco.

Hydroelectric stations, which are numerous in the Caucasus, are the main source of power both for transport and industry. In addition, coal is mined in Georgia, and the oil wells at Baku are of considerable importance.

Transcaucasia is rich in minerals. The manganese deposits at Chiaturs are among the richest in the world. Armenia has valuable copper deposits (mined and refined at Alaverdy and Kafan) and also valuable deposits of magnetite iron ore (mined at Dashkasan). Iron and steel are produced at Tbilisi and supplied to local industries.

Transcaucasia has an important textile industry. Leninsk, Kirovabad and Baku are centres of cotton spinning, while silks are woven at Tbilisi, Nukha and Kutais. Tbilisi is also noteworthy for clothing manufacture and for the production of chemicals, films and vegetable oils. There are throughout Transcaucasia important centres for food processing and canning and for the treating and packing of tea and tobacco. It also has a valuable timber industry based on the great variety of deciduous and coniferous trees in the Caucasian area, particularly oak, beech, maple and chestnut.

12. *Soviet Central Asia*—The vast area of the Kazakh S.S.R. is in the main barren desert land and the home of nomadic herders. The broad area of the Irtysh valley is, however, like an oasis, being extremely fertile and producing fruits and other crops. The irrigation of some areas in the southeast of Kazakhstan has resulted in an intensive cultivation which yields rich crops of rice, cotton, fruits, tobacco and sugar beets. The Tien-shan mountains contain rich deposits of silver, gold, zinc, lead, wolfram and copper.

The development of industries in the Kazakh republic followed the exploitation of its rich deposits of coal, iron ore, nonferrous metals, oil and salt. Kazakhstan possesses about 50% of the entire nonferrous metal deposits of the Soviet Union and supplies copper, zinc and lead to the industrial centres of the Urals and of the Kuznetsk basin. The Karaganda coal basin is the third most important coal field in the Soviet Union and has an annual output of more than 4,000,000 tons. Other coal mines are at Pavlodar, Mangyshlak and near Karsakpay. The great industrial development of the republic has been accompanied by considerable improvement in its communications, particularly in the railway system which links Kazakhstan with the Urals and the Kuznetsk basin.

The southern republics of central Asia are the Turkmen, Uzbek, Tadzhik and Kirghiz. They occupy a varied area of mountains, desert and steppelands. The cultivated areas are mainly in the south, where the soil is fertile but arid. Cattle and sheep are reared, but the greater part of the population is concentrated in the irrigated lands, which occupy little more than a tenth of the total area but which are intensively cultivated. Rice, cotton, fruits, raw silk and grain are the chief crops in these irrigated lands. The most noteworthy irrigation scheme is that of the Ferghana canal in the Uzbek republic which waters about 12,000 ac. Plans were adopted for extending the area of irrigation there and in other districts. Hydroelectric power is supplied by a number of stations constructed to make use of the many swift-flowing rivers in the mountainous districts. A number of coal mines are worked, particularly in the Kirghiz republic, which in 1939 had an output of 2,500,000 tons. Oil deposits are being utilized in the Ferghana valley of Uzbekistan and at Nefte Dag on the shores of the Caspian sea.

13. *The southern Siberian area* is for the greater part divided into dry steppelands, mountainous regions and coniferous forests. Development may in fact be dated from the construction of the Trans-Siberian railway. The area possesses great mineral wealth and considerable agricultural resources and has been intensively developed.

To the east the Chita region, containing fertile soils, produces good crops of wheat, oats, rye, fax and hay. The dairy industry is important. Iron, brown coal, zinc, lead, molybdenum and other mineral deposits are worked between the Shelka and Amur rivers. Ferrous and nonferrous metallurgical industries have been established at Petrovsk and in the neighbourhood of Chita. The Buriat Mongol A.S.S.R. is another area which was greatly developed under the prewar five-year

plans. At Ulan Ude (Verkhne-Udinsk) a large engineering plant has been established and the mineral wealth of the republic is being exploited. In the Irkutsk region coal, manganese and iron ore are mined and there has been considerable industrial development. Irkutsk itself has become an important industrial centre where machine tools, aircraft engines and mining machinery are manufactured, and it is the largest industrial town on the route of the Trans-Siberian railway, which connects it with the Chita region and with the Kuznetsk industrial basin.

Southwestern Siberia contains the Kuznetsk coal basin, which, making use of local deposits of iron, copper and manganese and being linked with the resources of the Urals, has become the second most important area for coal and metallurgy in the Soviet Union. The mines are well equipped, and more than 25,000,000 tons of coal were being produced annually by 1940, representing about 15% of the total Soviet coal output. The great steel industry of Stalingrad makes use of iron ore from the Magnitogorsk mines of the Urals and has an output of more than 2,000,000 tons of steel a year. Iron ore deposits are worked near Stalinsk and also at Minusinsk and Kemerovo. An important chemical industry has been developed to make use of the by-products of the coking plants. Industries producing machine tools, mining equipment, locomotives and rolling stock and agricultural and textile machinery have been established throughout the area and particularly at Novosibirsk, Leninsk, Barnaul, Prokopyevsk, Omsk and Tomsk. Communications have been developed to serve these industries, and railways were constructed in the Novosibirsk area to feed the Turkistan railway (Turkibak).

14. *The central Siberian area* lies in the basin of the middle and lower reaches of the Yenisei river, which, being navigable by river steamers and barges as far as Krasnoyarsk, has facilitated development. The mineral deposits include gold, nickel and, particularly in the Lower Tunguska and Kureyka valleys, considerable resources of coal, which are mined and sent to the industrial areas southward through Krasnoyarsk and north through Igarka. The area has rich deposits of gold, platinum and copper, and nickel is mined at Norilsk, a settlement near Dudinka. The native population depends for its livelihood on hunting, fishing and the rearing of reindeer. It has been Soviet policy to organize the reindeer industry into state farms, where more economic and scientific methods can be employed, and there are several of these farms in the central Siberian area. Fur hunting is an important occupation, and marten and sable in particular constitute a valuable export. The fishing industry has been highly developed, and collectives have been established at suitable points along the rivers and along the coast to supply equipment and handle the catch. Ut Yeniseisk has a refrigeration and canning plant, and along the lower reaches of the Yenisei fish is cured for winter food and also sent to the industrial areas in the south.

Timber in the Yenisei and its tributaries the lumber industry is important. Logs are floated down to Igarka and other points. Igarka has special importance as the main port of the northern sea route; by 1939 its population had grown to 20,000 inhabitants. It has sawmills, but in summer the timber assembled there is shipped to other centres of the timber industry. As shipping must be clear of the Arctic ocean by October, the loading must be done in September-October. This brief period is one of intense activity, and during the winter logs are sawed and stacked ready for loading in summer. Interesting experiments have been made in growing grain and vegetables in the region of Igarka and of other towns; some oats, barley, vegetables and hot-house tomatoes have been produced. Poultry, pigs and dairy cattle are reared in small numbers under special conditions. It is necessary, however, to transport flour and other supplies to Igarka by sea in summer.

Aviation has proved of great value in the development of the vast frozen expanses to the north. Aircraft regularly fly on routes linking Igarka with Krasnoyarsk, which is on the established routes to the far north and to the Far East of Russia.

15. *The northern Siberian area*, bitterly cold, has neither roads nor railways and is almost uninhabited. The greater part of the region lies in the basin of the Ob river, which is navigable only by small boats. The lack of mineral wealth and the difficulties of lumbering in the swampy land restrict the small native population to hunting, fishing and reindeer rearing for a livelihood.

16. *The Yakut S.S.R. and the northeastern Siberian area* consist of vast plateau lands including the basins of the Lena, Yana, Indigirka and Kolyma rivers. The rivers are of particular importance; in an area lacking railways and roads they provide the only means of communication. Except in the tundra zone of the far north the whole region is covered with dense forests predominantly of pine (although in the south the variety of trees is greater and includes alder, aspen and larch). The whole area is sparsely populated and the main occupations are fishing, fur hunting and reindeer breeding. At the mouth of the Lena there are deposits of silver, lead and coal; in the Yana valley silver and lead mines are worked; and in the mountains of the upper Kolyma a gold-mining industry has been developed. Verkhoyansk, on the right bank of the Yana, is the chief trading post of the area; the furs and mammoth ivory collected there are sent by sledge to Yakutsk in winter.

The plains and valleys of the middle reaches of the Lena and its tributaries are cultivated in parts; more than 250,000 ac. were sown

to barley, oats, rye and wheat in 1936. A certain industrial development has been achieved in the Lena coal basin, although the output of coal is small. Iron ore deposits are worked in the Vilyuy and Lena valleys, and gold is also mined. Plans were made to develop the lumbering industry, and the utilization of the enormous timber resources of the area was attempted on a small scale.

17. *The far eastern area*, comprising the basins of the Amur, Ussuri and Sungari rivers, has, in the Trans-Siberian railway and local lines and in its numerous waterways, good communications with southern Siberia and with the Pacific coast, where it is served by Vladivostok, the main Soviet port on the Pacific ocean. Much of the area is cultivated, and the rich mineral and timber resources have been greatly developed. Coal and lead are mined in the Zeya valley and in the Bureya valley, while the plateau between the two valleys has valuable deposits of gold. At Khabarovsk, oil, gasoline refineries and also an iron and steel industry have been established. Blagoveshchensk, a highly industrialized town, has important engineering works. The population of the region is in the main concentrated in agricultural and industrial areas where the main occupations are coal mining, lumbering and woodworking, metallurgy, leather tanning and dairying. The far eastern fisheries are extremely important to the economy of the area and of the Soviet Union itself, for they produce nearly 15% of the total Soviet catch. Vladivostok and Nikolayevsk-na-Amure, the two chief centres of the industry, have large canning factories from which fish is exported or sent to the more densely populated areas in the west. (T. Gv.)

Foreign Trade.—The management of foreign trade, a state monopoly, is in the hands of the Soviet government. Not yet a fully developed country, the Soviet Union has little to export. Early in the 1930s, when it was necessary to pay for machinery and heavy equipment imported from the United States and from Germany and other industrialized countries of Europe, the Soviet Union exported oil and oil products, but with the progress of industrialization the home consumption of oil increased and the exportable surplus was negligible. Other main items of export were timber, grain, furs, flax and caviar. From its great forest wealth the Soviet Union theoretically could export any quantity of timber, but in fact the home market was acutely in need of timber, the shortage being caused by a lack of essential machinery, of skilled lumberjacks and of transport. Even in 1930, when they reached their highest level, the value of Soviet exports amounted only to 3.5% of that of the total Soviet production; in 1938 the proportion fell to 0.8%.

Soviet imports were strictly limited to raw materials and machinery necessary to equip expanding industry. Items described as machinery, apparatus and parts, nonferrous metals and goods, iron and steel goods, and electrical equipment formed 34.7% of imports in 1929, then 66.1% in 1933 and 57.0% in 1938.

Among the trading partners of the U.S.S.R., Germany held the predominant part up to 1933; in that year it supplied 42.5% of Soviet imports and took 17.5% of Soviet exports. In 1938 the chief suppliers were the United States (28.8%) and Great Britain (16.9%). Great Britain was also the best customer, taking 17.6% of Soviet exports in 1933, then 32.7% in 1937 and 28.2% in 1938. (See Table XIV.)

After World War II the Soviet Union was able to exploit the economic resources of its satellites, buying from them at much cheaper rates and selling to them at much higher rates than the world market prices. The Soviet government declared the statistics of foreign trade a state secret, presumably because publication of the value and weight of foreign trade would inform the world at large about Soviet home shortages and would bring to the knowledge of the Soviet people the sale of grain to foreign markets by themselves were short of food, and of timber in spite of acute domestic need for housing; as also such data would expose to the satellite nations the fact that their economies were being exploited. (See Table XV.)

A. I. Mikoyan, deputy prime minister and the member of the Politburo in charge of foreign trade, wrote in *Pravda* on Dec. 21, 1949, that the volume of Soviet trade with the capitalist countries had decreased to one-third of the prewar total; on the other hand, trade

with the people's democracies had grown, on an unprecedented scale, to two-thirds of that total. In 1938 the United States and ten countries of western Europe took 64% of Soviet exports and supplied

6% of Soviet imports; Soviet trade with the countries of eastern Europe was negligible. In 1949 the Soviet Union took only 0.6% of British exports and supplied 0.7% of British imports; in the same year 0.66% of U.S. imports came from the Soviet Union, which received only 0.07% of U.S. exports. (K. Sm.)

Finances.—The completely different economic organization of the Soviet Union makes the national budget distinct in character and far wider in scope than the budgets of countries where private enterprise prevails. The financing of industry, transport, commerce and agriculture, which is arranged mainly through private channels in non-communist countries, is an item in the Soviet budget. The character of revenue is equally distinctive and unusual by comparison with the revenue of western countries. (See Table XVI.)

Revenue in 1950, for example, derived from the following sources: turnover tax, 236,069,000,000 roubles; profit tax, 40,374,000,000 roubles; direct taxes, 35,771,000,000 roubles; state loans, 1,013,000,000 roubles; unspecified income, 78,867,000,000 roubles. It will be noted that the biggest item of revenue, accounting for nearly 55% of the total revenue, was the turnover tax, levied on the proceeds of retail trade in grain, alcohol, oil, sugar, meat, cotton tissues, petroleum and other commodities.

Expenditure in 1950 was grouped under the following headings: grants to national economy, 157,312,000,000 roubles; social and cultural, 116,818,000,000 roubles; defense, 82,867,000,000 roubles; state administration, 13,848,000,000 roubles; unspecified, 41,830,000,000 roubles. Defense expenditure in 1950 amounted by comparison to about 21% of the total expenditure, which may be compared with 32.5% expended on defense in the war budget of 1940. It is not possible, however, to estimate even approximately what percentage of the Soviet national income this represents, since real Soviet expenditure on defense is not confined to the ministries of war and navy but is distributed among the budgets of many other ministries.

Inflation developed in the Soviet Union during World War II but was drastically arrested by a decree of Dec. 24, 1947, whereby 10 roubles of the old currency in cash were exchanged for 1 new rouble. Control of consumer prices and of wages together with the application of the turnover tax can be counted upon to regulate actual demands in accordance with the availability of consumer goods. The practically compulsory state loans serve also as surplus purchasing power. A further weapon against inflation was the policy of distributing the benefits of increased productivity by lower prices rather than by higher wages.

The official rate of exchange of the rouble was revised by a decree of March 1, 1950. This decree "raised" the value of the rouble to the high and fictitious rate of 4.00 to the U.S. dollar and of 11.20 to the pound sterling.

The Statistical office of the United Nations calculated that the national income in the Soviet Union on a per capita basis amounted in 1949 to \$98 as compared with \$14.53 in the United States and \$77.8 in the United Kingdom. (I. Gv.)

RUSSIA, CAMPAIGN IN NORTH. The campaign in north Russia must not be regarded as an isolated incident of World War I, but as a definite part of the Allies' plan for the defeat of the Central Powers.

Allied Expeditionary Force.—The original force consisted of 150 British marines who landed at Murmansk in April 1918. They were followed by 370 more at the end of May, with a further reinforcement of infantry and machine-gunners to the number of 600 on June 23. The strength of the forces gradually grew till the maximum strengths reached were: White Russians, 20,000; British, 18,400; U.S., 5,100; French, 1,800; Italian, 1,200; Serbian, 1,000. Maj. Gen. F. C. Poole, commander in chief of the Allied forces in north Russia, arrived at Murmansk on May 24, 1918, and found that the Allies were holding the Kola peninsula with detachments at Kandalaksha. He pushed southward down the Petrograd railway, and by the end of June had secured Kem and Soroka, the point where the road to Archangel via Onega branched eastward. The ice-free port of Murmansk was thus fully protected against any possible raid by German forces in Finland. On Aug. 3 Poole occupied Archangel with a force of 1,500 men, supported by British and French warships and a force of Serbs and Russians under Col. Thornhill moving overland via Soroka and Onega. Early in Oct. 1918 Gen. Poole proceeded to England, and in November Maj. Gen. W. E. Ironside, formerly chief general staff officer in north Russia, succeeded him. The commands of Archangel and Murmansk were then made independent of one another. The question of the maintenance of the Allied forces in north Russia had been early considered by the authorities. Murmansk, being an ice-free port, could be used all year round, and the troops based upon it could be withdrawn at any time. But with Archangel the case was different. The port becomes frozen from early November till late April. It was of the utmost importance to prevent the resources of Russia becoming available to the Germans, should they be able to continue fighting throughout 1919. The decision was therefore made to remain at Archangel during the winter.

The expedition to north Russia in the summer and autumn of 1918 undoubtedly did much to complicate the plans of the Germans. There is definite evidence that the German military authorities were unable to continue the transference of troops from east to west in the final stages of the World War of 1914-18, despite the urgent demands of Hindenburg and Ludendorff. The original object of the expedition was therefore fully achieved.

Peculiar Difficulties of the Campaign.—The armistice in Europe came just at the closing of the White sea with ice. For the north Russian force a new campaign was beginning, and all knew that relief could not come for at least six months. The feeling that demobilization was being carried out on all other fronts had a demoralizing effect upon all ranks of the force. Furthermore, the object of the campaign was obviously no longer the same. Germany as an enemy had disappeared from the scene, and the Allied troops were never again quite clear as to the reasons for the continuance of the fighting. In their efforts to reconstruct the Eastern Front, the Allies had espoused the cause of the White Russians and had called upon the Czech ex-prisoner of war units in Siberia to march westwards to join them. It was thus that the Bolsheviks became the new adversaries of the Allies.

For the British authorities the campaign was a serious responsibility. Food, clothing and munitions had to be unified so far as possible for the simplifying of supply. The town of Archangel contained at least three times its normal population owing to the influx of refugees, and it was impossible to let the population starve. Large supplies had to be imported for this purpose.

Winter of 1918-19.—The transition stage from summer to winter proved a difficult period for the Allies. The freezing of the Dvina came unusually late in Nov. 1918 and the Allied gunboats were withdrawn too soon for wintering in Archangel. The Bolshevik gunboats were thus enabled to descend the river from their more closely situated winter quarters and bombarded the Allied positions with their long-range guns. The situation was at one time critical, British and Americans, supported by Canadian artillery, fighting desperately to maintain their positions.

At Archangel during the winter the attitude of the Allies was purely defensive, covering the mobilization and training of the new troops of the north Russian provisional government. In the Murmansk area their task was to maintain a perpetual threat towards Petrograd and to divert as much of the Bolshevik forces as possible from Archangel. Fighting continued throughout the winter in both areas at irregular intervals, the Bolsheviks growing more efficient and exerting greater and greater pressure on the Allied columns. Nevertheless all the main Archangel positions were maintained intact against the repeated attacks of a superior enemy. In the Murmansk area, Gen. Maynard's troops succeeded in seizing the northern end of Lake Onega, thus making their threat against Petrograd an effective one, and containing a considerable force of active Bolshevik forces.

Arrival of Relieving Force.—The general thaw commenced in the first week of May, and by the 12th the river was free of ice. Two relief brigades under Brig.-Gens. Grogan and Sadlier-Jackson arrived at Archangel on May 26 and June 10 respectively, and evacuation of all troops which had spent the winter in north Russia commenced at once. The old contingents were embarked in turn, the British being the last to leave. Then followed those elements of the population which had elected to leave the country. In all, some 17,000 persons were transported from north Russia in British ships. By the end of July nothing remained but the fighting troops of the relief force and a few necessary administrative services.

A gradual substitution of Russian for British troops and administration was commenced, the process being accompanied by several outbreaks of mutiny amongst the new troops. The fronts of the various columns were cleared by vigorous action on the part of Brig.-Gens. Graham and Sadlier-Jackson, ably supported by the naval flotilla under Capt. Altham. By August 10 the withdrawal of the British troops to the inner defences of Archangel commenced.

Gen. Lord Rawlinson arrived at Archangel on August 12 and approved of the plans already arranged. Withdrawal continued without a hitch, and on September 27 the last 5,000 men were embarked simultaneously from 13 different points and the evacuation of Archangel was complete. The long withdrawal in the Murmansk area was then completed under the direction of Brig.-Gen. H. C. Jackson, who had replaced Gen. Maynard on September 20 owing to the latter's illness, the last man leaving the port on October 12.

RUSSIAN ARCHITECTURE. Historically, Russian architecture may be divided into two principal periods: the first, from the 10th to the end of the 17th century; the second, from about 1700 to the present. This chronological division is a consequence of the revolutionary activities of Peter the Great (1689-1725), whose drastic political and social reforms, intended to bring Russia into close contact with western Europe and its civilization, broke with the traditional conservative tendencies of Russian life and in architecture caused a shift from a deeply national style to the forms of western Europe. The architecture of the pre-Christian period was almost exclusively wooden, and, mainly due to the unlimited supply of lumber, the majority of buildings remained of timber during the era immediately following Russia's conversion to Christianity in 988. Typical peculiarities of this early wooden architecture are a horizontal disposition of wall logs and steeply pitched roofs.

Christianity found a fertile soil among the tribes inhabiting the widespread territories of what was to become the Russian empire, and an intensive building of churches set in after the acceptance of the new faith. The rulers of the various feudal principalities into which Russia was divided became defenders and champions of the church, and the building of a church became the central event in the reign of each of the numerous princes who, apart from religious considerations, wished to demonstrate

their power and wealth with splendour eclipsing that of predecessors and neighbours. Russian life centred in these churches; there new leaders were installed; the most important public questions were decided there; the prince kept his treasury in the church; the church was the last haven of refuge from invaders. Until the 17th century religion dominated Russian architecture which, nevertheless, was also closely connected with the fates of rulers and the geographical locations of the centres of political power. During this first period the most important schools of architecture were those of Kiev, Novgorod-Pskov, Vladimir-Suzdal and Moscow.

Early Centres.—The beginning of organized political life found Russia somewhat unified under the rule of the princes of Kiev, a city on the Dnieper river, the first capital of Christianized Russia. The Christian missionaries from the Eastern Church had brought their Byzantine culture with them, and this transplanted Byzantine art (*see* **BYZANTINE AND ROMANESQUE ARCHITECTURE; BYZANTINE ART**) was the starting point for the development of the new national architecture. In the different parts of Russia, Byzantine art, interpreted in different ways, developed into distinct forms. Sometimes, as in the neighbourhood of Novgorod-Pskov (in north-western Russia), Byzantine influence is scarcely perceptible; at others it flowered into exquisite forms representing a happy combination of the two cultures, as in the Vladimir district.

The oldest church in Kiev, still existing in part, is the Desiatinnaya church, begun in 991; it was the reproduction of a Byzantine church, rectangular in plan, with three altar-apses. The cathedral of St. Sophia in Kiev (1017), with five apses and crowned by 13 cupolas, is the next in age and the largest built during the first two centuries after conversion; the principal parts of this cathedral are still extant, but later additions have considerably changed its exterior.

The erection of churches in the Novgorod-Pskov district, which was to play an important part in the development of a national Russian architecture, began only a few decades later. An independent and distinctive school of architecture appeared there in the 12th century. Here Byzantine art lost its influence much quicker than in Kiev, where it was applied with only insignificant structural changes. The influence most responsible for the appearance of this deeply national art was that of the thoroughly original local wooden architecture which affected both design and construction. The two-storey cross-shaped church appeared with one-storey lateral additions. The church with only one apsis replaced the church with three apses. In conformity with climatic conditions, the arched roof became one that sloped. The spherical cupola gave way first to the helmet-shape; then it assumed the characteristic bulb-shape, a form similar to that which had developed centuries before and spread over Asia with the influence of Buddhism. The entrance took the form of a kind of porch; the belfry appeared, first as only an opening for bells on top of the wall, but later as an independent, high tower in which bells were hung in several tiers. The Byzantine cubic form of the church was broken up into a picturesque group of buildings, reflecting, like most of the innovations, national tastes that had been educated on wooden architecture. The rich Byzantine ornamentation either disappeared completely from the austere and simple walls of Novgorod churches, or else gave way to a plainly modelled geometric pattern, accentuating here and there the picturesque smoothness of the walls. The treatment of the stucco shows a characteristic feature. The lines and contours of the architectural forms were finished freehand, and are uneven, as is the surface of the walls, which lends the buildings a singular and effective charm.

In the principalities of Vladimir and Suzdal in the Central part of Russia we find, in the 13th century, not only Byzantine influences but partly Romanesque (*see* **BYZANTINE AND ROMANESQUE ARCHITECTURE**) brought there from Italy. The former manifests itself in the general form of the churches, the latter mainly in their decoration. The Romanesque arched gallery on the level of the second storey of the church was introduced as a decorative element in the form of an ornament of arches. In general the archi-

tecture of Vladimir is characterized by a love for ornamentation that accentuates architectural masses. The walls of St. George in Youryev, wholly covered with ornaments of Romanesque origin, but strongly influenced by motifs of the native wood-sculpture for which Vladimir was famous, are typical. In the native wooden architecture projecting beams were carved, and the whole length of the crest of a building was sometimes ornamented by such beams projecting through. When stone became common in buildings designers drew inspiration from these forms.

Moscow.—The dominance of Moscow's architecture increased gradually with its political ascendancy. Masters from Novgorod and Pskov worked there, and the Russian national architecture reached its highest development in Moscow during the 14th and 15th centuries. The application of the motifs of the wooden architecture to stone building found its best expression in the tented church. As in the wooden, the square plan of the stone church was transformed by a system of little arches of peculiar form (*kokoshniki*) into an octagon, the basis of the tent. This turret-shaped church was frequently used during the 16th and 17th centuries; the tent was also widely applied to the roofs of belfries and towers. The basic elements of the Moscow church architecture took final form in the 16th century, and thereafter attention centred on structural ornamentation, some of which is comparable in richness to the best examples of the Florentine Renaissance. A reaction followed, characterized by pettiness of form and excessive flourishes, and sometimes erroneously regarded as the typical Russian style. One typical feature, however, is evident even in this period of decadence: the grouping of buildings in ensembles in whose composition as well as that of the individual buildings picturesque effects were produced. Many of the old monasteries, which, being surrounded by towered and crenellated walls, frequently resemble little fortresses, are interesting specimens of such ensembles.

In the majority of Russian cities of the period their central part was surrounded by strong walls with towers and battlements and sometimes by embankments and water-filled moats. This was called the Kremlin. It contained the ducal palace, government buildings, houses for the dignitaries and ducal guard and the principal cathedrals and churches. The Kremlin was really a fortress and was usually located on an elevation dominating the surrounding territory. Beginning with the austere lines of the fortress wall and ending with a group of majestic cathedrals whose golden cupolas sparkled in the sun, it generally made an extremely picturesque composition. The Moscow Kremlin is probably the best preserved. Although rebuilt many times it nevertheless presents a true picture of an ancient Kremlin; at the same time having a considerable number of Italian details, it is a good example of the Russianizing of foreign architectural forms.

St. Petersburg.—At the beginning of the 18th century, while Moscow and the rest of Russia continued to live according to tradition, Peter the Great (1689-1725) undertook to build a new capital, St. Petersburg, in the far north of his empire—a move which at once involved extensive and imposing building and a radical change from an isolated political existence to closer contact with western Europe. A new epoch in Russian architecture began. Being an innovator in everything, Peter strove from the first to create a new architecture. Instead of employing Moscow masters, he enlisted an army of architects, engineers and craftsmen from all parts of Europe. Their work resulted in the erection of incongruous buildings in western European forms. A degree of order came into this architectural chaos only after Peter's death, when Russian architects became educated in western European art, and Russian architecture, although it could look back on nearly eight centuries of national traditions, turned toward classicism. Thereafter its evolution was divided into two currents, one characteristic of the new capital, St. Petersburg, the other of Moscow, the old. All subsequent architectural periods and fashions were perceived and developed differently in each. In St. Petersburg, the official capital, which grew rapidly, building progressed on a large scale. Architectural ensembles grew up along whole tracts of streets and quays and around vast squares. Most of the new buildings erected by the Government, its

officials and the aristocracy were palatial, solemn and somewhat haughty. In Moscow, which had then dropped out of political life but where the charm of the traditions of a great past still existed, the buildings were simple, noble and showed a certain intimate affinity.

The influence of the Renaissance (*see RENAISSANCE ARCHITECTURE*) scarcely reached Russia, but an outgrowth of it, the Baroque (*see BAROQUE ARCHITECTURE*), made a strong and lasting impression on Russian architecture, leaving numerous examples, which were, however, sometimes considerably affected by peculiar local conditions. In Moscow a wonderful specimen in this style is the church of Our Lady in Fili, representing a further evolution of the tented church. Here the tent loses its continuity and consists of several tiers of octagons diminishing in size and put one above the other. In St. Petersburg and in the provinces the Baroque was widely used by the court architect, Count V. V. Rastrelli, one of the greatest architects of the time, whose talent created an epoch for the development of the Baroque. One of the principal reasons for the great success of the Baroque in Russia was its picturesqueness, a quality after which Russian architecture had always striven.

Catherine the Great.—In all Europe, the middle of the 18th century was a period of reaction against the pretentious forms of the Baroque and of reawakening interest in the austere and noble forms of classic architecture. In Russia, the brilliant reign of Catherine the Great (1762-96) was favourable for the development of this movement and it found an immediate response. A multitude of architects, both Russian and foreign, invited by the court, carried on the beautifying of the new capital, surrounding its vast squares with rows of classic columns, with elegant porticoes and with majestic façades. Catherine's interest in architecture was exceptional. Peter influenced the direction of Russian architecture; she assisted the development of the new school itself. With an energy equal to Peter's, she continued to create the capital, not only personally examining the designs but also, according to contemporaries, giving instructions and even supplying sketches for proposed buildings. During her reign the classic style was so intimately mixed with the creative genius of Russia that it occupied almost the same position as the traditional Russian style prior to the 17th century. An inexhaustible supply of serf labour allowed ambitious building programmes to be carried out. The ruling class, the aristocracy and gentry, living on estates scattered throughout the vast country, kept in close touch with the capital and, anxious to keep abreast of its fashions, built many mansions in the fashionable classic style whose solemnity and austerity fitted the epoch to perfection. Considering the numerous and diverse structures built in the classic style, it would be no exaggeration to call Russia of the 18th and 19th centuries a country of classic architecture.

19th and 20th Centuries.—The beginning of the 19th century inclined to even more austere forms, the Corinthian column gave way to the Doric, Rome seemed not simple and severe enough and early Hellenic forms came into favour. The Temple of Paestum became an ideal for the artist and the so-called Russian Empire style, very different from the dry and formal designs of Persier and Fontaine, appeared. Its characteristic traits are a Paestum-like archaism combined with great flat planes, here and there accentuated by severe but pithy ornamentation. The architecture of this period may be regarded as the climax of the Russian classic style. Under Nicholas I. (1825-55) the character of the building activity in St. Petersburg changed and from the erection of grandiose palaces, turned to more practical and commonplace problems. Porticoes and great wall surfaces with few window-openings which did not respond to the practical requirements gradually lost favour. Petty, unnecessary details were frequently applied with the intention to conceal by their display the shortcomings of a weak composition. Russian architecture, with frequently changing artistic tastes, declined steadily during almost the whole second half of the 19th century. At one time designers turned to the old Russian national style, but inspiration was sought from its most decadent period, the end of the 17th century; fortunately this tendency was of short duration and

left no deep traces.

With the end of the 19th and the beginning of the present century the advent of industry introduced a new and rapidly growing factor. A period of active building began and symptoms of a renaissance of the best of the old Russian architecture appeared. Aside from current buildings a number of large factories were constructed. Residences no less splendid than the old palaces of the dignitaries of Catherine were built for the new kings of industry. At this time when the modernistic style prevailed in Europe, two more architectural currents were evident—one purely national, traditionally Russian, founded on the early and best sources of Russian art; the other classical, suggested by the severe and elegant architectural forms of Palladio. These two logically reflected the main traditions and the historical development of Russian architecture as though representing its two main courses of development. The World War and the subsequent revolution interrupted building for a whole decade.

(W. O. J.)

Post Revolutionary.—Since the World War, many attempts have been made to create a national architecture from existing European styles, but these have been found unsuitable to represent the revolutionary ideas of the nation. All modern fads have been tried—"cubism," "futurism," "new art," "the heroic," but these have gone their way. The form of architecture in favour in 1929 and employed in all the new government buildings is based entirely on what the Russians call "mechanical technical" facts. The aeroplane, motor car and modern battleship are their inspiration, and all decoration other than the "scythe and hammer" the Bolshevik coat of arms, is eliminated. As Ladovsky, the professor of the department of "modern architecture" at the Moscow academy has stated, "The future belongs to those who have remarkably little talent for the Fine Arts." Their desire is to create a new form of architecture devoid of any traditional inspiration, one which is essentially practical and suitable for its purpose. In other words they design the plan according to the requirements of the building on a purely constructional basis, and consider the result will produce its own beauty.

Lack of capital is another determining factor in this new form of architecture. Reinforced concrete has replaced stone and granite and everything is being designed and carried out with the greatest economy and simplicity. Russia prides itself in being a nation of workers and considers that its factories and business buildings should look like "work shops" and not like the mansions and palaces of an aristocracy. While the need for economy is evident in all modern Russian buildings, it is commendable that the new Government has not allowed the ancient buildings to fall into decay. Domed palaces and minarets have been painted and regilded. Mansions, now the headquarters of Government departments or of bakeries and other commercial industries, have been redecorated as originally designed. Churches of artistic merit have been repaired, and theatres, the pride of the people, receive particular attention.

Construction is of reinforced concrete throughout, painted in revolutionary red and grey. Walls are reduced to a minimum sufficient only for constructional purposes, while enormous glass areas are introduced to give the maximum window space to the workers. Flat roofs and balconies for the recreation of the workers are also considered essential. These new conditions produce their own problems in a country where the temperature is often 30° F below zero and the snow-fall great. To overcome the cold in winter elaborate heating systems have to be introduced. The windows are covered with a network of heating pipes placed behind the glazing bars, while double glazing is provided for all windows to keep out the cold. The greatest problem is that of the flat roof, as during winter the roof with its parapet walls forms a tank for the snow, with the resultant danger from leakages and burst pipes when thaw sets in. There are various methods of roof construction but the best is that in which a double concrete slab is used with an air space between.

Russia is still in a state of transition. Lack of materials and skilled craftsmen makes it difficult for their advanced dreamers and architects to carry out their conceptions. Nitski, one of the

able Bolshevik art critics, has said that the dreams of Lenin could not be realized for at least 100 years. Some of the most recent buildings carried out in the modern manner are: the Centrosyov warehouse; the new Telephone building; the Telegraph building and the Gostorg State building.

RUSSIAN ART. A comprehensive essay on the art of Russia implies a survey of the art of many races, beginning from remote antiquity. This article, therefore, deals with those artistic activities that have been manifested in Russia proper since her appearance as an organised and independent state under St. Vladimir (972-1015).

Premonogolian and Mongolian Period.—As with their religion, the Russians took their art from Byzantium and up to the 14th century they preserved in their icons all the austerity and simplicity of design and also the economy of colouring of the Byzantine frescoes of the 11th and 12th centuries. The centres of activity during this period were at Kiev, Novgorod and Suzdal, and in all probability a great number of artists were Greeks. A very fine example from this period is the Odigitry Madonna (12th century) in the Riabushinsky collection at Moscow.

Novgorod School.—The 14th century marks the beginning of a new style and icon-painting at that time flourished in Novgorod. The new elements may be due to a fresh influx of Greek and perhaps Serbian painters, for there are certain characteristics in the Russian icons and frescos of this period which are common to the 14th century frescos both at Mistra (Greece) and in Serbia. However, in such works as the "Ascension" (1363) at Volotovo there is a sense for line and a simplicity of rendering not present in the Greek and Serbian frescos. In this work and also in the St. Theodore Stratilotes (1370) and the "Nativity" in the same monastery, can be clearly discerned all the great qualities which distinguish the Novgorod school in the following century. At the end of the 14th century (1378-1405) a Greek painter referred to by Russian chroniclers as "Philosopher Theophanos the Greek" did works in various churches and monasteries in Moscow and Novgorod.

The golden age of Russian art, the 15th century, is marked by so much grace that some scholars attempt to ascribe it to Italian influence. The chief means by which this elegance is obtained is continuity of outline of the design and either rhythmical linear repetition or symmetrical linear opposition of the movement, imposed on the central figure by the artist's interpretation of the action in the subject. The colouring too shows improvement. Instead of slightly tinted drawings as were the earlier icons, we have icons with clear and harmonious colouring distributed in flat surfaces and emphasised by lines marking the light. The most accomplished master of this period—and indeed in the whole history of Russian art—is Andrea Rublyov (1370-1430), probably a pupil of "Philosopher Theophanos the Greek," one of whose very few preserved works is the Holy Trinity (1408) in the Troitse Cathedral of the Troitse-Sergios monastery near Moscow (even the authenticity of this example is doubted by Kandakov). Another master whose name is frequently mentioned in old records together with Rublyov is Dionysios who worked at the Theraponte monastery. Some fine examples of the icons from this period are in the collections of B. E. Chananov at Kiev and E. S. Ostruchov and S. P. Riabushinsky at Moscow.

Moscow and Stroganovsky Schools.—After the inclusion by Ivan the Terrible of Novgorod province into the Russian Empire the centre of artistic activity shifts to the capital of the new Empire, Moscow. Design in icons loses simplicity and the figures lose their dignified proportions. Colouring becomes dull and practically identical in all icons, and even their sizes tend

towards standardisation. The Byzantine architectural motives in the backgrounds of icons are supplanted by Russian ones, and even the type of faces bears a strong national character. In short, the Moscow school abandoned the high standards of its predecessor and came into closer touch with national life. Gradually icon-painting turned into more a manufacture of devotional objects than art. Meanwhile between the end of the 16th and the beginning of the 17th century sprang up the Stroganovsky school which combined to some extent some of the elements of both its predecessors. The craftsmanship is certainly of a very high grade, but the harshness of design, the somewhat exotic brilliance of colour, the lack of relationship between the national architectural forms in the background and the semi-Byzantine figures, the insistence on detail and finally—especially so in the later stages—the presence of undigested Western influence makes this school very inferior to the Novgorod school. However, it found great favour among the upper classes and became the most appreciated school in Russia. A great number of icons from this school are preserved; an inferior example is hung at the National Gallery. The best known masters from this school are Istoma and Nikifor Savin, Procopy Tchirin, Ivan Prokopiev and Spiridon Timoviev.

The efforts of Peter the Great to introduce Western civilisation into Russia gradually brought to an end an art which had flourished for over six centuries and Western influence became paramount. Among the first artists of the new era are S. Ushakov, Th. Abrosimov, Ivan Bezmin and Saltanov.

THE NEW ERA

The 18th and the first half of the 19th centuries form an epoch of foreigners in Russia. Just as in the beginnings of Russian religious art the Byzantine artists were predominant, so now Italian, French, Dutch and German artists were working for the Russian court and were laying the foundations of Russian secular painting. Among the great number of foreign painters were four English artists, Walker, Atkinson, Miles and Richard Brompton. While foreign artists were well treated, the conditions under which most of the native artists worked were lamentable. The land owners were closely imitating the Court and had their own architects and painters. These were conscripted from their serfs and remained serfs. It was not unusual for an artist to be flogged because his master was not satisfied with his work. The artist had also to perform other duties, such as valeting, kitchen work, farm work, etc. In spite of this, native artists quickly attained the standards of their European teachers, but strictly speaking, we must acknowledge that Russian art as such was dead and that since the beginning of the 18th century art in Russia was nothing more than a minor branch of European art. Thus we have the various European schools, e.g., Classical, Romantic, Realistic. The most prominent artists of the Classical school are Akimov, Ugrumov, Egorov and Shebuev. Among the Romantics are Kiprensky, Tropinin, Brullov, Prince Gagarin, Alexander Ivanov, Vasnetsov and Vrubel, and among the Realistics are Venetianzo, Vereshchagin, and Repine. The best known landscape painters are Lebedev, Ayvazovsky, Levitan and Syerov. Naturally, as soon as modern art arose in Europe, Russia followed suit. The most important modern artists are V. Kandinsky, Roerich, Larionov, Gontsharova, Chagal, Ostrumova, Punin, Iacovlev and Anrep.

Sculpture.—Sculpture never flourished in Russia owing to the fact that the Orthodox Church does not allow sculpture in churches. There are very few examples of ancient carving extant. Probably the best that can be seen is at Yuryev Polsky on St. George's Cathedral. Among modern sculptors the best-known are Prince Troubetsky, Orlov, Archipenko, Lipshitz, and Zadkin.

Minor Arts.—Among the lesser arts silver-work was turned out for centuries at Novgorod and Tula. From the 18th century onwards there has been a flourishing porcelain industry in many places in Russia, the most important factories being the Imperial Factory, Garder and Popov. (See RUSSIAN ARCHITECTURE.)

RUSSIAN LANGUAGE AND LITERATURE. The Russian language is the Slavonic language of Russia. Understood in the widest sense, i.e., including also Little Russian or Ukrainian and White Russian, Russian forms the Eastern group of the Slavonic languages. In philological works the term Great Russian is generally used to designate the language which the world at large calls Russian, and except where expressly stated, Russian in the course of this article stands for Great Russian—the language of Tolstoi and the other great writers so well known to Western Europe.

The main phonetic characteristics of Russian are:—I. Common Slav (C.S.) half vowels *ъ* and *і* have disappeared as such: *ъ*, which was written at the end of words until the recent Bolshevik orthographical reform, was mute and served but to show that the foregoing consonant was not palatalized. Where a vowel was indispensable to facilitate the pronunciation of a group of consonants, *ъ* and *і* have been replaced by *о* or *е*, but these vowels sometimes appear without such justification (e.g., *огонь*, Lat. *ignis*); *і* when so needed becomes *е*, otherwise it disappears or else leaves a trace in the palatal quality of the preceding consonant, in which case it is still written: C.S. *сънъ*, "sleep" and *днѣ*, "day"; R. *сонъ*, *денъ* (*d'en*).

II. C.S. *ѣ*—a sound not unlike the *y* in "rhythm"—has survived, as also in Polish. After gutturals it has become *і*.

III. Treatment of liquids: retention of *ѣ* and of hard *л* (not unlike English *l* in "wall"); helping out of sonant *р* and *л* by a vowel put in before the *р* or *л*; especially the so-called full vocalism, by which, e.g., C.S. *городъ*, "town," and *мѣло*, "milk," became *горо́д* and *моло́ко*.

IV. C.S. nasal vowels: *о* and *е* (like French *on* and *in*) became *у* and *ю*: C.S. *гору*, "way"; *гору*, "five"; R. *гору*, *пору*.

V. Palatalization (or softening): C.S. *тъ*, *дъ* gave R. *ѣ*, *ѣ*, C.S. *свѣтъ*, "candle"; *междѣ*, "boundary"; R. *свѣтъ*, *междѣ*. C.S. *бѣ*, *вѣ*, *мѣ* gave R. *бѣ*, *вѣ*, *мѣ*, e.g., R. *земля*, "land." Before C.S. soft vowels *е*, *ѣ*, *і*, *ѣ* consonants were affected, the tongue being raised in anticipation of the narrow vowel, and so not making so clean a contact with the palate. Then what amounted to a new *ѣ* developed in R., as *ѣ* became practically *і*; *е* and *ѣ* came to sound as *іе*, *е* as *іе* at the beginning of a syllable, and all together with *і* began very much to soften the preceding consonant. In literary R., however, this new *і* never broke down the consonant into a palatalized sibilant or affricate, though it had this effect in White Russian (Wh.R.) and Polish.

The result is that almost every consonant in Russian can be pronounced "hard" or "soft," a distinction which is very difficult for a foreigner to make, as his tendency is to overdo the softness and pronounce a full *л* after the consonant, instead of the palatal element melting into it. A soft consonant in its turn narrows the vowel before it, e.g., the vowel in *желѣ*, "fir," is like *о* in "Yale"; that in *желѣ*, "ate," like *е* in "yell."

VI. Great Russian has kept *г* where Little Russian and Wh.R., like Czech and High Sorb, now have *ж*.

VII. A specially Russian point is that *ю* and *я* beginning a word, appear in R. as *о* and *у*; C.S. *жеро*, "lake"; *јуро*, "morning"; R. *озеро*, *утро*.

VIII. Russian has lost the distinctions of quantity which survive in Czech and S. Slav., but its accent is free as in S. Slav. The accent is extremely capricious, often falling differently in different cases of the same noun, or persons of the same tense, also it is an expiratory accent, so strong that the unaccented syllables are much slurred over and their vowels dulled.

The above phonetic peculiarities mark Russian as far back as we can trace it. In the earliest documents it appears with an apparatus of grammatical forms practically identical with that ascribed to primitive Slavonic. The history of the language is not so much that of its phonetic decay as that of its morphological simplification and syntactic development. The tracing of this process is rendered difficult by the fact that Old Bulgarian was the ecclesiastical and literary language until the 17th century, and though in the end the O.B. texts suffer modifications, producing the Russian form of Church Slavonic, the Russian forms appear in them only by accident. Russian is better represented in additions made by

the scribe, as in the colophon of the Ostromir gospel (A.D. 1056-57), the oldest dated ecclesiastical ms. In a certain number of legal documents dating from the 12th century onwards Russian forms definitely predominate, but the subject-matter is too limited to offer much material.

Borrowings.—The effect of the Church language upon Russian has been very strong, comparable to that of Latin upon French or English: O.B. forms of words and suffixes, betrayed by their phonetic peculiarities though pronounced more or less *à la russe*, have in some cases ousted the native forms, in other cases the two exist side by side; the old Slav. form generally has the more dignified or metaphorical, the Russian the simpler and more direct sense: even some of the grammatical terminations (e.g., pres. part. act.; certain forms of the adj., etc.) are Slavonic; but speakers are quite unconscious of using anything that is not Russian, and not till the 18th century did even grammarians understand the difference. Less important elements have been the Tatar, which gave names for many Oriental things such as weapons, jewels, stuffs, garments and some terms concerned with government, and the Polish, which during the 17th century supplied many terms needed to express European things and ideas. In the 18th century such importations were made from Latin and all the Western European languages, in Peter's time mostly from German and Dutch (for nautical terms, English supplied some), in Catherine's rather from French, which had become the language of the aristocracy. During the first quarter of the 19th century modern Russian found itself and discarded superfluous Slavonic and European borrowings alike. Since then fresh loan-words have mostly belonged to the international quasi-Greek terminology, though like German R. sometimes prefers analogous compounds made from its own roots.

Literary Russian as spoken by educated people is the Moscow dialect (see p. 751) modified by these influences. It is still a highly inflected language, comparable in that respect rather to Latin and Greek than to the languages of western Europe, though during historic time it has lost many of the grammatical forms whose full development we can study in O.B., and whose presence we can assert in the scanty remains of Old R. This process has relieved it of the dual number, save for certain survivals; in the nouns, of the vocative case (save for certain ecclesiastical forms), and many of the distinctions between the declensions, especially in the plural, the oblique cases of the simple, and the more cumbersome forms of the compound, adjective; in the verbs, of the supine, the imperfect, the aorist and the conditional (now reduced to a participle); but this simplification leaves it with six cases, Nom., Acc., Gen., Dat., Instrumental and Locative, three genders, three substantival declensions, *-а*, *-о*, *-ѣ*, and traces of *-и* and consonantal stems, a special pronominal declension with many tricky forms, an adjective which takes its place between them, and a system of numerals in which a compromise between grammar and logic has produced a kind of maze. The forms of the verb are easier, as only the present indic. has three persons, the imperative has but the 2nd, and the past is a participle, which, having discarded the copula, distinguishes only gender and number. The infinitive and four participles offer no special difficulty, but the gerundive or verbal adverbs, from the old masc. nom. sing., are troublesome. The curious mechanism by which these few verbal forms are by means of the aspects made to express most of our tenses and other shades of meaning of which even English is incapable, is briefly explained under SLAVONIC LANGUAGES. On the whole the syntax is simple, the periods which imitation of Latin and German once brought into fashion having given place to the shorter sentences of French and English models.

Dialects.—The dialects of Great Russian fall into two main divisions, which do not greatly differ from each other, Russian being an amazingly uniform language when the vast extent over which it is spoken is considered. These dialect groups are the northern or *о* group and the southern or *а* group. The line between them runs roughly E.S.E. from Pskov to the Oka and then eastwards to the Urals. The northern group is the more conservative and pronounces very nearly according to the spelling, unaccented *о* remaining *о*, but *а* is in general rather like *а*, while *ѣ*

before hard consonants is apt to be *jo* and before soft consonants *i*. The southern part of this group, comprising most of the governments of Vladimir and Yaroslavl with adjoining parts of Tver and Kostroma, are alone free from a further peculiarity, a tendency to mix up *e* and *ě* which can be traced in the ancient documents of Novgorod and has spread with the Novgorod colonists across the whole of N. Russia to the Urals and Siberia. These distant dialects have adopted many words from the Ugro-Finnish natives. The southern or a group of dialects pronounces unaccented *o*, *e* and even *i* as *a* or *ja*; with this goes a tendency to pronounce *g* as *h*, and to mix up *a* and *u*.

The Moscow dialect, which is the foundation of the literary language, really covers a very small area, not even the whole of the government of Moscow, but political causes have made it the language of the governing classes and hence of literature. It is a border dialect, having the southern pronunciation of unaccented *o* as *a*, but in the *jo* for accented *e* before a hard consonant it is akin to the North and it has also kept the northern pronunciation of *g* instead of the southern *h*. So too unaccented *e* sounds like *i* or *ě*.

White Russian.—The present literary language arose in the 14th century and is based on one of the central dialects. The tendency of some modern writers to break with the earlier tradition and make their language different from Great and Little Russian has introduced into the vocabulary many foreign elements which have no real existence in the popular dialects. The language presents certain features which occur also in Ukrainian but in general character it agrees more closely with South Great Russian (being an *a*, not an *o* dialect, and distinguishing *y* from *i*, etc.). It is spoken in the whole or parts of the governments of Grodno, Suwalki, Vilna, Minsk, Vitebsk, Mogilev, Smolensk and in the N.W. part of Chernigov.

Little Russian or Ukrainian.—The literary language arose towards the end of the 18th century and has no genetic connection either with the ecclesiastical language of the S. Russian writers of the previous period or with the attempts of the preceding three centuries to write in Lit.R. The language is founded on the western dialects and the earlier writers avoided the use of such words as did not there occur. During the last quarter of the 19th century Lit.R. was persecuted in Russia and the Austro-Hungarian government seized the opportunity to encourage it in Galicia. Lwów (Lemberg) became a recognized literary centre and the refuge of writers who were expelled from Russia. The character of the literary language soon changed considerably and a number of Polishisms were adopted. After 1906, when the oppressive measures against the language in Russia were removed, the tide turned and the foreign elements were held in check. As a result of these conflicting tendencies the literary language is not yet stabilized.

Phonetically, Little Russian is characterized by itacism; for original *y* and original *i* have coincided in a sound between *i* and *y* not unlike the Eng. short *i*, and original *ě*, also *e* and even *o* after having been lengthened in compensation for lost semi-vowels are now represented by *i*.

Further, Little Russian has reduced the common Russian softening, only keeping it before *a* and *o* and *i* for *ě* and *o*, and hardening the consonant before *e* and original *i*. In common with Wh.R. it has *h* for *g*, a vocative case, gutturals made sibilant before *i* (for *ě*) in oblique cases, 3rd sing. generally without the *t*, 3rd plur. in *-i*, 1st plur. in *-mo* and *-me* instead of *-mā*, *nā* for *nŭ*, *h* for *ŭ*, *i* for *ŭ*, *w* for *u*, and hard *t*, but all these occur more or less throughout S. Russian and only tend to a superficial resemblance.

These phonetic peculiarities are not universal, but the presence of the narrowed *ě*, *e* and *o* is sufficient to mark a dialect as Little Russian. The Russian alphabet is modified for Little Russian use as *ŕ*=*h* and hence *ŕ*=*g*; *ě* is used for the *e* which does not soften the preceding vowel, *u* for the thick and *i* for the pure *i*.

BIBLIOGRAPHY.—DICTIONARIES: *Dict. of the R. Language*, published by the Second Section of the Academy of Sciences (St. Petersburg, 1895, etc.); four vols. have so far appeared reaching to the letter *L*; V. I. Dal', *Explanatory Dict. of Living Great R. Language* (4 vols., St. Petersburg—Moscow, 1903-09); I. I. Sreznhevskii, *Materials for a*

Dict. of Old R. Language (3 vols. St. Petersburg, 1903-1912); A. Alexandrow, *R.-Eng. and Eng.-R. Dict.* (2 vols.); J. Pawlowsky, *R.-Deutsches Wörterbuch* (Riga, 1911). The standard, but not quite completed, etymological dictionary is that by A. Proobrazhenski (Moscow, 1910-1917).

LITTLE RUSSIAN DICTIONARIES: E. Zedechowski, *Ruthenisch-Deutsches Wörterbuch* (Lemberg); B. Hirnchenko, *Slovar' ukr. movy* etc. (Kiev, 1908-09).

GRAMMARS: Historical—N. Durnovo, *Sketch of the Hist. of R. Lang.* (in Russian, Moscow, 1924); A. Sachmatov, *Sketch of the earlier period of the Hist. of R. Lang.* (in R., St. Petersburg, 1915); A. Sobolevskii, *Lectures on the Hist. of R. Lang.* (in R., 4th edit., St. Petersburg, 1908); K. M. Meyer, *Hist. Gram. der russ. Sprache* (Bonn, 1923). Descriptive and Practical—the best in English is the *Russian Grammar* by N. Forbes. The *Russ. Grammatik* by E. Berneker and M. Vasmer (1927), though short, is excellent. For Little Russian consult S. Smal' Stocky and F. Gartner (*Gram. d. ruth. Sprache*, Vienna, 1913) and Smal' Stocky's *Ruth. Gram.* in the *Sammung Göttingen*. For miscellaneous information concerning the White Russians and their language the authoritative work is by E. Karskij—*Études russes* (3 vols., 1903 etc.), which also gives a map of the White Russian territory.

DIALECTS: *The Attempt at a Dial. Map of the Russ. Lang. in Europe etc.* (Moscow 1915) by Durnovo, Sokolov and Usakov is most complete.

RUSSIAN PRONUNCIATION: M. V. Trofimov and D. Jones, *The Pron. of Russian* (1923).

RECENT LINGUISTIC DEVELOPMENTS: A. M. Selikoff, *The Lang. of Revolutionary Russia* (Moscow, 1928) is useful. (N. B. J.)

LITERATURE

The literature begins in the 11th century, about 50 years after introduction of Christianity into Russia, as an offshoot of the "Church Slavonic" literature of the Balkans. The "Church Slavonic" language, created in the 9th century by St. Cyril and Methodius, became the literary language of Russia. Though based on a Bulgarian dialect it was from the first used almost exclusively for translations from the Greek and is thus permeated with Greek syntactic and lexical influence. The overwhelming majority of Russian-Slavonic writings consists of translations of Christian books from the Greek. The secular literature of the Greeks remained practically untranslated. There was no literary contact with the West till much later. Original writings form only a small minority of the Old Russian mss. preserved. Printing was introduced in Moscow in 1564, but did not come into general use till the 18th century.

The first cultural and literary centre was Kiev, which retained its leading rôle till about 1200. The most important of the ecclesiastical writers of the period were the sacred orators, Ilarion, metropolitan of Kiev (d. 1053) and Cyril, bishop of Turov (later 12th century), brilliant and imaginative disciples of the Byzantine school. Of secular writings the most extensive are the *Chronicles* (*Letopisi*). They are anonymous and have been preserved only in later compilations. The contemporary entries go back to about 1040. The account of the preceding period is based partly on oral tradition, but consists partly of the conjectures of a learned monk of about 1100. Besides its invaluable historical importance the chronicle possesses considerable literary merits. The story of the blinding of Vasilko (1096) and the account of the years 1146-54 are particularly noteworthy, as well as the Galician chronicle of the 13th century. Imaginative literature is represented by an isolated masterpiece, the *Discourse* (*Slovo*) of the Campaign of Igor, an anonymous political prose-poem on an unsuccessful campaign of one of the border kings against the Cumans (1185). It was discovered in 1795, and first published in 1800. Its poetical qualities, magnificent diction and rich imagery give it a unique place in Old Russian literature. Only insignificant fragments of works in a similar style have been preserved from the 12th and 13th centuries, but its influence is clearly apparent in later works such as the stories of the battle of Kulikovo (1380).

After the middle of the 13th century north-eastern Russia was politically and culturally separated from the south and west. From the end of the 14th century Moscow became the leading centre of the north. Literature became more exclusively ecclesiastical and more Byzantine in spirit. A new style of standardized and impersonal rhetoric becomes obligatory and is extensively cultivated in the numerous lives of saints and in the, now official,

chronicles. By the side of these we find also more personal writings, polemical and historical. Of the former we may mention the correspondence exchanged between the oligarchic politician Prince Andrew Kurbsky (1528-83) and the Tsar Ivan the Terrible (1530-84), who was a pamphleteer of genius. The greatest of all Muscovite writers was the Archbishop Avvakum (c. 1620-81), the leader of the schism of the Old Believers (see *RUSSIA: History*). He wrote several epistles denouncing religious and cultural innovations, and encouraging his followers to resistance, and a *Life of Himself* (1673, Eng. trans. by Jane Harrison and Hope Mirrlees, 1924), which reveal a powerful personality. He was the first writer to reject literary Slavonic, and to use the vernacular for literary purposes. He remains unsurpassed in the wonderful use he made of it.

The later Muscovite period saw the beginnings of Russian fiction which developed from several distinct roots,—legendary and didactic stories related to the lives of the saints; romances imported from East and West, but which received free fairy-tale treatment; and picturesque tales of Muscovite manners.

Folk Literature.—The "oral literature" of the Great Russian people is rich and varied. The so-called *byliny* are narrative poems in unrhymed, unstanzed stress-verse, intoned (not sung) by specially trained reciters. Their subject-matter is either historical, referring to events that go back to the taking of Kazan (1552); or legendary, dealing with the exploits of heroes (*bogatyry*), who are usually represented as grouped round the figure of Prince Vladimir. Their exploits are partly of the fairy-tale, partly of the *fabliau* type. The oldest texts of *byliny* (all on historical subjects) were written down in 1620 for the Englishman, Richard James (ms. in the Bodleian library). Next in antiquity comes the large collection ascribed to Kirsha Danilov, made in the mid-18th century in Siberia, and first published in 1804 (later, and more critical editions 1818 and 1901). In the later 19th century the *byliny* were discovered to be still extensively preserved in northern Russia, especially among the fishing population of lake Onego and Pechora. Large collections of them were published by Rybnikov (1861-67), Hilferding (1873), Markov (1901), Onchukov (1904) and Grigoriev (1904-10). Other poems surviving in the north of Russia are the laments for the dead, recited by professional wailing-women (collection by Barsov, 1872). Related in style to the *byliny* are the so-called *Spiritual Verses* (*Dukhovnye Stikhi*) recited by wandering mendicants. Their subject-matter is strongly influenced by Byzantine apocryphal literature. Among the Old Believers and mystical dissenters there developed a very remarkable lyrical poetry, devotional and mystical, often of great beauty. The lyrical, elegiac and choric songs are numerous and varied (principal collection by Sobolevsky, 1895-1902). Within the last decades a new type of improvised song, the *chastushka* (usually consisting of four rhymed lines), has received an extraordinary development among the peasants and working class. Of the prose forms of folklore *charms* can probably claim the greatest antiquity. *Folk-tales* cover a great variety of subject-matter, and display marked originality of treatment (collections by Afanasiev 1870, Onchukov 1903). An interesting branch of folklore is the popular drama. It goes back to 17th and 18th century literary sources, but the treatment, based mainly on wordplay, is characteristic (collection by Onchukov, 1913).

Beginning of Western Influence.—About 1650 Ukrainian and White Russian scholars and clerics began to introduce their new latinized scholasticism to Muscovy (see UKRAINIAN LITERATURE). Symeon of Polotsk was the first to publish books of rhymed didactic verse in Moscow. In the reign of Peter the Great two prelates of Ukrainian extraction and education, St. Demetrius Tuptalo, metropolitan of Rostov (1651-1709), and Theophan Prokopovich, archbishop of Novgorod (1681-1736), were prominent men of letters. Both wrote plays and possessed real poetical talent; Prokopovich was famous as the greatest orator of his day. His oratory like that of his successors in the reign of Elizabeth is markedly Italianate and *baroque*.

Parallel to the Latin-Ukrainian invasion, another current, coming from Germany, brought a new secular literature. Plays from

the repertory of the German strolling actors were performed before Tsar Alexis as early as 1672. From 1675 onwards numerous translations of Latin romances were made and circulated in ms. and by the end of the century the writing of amorous verses had become the fashion among the young Muscovites. The reforms of Peter the Great confirmed the conquest of the Russian upper classes by the West. Culture was secularized. "Church Slavonic" was replaced by a clumsy Russian, larded with indigestible bits of every kind of European idiom. The romances, plays and songs of the first 30 years of the 18th century, however interesting as symptoms of a great cultural revolution, can hardly be described as literature. Modern Russian literature begins only with the birth of the direct influence of the metropolitan literature of Europe, that of France. Parallel to the French-influenced literature of the upper classes there existed, however, throughout the 18th century a curious popular literature. It includes, besides a variety of narrative chap-books, an interesting series of inscriptions in rhymed doggerel, on cheap woodcuts (collection by Rovinsky, 1881).

The Age of Classicism.—The first pioneers of French classicism were Prince Antioch Cantemir (1708-44) (q.v.), whose Horatian satires mark the advent of conscious artistic realism into Russian literature, and Vasilii Trediakovskiy (1703-69), whose reputation as the type of the poetaster should not overshadow his real services in the reformation and study of Russian prosody. The actual founder of modern Russian literature was Mikhail Lomonosov (c. 1711-65) (q.v.). He was a man of encyclopaedic genius; in letters, his influence as lawgiver of the literary language and founder of the new prosody cannot be exaggerated. A minor pioneering figure by his side was Alexander Sumarokov (1717-74) who created the Russian dramatic repertory, and was the first literary critic and the most gifted song-writer of the century. The hierarchy of literary genres, as established by Lomonosov, placed tragedy, the heroic poem, and the solemn ode uppermost. In the first two genres nothing was produced of lasting value, although Sumarokov pretended to the title of a "Russian Racine," and Michael Kheraskov's (1733-1807) epic *Rosnada* (1775) earned him, for a generation, the title of the "Russian Homer." The ode proved a more vigorous growth. Lomonosov's odes are still almost unrivalled in the language for solemn majesty and mightiness of diction. Gavriila Derzhavin (1743-1816) equalled Lomonosov in the gift of lyrical oratory, but his originality and the visual splendour of his imagery make him an even greater poet. Often harsh and rugged, his poetry is full of untamed vitality, and his classicism is the classicism of a barbarian.

In the "lower" genres classicism was above all a school in which Russian literature could develop what later became its most characteristic virtue. The burlesque epics of Vasilii Maykov (1728-78), the fables of Ivan Khemnitser (1744-84), the comic operas and comedies of Alexander Ablesimov (1742-1823), Yakov Knyazhnin (1742-93), and Vasilii Karpnits (1757-1823) display a rough and unrefined, but vigorous and lively realism, and are more interesting than the clumsy rococo graces of the once enormously popular adaptation of La Fontaine's *Psyché*, by Ippolit Bogdanovich (1742-1803). The same realism, with a higher degree of talent, is seen in the famous comedies of Denis Fonvizin (1744-92). The *Minor* (1782), especially, a clever satire of the boorish provincial gentry, contains the first great character creation in Russian literature. The classical-realist tradition culminated in the work of the great fabulist Ivan Krylov (1768-1844) (q.v.), whose first book of *Fables* appeared in 1809.

In prose, satirical journals started in 1769 in imitation of Steele and Addison present the same kind of realism. Those edited by Nicolas Novikov (1744-1816) were marked by a high degree of public-spiritedness and contain much courageous criticism of existing social conditions. They were suppressed in 1773 by Catherine II. Novikov, who was a freemason and a pietist, represents the right wing of Enlightenment. Its left wing is represented by Alexander Radishchev (1749-1802), a disciple of Rousseau. His *Journey from Petersburg to Moscow* (1790, burnt by the hangman) is a powerful, if over-rhetorical, vindication of freedom against both serfdom and autocracy. ◊

The movement started about 1791 by Nikolai Karamzin (1765-1826) (*q.v.*) continued the secularizing and enlightening work of the 18th century. Karamzin's reform of the literary language consisted in an extensive elimination of such "Church-Slavonic" as had been preserved by Lomonosov, in the wholesale translation from French of new words to denote modern ideas and feelings, and in a general tendency to follow French syntactic and stylistic models. The Karamzinian movement was also a reaction against the roughness and ruder force of the age of Derzhavin in favour of the "middle" literary genres and of a softer and more fluent style. Finally Karamzin was the pioneer of the "new sensibility" of Rousseau, and of the early forms of the romantic revival. He was opposed by a group of literary conservatives, the enemies of French influence and of "soft" poetry. Their leader was Admiral Alexander Shishkov (1754-1841). His followers, Semen Bobrov (c. 1769-1810) and Prince Sergius Shkirinsky-Shikhmatov (1783-1837), were devotional and metaphysical poets of talent, but their archaistic manner was against the grain of the time. Of the followers of Karamzin the most gifted were Vasilii Zhukovsky (1783-1852) and Constantine Batiushkov (1783-1855). Batiushkov was a pupil of the French and Latin elegiac poets and of Tasso. His elegies are classical and sensuous with few traces of sentimentality. Zhukovsky was imbued with German and English influences. He wrote little original verse though some of his lyrics are among the purest gems of Russian poetry. As a translator he has few equals in any language. Up to about 1825 he translated modern, chiefly pre-romantic poets; in his old age he turned to the great epics, Indian, Persian and Greek. His complete version of the *Odyssey* appeared in 1847. A no less excellent version of the *Iliad*, by Nicolas Gnedich (1784-1833), had preceded it in 1830.

PUSHKIN AND HIS SUCCESSORS

Pushkin.—Zhukovsky and Batiushkov were the immediate forerunners of Pushkin (1799-1837) (*q.v.*), whose apprenticeship was passed in the French and anti-Slavonic school of the Karamzinists. Later he freed himself from French influence, but his style always remained lucid and classical. His greatest popularity lasted from the appearance of his first "Byronic" poem in 1822 to about 1830. The work of his later years in which, discarding his earlier fluency and softness, he aimed at a severer and more impersonal style, met with little contemporary recognition. Only his tragic death reinstated him in public opinion and made him a national classic. He has since become to Russia what Dante is to Italy and Goethe to the Germans. The cult rendered to him has not always been kept this side of idolatry, and has tended to obscure the fact that he is an end rather than a beginning. His work is the culminating achievement of the period of the cultural ascendancy of the self-owning nobility, rather than the fountainhead of later Russian literature. Of all his work only the "novel in verse" *Evgenii Onegin* (1825-33) with its central characters of Onegin and Tatiana had a considerable influence on the writers of the following age.

Pushkin was surrounded by a whole galaxy of poets, usually referred to as "The Pushkin Pleiad." The most notable of them were Eugene Baratynsky (1800-44), a philosophical poet of profound and noble originality, second only to Pushkin himself as a master of words, and Nicolas Yazykov (1803-46), whose verse his contemporaries liked to compare to champagne, and who possessed a poetical momentum of exceptional force. Other remarkable poets were Denis Davydov (1784-1839), a hero of the Napoleonic wars, and the author of some sincere and vigorous lyrics of war and love; Prince Peter Vyazemsky (1792-1878), a master of poetical wit, and one of the most influential critics of the '20s; Baron Antony Delvig (1798-1831), an exquisite artist in classical and antique forms; the revolutionary Kondrati Ryleev (1795-1826), hanged as the head of the Decembrist conspiracy, who in his civic verse continued the noble oratorical tradition of Lomonosov; Dmitri Venet'vich (1805-27), whose early death was a great loss to the generation; and Fedor Glinka (1788-1880), a devotional poet who combined striking and effective simplicity with elevated mysticism. The movement of which Pushkin

and Vyazemsky were the recognized heads began by calling itself romantic, but was in reality much rather classical in spirit. Though they rejected the authority of Boileau they remained entirely free from romantic vagueness, from all "intercourse with the infinite," and from all aspirations after the unknown. The most general characteristic of even the minor poets of this Golden Age is a complete mastery of technique and a perfect adequacy of form to content.

After 1830 poetry begins to lose the sense of words, and to degenerate into untransformed emotion or shrill rhetoric. This is already the case with Alexander Polezhaev (1805-38), a pupil of Hugo and Byron and the direct forerunner of Lermontov in the passionate rhetoric of revolt. Lermontov himself (1814-41) (*q.v.*) was often merely a gushing emotionalist, or a thundering rhetorician. But at his highest moments of inspiration he reached summits of romantic vision that stand isolated in Russian poetry, while towards the close of his tragically ended life he was well on the way towards forming a sober and realistic style of great distinction and force. The general decline of poetry is not reflected in the work of Theodore Tyutchev (1803-73) whose compact and concentrated lyrics, though most of the best appeared as early as 1836, were not fully appreciated till much later. His poetry combines a penetrating pantheistic vision of the universe with the severe discipline of 18th century classicism. He has come to be generally regarded as Russia's second greatest poet. An interesting by-current was the artificial folk-song. It was cultivated already in the 18th century, but reached its highest development in the work of Alexis Koltsov (1808-42), the most famous of the Russian "uneducated poets." For all their artificial and literary antecedents his songs breathe a genuinely popular spirit.

The Russian drama of the first third of the century, though often quite competent for production on the stage, possesses small literary significance. Quite apart from the common run of plays stands the one comedy of Alexander Griboyedov (1795-1829) (*q.v.*), *Goré et Uma* (*Woe from Wit*, 1825), one of the major classics of Russian literature. Historically it forms a connecting link between the classical realistic tradition that culminated in Fonvizin and Krylov, and the social realism of the later 19th century.

Russian prose-fiction remained for a long time without much vigour or originality. The only early novelist worth mentioning except Karamzin is Vasilii Narezhny (1780-1825), a robust realist in the tradition of Le Sage and Smollett. From the end of the '20s the writing of fiction became more intense, though remaining largely imitative. Romances of Russian history in the manner of Scott by Michael Zagoskin (1792-1853) and Ivan Lazhechnikov (1792-1869) were particularly popular. The "Byronic" romanticism and smartness of Alexander Bestuzhev (pseud. Marlinsky, 1797-1837) also had a great success. The more refined forms of German romanticism were cultivated by Prince Vladimir Odoevsky (1804-69) and by Alexis Weltmann (1800-69), a gifted disciple of Jean-Paul. Pushkin himself, after 1830, began to pay more attention to prose than to poetry, elaborating a prose style that avoided all unnecessary ornament, and a narrative technique that discarded all that was not strictly relevant to the story. Lermontov's one masterpiece, *A Hero of Our Times* (1840), links the Russian psychological novel to the French analytical novel, while one of the stories included in it contains, *in nuce*, all the short-story technique of Chekhov.

The years 1832-45 are swayed by the genius of Gogol (1809-52) (*q.v.*). Much of his best work is distinctly romantic, and in a certain sense Gogol even marks the high-water mark of romanticism in Russia. But he was also a realist by his extraordinary power of visual convincingness, and in the way he opened to literature large regions of the vulgar and the ugly that had been taboo. Psychologically, he was not a social satirist—the grotesquely lifelike creations of his imagination were exteriorizations of his own inner fauna. But the state of the nascent Russian intelligentsia in the later '30s was such that it could only accept Gogol's work as a satirical criticism of contemporary Russia. His comedy *The Government Inspector* (*Revizor*, 1836) and his comic "epic" *The Dead Souls* (1842) became the main landmarks in the awakening of

Russian society from the political torpor it had been plunged into after the suppression of the Decembrist rebellion (1825).

The Intellectual Revolution.—The great intellectual revolution that led to the formation of the "intelligentsia," as we now understand the term, began outside the political sphere in an awakened interest in general and philosophical ideas. The generation of 1825-40 was intoxicated with the metaphysics of Schelling and Hegel. At the same time, in spite of a savage censorship, journalism began to aspire to the leadership of opinion. *The Moscow Telegraph*, the organ of advanced romanticism edited from 1825 to 1834 by Nicolas Polevoy (1796-1846), is particularly noteworthy in this connection. Towards the end of the '30s the intellectual fermentation began to take on a political and social colouring and to express itself in a general disapproval of existing conditions. By 1840 the intellectuals had formed themselves into two camps: the Slavophiles who criticized contemporary Russia for abandoning those of their ideals they discovered in Old Russia and in the religious traditions of the people; and the Westernizers whose faith was in rational progress on European lines. The most notable of the former were Alexis Khomyakov (1804-60), a man of brilliant gifts, a devotional and religious poet of talent, and the greatest theologian ever produced by Russia; and the brothers Aksakov, Konstantin (1817-60) and Ivan (1823-86). The influence of the Westernizers was stronger. Their chief leaders were the literary critic Vissarion Belinsky (1811-48) and Alexander Herzen (or Gertsen, 1812-70, see HERZEN). The former started his career as a romantic and aesthetic idealist. After 1840 he began to place social problems foremost and to demand a social significance of all literary work. His critiques became enormously influential, and he may be considered as the spiritual father of Russian Radicalism. The activity of Herzen, who emigrated in 1847, was chiefly political. In literature he owes his high standing to such work as *From the Other Shore*, a series of dialogues and essays in which he gave expression to his disillusionment in the revolution of '48, and *My Past and Thoughts* which is a great autobiography.

After the general political awakening of the country that followed the Crimean War the tradition of Belinsky was carried on by Nikolay Chernyshevsky (1828-89), Nicolas Dobrolyubov (1836-61) and Dmitri Pisarev (1840-68). They still further identified literary criticism with social politics. They rejected all non-utilitarian values, while Pisarev even condemned all art that was not directly and simply useful. About 1870 Russian Radicalism entered on a new phase, less rationalistic and more ethical, which proclaimed service to the people in atonement for the sins of serfdom, the only way of virtue open to the educated classes. These Radicals are known as the *narodniks* (populists). Their chief spokesman was Nicolas Mikhaylovsky (1842-1904), whose influence over the Radical intelligentsia was for about 20 years almost unlimited. The other camp was less influential (except in the purely political sphere where the brilliant journalism of Ivan Aksakov was a great power) but richer in original and independent personalities. The critic Apollon Grigoriev (1822-64) was excessively prolific and hot-headed, but at his rare best he displayed an imaginative understanding of the highest order. He is also the author of a few songs of strange and poignant beauty. A no less striking personality was that of Constantine Leontiev (1831-91), whose political philosophy of extreme conservatism is a curious amalgam of religious, aesthetic and biological considerations, that presents certain affinities with Nietzsche. Nicolas Strakhov (1828-96), was a good critic but a personality of less significance.

Rise of the Realistic Novel.—The Russian realistic novel grew up under the presiding influences of Gogol and of the idealistic social realism of French writers, especially of George Sand. The note of social revolt, echoed from France, is first heard in the *Three Tales* (1835) of Nicolas Pavlov (1805-64), and in the naïve and sincere work of Elena Hahn (pseud. Zinaida R-va, 1814-43). The influence of Gogol dominates the work of Yakov Butkov (c. 1815-56) and of Count Vladimir Sollogub (1814-82). These first groupings were followed by the great creative outburst of 1846-47, when in the course of a few months Turgenyev, Dos-

toievsky, Goncharov and others gave the world their first works. The main characteristics of the new school were: the realistic rendering of contemporary Russian life; an interest concentrated on social problems; a critical attitude to existing social conditions; an avoidance of all extremes of the grotesque and the romantic; and an endeavour to write as simply and "transparently" as possible, so that words should be only a reflection of things. In these two latter points they distinctly broke away from Gogol, whose disciples they otherwise claimed to be. The most successful novelists during the first 15 years of the movement were Ivan Goncharov (1812-1891) (q.v.) and especially Ivan Turgenyev (1818-1883) (q.v.). The former in his second novel, *Obломov* (1858) achieved one of the greatest masterpieces of social realism; the figure of Obломov is at once strictly realistic and immensely symbolical, the imaginative quaintness of a characteristic aspect of the self-owning intelligentsia. Turgenyev is, of all his contemporaries, most closely related to Pushkin: most of his characters are developments of Onegin and Tatiana, the weak man and the strong woman. His novels, from *Rudin* (1856) to *Fathers and Sons* (1862), realize the perfect type of the "social" novel that is at once relevant to the solution of social problems and full of human significance. His style, realistic without rudeness, and poetical without emphasis, answered to perfection to the aesthetic ideal of the age, and was proclaimed the exemplar of Russian prose.

A different literary type is presented by the "philanthropic" fiction that sought to awaken sympathy with the poor and oppressed. Some writers (including the young Dostoevsky) took their subject matter from the life of the poorer urban classes, the "poor clerk" being a particularly favourite character; others devoted themselves to the peasant. The unquestionable masterpiece of the latter group is Turgenyev's *A Sportsman's Sketches* (1847-52). Other writers of peasant fiction were Dmitri Grigorievich (1822-1900), whose first novels were among the literary events of 1846-47; and Marko-Vovchok (pseud. of Mme. Markovich, née Velinsky, 1834-1907), whose best work was done in Ukrainian (see UKRAINIAN LITERATURE). Another group of novelists chose the uneducated classes for their heroes, not as objects of compassion, but as the depositories of characteristic Russian qualities and of a moral strength that had been forfeited by the gentry. The best stories of this kind were written by Alexey Pisemsky (1820-81), especially *The Petersburgers* (1853). His novels of "genteel" life (e.g., *A Thousand Souls*, 1862) are full of a bitter contempt for the educated classes. His characters are powerfully drawn and there is more masculine vigour in his narrative art than in that of any of his contemporaries. The novels of Nicolas Melnikov (pseud. A. Pechersky, 1819-83) contain more valuable ethnographical information than literary merits. Sentimentality, tempered by humour, marks the stories of Mme. Sokhansky (pseud. Nadezhda Kokhanovsky, 1825-84) who took her material from the life of the provincial squirehood of the back-steppes.

Sergei Aksakov, a much older man (1791-1859), realized his possibilities only under the influence of Gogol and of the new realism. After several books on sport and animal life he published *Chronicles of a Russian Family* (1856), describing with extraordinary objectivity and vividness the life of the East Russian squire in the 18th century. It was followed by *Years of Childhood of Bagrovgrandson* (1858) where he tells the story of his first eight years with a minuteness of convincing detail that has been rivalled only by Proust. Aksakov's Russian is remarkable for its purity and plasticity. His works have been admirably translated into English by J. C. Duff.

The two novelists now unquestionably classed as the greatest of their age, Tolstoy (q.v.) and Dostoevsky (q.v.), produced their chief work between 1864 and 1880. Both are somewhat unrepresentative of their time in that their interest was in the permanent entities of the soul rather than in current social problems. Dostoevsky was moreover unlike his contemporaries in the dramatic power and sense of tragedy revealed in his great novels. But Tolstoy's *War and Peace* may be regarded as the fulfilment of an ideal common to all the Russian realists: a form of fiction

REPRESENTATIVE RUSSIAN WRITERS, 18TH-20TH CENTURIES

- | | | |
|-----------------------------------|----------------------------------|---|
| 1. Mikhail Lomonosov (c. 1711-65) | 5. Nikolai Gogol (1809-52) | 9. Leo Tolstoy (1828-1910) |
| 2. Ivan Krylov (1768-1844) | 6. Theodore Dostoevsky (1821-81) | 10. Anton Chekhov (1860-1904) |
| 3. Mikhail Lermontov (1814-41) | 7. Nikolai Nekrasov (1821-77) | 11. Maxim Gorki (Alexey Pashkov, 1868-1936) |
| 4. Alexander Pushkin (1799-1837) | 8. Ivan Turgenev (1818-83) | 12. Dmitri Merezhkovsky (1865-1941) |

The most famous of these was Mikhail Artsibashev (1878-1927), the author of the notorious *Savin* (1907, Eng. trans. 1915), a dreadfully didactic novel that preached the gospel of complete obedience to sexual impulses, in a style unintelligently aped from Tolstoy. S. Sergeyev-Tsensky (b. 1876), another pessimist, is a much more genuine writer, and the master of an individual style. His novel *Movements* (1910) is one of the most powerful stories of dying and death written after *Ivan Ilyich*. Ivan Bunin (1870-1953) (*q.v.*) may also be classed with the pessimists. His most important works, *The Village* and especially *Sukhodol* (1912), give an impressive picture of the spiritual decay and cultural poverty of the peasantry and provincial gentry of central Russia.

before the Revolution. Numerous novelists practising a more or less "modernized" realism came up in the years preceding the World War of 1914-18. Two deserve mention: Ivan Shmelev (1875-), whose story *That which happened* (1921, Eng. trans. 1926) was perhaps the best Russian story inspired by the war; and Boris Savinkov (q.v.) (pseud. V. Ropsin, 1879-1925), author of *The White Horse* (1909, Eng. trans. 1915), a striking revelation of the terrorist mentality.

Chekhov's innovations in dramatic technique carried to its logical end the anti-artificial and "anti-theatrical" realism of Turgenyev and Ostrovsky. Gorki and Andreyev attempted to imitate his plays, but failed to master their inner, "musical" construction which alone makes them what they are. Andreyev also wrote "modernist" plays which are nothing but a succession of rhetorical clichés, and crude symbolism.

The "religious-philosophic" movement had its roots in the Christianity of Dostoevsky and in the gnostic idealism of Vladimir Soloviev (1853-1900) (q.v.). Soloviev, a brilliant dialectician and polemist, was not a creative philosopher, but his influence was very great. As a writer he is best remembered, apart from his mystical poetry, for his last work, *Three Dialogues on War, Progress and the End of the History* (1900, Eng. trans. 1915), an apocalyptic treatise in the form of a brilliantly witty conversation. Of his numerous followers we need only mention Father Paul Florensky, a writer of extraordinary subtlety and sophistication, and Nicolas Berdyaev (1874-1948), an impulsive thinker, more stimulating than profound. A very different kind of philosopher was Vasilii Rozanov (1856-1919), one of the greatest masters of modern Russian prose. By rejecting what he called the "Gutenberg" style he made his Russian as flexible and spontaneous as spoken language. He was a convinced enemy of Reason, in theory as well as in practice. His religion was mainly a religion of sex and procreation, but he had a deep emotional sympathy with the traditions of Russian Christianity. One of his most characteristic books, *Solitaria* (1912), was translated into English (1927). Leo Shestov (1866-1938) was also an irrationalist, but in his war on Reason he used the weapons of his enemy with consummate skill. He had an intimate affinity with Dostoevsky and Tolstoy (Eng. trans. Anton Chekhov, 1916; *All Things Are Possible*, 1920).

Symbolist Poetry.—The literary movement of the '90s, dubbed "modernism" by its opponents, had for its principal components aestheticism and individualism. Dmitri Merezhkovsky (1865-1941) (q.v.) was one of the earliest and most influential mouthpieces of "modernism." He did excellent work at first as the interpreter of foreign values. But his historical novels reveal no originality, and as a religious thinker he was a long-explored nonentity. The most important literary expression of the "modernist" movement was the poetry of the Symbolists. In the first stages their poetry was largely derivative from foreign sources. The work of Constantine Balmont (1867-1943) (q.v.) and Valery Bryusov (1873-1924) (q.v.) has a translated and un-Russian flavour. But they contributed a great deal to raising the standards of poetic workmanship and the general level of literary culture. Other poets more original and at the same time more organically rooted in the Russian tradition were Fedor Sologub (1863-1927) (q.v.); Zinaida Hippis (1869-1945) (q.v.), an intellectual poet of great technical originality; Innocent Annensky (1866-1909), whose small posthumous book *The Cypress Chest* (1910) contains lyrics of the most quintessential beauty; and Vycheslav Ivanov (1866-1949), a gnostic metaphysician, a classical scholar, saturated with culture, the master of a magnificent ornate, Alexandrine style (*Cor Ardens*, 1911), as well as a splendid producer of ornate prose. The younger generation of Symbolists produced the greatest poet of the movement in Alexander Blok (1880-1921) (q.v.). His early mystical lyrics were purely mystical and immaterial. Later when he lost his mystical visions, his poetry became more full-blooded and realistic. It is romantic in substance, but instinct with a grim and hopeless irony. His last poem, *The Twelve*, written immediately after the October revolution, is a sublime symphony made out of realistic dirt. Blok's contemporary Andrei Belyy (pseud. of Boris Bugaiev, 1880-

1934), was the most original and "advanced" of the younger Symbolist poets. His poetry is mystical in content, experimental in form and often humorous. Of the minor and later Symbolists there are Maximilian Voloshin (1877-1932), and Vladimir Khodasevich (1886-1939). The exclusively metaphysical character of Symbolism produced a reaction towards more concrete and less sophisticated poetry. Michael Kuzmin (1875-) was its first herald. About 1912 it crystallized into a movement whose leader was Nicolas Gumilev (1886-1921). His poetry is a strange mixture of gaudy aestheticism and manly romanticism. The poetry of Anna Akhmatova (Eng. trans. *Twenty-Seven Love Poems*, 1927) is also an assertion of human and concrete emotion as against the mysticism and metaphysics of Symbolism. Osip Mandelstam (1891-) (*The Stone*, 1916) is more concerned with cultural than with sentimental values. His technique is a curious combination of classical eloquence with an illogical associationism akin to that of the *surréalistes*.

The Symbolist Novel.—Of the elder Symbolists who attempted prose fiction Sologub (q.v.) is easily first. *The Little Demon* (1907) is one of the greatest Russian novels since Dostoevsky. Superficially it is a story of Russian provincial life, in the realistic tradition, but its symbolism has a metaphysical rather than a social significance. Other poets like Bryusov and Kuzmin tried to renovate Russian prose by adopting old and foreign styles. Bryusov's romance of witchcraft, *The Fire Angel* (1907), for instance, imitates the manner of a 16th century German memoirist. Russian prose was revolutionized by Andrei Belyy (see above) and Alexei Remizov (1877-) (q.v.). They aimed at the maximum of verbal expressiveness, thus reviving the true tradition of Gogol and continuing the work of Leskov. Belyy achieved this by a variety of means, among which rhythm, bold metaphor and verbal creation are most prominent. His novels, from the first, *The Silver Dove* (1909), to *Moscow* (first parts 1926), reveal a creative genius of a very rare order. Remizov's Russian is more colloquial; he continues the work of Avvakum and Rozanov of "de-latinizing" the language. His writings present an enormous variety of kind and subject. But most important of all are his stories of provincial life (*The Story of Stravilodov*, 1909, and *The Fifth Pestilence*, Eng. trans. 1927) which introduced a new type of grotesque realism and a new technique. They had a considerable influence on the rise of a new realism which used Russian life not as a peg on which to hang social or metaphysical problems, but as purely aesthetic material. Alexei N. Tolstoy (1884-1945) was the most popular and liveliest of these writers, the master of an admirable narrative manner, free from any kind of sophistication. His masterpiece is *The Childhood of Nikita* (1922). Michael Prishvin (1873-) is the author of the best animal stories in the language (*The Beast of Krutoyarsk*, 1913). Eugene Zamiatin (1884-1937) began as a disciple of Remizov, but later developed a complicated expressionist manner of his own.

The War of 1914-18 and Revolution.—World War I. did not profoundly affect Russian literature. The intellectual classes kept aloof from it. The Revolution of March 1917 remained almost equally alien to the Russian imagination, but not the Bolshevik revolution of eight months later, or the ensuing civil wars. Their external result was the division of intellectual Russia into two hostile camps, which after 1920-21 became a geographical division between those who remained in U.S.S.R. and the *émigrés*. The older generation of writers was pretty equally divided between the two sides. But the young generation of *émigrés* produced no valuable work with the possible exception of the historical novelist, Mark Aldanov (1889-) (q.v.). In the literature of ideas the *émigrés*, however, gave birth to the vigorous movement of the "Eurasians," with Peter Suvchinsky and Prince Nicolas Trubetsky as leaders. Of the Bolsheviks, Kenin was an orator and a political writer of genius. Trotsky was a brilliant pamphleteer and his book, *Literature and Revolution* (Eng. trans. 1925), discussing the literary policy of the Communist party, is of interest. But the strictly literary men of the party were very second-rate. Anatoly Lunacharsky (1875-1933) (q.v.) was a conspicuous mediocrity, and Demian Bedny (pseud. of E. A.

Pridorov, 1883-1945), the Communist poet laureate, was no more than an able and sometimes witty writer of rhymed propaganda.

During the years of civil war and blockade (1918-21) Russian prose writers almost ceased from production and poetry ruled supreme. Of the "advanced" poetical groups, the Futurists were the most prominent. The Futurist movement began about 1912 as a revolt against the hieratic mysticism of the Symbolists. It united several fundamentally different tendencies, and there is little in common between its two principal representatives, Victor Khlebnikov (1885-1922) and Vladimir Mayakovsky (1893-1930), besides the common desire to give poetry a more rugged and virile accent and to tear it away from the withering hold of traditional poetical associations. Khlebnikov was a recluse and a stammerer, a mole who lived, as it were, at the linguistic roots of poetry. His work is caviare to the general public, but highly appreciated by fellow poets. Mayakovsky was an open-air orator. Much of his verse is revolutionary propaganda. Though totally lacking in the "finer touch," it is intensely original and highly craftsmanlike. Boris Pasternak (b. 1890), unquestionably the greatest living Russian poet (principal book of lyrics, *My Sister, Life*, written 1917, published 1928) is externally connected with some aspects of Futurism, but in substance he is nearer to the traditions of Tyutchev and Fet. His poetry is marked by an absolute freshness of perception and diction combined with a tensile lyrical emotion that is to be found only in the greatest. His prose (*Tales*, 1925) is also of the highest order, and being concerned with the realities of the soul stands apart from that of his contemporaries. Next to Pasternak the most significant recent poet was Marina Tsvetayeva (an *émigrée* since 1922), whose poetry is marked by an exceptional variety and richness of rhythmical imagination, and an exuberant vitality. Sergius Esenin (1895-1925) (*q.v.*), the favourite poet of the post-revolutionary intelligentsia, was at one time connected with "advanced" movements, but in reality he is a poet of sentiment of an essentially "19th century" type. After 1921 poetry began to lose its ascendancy. None of the poets who came forward after that time are of any very great significance, though the "proletarian poet" Vasil Kazin has a genuine gift of song, and Nicolas Tikhonov (1896-) and Ilya Selinsky (1899-) are consummate and original masters of technique.

Post-Revolutionary Prose.—The period of the "New Economic Policy" (inaugurated 1921) saw the rise of a whole host of prose writers who, while remaining outside the pale of party Communism, sympathized with the Communist Revolution. They have been given the name of *poputchiki*, which means "fellow-travellers up to a certain point." The first of the *poputchiki* were strongly under the influence of the "ornamental" style of Bely and Remizov, and of the "formalist" school of criticism, which insisted on the complete reduction of all literary facts to form. The most prominent of the "formalists" was Victor Shklovsky (b. 1893), a vivacious and clever critic, and the author of a very remarkable book of reminiscences of World War I and the Revolution (*A Sentimental Journey*, 1923). The young "ornamental" novelists laid all their emphasis on style and formal originality, almost abandoning all pretence of narrative. The spirit of the Revolution expressed itself in their work in their treatment of mass movements. In the early novels of Boris Pilnyak (b. 1894) (*q.v.*) and of Vsevolod Ivanov (b. 1895) there are no individual characters, only vast movements of masses, crowds or peoples. Ivanov has overcome the limitations of "dynamism" and his later stories show more grit. The tales of Isaac Babel (b. 1894) are "intensified anecdotes" with a maximum of artistic concentration. He is a supreme master in the imaginative treatment of slang and mongrel dialects, and the most perfect artist of the younger generation. His best stories are about the Polish War of 1920. Leonid Leonov (b. 1899) is a more old-fashioned writer, related in tone and subject-matter to earlier masters, and full of sympathy for the underdogs of the Revolution. Other novelists tried to remedy the lack of narrative interest inherent in "ornamental" and "dynamic" fiction. Ilya Erenburg (b. 1897), who had been made famous by *The Adventures of Julio Jureto* (1922), a satire of Capitalist

Europe, won still greater fame by crude novels of melodrama and adventure. Constantine Fedin (b. 1892) is a more serious writer; his novel *Cities and Years* (1924), a powerful story of war and revolution, restored to a place of honour the ethical conception of human conduct, as opposed to the elemental dynamics of the masses. After about 1925 "soviet workdays" replaced the civil war as the chief subject of fiction. Most of this new fiction of "soviet manners" is not above the level of good journalism. Among those who represent soviet life in a satirical light the most popular is Michael Zoshchenko (1895-), but Sergey Zayaitzky is the only writer of this description to have shown real imaginative power. Other writers like Lydia Seyfullina (b. 1889), in a curious type of best seller, try to answer the soviet typist's demand for "uplift." Recently there has grown up a great interest in the historical novel. Those by Yuri Tynyanov and by Olga Forsch (b. 1879) are works of real and solid merit.

By the side of the *poputchiki*, the "proletarian" novelists at first cut a rather inferior figure. The work of Yuri Libedinsky (b. 1898; *The Week*, Eng. tr. 1923), of Theodore Gladkov (b. 1883; *Cement*, 1926) and of D. Furmanov (d. 1926) is hardly literature, but it is interesting as reflecting the optimistic energy of the men who won the civil war and shouldered the work of reconstruction after it. The younger proletarian generation has produced writers of real talent. Artem Vesely (b. 1898) carried the "dynamic" novel to its highest perfection (*My Native Land*, 1926), infusing into it a vitality and cheerfulness entirely alien to its *poputchiki* initiators. A. Fadeyev and Sergey Semenov, on the other hand, are more interested in individual and ethical man. Fadeyev's *The Defeat* (1927) and Semenov's *Natalia Tarpana* (1927) are works of great merit and still greater promise.

The drama, in spite of the continued vitality of the theatre, has produced little of importance. The realistic tradition has been abandoned. The plays of Nicolas Evreinov (b. 1879), a leading theatrical producer, have many points in common with Pirandello's. The Futurists at one time attempted to create a high-standard, boldly Aristophanesque propaganda play; but the only successful venture was Mayakovsky's *A Mystery-Bouffe* (1918). The dominant type of drama is a kind of conventional puppet-play with characters stripped of all reality and humanity. Such are the crude and mediocre plays of Lunacharsky (Eng. tr. *Three Plays*, 1923). Only the plays of the regretted Leo Lunts (1901-24) are on a much higher level. They are simplified tragedies of pure action, full of a genuine heroic spirit.

Historians.—Modern Russian historiography begins with V. N. Tatishchev (1686-1750); his history of Russia is a laborious but uncritical compilation from the chronicles. Gerhard Friedrich Müller (1705-83), a German member of the Petersburg academy and a pioneer in many fields, was the first to open up the jungle of official acts and records. A critical spirit was first introduced by another German, August Ludwig von Schlozer, and by the amateur historian I. N. Boltin (1735-92). Karamzin's (*q.v.*) *History of the Russian State* (12 vol., 1818-26) summed up the work of the 18th century, to which it essentially belongs: it is moralizing and rhetorical, and devoid of all "sense of period." Its conception of autocracy as the only constructive and beneficent force in the Russian past made it the bible of official and conservative Russia. But before Karamzin was dead new ideas were abroad; and acquaintance with Niebuhr and Hegel demanded a new approach to Russian history. Nicolas Polevoy (*see p. 754*) in his *History of the Russian People* (1830-33) attempted to supply the demand, but being no more than a journalist, failed. Michael Pogodin (1800-75), who did much to advance a critical and detailed knowledge of Russia's past, was prevented from achieving a synthesis by the provincial conservatism of his outlook. The younger Slavophiles were more imaginative, and being convinced that the chief hero of history was the people and not the state, concentrated their attention on the history of the masses. Their best historian was I. D. Belyaev (1810-73). The same predilection for social history and for the masses marks the work of the radical historians, N. I. Kostomarov (1817-85), the most "literary" and widely read historian of the time, and A. P. Shchapov (1830-76), who tried to apply to Russian history the

methods of Buckle. The moderate and Liberal Westernizers, on the contrary, devoted themselves to the history of the State, which appeared to them as the only civilizing force, and of its legislation. The most industrious of them, S. M. Soloviev (1820-79), compiled what is the most complete, detailed history of Russia (29 vol., 1857-79). It is little more than a transcript of the sources, interspersed with a few historical discussions, reflecting the ideas of Hegel. Russian historiography was freed from philosophy and party bias by K. N. Bestuzhev-Ryumin (1829-97) and V. O. Klyuchevsky (1841-1911). Klyuchevsky, especially, introduced a more intimate study of the sources, resulting in a more general reconstruction of the past; and his monographs on the pre-Muscovite and Muscovite period have become classics. His *Course of Russian History* (4 vol., 1904) has charmed many readers by its literary form, but is handicapped by the absence of a sincerely considered point of view. Bestuzhev-Ryumin became the master of a whole school of historians, among whom S. Th. Platonov (1860-1922) was the most eminent. *The Time of Troubles* (1899) is a masterpiece of knowledge and presentation. Apart from the main schools stand V. I. Sergeevich (1838-1909), whose *Antiquities of Russian Law* is a brilliant work of criticism, written in a concise and trenchant style; and E. E. Golubinsky (1834-1912), whose *History of the Russian Church* presents a strange mixture of great critical acumen and quaint stolidity. The old Westernizing tendency survives in the work of P. N. Milyukov (1859-1943). *Studies in the History of Russian Civilization*, whose leading idea is to prove the poverty and inferiority of old Russian civilization. N. P. Pavlov-Silvansky (1869-1908) was a Westernizer of a different type, who tried to prove the essential similarity of the historical process in Russia and the West. The rise of Marxism has led to the rise of a school of Marxist historians, who aim at reducing Russian history to universally applicable methods of dialectic materialism. Their patriarch, M. N. Pokrovsky (1868-1932), was a historian of great gifts whose treatment of historical problems did much to renovate our ideas of the Russian past.

The Study of Literature.—The study of literature began in the 18th century in the form of biographical compilations and bibliographical indexes, Novikov being the principal pioneer. Towards 1830 literary studies came under the influence of German philosophical idealism. Stepan Shevryev (1806-64), a highly cultured critic and a right-wing Slavophil, was the first to attempt, without much success, a scholarly presentation of Russian literature. The journalistic surveys of Belinsky were much more influential in establishing a generally accepted *vulgate* of literary history. In the second half of the 19th century Russian folklore attracted considerable learned attention, almost invariably influenced by the romantic theories of Grimm. An extreme form of such romanticism is apparent in the work of Orest Miller (1838-89). Theodore Buslayev (1818-97) was a more circumspect idealist, and the first to attempt to bring together the study of old Russian literature and old Russian art. In the following generation A. A. Potebnya (1835-91) tried to place the study of folklore on a broad basis of linguistic psychology. Alexander Veselovsky (1838-1906) directed his efforts towards a strictly scientific study of comparative literature. Old Russian literature remained in the hands of philologists and its study was conducted on somewhat narrowly academic lines. The foremost representatives of this line of study today are V. N. Peretts (1870-) and V. M. Istrin, whose history of Kiev literature (1922) is the most authoritative survey of the period. Less moderate is the work of A. M. Pypin (1833-1904) whose *History of Russian Literature* is a scholarly and industrious attempt to represent old Russian civilization in the poorest possible light. The work of most historians of modern Russian literature is marked by a strong party bias and an absence of literary understanding. *The History of Russian Literature after 1848*, by A. M. Skabichevsky (1838-1910), and the writings of S. A. Vengerov (1855-1920), literary editor of the Brockhaus-Efron Encyclopedia (1890-1907) and of numerous other publications, are best known and most frequently utilized. The Marxists introduced a fresh note by subordinating the study of literature to that of economics. Of the

early Marxists, the gifted Eugene Soloviev (pseud. Andreyevich, 1863-1905) wrote a *Philosophy of Russian Literary History* (1905) which is certainly worth reading. The canons of Marxist literary history were established by G. V. Plekhanov (1856-1918). Since 1917 Marxism is the official doctrine in literary history. The opposition is provided by the "formalists," whose influence on literary development has already been alluded to. Their most notable workers in the field of literary history are Boris Eichenbaum and Yuri Tynyanov. On the whole, Russian literary history is in a far from satisfactory state, and there is no single adequate presentation of it. For the ancient period (including the 18th century) the student will be best guided by such collections of extracts as the *Chrestomathy* of Brodsky, Mendelson and Sidorov (3 parts, Moscow 1922-23). For the 19th century and later he will have to find his own way with the aid of existing bibliographies.

White-Russian Literature.—White-Russian was, by the side of Latin, the official language of the Grand Duchy of Lithuania from the 14th century to its absorption by Poland, but apart from a few chronicles and a few translated romances it produced no literature. In the 19th century White-Russian literature did not rise above the level of provincial amateurishness. But in the present century a literary movement of which the chief names are Yanko Kupalo (b. 1882) and Michael Bagdanovich (Bagdanovich, 1892-1917) has resulted in the formation of a national literature. White-Russian folklore is less varied than either great Russian or Ukrainian, and has no narrative poetry. Its lyrical song however is rich, and some of it presents archaic features. White-Russian studies are now centred in the White-Russian State university at Minsk (founded 1921).

See N. Karasy, *The White-Russians* (in Russian, Warsaw, 1903 etc.); M. Haretsky (Goretsky), *History of White-Russian Literature* (in White-Russian, Minsk, 1926). For Ukrainian (or Little-Russian or Ruthenian) literature see UKRAINIAN LITERATURE. (D. S. M.)

RUSSKY, NIKOLAI (1854-1918), Russian general, was educated at the infantry military school in St. Petersburg, graduated from the academy of the general staff in 1881, and by 1896 had reached general's rank. During the war with Japan (1904-5) he was the head of the staff of the II. Army, and planned the offensive carried out by General Gripenberg which led to the prematurely abandoned offensive of Sandepu. In 1914 he commanded the III. Army which attacked in Galicia, and advanced to Lvov (Lemberg) through which it passed in the further advance to the San-Dniester line. The dramatic entry of the III. Army into Lvov created for General Russky a prestige out of proportion to the real importance of his success. In Oct. 1914 he was appointed commander-in-chief of the north-western and afterwards of the northern armies. He continued to hold the command in spite of ill-health, and it was at his headquarters that the final scenes of Nicholas II.'s reign and his abdication took place in March 1917.

Soon after the Revolution General Russky retired, and in 1918 he was reported killed by the Bolsheviks.

RUSSO-JAPANESE WAR (1904-05). The seizure by Russia of the Chinese fortress of Port Arthur, which it had a few years previously, in concert with other powers, compelled Japan to relinquish, was from the Russian point of view the logical outcome of its eastward expansion and its need for an ice-free harbour on the Pacific. The extension of the Trans-Siberian railway through Manchuria to Port Arthur and a large measure of influence in Manchuria followed equally naturally. But the whole course of this expansion had been watched with suspicion by Japan, from the time of the Sakhalin incident of 1875—when the island power, then barely emerging from the feudal age, had to cede its half of the island to Russia—to the Shimomoseki treaty of 1895, when the powers compelled it to forego the profits of its victory over China. The subsequent occupation of Port Arthur and other Chinese harbours by European powers, and the evident intention of consolidating Russian influence in Manchuria, were again and again the subject of Japanese representations at St. Petersburg (Leningrad), and these representations became more vigorous when, in 1903, Russia seemed to be about to extend its Manchurian policy into Korea. No less than ten draft treaties were discussed in vain between Aug. 1903 and Feb. 1904, and finally negotiations were broken off on Feb. 5.¹ By the fourth negotiation Japan had decided to use force, and its military and naval preparations kept pace with its diplomacy.

This was in fact an eventuality which had been foreseen and on which the naval and military policy of Japan had been based for ten years. It, too, had its projects of expansion and hegemony, and by the Chino-Japanese War it had gained a start over its rival. The reply of the western powers was first to compel the victor to maintain the territorial integrity of China, and then within two years to establish itself in Chinese harbours. From that moment Japanese policy was directed toward establishing its own hegemony and meeting the advance of Russia with a *fait accompli*. But its armaments were not then adequate to give effect to a strong-handed policy, so that for some years thereafter the government had both to impose heavy burdens on the people and to pursue a foreign policy of marking time, and endured the fiercest criticism on both counts, for the idea of war with Russia was as popular as the taxes necessary to that object were detested. But as the army and the navy grew year by year, the tone of Japanese policy became firmer. In 1902 its position was strengthened by the alliance with England; in 1903 its army, though in the event it proved almost too small, was considered by the military authorities as sufficiently large and well prepared, and the arguments of the Japanese diplomatists stiffened with menaces. Russia, on the other hand, was divided in policy and consequently in military intentions and preparations. In some quarters the force of the new Japanese army was well understood, and the estimates of the balance of military power formed by the Russian minister of war, Alexei Kuropatkin, coincided so remarkably with the facts that at the end of the summer of 1903 he saw that the moment had come when the preponderance was on the side of the Japanese. He therefore proposed to abandon Russian projects in southern Manchuria and the Port Arthur region and to restore Port Arthur to China in return for considerable concessions on the side of Vladivostok.

His plan was accepted, but "a lateral influence suddenly made itself felt, and the completely unexpected result was war." Large commercial interests were in fact involved in the forward policy, "the period of heavy capital expenditure was over, that of profits about to commence," and the power and intentions of Japan were ignored or misunderstood. Thus Russia entered upon the war unprepared in a military sense. To the guards and patrols of the Manchurian railway and the garrisons of Port Arthur and Vladivostok, 80,000 in all, Japan could, in consequence of her recruiting law of 1896, oppose a first-line army of about 270,000 trained men. Behind these, however, there were scarcely 200,000 trained men of the older classes, and at the other end of the long Trans-Siberian railway Russia had almost limitless resources.² The

strategical problem for Japan was how to strike a blow sufficiently decisive to secure its object before the then insignificant forces of the East Siberian army were augmented to the point of being unassailable. It turned, therefore, principally upon the efficiency of the Trans-Siberian railway and in calculating this the Japanese made a serious underestimate. In consequence, far from applying the "universal service" principle to its full extent, they trained only one-fifth of the annual contingent of men found fit for service. The quality of the army, thus composed of picked men (a point which is often forgotten), approximated to that of a professional force; but this policy had the result that, since there was no adequate second-line army, parts of the first-line had to be reserved, instead of being employed at the front. And when for want of these active troops the first great victory proved indecisive, half-trained elements had to be sent to the front in considerable numbers—indeed, the ration strength of the army was actually trebled.

Objects of Japanese Attack.—The aim of the war, "limited" in so far that the Japanese never deluded themselves with dreams of attacking Russia at home, was to win such victories as would establish the integrity of Japan itself and place its hegemony in the far east beyond challenge. Now the integrity of Japan was worth little if the Russians could hope ultimately to invade it in superior force, and since Port Arthur was the station of the fleet that might convoy an invasion, as well as the symbol of the longed-for hegemony, the fortress was necessarily the army's first objective, a convincing Sedan was the next. For the navy, which had materially only a narrow margin of superiority over the Russian Pacific squadron, the object was to keep the two halves of that squadron at Port Arthur and Vladivostok respectively separate and to destroy them in detail. But in February weather these objects could not be pursued simultaneously. Prior to the breakup of the ice, the army could disembark only at Chemulpo, far from the objective, or at Dalny under the very eyes of its defenders. The army could therefore, for the moment, occupy only Korea and try to draw upon itself hostile forces that would otherwise be available to assist Port Arthur when the land attack opened. For the navy, instant action was imperative.

On Feb. 8, the main battle fleet, commanded by Vice-Adm. Heihachiro Togo, was on the way to Port Arthur. During the night his torpedo boats surprised the Russian squadron in the harbour and inflicted serious losses, and later in the day the battleships engaged the coast batteries. Repulsed in this attempt, the Japanese established a stringent blockade, which tried the endurance of the ships and the men to the utmost. From time to time the torpedo craft tried to run in past the batteries, attempts were made to block the harbour entrance by sinking vessels in the fairway and free and deadly use was made by both sides of submarine mines. Though not destroyed, the Port Arthur squadron was paralyzed by the instantaneous assertion of naval superiority.

Alexeev and Makarov.—Adm. Evgeni Alexeev, the tsar's viceroy in the far east and the civil genius of the war, was at Port Arthur and forbade the navy to take the risks of proceeding to sea.³ For a time, when, in place of Admiral Starck (who was held responsible for the surprise of February), Adm. Stepan Makarov, an officer of European reputation, commanded the fleet, this lethargy was shaken off. The new commander took his ships to sea every day. But his energetic leadership was soon ended by a tragedy. A field of electromechanical mines was laid by the Japanese in the night of April 12-13, and on the following day the Japanese cruisers stood inshore to tempt the enemy on to the mine field. Makarov, however, crossed it without accident, and pursued the cruisers until Togo's battle fleet appeared, whereupon he went about and steamed for port. In doing so he recrossed the mine field, and this time the mines were effectual. The flagship "Petropavlovsk" was struck and went down with the admiral and 600 men, and another battleship was seriously injured. Then the advocates of passivity regained the upper hand and kept the squadron in the harbour, and henceforward for many months the Japanese navy lay unchallenged off Port Arthur, engaging in minor oper-

¹Belated declarations of war appeared on Feb. 10.

²The total Russian army on a peace footing was almost 1,000,000 strong.

³A vivid picture of the state of affairs in the navy at this period is given in Semenov's *Raspklat* (Eng. trans.).

ations, covering the transport of troops to the mainland, and watching for the moment when the advance of the army should force the Russian fleet to come out. Meantime seven Japanese cruisers under Vice-Admiral Kaimamura went in search of the Russian Vladivostok squadron; this, however, evaded them for some months, and inflicted some damage on the Japanese mercantile marine and transports.

Landing of Japanese 1st Army.—The Japanese had not waited to gain command of the sea before beginning the sea transport of that part of their troops allotted to Korea. The roads of that country were so poor that the landing had to be made not on the straits of Tsushima, but as far north as possible. Chemulpho, nearer by 50m. to Port Arthur than to Japan, was selected. On the first day of hostilities Rear-Admiral Uriu disembarked troops at Chemulpho under the eyes of the Russian cruiser "Variag," and next day he attacked and destroyed the "Variag" and some smaller war-vessels in the harbour, and the rest of the 1st Army (Gen. Kuroki) was gradually brought over during February and March in spite of an unbeaten and, under Makarov's régime, an enterprising hostile navy. But owing to the thaw and the subsequent break-up of the miserable Korean roads, six weeks passed before the columns of the army (Guard, 2nd and 12th Divisions), strung out along the "Mandarin road" to a total depth of six days' march, closed upon the head at Wiju, the frontier town on the Yalu. Opposite to them they found a large Russian force of all arms.

The Russian commanders, at this stage at least, had not and could not have any definite objective. Both by sea and by land their policy was to mass their resources, repulsing meantime the attacks of the Japanese with as much damage to the enemy and as little to themselves as possible. Their strategy was to gain time without immobilizing themselves so far that the Japanese could impose a decisive action at the moment that suited them best. Both by sea and by land such strategy was an exceedingly difficult game to play. But afloat, had Makarov survived, it would have been played to the end, and Togo's fleet would have been steadily used up. One day, indeed (May 15), two of Japan's largest battleships, the "Hatsuse" and the "Yashima," came in contact with five mines and were sunk. One of them went to the bottom with 500 souls. But the admiral was not on board. The Russian sailors said, when Makarov's fate was made known, "It is not the loss of a battleship. The Japanese are welcome to two of them. It is *he*." Not only the skill, but the force of character required for playing with fire was wanting to Makarov's successors.

Plans of Kuropatkin.—It was much the same on land. Kuropatkin, who had taken command of the army, saw from the first that he would have to gain three months, and disposed his forces as they came on the scene, unit by unit, in perfect accord with the necessities of the case. His expressed intention was to fight no battle until superiority in numbers was on his side. He could have gained his respite by concentrating at Harbin or even at Moukden or at Liao-Yang. But he had to reckon with the fleet? at Port Arthur. He knew that the defences of that place were defective, and that if the fleet were destroyed whilst that of Togo kept the sea there would be no Russian offensive. He therefore chose Liao-Yang as the point of concentration, and having thus to gain time by force instead of by distance he pushed out a strong covering detachment towards the Yalu. But little by little he succumbed to his *milieu*, the atmosphere of false confidence and passivity created around him by Alexeiev. After he had minutely arranged the eastern detachment in a series of rearguard positions, so that each fraction of it could contribute a little to the game of delaying the enemy before retiring on the positions next in rear, the commander of the detachment, Zaslulich, told him that "it was not the custom of a knight of the Order of St. George to retreat," and Kuropatkin did not use his authority to recall the general, who, whether competent or not, obviously misunderstood his mission. Thus, whilst the detachment was still disposed as a series of rearguards, the foremost fractions of it stood to fight on the Yalu, against odds of four to one.

*Not, as is often assumed, the fortress itself.

Battle of the Yalu.—The Japanese 1st Army was carefully concealed about Wiju until it was ready to strike. Determined that in this first battle against a white nation they would show their mettle, the Japanese lavished both time and forethought on the minutest preparations. Forethought was still busy when, in accordance with instructions from Tokio, Kuroki on April 30 ordered the attack to begin at daybreak on May 1. For several miles above Antung the rivers Yalu and Aihō are parallel and connected by numerous channels. The majority of the islands thus formed were held and had been bridged by the Japanese. The points of passage were commanded by high ground a little farther up where the valleys definitely diverge, and beyond the flank of the ill-concealed positions of the defence. The first task of the right division (12th) was to cross the upper Yalu and seize this. To the Guard and 2nd Divisions was assigned the frontal attack on the Chiuliencheng position, where the Russians had about one-half of their forces under Maj-Gen. Kashtalinski. On April 30, Inouye's 12th Division accomplished its task of clearing the high ground up to the Aihō. The Russians, though well aware that the force in their front was an army, neither retired nor concentrated. Zaslulich's mediaeval generalship had been modified so far that he intended to retreat when he had taught the Japanese a lesson, and therefore Kuropatkin's original arrangements were not sensibly modified. So it came about that the combined attack of the 2nd and Guard Divisions against the front, and Inouye on the left flank and rear, found Kashtalinski without support. After a rather ineffective artillery bombardment the Japanese advanced in full force, without hesitation or finesse, and plunging into the river stormed forward under a heavy fire. A few moments afterwards Zaslulich ordered the retreat. But the pressure was far too close now. Broken up by superior numbers the Russian line parted into groups, each of which, after resisting bravely for a time, was driven back. Then the frontal attack stopped and both divisions abandoned themselves to the intoxication of victory. Meanwhile, the right attack (12th Division) encountering no very serious resistance, crossed the Aihō and began to move on the left rear of the Russians. On the side of the defence, each colonel had been left to retire as best he could, and thus certain fractions of the retreating Russians encountered Inouye's advancing troops and were destroyed after a most gallant resistance. The rearguard itself, at Hamatan, was almost entirely sacrificed, owing to the wrong direction taken in retreating by its left flankguard. Fresh attempts were made by subordinates to form rearguards, but Zaslulich made no stand even at Fêng-hwang-chêng, and the Japanese occupied that town unopposed on May 5. The Japanese losses were 1,100 out of over 40,000 present, the Russian (chiefly in the retreat) at least 2,500 out of some 7,000 engaged.

The Yalu, like Valmy, was a moment in the world's history. It mattered little that the Russians had escaped or that they had been in inferior numbers. The serious fact was that they had been beaten.

Distribution of Russian Forces.—The general distribution of the Russian forces was now as follows: The main army under Kuropatkin was forming, by successive brigades, in two groups—1st Siberian Corps (Stakelberg), Niu-chwang and Kaiping; and Siberian Corps, Liao-Yang. Zaslulich (3rd Corps and various other units) had still 21,000. In the Port Arthur "fortified rayon," under Lieut-Gen. Stössel (4th Corps), were 27,000 men, and Gen. Linievich around Vladivostok had 23,000. These are, however, paper strengths only, and the actual number for duty cannot have been higher than 110,000 in all. The Trans-Siberian railway was the only line of communication with Europe and western Siberia, and its calculated output of men was 40,000 a month in the summer. In October 1904, therefore, supposing the Japanese to have used part of their forces against Port Arthur, and setting this off against the absence of Linievich and Stössel, Kuropatkin could expect to have a sufficient superiority in numbers to take the offensive. His policy was still, "No battle before we are in superior force."

Landing of Japanese 2nd Army.—For the moment it was equally Japan's interest to mark time in Manchuria. Still intent upon the Russian Port Arthur squadron, she had embarked her

2nd Army (Gen. Oku, 1st, 3rd, 4th and 5th Divisions) during April, and sent it to Chinampo whence, as soon as the ice melted and Kuroki's victory cleared the air, it sailed to the selected landing-place near Pitszewo. Here, under the protection of a continuous chain of war-vessels between the Elliot islands and the mainland, Oku began to disembark on May 5. But the difficulties of the coast were such that it took three weeks to disembark the whole and to extend across the peninsula to Port Adams. Oku then, leaving the 5th Division behind, moved down with the rest towards Kinchow, and after storming that place found himself face to face with a position of enormous strength, Nanshan hill, at the narrowest part of the peninsula, where part of a Russian division (3,000 only out of 12,000 were actually engaged) had fortified itself with extreme care. On May 26 took place the battle of Nanshan. The Japanese attack was convergent, but there was no room for envelopment; the Russian position moreover was "all-round" and presented no flanks, and except for the enfilade fire of the Japanese and Russian gunboats in the shallow bays on either side the battle was locally at every point a frontal attack and defence. The first rush of the assailants carried them up to the wire and other obstacles, but they were for many hours unable to advance a step farther. But the resolute Oku attacked time after time, and at last the 4th Division, on his right, assisted by its gunboats, forced its way into the Russian position. The Russians had just begun to retreat, in accordance with orders from higher authorities. But it was a second undeniable victory. It was, moreover, a preface to those furious assaults on Port Arthur which, because they were the expression of a need that every soldier felt, and not merely of a tactical method, transcend all cool-blooded criticism. The Japanese losses were 4,500 out of 30,000 engaged, or 15%, that of the Russians fully half of the 3,000 engaged. The victors captured many guns, but were too exhausted to pursue the Russians, whose retirement was not made in the best order.

The transports were now conveying the 6th and 11th Divisions to Pitszewo; these were to form the 3rd Army (Nogi) for operations against Port Arthur. Oku exchanged his 1st Division for the 6th. The 2nd Army then turned northward (3rd, 4th, 5th and 6th Divisions). The 10th Division, forming the nucleus of the 4th Army, had begun to land at Takushan on May 19. The 2nd and 4th Armies were the left wing of a widespread converging movement on Liao-Yang. Oku had the greatest distance to march, Kuroki the smallest. The latter therefore had to stand fast in the face of the Russian eastern detachment, which was three days' march at most from Feng-hwang-cheng and could be supported in three more days by Kuropatkin's main body, whereas the pressure of Oku's advance would not begin to be felt by the Russian southern detachment until the twelfth day at earliest. It was necessary therefore for the first objective to make a slight concession to the second. Oku had to start at the earliest possible moment, even though operations against Port Arthur were thereby delayed for a week or two. In fact, Oku's march began on June 13, Kuroki's on June 24; the moves of the intermediate forces at various dates within this time.

Meanwhile Kuropatkin, assembling the main army week by week, was in a difficult position. His policy of gaining time had received a severe blow in the failure of his executive officer to realize it, and that officer, though his unpursued troops quickly regained their *moral*, had himself completely lost confidence. On the news of the battle (coupled with that of a fresh army appearing on the Korean coast), Kuropatkin instantly sent off part of his embryo central mass to bar the mountain passes of Fenshuiling and Motienling against the imagined relentless pursuit of the victors, and prepared to shift his centre of concentration back to Moukden. The subsidiary protective forces on either flank of Zasulich had promptly abandoned their look-out positions and fallen back to join him. But the commander-in-chief, soon realizing that the Japanese were not pursuing, reassured himself, sent the protective troops back to their posts, and cancelled all orders for the evacuation of Liao-Yang. From this time forward Kuro-

patkin allowed his subordinates little or no initiative. A few days later, Zasulich's persistent requests to be allowed to retreat and the still uncertain movements of the 2nd Army induced him once more to prepare a concentration on Moukden. But on May 6 he learned that the Japanese 1st Army had again halted at Feng-hwang-cheng and that the 2nd Army was disembarking at Pitszewo, and he resumed (though less confidently) his original idea. The eastern protective detachment, now strengthened and placed under the orders of Count Keller, was disposed with a view to countering any advance on Liao-Yang from the east by a combination of manoeuvre and fighting.

Alexeev and Kuropatkin.—It was at this moment of doubt that Alexeev, leaving Port Arthur just in time and profoundly impressed with the precarious state of affairs in the fleet and the fortress, gave the order, as commander-in-chief by land and sea, for an "active" policy (May 19). Kuropatkin, thus required to abandon his own plan, had only to choose between attacking the 1st Army and turning upon Oku. He did not yield at once; a second letter from the viceroy, the news of Nanshan, and above all a signed order from the tsar himself, "Inform General Kuropatkin that I impose upon him all the responsibility for the fate of Port Arthur," were needed to induce him to execute a scheme which in his heart he knew to be perilous. The path of duty for a general saddled with a plan which he disapproves is not easily discoverable. Napoleon in like case refused, at the risk of enforced resignation, and so did Moreau; the generality of lesser men have obeyed.

Stakelberg's 1st Siberian Corps was therefore reinforced towards the end of May up to a strength of above 35,000. But it remained a detachment only. The Liao-Yang central mass was still held in hand, for the landing of the 4th Army—really only a division at present—at Takushan and the wrong placing of another Japanese division supposed to be with Kuroki (really intended for Nogi) had aroused Kuropatkin's fears for the holding capacity of Keller's detachment. Moreover, disliking the whole enterprise, he was most unwilling to use up his army in it. The Russians, then, at the beginning of June, were divided into three groups, the southern, or offensive group (35,000), in the triangle Neuchwang-Haicheng-Kaiping; the eastern or defensive group (30,000), the main body of it guarding the passes right and left of the Wiju-Liao-Yang road, the left (Cossacks) in the roadless hills of the upper Aihao and Yalu valleys; the right (Mishchenko's Cossacks and infantry supports) guarding Fenshuiling pass and the road from Takushan; the reserve (42,000) with Kuropatkin at Liao-Yang; the "Ussuri Army" about Vladivostok; and Stössel's two divisions in the Kwantung peninsula.

On the other side the 1st Army was at Feng-hwang-cheng with one brigade detached on the roads on either hand, the left being therefore in front of the Takushan division and facing the Fenshuiling. Oku's 2nd Army (four divisions or 60,000 combatants) was about Port Adams. This last was the objective of the attack of Stakelberg's 35,000. Kuropatkin's orders to his subordinate were a compromise between his own plan and Alexeev's. Stakelberg was to crush by a rapid and energetic advance the covering forces of the enemy met with, and his object was "the capture of the Nanshan position and thereafter an advance on Port Arthur." Yet another object was given him, to "relieve the pressure on Port Arthur by drawing upon himself the bulk of the enemy's forces," and he was not to allow himself to be drawn into a decisive action against superior numbers. Lastly, on June 7, while Stakelberg was proceeding southward on his ill-defined errand, Kuropatkin, imposed upon by the advance of the Takushan column to Siu-yen, forbade him to concentrate to the front, only removing the veto when he learned that the 4th Army had halted and entrenched at Siu-yen.

Battle of Telissu.—On the 14th, all his arrangements for supply and transport being at last complete, Oku moved north. Although he was still short of part of the 6th Division, he was in superior force. He had, moreover, the perfectly definite purpose of fighting his way north, and at Telissu or Wafangkou on June 14, as he expected, he came upon Stakelberg's detachment in an entrenched position. On the 14th and 15th, attacking sharply on

¹This was the 2nd Army, waiting in the port of Chinampo for the moment to sail for Pitszewo.

the Russian front and lapping round both its flanks, Oku won an important and handsome victory, at a cost of 1,500 men out of 35,000 engaged, while the Russians, with a loss of at least 3,600 out of about 25,000 engaged, retired in disorder. Thus swiftly and disastrously ended the southern expedition. Meantime, except for the movement on Siu-yen already mentioned¹, and various reconnaissances in force by Keller's main body and by Rennenkampf's Cossacks farther inland, all was quiet along the Motienling front. Kuroki entrenched himself carefully about Fêng-hwang-chêng, intending, if attacked by the Russian main army, to defend to the last extremity the ground and the prestige gained on May 1.

From this point to the culmination of the advance at Liao-Yang, the situation of the Japanese closely resembles that of the Prussians in 1866. Haicheng represents Münchengrätz, Liao-Yang Gitschin, and the passes east of Liao-Yang Nachod and Trautenau. The concentration of the various Japanese armies on one battlefield was to be made, not along the circumference of the long arc they occupied, but towards the centre. Similarly, Kuropatkin was in the position of Benedek. He possessed the interior lines and the central reserve which enables interior lines to be utilized, and a stroke of good fortune prolonged the period in which he could command the situation, for on June 23 an unexpected sortie of the Russian Port Arthur squadron paralysed the Japanese land offensive. In the squadron were seen the battle-ships damaged in the February attacks, and the balance of force was now against Togo, who had lost the "Yashima" and the "Hatsuse." The squadron nevertheless, tamely returned to harbour, Togo resumed the blockade and Nogi began his advance from Nanshan, but the 2nd and 4th Armies came to a standstill at once (naval escort for their seaborne supplies being no longer available), and the 1st Army, whose turn to advance had just arrived, only pushed about a few miles to cover a larger supply area. On July 1 the Vladivostok squadron appeared in the Tsushima straits, and then vanished to an unknown destination, and whether this intensified the anxiety of the Japanese or not, it is the fact that the 2nd Army halted for 31 days at Kaiping, bringing the next on its right, 4th Army, to a standstill likewise. Its next advance brought it to the fortified position of Tashichiao, where Kuropatkin had, by drawing heavily upon his central reserve and even on the eastern detachment, massed about two army corps.

Tashichiao.—On the 24th Oku attacked, but the Russian general, Zarubayev, handled his troops very skillfully, and the Japanese were repulsed with a loss of 1,200 men. Zarubayev, who had used only about half his forces in the battle, nevertheless retired in the night, fearing to be cut off by a descent of the approaching 4th Army on Haicheng, and well content to have broken the spell of defeat. Oku renewed the attack next day, but found only a rearguard in front of him, and without following up the retiring Russians he again halted for six days before proceeding to Haicheng to effect a junction with the 4th Army (Nozu), which meantime had won a number of minor actions and forced the passage of the mountains at Fenshuiling South².

The 1st Army, after its long halt at Fêng-hwang-chêng, which was employed in minutely organizing the supply service—a task of exceptional difficulty in these roadless mountains—reopened the campaign on June 24, but only tentatively on account of the discouraging news from Port Arthur. A tremendous rainstorm imposed further delays, for the coolies and the native transport that had been laboriously collected scattered in all directions. The Motienling pass, however, had been seized without difficulty, and Keller's power of counter-attack had been reduced to nothing by the dispatch of most of his forces to the concentration at Tashichiao. But Oku's 2nd Army was now at a standstill at Kaiping, and until he was further advanced the 1st Army could not press forward. The captured passes were therefore fortified (as Fêng-

hwang-chêng had been) for passive resistance. This, and the movements of the 4th Army, which had set its face towards Haicheng and no longer seemed to be part of a threat on Liao-Yang, led to the idea being entertained at Kuropatkin's headquarters that the centre of gravity was shifting to the south. To clear up the situation Keller's force was augmented and ordered to attack Kuroki. It was repulsed with a loss of nearly 1,000 men in the action at the Motienling (July 17), but it was at least ascertained that considerable forces were still on the Japanese right, and upon the arrival of a fresh army corps from Europe, Kuropatkin announced his intention of attacking Kuroki. And in effect he succeeded in concentrating the equivalent of an army corps, in addition to Keller's force, opposite to Kuroki's right. But having secured this advantage he stood still for five days, and Kuroki had ample time to make his arrangements. The Japanese general occupied some 20m. of front in two halves, separated by 6m. of impassable mountain, and knowing well the danger of a "cordon" defensive, he met the crisis in another and a bolder fashion. Calling in the brigade detached to the assistance of Nozu as well as all other available fractions of his scattered army, he himself attacked on July 31 all along the line. It was little more than an assertion of his will to conquer, but it was effectual. On his left wing the attacks of the Guard and 2nd Divisions (action of Yang-tzu-ling) on the Russian front and flank failed—the frontal attack because of the resolute defence, the flank attack from sheer fatigue of the troops. Count Keller was killed in the defence. Meantime on the Japanese right the 12th Division attacked the large bodies of troops that Kuropatkin had massed (Yu-shu-ling) equally in vain. But one marked success was achieved by the Japanese. The Russian 35th and 36th Regiments (10th European Corps) were caught between two advancing columns, and, thanks to the initiative of one of the column leaders, Okasaki, destroyed. At night, discouraged on each wing by the fall of Count Keller and the fate of the 35th and 36th, the whole Russian force retired on Anping, with a loss of 2,400 to the Japanese 1,000 men.

Russian Retirement on Liao-Yang.—This was the only manifestation of the offensive spirit on Kuropatkin's part during the six months of marking time. It was for defence, sometimes partial and elastic, sometimes rigid and "at-all-costs," that he had made his dispositions throughout. His policy now was to retire on Liao-Yang as slowly as possible and to defend himself in a series of concentric prepared positions. In his orders for the battle around his stronghold there is no word of counter-attack, and his central mass, the special weapon of the commander-in-chief, he gave over to Biderling and to Zarubayev to strengthen the defence in their respective sections or posted for the protection of his line of retreat. Nevertheless he had every intention of delivering a heavy and decisive counterstroke when the right moment should come, and meantime his defensive tactics would certainly have full play on this prearranged battlefield with its elaborate redoubts, bomb-proofs and obstacles, and its garrison of a strength obviously equal (and in reality superior) to that of the assailants. The Japanese, too, had effected their object, and as they converged on their objective the inner flanks of the three armies had connected and the supreme commander Marshal Oyama had taken command of the whole. But instead of boldly pushing out the 1st Army to such a distance that it could manoeuvre, as Moltke did in 1866 and 1870, he attached it to the general line of battle. It was not in two or three powerful groups but in one long chain of seven deployed divisions that the advance was made.

Battle of Liao-Yang.—On Aug. 25 the 2nd and 4th Armies from Haicheng and the 1st Army from the Yin-tsu-ling and Yu-shu-ling began the last stage of their convergent advance. The Russian first position extended in a semicircle from Anshantien (on the Liao-Yang-Hai-cheng railway) into the hills at Anping, and thence to the Taitse river above Liao-Yang; both sides had mixed detachments farther out on the flanks. The first step in the Japanese plan was the advance of Kuroki's army to Anping. Throughout the 25th, night of the 25th-26th, and the 26th of August, Kuroki advanced, fighting heavily all along the line, until on the night of the 26th the defenders gave up the contested ground at Anping. Hitherto there had only been skirmishing on a

¹The occupation of Siu-yen was chiefly the work of the brigade pushed out to his left by Kuroki. Only a portion of the 10th Division from Takushan helped to drive away Mishchenko's Cossacks.

²The 5th Division of the 2nd Army had been sent to join the 10th as the latter approached Hsinmicheng. The Guard brigade of Kuroki's army which had served with Nozu in the advance had now returned to Fêng-hwang chêng.

large scale on the side of Hai-cheng. Kuropatkin having already drawn in his line of defence on the south side towards Liao-Yang, the 2nd and 4th Japanese Armies delivered what was practically a blow in the air. But on the 27th there was a marked change in the Japanese plan. The right of the 1st Army, when about to continue the advance west on Liao-Yang, was diverted northward by Oyama's orders and ordered to prepare to cross the Taitseho. The retirement of the Russian southern force into its entrenchments emboldened the Japanese commander-in-chief to imitate Moltke's method to the full. On the 28th, however, the 1st Army made scarcely any progress. The right (12th) division reached the upper Taitseho, but the divisions that were to come up on its left were held fast by their opponents. The 29th was an uneventful day, on which both sides prepared for the next phase.

The Russians' semicircle, now contracted, rested on the Taitseho above and below the town, and their forces were massed most closely on either side of the "Mandarin" road that the 1st Army had followed. Opposite this portion of the line was the Guard and the 4th Army. Oku was astride the railway, Kuroki extending towards his proposed crossing-points just beyond Kuropatkin's extreme left (the latter was behind the river). On the 30th the attack was renewed. The Guard, the 4th Army and the 2nd Army were completely repulsed.

On the night of the 30th the first Japanese troops crossed the Taitseho near Lien-Tao-Wun, and during the 31st three brigades were deployed north of Kwan-tun, facing west. The Russian left wing observed the movement all day, and within its limited local resources made dispositions to meet it. Kuropatkin's opportunity was now come. The remainder of the Japanese 2nd Division was following the 12th, leaving a nine-mile gap between Kuroki and Nozu, as well as the river. It was not into this gap, but upon the isolated divisions of the 1st Army that the Russian general proposed to launch his counterstroke. Reorganizing his southern defences on a shorter front, so as to regain possession of the reserves he had so liberally given away to his subordinates, he began to collect large bodies of troops opposite Kuroki, while Stakelberg and Zarubayev, before withdrawing silently into the lines or rather the fortress of Liao-Yang, again repulsed Oku's determined attacks on the south side. But it was not in confidence of victory that Kuropatkin began the execution of the new plan—rather as a desperate expedient to avoid being cut off by the 1st Army, whose strength he greatly overestimated.

On the morning of Sept. 1—the anniversary of Sedan, as the Japanese officers told their men—Oyama, whose intentions the active Kuroki had somewhat outrun, delivered a last attack with the 2nd and 4th Armies and the Guard on the south front, in the hope of keeping the main body of the Russians occupied and so assisting Kuroki, but the assailants encountered no resistance, Zarubayev having already retired into the fortress. North of the Taitseho the crisis was approaching. Kuroki's left, near the river, vigorously attacked a hill called Manjuyama which formed part of the line of defence of the 17th Corps from Europe. But the right of the 1st Army (12th Division) was threatened by the gathering storm of the counterstroke from the side of Yentai mines, and had it not been that the resolute Okasaki continued the attack on Manjuyama alone the Japanese offensive would have come to a standstill. Manjuyama, thanks to the courage of the army commander and of a single brigadier, was at last carried after nightfall, and the dislodged Russians made two counter-attacks in the dark before they would acknowledge themselves beaten. Next morning, when Kuroki (who had conceived the mistaken idea of a general retreat of the Russians on Mukden) was preparing to pursue, the storm broke. Kuropatkin had drawn together seven divisions on the left rear of the 17th Corps, the strength of the whole being about 90,000. On the extreme left was Orlov's brigade of all arms at Yentai mines, then came the 1st Siberian Corps (Stakelberg), the 10th Corps, and finally the 17th. But Orlov, perplexed by conflicting instructions and caught in an unfavourable situation by a brigade of the 12th Division which was executing the proposed "pursuit," gave way—part of his force in actual rout—and the cavalry that was with him was driven back by the Kobi (reserve army) brigade of the Guard. The fugitives

of Orlov's command disordered the on-coming corps of Stakelberg, and the outer flank of the great counterstroke that was to have rolled up Kuroki's thin line came to an entire standstill. Meantime the 10th Corps furiously attacked Okasaki on the Manjuyama, and though its first assault drove in a portion of Okasaki's line, a second and a third, made in the night, failed to shake the constancy of the 15th Brigade. Misunderstandings and movements at cross-purposes multiplied on the Russian side, and at midnight Kuropatkin at last obtained information of events on the side of Yentai mines. This was to the effect that Orlov was routed, Stakelberg's command much shaken, and at the same time Zarubayev in Liao-Yang, upon whom Oku and Nozu had pressed a last furious attack, reported that he had only a handful of troops still in reserve. Then Kuropatkin's resolution collapsed, although about three divisions were still intact, and he gave the order to retreat on Mukden.

Russian Retreat on Mukden.—Thus the Japanese had won their great victory with inferior forces, thanks "in the first instance to the defeat of Gen. Orlov. But at least as large a share in the ruin of the Russian operations must be attributed to the steadfast gallantry of the 15th Brigade on Manjuyama." The losses of the Japanese totalled 23,000, those of the Russians 19,000. Coming, as it did, at a moment when the first attacks on Port Arthur had been repulsed with heavy losses, this successful climax of the four months' campaign more than restored the balance. But it was not the expected Sedan. Had the two divisions still kept in Japan been present Kuroki would have had the balance of force on his side, the Russian retreat would have been confused, if not actually a rout, and the war might have been ended on Japan's own terms. As it was, Kuropatkin drew off the whole of his forces in safety, sharply repulsing an attempt at pursuit made by part of the 12th Division on Sept. 4. The railway still delivered 30,000 men a month at Mukden, and Japan had for a time outrun her resources. At St. Petersburg the talk was not of peace but of victory, and after a period of reorganization the Russians advanced afresh to a new trial of strength. But the remainder of the Manchurian campaign proved little more than a series of violent and resultless encounters of huge armies—armies far larger than those which had fought out the real struggle for supremacy at Liao-Yang.

Naval Actions.—At this time the siege of Port Arthur had progressed only so far that the besiegers were able to realize the difficulties before them. Their exertions and sacrifices were not crowned with success until the year had run its full course, and meantime the repeated frustration of their hopes had a moral reaction on the main struggle in Manchuria, apart from keeping one of their armies away from the decisive theatre. At sea, however, the Japanese navy scored two important successes. After months of blockade and minor fighting, the Russian Port Arthur squadron had been brought to action on Aug. 10. Admiral Vithet, Makarov's successor, had put to sea shortly after the appearance of the 3rd Army on the land front of Port Arthur. The battle opened about noon, 20m. south of the harbour; the forces engaged on each side varied somewhat, but Togo finally had a superiority. As the Russians became gradually weaker, the Japanese closed in to within 3m. range, and Prince Ukhomsky (who succeeded to the command on Vithet being killed) gave up the struggle at nightfall. The Russians scattered, some vessels heading southward, the majority with the admiral making for Port Arthur, whence they did not again emerge. All the rest were either forced into neutral ports (where they were interned) or destroyed, among the latter being the third-class cruiser "Novik," which had already earned a brilliant reputation for daring, and now steamed half round Japan before she was brought to action and run ashore. The victors blockaded Port Arthur, until near the close of the siege when, after going ashore and examining the remnant of the Russian fleet from 203-Metre hill, Togo concluded that it would be safe to return to Japan and give his ships a complete refit. Kaimura's squadrons, after various adventures, at last succeeded on Aug. 14 in engaging and defeating the Russian Vladivostok squadron (Admiral Jessen). Thus the Russian flag disappeared from the Pacific, and thenceforward only the Baltic

fleet could hope seriously to challenge the supremacy of the Japanese navy.

The remainder of the war on land, although it included two battles on a large scale and numerous minor operations, was principally a test of endurance. After Liao-Yang there were no widely extended operations, the area of conflict being confined to the plain of the coast side of the Hun-ho and the fringe of the mountains. Japan had partially accomplished her task, but had employed all her trained men in this partial accomplishment. It was questionable, even in Oct. 1904, whether she could endure the drain of men and money if it were prolonged much further. On the other hand, in Russia opposition to the war, which had never been popular, gradually became the central feature of a widespread movement against irresponsible government. Thus, while the armies in Manchuria faced one another with every appearance of confidence, behind them the situation was exceedingly grave for both parties. A state of equilibrium was established, only momentarily disturbed by Kuropatkin's offensive on the Sha-ho in October, and by the Sandepu incident in the winter, until at last Oyama fought a battle on a grand scale and won it. Even then, however, the results fell far short of anticipation, and the armies settled down into equilibrium again.

Battle of the Sha-ho.—After the battle of Liao-Yang Kuropatkin reverted for a moment to the plan of a concentration to the rear at Tieling. Politically, however, it was important to hold Mukden, the Manchurian capital, and as the Japanese, as on previous occasions, reorganized instead of pursuing, he decided to stand his ground, a resolution which had an excellent effect on his army. Moreover, growing in strength day by day, and aware that the Japanese had outrun their powers, he resolved, in spite of the despondency of many of his senior officers, to take the offensive. He disposed of about 200,000 men, the Japanese had about 170,000. The latter lay entrenched north of Liao-Yang, from a point 6 m. west of the railway, through Yentai station and Yentai mines, to the hills farther east. There had been a good deal of rain, and the ground was heavy. Kuropatkin's intention was to work round the Japanese right on the hills with his eastern wing (Stakelberg), to move his western wing (Bilderling) slowly southwards, entrenching each strip of ground gained, and finally with the centre—i.e., Bilderling's left—and Stakelberg, to envelop and crush the 1st Army, which formed the Japanese right, keeping the 4th Army (Nogi) and the 2nd Army (Oku) fixed by means of Bilderling's main body. The manoeuvre began on Oct. 5, and by the evening of the 10th, after four days of advanced-guard fighting, Stakelberg was in his assigned position in the mountainous country, facing west towards Liao-Yang, with his left on the Taitszeho. The advance of Bilderling, however, necessarily methodical and slow in any case, had taken more time than was anticipated. Still, Bilderling crossed the Sha-ho and made some progress towards Yentai, and the demonstration was so far effectual that Kuroki's warnings were almost disregarded by the Japanese headquarters. The commander of the 1st Army, however, took his measures well, and Stakelberg found the greatest trouble in deploying his forces for action in this difficult country. Oyama became convinced of the truth on the 9th and 10th, and prepared a great counterattack. Kuroki, with only a portion of the 1st Army, was left to defend at least 15 m. of front, and the entire 2nd and 4th Armies and the general reserves were to be thrown upon Bilderling. On the 11th the real battle opened. Kuroki displayed the greatest skill, but he was of course pressed back by the four-to-one superiority of the Russians. Still the result of Stakelberg's attack, for which he was unable to deploy his whole force, was disappointing, but the main Japanese attack on Bilderling was not much more satisfactory, for the Russians had entrenched every step of their previous advance and fought splendidly. The Russian commander-in-chief states in his work on the war that Bilderling became engaged *à fond* instead of gradually withdrawing as Kuropatkin intended, and at any rate it is unquestioned that in consequence of the serious position of affairs on the western wing, not only did Stakelberg use his reserves to support Bilderling, when the 12th Division of Kuroki's army was almost at its last gasp and must have yielded to fresh

pressure, but Kuropatkin himself suspended the general offensive on Oct. 13. In the fighting of Oct. 13–16 the Russians gradually gave back as far as the line of Sha-ho, the Japanese following until the armies faced roughly north and south on parallel fronts. The fighting, irregular but severe, continued. Kuropatkin was so far averse to retreat that he ordered a new offensive, which had fair success on the 16th–17th. Kuropatkin wished to continue the offensive, but his corps commanders offered so much opposition to a further offensive that he at last gave up the idea. The positions of the rival armies from Oct. 18, the close of the battle of the Sha-ho, to Jan. 26, 1905, the opening of the battle of Sandepu (Heikoutai)—a period almost entirely devoid of incident—may be described by the old-fashioned term "winter quarters."

In Jan. 1905 the Russians, 300,000 strong, were now organized in three armies, commanded by Generals Linievich, Gripenberg and Kaulbars; the total strength of the Japanese 1st, 2nd and 4th Armies and reserve was estimated by the Russians at 220,000. Towards the end of January Kuropatkin took the offensive. He wished to inflict a severe blow before the enemy could be reinforced by the late besiegers of Port Arthur, and sent Gripenberg with seven divisions against Oku's two on the Japanese left. The battle of Sandepu (Heikoutai), fought in a terrible snow-storm on Jan. 26 and 27, 1905, came near to being a great Russian victory. But after two days' severe fighting, although Gripenberg had not been checked, Kuropatkin, in face of a counterattack by Oyama, decided to abandon the attempt.

Battle of Mukden.—Both sides stood fast in the old positions up to the verge of the last and greatest battle. Kuropatkin was reinforced, and appointed Kaulbars to succeed Gripenberg and Bilderling to the command of the 3rd Army vacated by Kaulbars. On the other hand, Nogi's 3rd Army, released by the fall of Port Arthur, was brought up on the Japanese left, and a new army under Kawamura (5th), formed of one of the Port Arthur and two reserve divisions, was working from the upper Yalu through the mountains towards the Russian left rear. The Russian line covering Mukden was 47 m. long, the armies from right to left being 2nd (Kaulbars), 3rd (Bilderling) and 1st (Linievich); a general reserve was at Mukden. On the other side from left to right, on a line 40 m. long, were Oku (2nd Army), Nogi (4th), Kuroki (1st) and Kawamura (5th), the general reserve in rear of the centre at Yentai and the 3rd Army in rear of Oku. Each side had about 310,000 men present. The entire front of both armies was heavily entrenched. The Russians had another offensive in contemplation when the Japanese forestalled them by advancing on Feb. 21. The 5th Army gradually drove in Kuropatkin's small detachments in the mountains, and came up in line with Kuroki, threatening to envelop the Russian left. The events on this side and misleading information induced Kuropatkin to pay particular attention to his left. The Japanese 1st and 5th Armies were now engaged (Feb. 25), and elsewhere all was quiet. But on the 27th the fighting spread to the centre, and Nogi (originally behind Oku) was on the march to envelop the Russian right. He was held under observation throughout by Russian cavalry, but it seems that little attention was paid to their reports by Kuropatkin, who was still occupied with Kuroki and Kawamura, and even denied his right of its reserves to reinforce his left. With a battle-front exceeding two days' marches the wrong distribution of reserves by both sides was a grave misfortune. Kuropatkin was at last convinced, on Feb. 28, of the danger from the west, and did all in his power to form a solid line of defence on the west side of Mukden. Nogi's first attack (March 1–2) had not much success, and a heavy counterstroke was delivered on the 2nd. Fighting for localities and alterations in the interior distribution of the opposing forces occupied much time, and by the 3rd, though the battle had become severe, Kuropatkin had merely drawn in his right and right centre (now facing west and south-west respectively) a little nearer Mukden. His centre on the Sha-ho held firm, Kuroki and Kawamura made but slight progress against his left in the mountains. Nogi and Oyama were equally impressed with the strength of the new (west) Russian front, and, like Grant at Petersburg in 1864,

extended farther and farther to the outer flank, the Russians following suit. The Japanese marshal now sent up his army reserve, which had been kept far to the rear at Ventai, to help Nogi. It was not before the evening of March 6 that it came up with the 3rd Army and was placed in position opposite the centre of the Russian west front. On the rest of the line severe local fighting had continued, but the Russian positions were quite unshaken and Kuropatkin's reserves—which would have been invaluable in backing up the counter-attack of March 2—had belatedly returned to face Nogi. He had organized another counterstroke for the 6th, to be led by Kaulbars, but this collapsed unexpectedly after a brief but severe fight.

Russian Retreat on Tieling.—Kuropatkin now decided to draw in his centre and left towards Mukden. On the 7th, the various columns executed their movement to the Hun-ho with complete success, thanks to good staff work. The Japanese followed up only slowly. Nogi and Kaulbars stood fast, facing each other on the west front; after the arrival of the general reserve, Nogi was able to prolong his line to the north and eventually to bend it inwards towards the Russian line of retreat. On the 8th the fighting between Nogi and Kaulbars was very severe, and Kuropatkin now made up his mind to retreat towards Tieling. On the 9th, by Oyama's orders, Nogi extended northward instead of further swinging in south-eastward, Oku now occupied all the original line of the 3rd Army, Nogi alone was left on the south front, and Kuroki and Kawamura began to engage Linievich seriously. But Nogi had not yet reached the Mukden-Tieling railway when, on the night of the 9th, every preparation having been made, Kuropatkin's retreat began. On the 10th, covered by Kaulbars, who held off Nogi, and by strong rearguards at and east of Mukden, the movement continued, and though confusion was prevalent and the rearguards suffered very heavily, the Russians managed to draw off in safety to the northward. On the evening of the 10th, after all their long and hardly contested enveloping marches, Nogi's left and Kawamura's right met north of Mukden. The circle was complete, but there were no Russians in the centre, and a map of the positions of the Japanese on the evening of the 10th shows the 17 divisions thoroughly mixed up and pointing in every direction but that of the enemy. Thus the further pursuit of the Russians could be undertaken only after an interval of reorganization by the northernmost troops of the 5th and 3rd Armies. But the material loss inflicted on the Russians was far heavier than it had ever been before. It is generally estimated that the Russian losses were no less than 97,000, and the Japanese between 40,000 and 50,000. Japan had had to put forth her supreme effort for the battle, while of Russia's whole strength not one-tenth had been used. But Russia's strength in Europe, with but one line whereby it could be brought to bear in the Far East, was immaterial, and on the theatre of war a quarter of the Russian field forces had been killed, wounded or taken.

Rozhstvenski's Voyage.—It remains to narrate briefly the tragic career of the Russian Baltic fleet. Leaving Libau on Oct. 13-15, 1904, the fleet steamed down the North sea, expecting every night to be attacked by torpedo-boats. On the 21st, in their excitement, they opened fire on a fleet of British trawlers on the Dogger Bank (q.v.), and several fishermen were killed. This incident provoked the wildest indignation, and threatened for some days to bring Russia into conflict with England. A British fleet "shadowed" Rozhstvenski for some time, but eventually the Russians were allowed to proceed. On reaching Madagascar, Rozhstvenski heard of the fall of Port Arthur, and the question of returning to Russia arose. But a reinforcement under Rear-Admiral Nebogatov was despatched from the Baltic via Suez early in March 1905, and the armada proceeded by the Straits of Malacca, Nebogatov joining at Kamranh bay in Cochinchina. The united fleet was formidable rather in number than in quality; the battleships were of very unequal value, and the faster vessels were tied to the movements of many "lame ducks." Rozhstvenski had, moreover, numerous store-ships, colliers, etc. Nevertheless, the Japanese viewed his approach with considerable anxiety, and braced themselves for a final struggle. Of the vari-

ous courses open to him, Togo prudently chose that of awaiting Rozhstvenski in home waters. The Russians left Kamranh on May 14, and for a time disappeared into the Pacific. It was assumed that they were making for Vladivostok either via Tsushima strait or by the Pacific. Rozhstvenski chose the former course, and on May 27 the fleets met near Tsushima. By superior speed and handling the Japanese gained an increasing advantage, and by the following day the whole Russian fleet, with few exceptions, had been captured or sunk. (See TSUSHIMA for battle.)

The Peace of Portsmouth.—After the disasters of Mukden and Tsushima, and being threatened with internal disorder in European Russia, the tsar, early in June, accepted the mediation of the president of the United States, and *pourparlers* were set on foot. The war, meanwhile, drifted on through May, June and July. Linievich, who succeeded Kuropatkin shortly after the battle of Mukden, retired slowly northward, reorganizing his forces and receiving fresh reinforcements from Europe. A Japanese expedition occupied Sakhalin (July 8-30), and another, under General Hasegawa, advanced through Korea towards Vladivostok. But the fighting was desultory. The peace negotiations were opened at Portsmouth (N.H.), on Aug. 9, and by the end of the month the belligerents had agreed as to the main points at issue—that Russia should cede the half of Sakhalin, annexed in 1875, surrender her lease of the Kwantung peninsula and Port Arthur, evacuate Manchuria, and recognize Japan's sphere of influence in Korea. The treaty of peace was signed on Aug. 23, 1905.

BIBLIOGRAPHY.—Among the first-hand narratives the most important are: Ian Hamilton, *A Staff Officer's Scrap Book*; and the *British Officers' Reports*, War Office, 1908. Also *Reports of Military Observers*, General Staff U.S.A.; Major v. Tettau, *18 Monate beim Heere Russlands*; von Schwarz, *Zehn Monate beim Heere Kuropatkins*; and Kuropatkin's own work (part of which has been translated into English). Of detailed military histories the principal are the semi-official series of narratives and monographs produced by the Austrian military journal "Streifzug" (*Einselschriften über den russ.-japanischen Krieg*); the volumes of lectures delivered at the Russian staff college after the war; *Étude sur la campagne de 1904-1905* (Paris, 1905); *la guerre russo-japonaise jugée à l'Académie Nicolas*; British official *History of the Russo-Japanese War*; German official *Russisch-japanischer Krieg* (Eng. trans. by K. von Donat); Löffler, *Der russisch-japanische Krieg* (Leipzig, 1907; French trans.); L. Gianni Trapani, *La Guerra russo-japonese* (1908); E. Bujac, *La Guerre russo-japonaise* (1909). Of critical studies one of the most important is Culmann, *Étude sur les caractères généraux de la guerre en extrême-orient* (1909). One naval narrative of absorbing interest has appeared, *Semenov's Rasplata* (Eng. trans.).

RUSSO-POLISH CAMPAIGN. This campaign, of 1920, which resulted in the defeat and rout of the Soviet Army when it was within sight of the Polish capital, is full of dramatic incident. Organization of command, staff and administration was lacking on both sides, but above all it was the want of a proper system of supply which accounted for the sudden collapse of troops engaged in a victorious advance. The thinly populated territory lying between the Niemen in the north and the Dniester in the south was incapable of supporting large bodies of troops, and as both sides attempted to live on the country during their advances the failure of their operations followed quickly each success.

Cause of the War.—During the course of 1919 and early 1920, the Soviet Government had succeeded in clearing their territory of the White Russian armies under Kolchak, Denikin and Yudenich. They were thus at liberty to examine the situation on their frontiers. With such a mixture of races living side by side in the disputed regions no delimitation of frontier would have suited all parties, and in the absence of authority to enforce a decision, trouble quickly arose between the Soviet and the newly formed Polish State. Poland was determined to maintain her new liberty and had called up fresh levies to support the various legions which had been repatriated from the fronts upon which they had been fighting in the World War. The Soviet began to concentrate their troops towards the west. Inflammatory speeches in Moscow and a fierce propaganda amongst the Polish working people brought Polish public opinion to a fever heat. From seven divisions in January the Soviet had, by March, increased the number of their

troops facing the Poles to 20 divisions, with three cavalry divisions. Poland decided that she could not wait quietly for the inevitable Soviet attack by which she would certainly be destroyed, and that she must act at once.

Polish Offensive.—Strategically, the territory in dispute may be divided into two separate areas: White Russia in the north and Volhynia and Podolia in the south. The marshes of the Pripiet divide one area from the other. Acting in collusion with Petlura, the Hetman of the Ukraine, who had promised to raise his country against the Soviet, the Poles advanced in April as far as Kiev. By the beginning of May the Polish-Soviet front ran from Dvinsk in the north along the course of the Dnieper to Kiev and thence to the Dniester near Kamienets. No sooner were the Poles established in Kiev than the Soviet northern army began to advance. The Poles were able to transfer troops from the south and counter-attacked the Soviet forces which had already penetrated as far west as Lida and Baranowicz. By the end of May the line held at the beginning of the month had been restored. Operations had been most ably carried out by the Polish minister of war, Gen. Sosnkowski, but there were indications that the Soviet were transferring more and more troops to the west and that a renewal of their attacks might be expected.

At the beginning of June, in the southern area there appeared a new Soviet cavalry leader, Budenny, who completely altered the situation. Budenny had been a non-commissioned officer in the old Russian Army and soon proved himself a man of action. Within a month he had driven back the Poles a distance of 200m. until their line in the south ran just east of Pinsk and Równe (Rovno) to the junction of the Dniester and Siret (Sereth).

Russian Success.—Fighting in the northern area continued intermittently during the month of June, preventing the Poles from transferring troops to the hard-pressed south. Despite the operations in the south it was clear that the main Soviet attack was coming in the north. On July 4 the blow fell. The whole Polish line gave way. Wilno (Vilna) and Minsk were lost in the first week. Grodno fell on July 20 and Bialystok on July 25. By the end of July the Soviet advance guards had reached the Bug. In 25 days the Poles had lost 300m. of territory. The main cause of the collapse was their failure to constitute reserves. In their desire to protect their new territory they had been led into a linear defence on a front of nearly 800m., where they were strong nowhere.

Disposition of Troops.—The Polish situation was now critical. With the help of the French military mission, under Gen. Weygand, a plan for a great counter-attack was evolved on Aug. 6. The situation of the opposing sides on that date was as follows:—

Soviet: (1) Northern group. Four armies—4th, 15th, 3rd and 16th, with a cavalry corps on the extreme north aiming to outflank the Polish left.

(2) Southern group. Two armies—12th and 14th with Budenny's cavalry, along a line from Kowel through Brody to Tarnopol. The men of the Soviet army were unfed and worn out with a month's marching.

Poles: (1) A Northern group formed of units which had been retreating for over a month, strengthened by reinforcements thrown in hastily as they came up. Much material had been lost and the men were tired and hungry, but the approach to the line of the Vistula was beginning to simplify the supply of food and munitions.

(2) Southern group. Three armies—6th, 3rd and 4th—facing the Soviet southern group. Here pressure from the enemy had been by no means so severe as in the north and many of the divisions still retained their original fighting value.

Polish Plan of Attack.—The Polish plan was to withdraw all but a minimum of force from the southern area and to attack the Soviet northern group with the greatest possible strength. The operation bears a close resemblance to Ludendorff's manoeuvre at Tannenberg. In many respects the situation was similar. The Russians were advancing in two main groups divided by the Pripiet marshes instead of the Masurian lakes. Here the Soviet southern group was advancing slowly like *Rennenkampfs* army in 1914. The situation would become critical as

soon as the two Soviet groups converged upon the Polish Army. No time was to be lost. Would the commander of the Soviet armies in the south allow himself to be deceived in the same manner as *Rennenkampfs*?

On August 6 orders for the following fresh groupings were issued from Polish headquarters:—

(1) Three armies—2nd, 1st and 5th—under Gen. Joseph Haller, were to withdraw slowly to the line of the Vistula from Dęblin to Modlin, with the 5th Army pushed well forward on the left to prevent any outflanking of the Polish left between Warsaw and the East Prussian frontier.

(2) Two armies, 3rd and 4th—were to concentrate behind the Wieprz between Chełm and Dęblin, ready to strike due north; the advance of these two armies to commence on Aug. 16.

(3) One army, 6th—would withdraw as necessity arose in the direction of Lemberg, tempting the Soviet southern group away from the critical point in the north.

By Aug. 12 all the armies, with the exception of the two on each flank, had reached their assigned positions without incident. In the south the 3rd had found the 12th Soviet army advancing and had been forced to throw out a detachment on its right flank to cover its concentration. It had been delayed in consequence. In the north, the 5th had been driven back by overwhelming strength and had been unable to prevent the enemy outflanking movement.

Enthusiasm in the Polish army had risen surprisingly in the days since the momentous decision to attack had been taken. The chief of the Polish State, Marshal Piłsudski, had himself taken command of the 3rd and 4th Armies. With the help of Weygand and his staff the service of supply had been restored. New bodies of reinforcements were moved forward from the depôts in Western Poland and the depleted units began to raise their heads again. National optimism returned. The enemy in the south made no determined move and appeared to have no inkling of what was afoot. Every hour that he delayed meant more chance of success for the Polish plan.

Polish Advance.—Gen. Sikorski's 5th Army in the north was the first to move. The Soviet movement round his left had assumed alarming proportions and had to be stopped. On Aug. 14 he pressed forward from his defensive position at Modlin and at once encountered the Soviet 15th Army advancing to the attack. Sikorski persisted in his attacks all through Aug. 15 and 16, his men fighting with determination. Not even the appearance of elements of the Soviet 4th Army in his left rear turned him from his purpose. Throwing out covering detachments to watch his rear, he attacked again on Aug. 17. His determination reaped its reward, for the enemy gave way in front of him, their retreat rapidly developing into a rout.

In the south Piłsudski's armies made good progress. The blow against the left of the Soviet 16th Army came as a complete surprise and they offered little resistance. During Aug. 16 and 17 the Poles covered over 50 miles. By Aug. 18 the 3rd Soviet Army, which lay between the 15th destroyed by Sikorski, and the 16th broken by Piłsudski, turned also in hopeless confusion.

On the extreme Soviet right the 4th Army, containing some of the picked Communist regiments, together with the cavalry corps, had reached the Vistula between Toruń and Płock in their great turning movement when Sikorski suddenly advanced. Had they advanced resolutely even then, all might have been well, but they hesitated and were lost. Their half-hearted attacks against Sikorski's left had little effect. It was not till Aug. 20 that the order for a general retreat reached them. On Aug. 22, at Miawa, and Aug. 23 at Chorzów they were successful in cutting themselves a passage, but on Aug. 24 at Kowno they ran up against Piłsudski's 4th Army blocking the way. Almost without making an effort to attack they passed ignominiously over the East Prussian border to internment.

The pace of the Polish pursuit was remarkable. From Aug. 16 to Aug. 25 the advanced units of the 2nd army had covered 200m. as the crow flies. The 4th Army averaged 25m. a day in their advance. The service of supply was left far behind. The troops existed as they could upon the exhausted country. Luckily

the Soviet resistance was so completely broken that there was no further fear of counter-attack and the Polish units had ample time in which to reorganize.

Conclusion.—The results of the battle of Warsaw, as it has been named, are only exceeded by those of Tannenberg. The Poles captured 70,000 prisoners, 200 guns and 1,000 machine-guns. From 50,000 to 100,000 Soviet troops passed over into East Prussia. The victory of the Poles was due to the adoption of a determined offensive based upon a sound plan. The raising of the morale of the beaten troops by the Polish authorities, roused to enthusiasm themselves by the inspiring presence of Gen. Weygand, is little short of miraculous. The crisis of the battle was undoubtedly Aug. 15-16, when Sikorski's 5th army cleared its front. If it was Pilsudski's force which completed the Soviet defeat, it was undoubtedly the magnificent fighting of Sikorski and his men which made victory possible.

RUSO-TURKISH WARS. The Greek insurrection in 1824 gave England, France and Russia occasion to press demands upon Turkey, which the Porte refused to accede to, rejecting besides the London Protocol of July 1827. Hostilities broke out in Oct. 1827, when the allied fleet under Admiral Codrington defeated the Turkish flotilla off Navarino. This victory greatly facilitated the eventual Russian operations against Turkey as the Russian army supported and provisioned by her own fleet could march along the coast by the shortest road to Adrianople and thence towards the Turkish capital.

Towards the end of April 1828 the Russian army consisting of three army corps stood between the Pruth-Dniester 69,000 strong, war having been formally declared on April 28. Turkey, whose army was being reorganized at the time, decided to resist the enemy in the quadrilateral, Ruschuk, Silistria, Varna and Shumla, for which purpose she assembled about 80,000 men. One corps of the invading army invested Braila, which was captured on June 17; another Russian corps crossed at the mouth of the Danube on June 11, while a third drove back the garrisons of Ruschuk and Widdin into these fortresses from which they had emerged. The first two Russian corps now advanced on Shumen but finding the Turks to be stronger than they supposed, they fell back on Venibazar. A Russian force was thrown forward towards Varna but only on the arrival of the Russian guard corps could the idea be entertained of investing it. The siege began on Sept. 10 and a month later Varna surrendered. The Russians owing to numerical weakness retired into winter quarters in Moldavia and Wallachia, leaving two corps in the vicinity of Varna, Pravodi and Bazardjik. The fortress of Silistria was still in Turkish hands and it now became on the resumption of hostilities the principal Russian objective. Sizopol at the entrance to the harbour of Burgas was captured providing the Russians with a base for their operations south of the Danube. Silistria being invested fell on June 29. Meanwhile Reschid Pasha advanced from Shumla against Pravodi hoping to recapture Varna but was beaten off. General Diebitch, who had replaced Wittgenstein as Russian commander-in-chief, defeated Reschid Pasha at Tcherkovna on June 11. Diebitch now decided to advance south of the Balkans. Reschid attempted to hinder his march but was vanquished at Sliven on Aug. 12. Adrianople was entered Aug. 20, but as Diebitch had only 15,000 men and pestilence was ravaging his ranks he deemed it wiser to conclude a treaty in September before Turkey became aware of the state of his army. Success crowned the Russian arms in Asia, Paskevitch gaining two important victories on June 1 and 2 at Erivan, his advance coming to a close by terms of the treaty arranged in Europe. A conference held in London proclaimed the independence of Greece, Russia receiving the islands at the mouth of the Danube, while Moldavia and Wallachia were to be no longer provinces of Turkey, but only under her protectorate.

The War of 1877-78.—The oppression of the Christian subjects of the Sultan had made hostilities in 1877 between Turkey and Russia inevitable. After the Crimean War Turkey promised

to grant reforms, thereby bettering the treatment of the Christian population, but the following years brought no material change. In 1875 an insurrection broke out in Hercegovina and Montenegro, to be followed by Serbia openly taking up arms against Turkey. Russia, whose sympathies by reason of race and religion, were wholly on the side of the Slavs, could not remain a silent onlooker of the events in the Balkans. Russian volunteers flocked in great numbers to join the Serbians and General Chernyaeff was entrusted with their command. Disparity of numbers however, went against the Serbians, the Turks gaining several successes, which culminated in their victory at Djunis on Oct. 29, 1876. Alexander II. then stepped forward and insisted on hostilities ceasing, to which Turkey hurriedly assented. A conference now assembled at Constantinople, but after months of deliberation, it failed to come to an agreement, Turkey taking advantage of the divergent views of the Great Powers. She became as time progressed less willing to make concessions. To prepare for all eventualities and to bring greater weight to her influence at the conference Russia mobilized six army corps in Nov. They consisted of the VII., VIII., IX., X., XI. and XII. corps and were concentrated on the southern frontier, on the Rumanian borders. Mobilization arrangements were not worked effectively nor the deployment of the forces. It must be borne in mind that conscription had been only enforced in Jan. 1874 and there was consequently a lack of well trained officers and reserves. Another great obstacle that hindered Russia from dealing a quick blow at Turkey was the lack of a fleet in the Black sea, though this restriction was removed in 1871. Knowing the unprepared state of the forces several experts, among them General Todleben, the world famous defender of Sevastopol in the Crimean War (*q.v.*), were opposed to Russia undertaking an active campaign, but the Pan-Slav movement which was general in Russia, forced the Tsar to declare war April 24. Having underrated her foe Russia began hostilities with insufficient forces, sending 257,000 men into Rumania and 70,000 each to the Caucasus and to the Austrian frontier. The Grand Duke Nicholas, the Tsar's brother, was in command of the forces and orders were instantly given to cross the Rumanian frontier; this state having proclaimed her independence of Turkey afforded every facility to the Russians to move their army to the Danube. Early in June the Russian army was assembled around Bucharest; it consisted of the VIII., IX. and XII. corps, with detachments thrown forward to the Danube. The XI. corps was guarding the region from the river Argis to the river Yalomniza, further east towards the Pruth stood the XIV. corps while the XIII. was expected by the middle of June and the IV. a month later. The Russian army was armed indifferently and tactically was ill trained, which was due to the men being unused to handling their new weapons. The Russian forces in the middle of June which intended crossing the Danube numbered 257,000 men, but one must deduct those guarding the railway line through Rumania.

The Turks numbered 135,000 men north of the Balkans who were distributed in the following manner: 80,000 in the quadrilateral, 23,000 around Vidin, 10,000 in Nicopol, 8,000 in Dobrudja, 3,000 in Timovo, 4,000 in Sistovo, 2,000 at Lom Palanka and 5,000 at Rahoff. Forty thousand men were grouped around Adrianople and Constantinople and some 80,000 in Bosnia, Montenegro and Epirus. The Turks besides disposed of another 120,000 men in Asia Minor.

Political and military reasons forced Turkey to remain on the defensive while Russia was bent on the swiftest possible offensive—bordering on rashness. Rumania having allowed the Russians to traverse her territory greatly aided their initial concentration towards the Danube. She was even prepared in the middle of June to join the Russians against the Turks with her force of 32,000 infantry and 5,000 cavalry, but the Russians, feeling certain of an easy victory, declined her proffered help. Two months later they were only too glad to avail themselves of this assistance which would have been of inestimable value in their first operations south of the Danube. To cross this river was their primary object, but this was impeded by the Turkish flotilla which patrolled the Danube and prevented them bridging

it. The Russians by means of steam launches, batteries, mines and torpedoes drove the Turkish ironclads into Sulina harbour, one being destroyed, while the smaller vessels were obliged to seek refuge in Silistria and Ruschuk. Mines were laid across the Danube, bridging now being made possible. Hearing of the hostile approach, Abdul Kerim, the Turkish leader, decided not to make a resolute defence against the enemy crossing the Danube, but to attack him, when advancing to besiege Ruschuk and Shumla. The distribution of the Turkish troops remained little changed by the middle of June; the detachments guarding the Danube were generally too weak to offer any serious resistance to the invader.

The Russians began crossing the river in boats at Zimniza early on June 23 and the following day the VIII. corps was across, standing on the southern bank of the Danube. The same day a bridge 1,300 yards long was begun to be constructed at Nicopol, which was ready by July 1, a second one being ready by Aug. 1. The other Russian corps, the XII. and XIII., commanded by the Tsarevitch, having crossed the Danube moved to the Lom and Yantra facing Ruschuk with the object of laying siege to it while the IX. corps made for Nicopol. Gourko's advance guard entered Timova July 7, the VIII. corps following it five days later. The Grand Duke Nicholas wished to cross the Balkans with two corps while guarding his right flank with the IX. corps, and watching Ruschuk fortress with the XII. and XIII. corps, but Alexander II. would not sanction this, rightly considering this plan too risky. Gourko left Timova July 12 hearing the Shipka Pass was defended by only 3,000 men. He made for the Hainkiof Pass intending to turn the Shipka Pass (*q.v.*), while a Russian detachment attacked the Pass from the north. Gourko having been delayed 24 hours, was repulsed by the Turks when attacking the Pass; the same fate befell the Russians advancing north of Shipka. Nevertheless next day Gourko again pressed forward, when the Turks offered to negotiate terms of capitulation. While they were being drawn up the Turks evacuated all their positions and retreated to Philippopolis. Gourko's capture of Shipka gave the advantage to the Russians for a short time only, though he hastened to put it in a state of defence and it remained in their hands up to the end of the war. Alarmed by the incursion of the Russians, the Turks recalled Suleiman Pasha from Montenegro with his army 30,000 strong and having transported it by sea to the mouth of Maritza pushed it forward without delay on July 23 between Hermanli and Karabunar. After several engagements against greatly superior forces Gourko received orders Aug. 5 from the Headquarters to return north of the Balkans. The passes being deemed of great importance the Russians decided to defend them with the 9th Division, 4th Rifle Brigade and a Bulgarian contingent.

Meanwhile Nicopol fell July 17, the IX. corps capturing 8,000 men and it now received orders to advance to Plevna. General Krudener, its commander, detached one division under Schilder-Schuldner, which without any preliminary reconnaissance attacked the Turks July 20, only to be thrown back with heavy losses by Osman Pasha's much superior force, which had marched from Vidin unperceived by the Russians. Though the Rumanians had warned them of the hostile approach no serious attention was given by the Russian military authorities, for which they had to pay dearly. But even now the Russians thought this to be a momentary check and gave orders to make a fresh effort to capture Plevna, for which purpose they detailed 40,000 men. Osman Pasha had meanwhile entrenched himself round Plevna and had occupied Lovcha on the 26th, thereby securing the direct road to Sofia. The second attempt to capture the town, July 31, failed as the first and the Russians at last began to realize that their forces were inadequate to vanquish the enemy. The Tsar, by an Imperial Ukaze called up the Guard and Grenadier Corps, 24th and 26th Infantry Divisions, also the 2nd and 3rd Infantry Divisions with the 3rd Rifle Brigade which had already left Moscow for Bulgaria. Valuable assistance was also forthcoming from the Rumanian forces, which now joined the Russians. The Russian plan of campaign, which was faulty to a degree, now became absolutely impossible, there being no longer any question

of moving south of the Balkans, whilst Osman from Plevna might threaten not only their right flank, but the bridges across the Danube. Every effort was to be made to vanquish the Turkish force defending Plevna, now greatly strengthened by field works.

At the end of July, Abdul Kerim, the Turkish commander-in-chief was superseded by Mohammed Ali, who decided to attack the Russian forces under the Tsarevitch (XI., XII. and XIII. corps) on the river Lom. Mohammed Ali had two army corps for his offensive, not to mention five divisions at Shumla and two at Ruschuk, but he carried out his movement with little skill, sending his left wing against the Russians standing on the Yantra, which brought about two engagements at Ayazia on Aug. 22 and 23. The Russians retreated slightly, and a week later the XIII. corps was attacked at Karahassankioi, but no serious result was gained by this move. On Sept. 5, another engagement occurred, but though the Russians retired across the Lom the Turks were unable to march further west. The intended plan to unite the forces of Mohammed Ali with those of Suleiman at Trnova failed, his advance producing no effect on the Russian forces assembled around Plevna, which were by that time considerably reinforced (two Russian and three Rumanian infantry divisions, together with a Russian rifle brigade). On the Rumanians joining the Russians, it was agreed that Prince Charles of Rumania should be in nominal command of the forces grouped around Plevna, which were now known as the Western army. But the authority vested in Prince Charles was small, as the Commander-in-Chief, the Grand Duke Nicholas, was living in the vicinity, not to mention the Tsar himself and General Milutin, the War Minister. By this time the Russians had mobilized a huge army.

Meantime Suleiman Pasha was ordered to join Osman, but he was instructed firstly to capture the Shipka Pass which he attempted to do Aug. 21. Severe fighting took place for several days, but Radetsky, being reinforced, maintained his position, beating off every hostile attack. Suleiman in five days having lost 10,000 men, a quarter of his effective strength, decided to fall back on Kazanlik, leaving detachments by the pass. Hearing that Suleiman had been forced to give up momentarily the attempt to capture the Shipka Pass, the Russians began to fear that he might endeavour, by using the Rosalita and Trojan Passes, not only to turn the Shipka Pass, but by moving via Lovcha to get into communication with Osman Pasha, who might at any moment make for Timova. For this purpose Prince Imeretinsky was ordered to drive a Turkish detachment from Lovcha, which he forced to retire into Plevna. Leaving a brigade to guard the town, Imeretinsky fell back on Bogot. The Allies now decided to assault Plevna again, for which purpose they assembled about 100,000 men. Three Rumanian divisions were to advance from Grivitza, four Russian from Radishevo, and a division, having a brigade in reserve under Skobelev, facing the Green Hills. A long artillery preparation took place Sept. 7-11, but the allies failed to make any proper reconnaissance, for which they had to pay a severe penalty, thousands of lives being sacrificed in vain. They advanced on the 11th, but failed to break the Turkish circle of defence. The Rumanians captured a redoubt at Grivitza, but were held up at Radishevo; Skobelev on his part established himself on the Green Hills, but was thrown back the next day by Osman Pasha, who used his reserves for the counter attack. A serious crisis now arose among the Allies and a council of war was held. Many of the members, including Milutin, the War minister, urged that the army should recross the Danube and renew the advance the following spring with increased forces. This opinion was over-ruled, the Tsar showing great determination, and it was decided to invest Plevna, entrusting all operations to General Todleben, the heroic defender of Sevastopol during the Crimean War. With his arrival, the Russians gained confidence and renewed energy, one and all feeling they were at last being led by a masterly head, that chaos was replaced by order. The Guard Corps, on arriving from Russia, was sent to cut the Turkish communications and the enemy was driven out of Gorni Dubniak and Telish by General Gourko, Plevna being thus cut off from the outer world. In the middle of Nov. the Russians stood as follows: 12 divisions around Plevna, 6 on the Lom; 3 by the Shipka Pass;

2½ on the Plevna-Orhanie road.

Suleiman, now commanding the main Turkish army, took the offensive, crossed the Lom and attacked the Russians at Mechka and Tristenik Nov. 19 and 26, but both times sustained a repulse. Vessil Pasha, who now in place of Suleiman stood facing the Shipka Pass, had been considerably weakened through sending reinforcements to aid Mohammed Ali near Sofia, and he could only muster 20,000 men. Meanwhile Gourko, hearing of Mohammed's preparations to relieve Plevna, urged that the Russians should advance boldly on Sofia, thereby depriving the enemy of the initiative. This plan being agreed to, Gourko, at the head of 30,000 men, drove the Turks out of Entropol, forcing Mohammed to retreat to Araba Konak Nov. 23. Gourko disposed of too small a force to be able to pursue the enemy, and so took up a position near Orhanie. Meantime in Plevna Osman's provisions were getting shorter every day, and ultimately he attempted a sortie, hoping to cut his way through Berkovitz to Sofia. After several hours severe fighting, however, Osman was convinced of the impossibility of breaking through, and surrendered with his whole army, about 40,000 men, on Dec. 10.

The Russians now decided to move on Sofia, cross the Balkans, relieve Shipka from the south and attack Vessil Pasha, the Tsarevitch with his 70,000 men being left to guard the communications. Gourko on Dec. 25 advanced with 5½ divisions against the Turks but on reaching Toshkesen he found that the Turks had already retreated. The Russians, after occupying Sofia, followed the enemy, who was making for Tatar Bazardjik. There Suleiman assumed command, having collected a force 50,000 strong, including reinforcements from Shumen. Radetsky began his attack on Jan. 5 at Shipka, being aided by two columns coming on his left and right; the western, Skobelev with 17,000; the eastern, Prince Imretinsky with 19,000 men. The Prince's advance was held up, while Skobelev, delayed, came on the scene only the following day, when they together captured the Turkish entrenched camp two miles south of the Pass, forcing Vessil Pasha to capitulate with 36,000 men. Suleiman, on hearing of Vessil Pasha's surrender, made for Philippopolis, Gourko following in direct pursuit, while Radetsky cut off his retreat from Adrianople, entering the town with his advanced guard on Jan. 19. After several minor actions near the town Suleiman retreated to the south over the Rhodope Mountains direct to the coast reaching Enos on Jan. 28. His forces were then shipped to Constantinople. The Russians advanced rapidly towards the Turkish capital, reaching the Chataldja lines on Jan. 30. Next day an armistice was concluded, the terms being greatly modified at the Berlin conference which took place the following July, when Russia was deprived of many important concessions, which greatly irritated both the nation and the army. Bulgaria now became an independent principality, while Eastern Roumelia was to be under the protectorate of Turkey.

While these events were taking place in Europe military operations were simultaneously being carried on in the Caucasus. The Grand Duke Michael, the Tsar's brother, commanded the Russian forces which were 65,000 strong. The Turks numbered 70,000 men under Mukhtar Pasha. The same mistake was committed in the Caucasus as had been done in Europe—the Russian army finding itself too weak was obliged to await reinforcements, which arrived by the end of August when they began their advance. The first serious battle occurred on Oct. 15, at Aladja Dag, when the Turks were defeated, a part of their forces hurriedly making for Kars, which was an important fortress, while the other portion fled to Erzerum. Kars was now invested. A month later on Nov. 18, the Russians stormed and captured it. This was a brilliant feat of arms, perhaps the finest Russian exploit throughout this war. Their communications now being assured, the Russians moved rapidly towards Erzerum, but the severe winter weather and the strength of the fortifications prevented them capturing it as quickly as they had hoped. When the armistice was concluded Erzerum was still holding out, but the Turks were now forced to evacuate it under the terms of the armistice. The Russo-Turkish War amply proved the truth of the military maxim that to wage war with insufficient forces is

highly risky. The Russians were many times on the brink of disaster, which would most certainly have occurred had they been faced by abler Turkish leaders and more efficiently trained troops (A. SMT.)

RUST, RICHARD SUTTON (1815–1906), U.S. clergyman and educator, was born in Ipswich, Mass., on Sept. 12, 1815, the son of a shoemaker. In 1841 he was graduated from Wesleyan university, Middletown, Conn. Ordained an elder in the Methodist Episcopal church in 1846, Rust was president of Wilberforce university, Wilberforce, O., a school for Negroes, 1858–62. For many years he was active in the Freedmen's Aid Society of the Methodist Episcopal church, which he helped to organize in 1866. In 1880 he published *The Freedmen's Aid Society of the Methodist Episcopal Church*. He died June 17, 1906.

RUST, a term usually applied to the reddish deposit formed on iron and having the approximate chemical composition $2\text{Fe}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$. (See also CORROSION AND OXIDATION OF METALS.)

RUSTICATION, in architecture, a form of masonry in which the stones have their edges cut back to a careful plane surface, but with the central portion of the stone face either left rough or projecting markedly. (See DRAFTED MASONRY.) Rusticated masonry is found in the platform of the tomb of Cyrus at Pasargadae in Persia (560 B.C.) and is common in certain types of Greek and Hellenistic work such as retaining walls and the like. It was similarly used for terrace and retaining walls by the Romans, who also realized its decorative value and employed it not only for such utilitarian works as the Pont du Gard at Nîmes, France and the aqueduct at Segovia, Spain (c. 109), but also decoratively as in the Porta Maggiore at Rome (time of Claudius), where the rustication is very rough, and the walls of the temple of Augustus at Vienne, France (c. 47), in which the rustication is carefully finished, the faces of the stone cut to a plane and the edges very delicately sunk.

The early Renaissance architects developed this tradition still further, and in the 15th century palaces in Florence used it with magnificent effect. Thus in the Pitti palace, by Brunelleschi (1458), the Riccardi, by Michelozzo (1444–52), and the Strozzi, by Benedetto da Maiano (1489), the carefully studied rustication forms the chief element in the design, and in the Rococo, from designs by Alberti (1446–51), the wall surfaces between the pilasters are delicately rusticated. During the Baroque period rustication assumed great importance in garden and villa design and all sorts of fantastic surfaces were employed on the projecting portions of the stones, such as vermiculated work, in which the surface is covered with wavy and serpentine sinkings like worm-eaten wood, or treated with vertical dripping forms like lime deposits from dripping water. Sometimes the stones had sides bevelled and brought to a point or ridge in the centre.

The use of rustication was introduced into England by Inigo Jones, as in the gate of the Botanic Gardens at Oxford (1632), and became a dominant feature in much English Renaissance work. In American colonial work this influence is seen in the occasional shaping of outside sheathing boards to imitate rusticated masonry, as in portions of the Morris-Jumel house in New York (1765). Quoins (q.v.), or corner blocks are, in many styles, rusticated, where the face of the wall is left smooth.

RUTABAGA: see TURNIP.

RUTACEAE, a family of dicotyledonous plants, mostly shrubs and trees, comprising about 144 genera and 1,600 species found in temperate and tropical regions, and especially abundant in Australia and South Africa. *Ruta graveolens* is rue (q.v.). *Citrus* includes the grapefruit, orange, lemon (q.v.), etc. *Chloroxylon swietenia* is satinwood (q.v.). *Ptelea trifoliata* is the shrubby trefoil or wafer ash; *Zanthoxylum americanum* is the prickly ash (q.v.). See A. Engler, "Rutaceae," in Engler and Prantl, *Die Natürlichen Pflanzenfamilien* 19a:187–357, fig. 89–164 (1931).

RUTBA WELLS, a post and watering place in the Syrian desert, in 33° N. and 40° E. The post, which is the headquarters of part of the desert police is the most westerly occupied place in Iraq. Westward from this point L. H. D. Buxton found considerable traces in the desert of palaeolithic remains.

See L. H. D. Buxton, *Antiquaries Journal* (1936).

RUTEBEUF or **RUSTEBUEF** (fl. 1245-1285), French trouvère, was born in the first half of the 13th century. His name is nowhere mentioned by his contemporaries. He frequently plays in his verse on the word Rutebeuf, which was probably a pseudonym. Some of his poems have autobiographical value. In *Le Mariage de Rutebeuf* he says that on Jan. 2, 1261, he married a woman old and ugly, with neither dowry nor amiability. In the *Complainte de Rutebeuf* he details a series of misfortunes which have reduced him to abject destitution. In these circumstances he addresses himself to Alphonse, comte de Poitiers, brother of Louis IX, for relief. His distress could not be due to lack of patrons, for his metrical life of Saint Elizabeth of Hungary was written by request of Erard de Valéry, who wished to present it to Isabel, queen of Navarre; and he wrote elegies on the deaths of Anceau de l'Isle Adam, the third of the name, who died about 1251, Eude, comte de Nevers (d. 1267), Thibaut V of Navarre (d. 1270) and Alphonse, comte de Poitiers (d. 1271), who were probably paid for by the families of the personages celebrated. In the *Pauvreté de Rutebeuf* he addresses Louis IX himself.

The piece which is most obviously intended for popular recitation is the *Dit de l'Herberie*, a dramatic monologue in prose and verse supposed to be delivered by a quack doctor. Rutebeuf was also a master in the verse *conte*, and the five of his *fabliaux* that have come down to us are gay and amusing. The adventures of *Frère Donyse le cordelier*, and of "*la dame qui alla trois fois autour du moulin*," find a place in the *Cent Nouvelles nouvelles*.

Rutebeuf's serious work as a satirist probably dates from about 1260. His chief topics are the iniquities of the friars, and the defense of the secular clergy of the university of Paris against their encroachments; and he delivered a series of eloquent and inconsistent poems (1262, 1263, 1268, 1274) exhorting princes and people to take part in the crusades. He was a redoubtable champion of the university of Paris in its quarrel with the religious orders, and he boldly defended Guillaume de Saint-Amour when he was driven into exile. The libels, indecent songs and rhymes condemned by the pope to be burned together with the *Péris des derniers temps* attributed to Saint-Amour, were probably the work of Rutebeuf. The satire of *Renart le Bestourné*, which borrows from the Reynard cycle little but the names under which the characters are disguised, was directed, according to Paulin Paris, against Philip the Bold. To his later years belong his religious poems, and also the *Voie de Paradis*, the description of a dream, in the manner of the *Roman de la Rose*.

The best work of Rutebeuf is to be found in his satires and verse *contes*. A miracle play of his, *Le Miracle de Théophile*, is one of the earliest dramatic pieces extant in French.

BIBLIOGRAPHY—The *Oeuvres* of Rutebeuf were edited by Achille Jubinal in 1839 (new edition, 1874); a more critical edition is by Dr. Adolf Kressner (*Rutebeuf's Gedichte*; Wolfenbüttel, 1885). See also the article by Paulin Paris in *Hist. lit. de la France* (1842), vol. xx, pp. 719-783; and Rutebeuf (1891), by M. Léon Clédard, in the *Grands écrivains français* series.

RUTGERS UNIVERSITY, the state university of New Jersey, has its main campuses in New Brunswick, N.J., with major centres in Newark and Camden. It offers undergraduate and graduate instruction for both men and women.

The university dates from Nov. 10, 1766, when Queen's college was chartered as the eighth college in the American Colonies. It owed its founding largely to the zeal for religion and education of Dutch settlers of the reformed Protestant faith who saw the need of an institution of higher learning that might provide training for candidates for the ministry. The New Brunswick Theological seminary was affiliated with the college until 1856. Classes began in 1771 in New Brunswick, but during the American Revolution the small student body was forced to evacuate the city and meet elsewhere. In 1809 Queen's building, a splendid example of Georgian Colonial architecture designed by John McComb, was erected and for several decades housed all the college work. It became the main administration building of the university.

In 1825 the name of the institution was changed to Rutgers college in honour of Col. Henry Rutgers, a leading churchman and philanthropist of New York city. In 1864 the state legislature designated the newly organized Rutgers Scientific school to be

"The State College for the Benefit of Agriculture and the Mechanic Arts," and in 1917 the land-grant units were declared to be the state university of New Jersey. Rutgers is the only land-grant college with a colonial charter. In 1880 the New Jersey Agricultural Experiment station was located at the college farm.

The New Jersey College for Women was created in 1918 by the trustees of Rutgers as an integral part of the university but with a separate campus in New Brunswick. The name "Rutgers University" was adopted in 1924, although the corporate title remained "The Trustees of Rutgers College in New Jersey." Divisions, with the dates of their founding or their association with the university, are: the college of arts and sciences (1766), the college of engineering (1864), the college of agriculture (1864), the school of education (1923), the university extension division (1925), the college of pharmacy (Newark, 1927), the graduate faculty (1932), University college (1934), the Newark Colleges of Arts and Sciences (Newark, 1946), the school of business administration (1946), the school of law (Newark and Camden, 1946, 1949), the institute of microbiology (1949), and the College of South Jersey (Camden, 1950).

Rutgers university was designated by legislation effective July 1, 1945, as the state university of New Jersey "to be utilized as an instrumentality of the State for providing public higher education" on a contractual basis, and the state board of education was given "visitorial general powers of supervision and control" over the university. Management of the institution was vested in a board of trustees of 58 members, 16 of whom would represent the state, seven the alumni and one the State Federation of Women's Clubs. Thirty-four "charter trustees" are elected for life terms by the board.

About 50 courses of study leading to the degrees of bachelor of arts, bachelor of letters, bachelor of science and bachelor of laws were established. Graduate instruction leading to the degrees of master of arts, master of science, master of laws, master of education, doctor of education and doctor of philosophy is also offered.

In 1940-41, prior to the incorporation of the Newark colleges into the university, the enrolment of full-time graduate and undergraduate students was about 3,000. This figure expanded to more than 9,000 in the post-World War II years and then declined slightly to approximately 8,000 by 1950-51. In the latter year there were also about 19,000 part-time students enrolled mainly in the extension divisions.

Rutgers university's physical plant was valued in the early 1950s in excess of \$60,000,000 and it comprised more than 50 major structures and more than 3,000 ac. of land. In 1950-51 its endowment was \$6,754,000 and its total budget was \$14,000,000, 35% of which was met by state appropriations. The Rutgers University libraries contained more than 500,000 catalogued volumes. (R. P. McC.)

RUTH, GEORGE HERMAN (BAHR) (1895-1948), U.S. baseball player, was born at Baltimore, Md., on Feb. 6, 1895. He spent a considerable part of his boyhood in the St. Mary's Industrial school in Baltimore as (by his own account) an incorrigible.

On Feb. 27, 1914, he joined the Baltimore Orioles of the International baseball league and later that year was sold to the Boston Red Sox, with whom he played through the 1918 season as a pitcher, his record including three world series victories. In the 1919 season, performing mostly as an outfielder, Ruth set a new big-league home-run record by hitting 29.

In 1920 Ruth was sold to the New York Yankees and in that season set a new record by hitting 54 home runs. In the winter of 1920-21 the scandal of the 1919 world series became public with the revelation that certain Chicago White Sox players had colluded with gamblers, agreeing to lose the series. Baseball observers called this the greatest crisis in the U.S. national game and credited Ruth's sensational play in 1921, including a new record of 59 home runs, with reviving interest in the sport. He was voted the most valuable player in the American league in 1923.

During his major league career Ruth broke more than 50 records, setting a new record for home runs in one season by hitting 60 in 1927. He led the American league in home runs for 12

years; he hit at least 50 home runs in four separate seasons and 40 in 11 seasons. He played in ten world series—three with Boston and seven with New York. His high earnings and congenial nature tempted Ruth periodically into waywardness, and he was suspended for 30 days of the 1922 baseball season by Baseball Commissioner K. M. Landis for an unauthorized barnstorming tour. In 1925 he was fined \$5,000 by Yankee Manager Miller Huggins for "misconduct off the ball field."

Ruth quit the Yankees after the 1934 season, played for a part of a season with the Boston Braves in 1935 and became a coach of the Brooklyn Dodgers in 1938, after which his formal baseball career ended. Throughout World War II he lent himself to patriotic promotions, and he appeared in a motion picture on the life of his teammate, Lou Gehrig. He acted as consultant on the motion picture on his own life. Ruth died in New York City on Aug. 16, 1948. (See *BASEBALL*, Plate I, fig. 3, and Plate II, fig. 1.)

RUTH, BOOK OF, in the Old Testament. The story of Ruth, the Moabitess, great-grandmother of David, is one of the Old Testament Hagiographa (see *BIBLE: Old Testament: Canon*). On the other hand, it follows Judges in the Septuagint, the Vulgate and the English version. But although a late rearrangement might transfer Ruth from the Hagiographa to the historical books, and place it between Judges and Samuel, no motive can be suggested for the opposite change, unless it had been placed in the last part of the Jewish canon after the second (with the historical books) had been definitely closed. Moreover, the book is untouched by the "prophetic" or "Deuteronomistic" editing, which helped to give the "Former Prophets" (Joshua—Kings) their present shape after the fall of the kingdom of Judah. Nor has the narrative any affinity with the view that the history of Israel was a series of examples of divine justice and mercy in the successive rebellions and repentances of the people of God. Finally, if the book had been known when Joshua—Kings was edited it could hardly have been excluded, since David's ancestry (iv, 17, 18–22) was of greater interest than that of Saul (given in i Sam. ix, 1), whereas the old history names no ancestor of David beyond his father Jesse.

Date.—The book of Ruth deals with a distant past (Ruth i, 1), and delights in depicting details of antique life and obsolete usages (iv, 7). It views the stormy period before the kingship through the softening atmosphere of time, in contrast to the harsher colours of the old narratives of the book of Judges. It has been argued that, as the author seems to take no offence at the marriage of Israelites with Moabite women, he must have lived before the time of Ezra and Nehemiah (Ezra ix; Neh. xiii); but the same argument would prove that the book of Esther was written before Ezra. The very designation of a period of Hebrew history as "the days of the Judges" is based on the exilic "Deuteronomistic" parts of the book of Judges (ii, 16 sqq.), and although the language sometimes recalls the narratives in Samuel and Kings, it can be assumed, either that the book is the work of a late author acquainted with the earlier literature, or that an old narrative was rewritten. The fact that the language is in contrast to that of Chronicles, Ezra, Nehemiah, etc., has no force since writings evidently more or less contemporary did not necessarily share the same characteristics (observe, for example, the prose parts of Job).

Purpose.—Like the stories appended to Judges, the book of Ruth connects itself with Bethlehem, the birthplace of David. Some connection between Bethlehem and Moab has been found in i Chron. iv, 22 (where the Targum and rabbinical exegesis discover references to the story of Ruth), and is explicitly suggested by the isolated i Sam. xxii, 3 seq., which knows of some relationship between Moab and David. Next, the writer claims the sympathy of his readers for Ruth, upon whose Moabite origin he insists, and this is noteworthy in view of the aversion with which intermarriage was regarded at a certain period (Deut. xxiii, 3; Neh. xiii; Ezra ix seq.). The independent evidence for the present late form of the book has led many scholars to the conclusion that it was directed against the drastic steps associated with the reforms of Ezra and Nehemiah, which, as is known, were not everywhere acceptable. Thus, not only have we a beau-

tiful portrait of a woman of Moabite origin, but she becomes the ancestress of David himself; and in the days of these measures the simple story would raise the question whether the exclusiveness of Judaism was being carried too far.

RUTHENIA or CARPATHIAN RUTHENIA, formerly an autonomous part of Czechoslovakia, and later of Hungary, became, after it was briefly returned to Czechoslovakia, an administrative division (Transcarpathian oblast) of the U.S.S.R. in 1945. Its northern frontier follows the ridge of the Carpathian mountains between Hungary and Poland. Much of Ruthenia is mountainous, deeply dissected by incised valleys which often open into broad, fertile basins in their upper courses. The southern edge of the highland is heavily forested with beech on its lower levels and confers on the higher. But the plain, largely the drainage basin of the upper Tisa and its tributaries, is the important region. Sheltered from the cold winds of the north and northeast, it receives the moist southwesterly currents and the climate is ideal for cereal and vine cultivation. Agricultural products include maize, oats, wheat, potatoes, rye, tobacco and barley. The lower slopes are devoted to vineyards and orchards of plum and apple trees.

Ruthenia had been a much neglected district of Upper Hungary, inhabited by a backward population, where agricultural methods were most primitive and therefore insufficient to assure a decent standard of living to the population, which in its large majority was Ruthenian, a Slav people closely related to the Ukrainians who lived on the northeastern slopes of the Carpathian mountains. Industrial activity was small, illiteracy widespread, and the Ruthenian peasants were without any initiative as a result of centuries of servitude. The peace treaty of Trianon brought the country under Czechoslovak administration, guaranteeing its autonomous status. This autonomy was during the first years very much restricted. The Czech administration, however, founded a large number of schools with Ruthenian as the language of instruction, combated illiteracy and the low state of public health, and helped to modernize the economic life.

The area of the province was 4,886 sq. mi., the population in 1930, 725,357, of whom 450,925 were Ruthenians, 115,805 Magyars, 95,008 Jews, 34,511 Czechoslovaks, 13,804 Germans, and 12,777 Rumanians. The Ruthenians therefore formed 62.17% of the population, 15.96%, of the population. With regard to religion, 49.52% belonged to the Greek Catholic Church, 15.44% to the Greek Orthodox Church, and 14.14% to the Jewish faith. In 1930, 30.88% above the age of ten were illiterate. The 1941 population of towns over 20,000 was: Užgorod 32,250; and Mukačëvo 31,602.

As a result of the German-Italian award of Nov. 2, 1938, at Vienna, Czechoslovakia lost the southern and more fertile part of Ruthenia to Hungary. The remaining part was constituted as one of the three autonomous governments within the new Czechoslovakia. Its name was changed to Carpatho-Ukraine and it was regarded as the nucleus of a Pan-Ukrainian national movement the purpose of which was to create a great Ukraine embracing the Ukrainian parts of Poland and of the Soviet Union. The capital is Khust (1947, 21,118); the area of the state was, in 1941, approximately 5,000 sq. mi., with a population (1947 estimate) of 900,000. On March 14, 1939, Hungary, with Germany's action against Czechoslovakia, annexed Ruthenia. Occupied by the Soviet Union in 1944, Ruthenia, after a brief period under Czech control, was incorporated in the U.S.S.R. as the Transcarpathian oblast in 1945. (H. Ko.; X.)

RUTHENIANS, a name also applied to those Ukrainians, or Little Russians, who were formerly Austrian subjects. The name is simply a Latinized form of "Russian," the terms "Red Russian," etc., being due to false derivations. When, however, the early Ruthene states lost their independence, the term "Russia" was monopolized by the Muscovite state which, anxious to deny to the Ruthenes a national individuality, gave them the name of

"Little Russians." The Ruthenes themselves adopted the distinguishing title of "Ukrainians," i.e., inhabitants of the Tatar frontier in S. Russia. The name Ruthene survived among the subjects of Poland and Lithuania, and later, Austria. The Ruthenians are thus neither more nor less than Ukrainians, and their linguistic and ethnographical features are described under that head. Yet they can be distinguished from the Ukrainians of Russia, both by their separate history (see POLAND, GALICIA) and by their religion. After Galicia and Volhynia came under Polish and Lithuanian rule in the 14th century, their upper classes were soon assimilated into the conquering nations, whose language and Catholic faith they adopted. The peasants sank into a state of great degeneracy, which was largely due to the decadence of their own Orthodox priests; recognizing which, they themselves proposed union with Rome. This was proclaimed by the Pope and accepted by the Ruthenes at the Union of Brest-Litovsk, Oct. 6-10, 1596. Under this new "Uniate Church," the Ruthenes retained their Slavonic liturgy and most of the outward forms of the Greek Orthodox Church, while acknowledging the spiritual supremacy of the Pope. Although the two liturgies were nominally entitled to equal treatment in Poland, actually the Uniate was always treated as inferior, and its adherents sank into a lamentable state of ignorance and poverty, due partly to the exactions of their feudal masters, partly to national oppression, partly to their portentous capacity for consuming fiery liquor, their habit of keeping the holidays of both Julian and Gregorian calendars (in 1860 16 districts in Galicia kept 160-200 days annually as holidays) and their superstitions (in 1807 a current method of exorcising cattle plague was to place the carcasses of the stricken animals in the wells, pastures and stables of uninfected districts).

On the partition of Poland, a number of Ruthenes passed back under Russian rule. Many of them were quickly converted to the orthodox faith, and every effort was made to Russify them. The orthodox propaganda was extended to Galicia (see PAN-SLAVISM) but the results were more sensational than practical. The Russian Government systematically discouraged Ruthenian nationalism until after the revolution of 1905, when some relaxation was made in the oppressive regulations. Similar efforts were made by the Poles of Galicia, and winked at by the Austrian Government, but here something was done for the Ruthenes. A metropolitan bishopric was founded at Lemberg in 1806, and suffragates added at Przemyśl and Stanisław. In 1877 a Ruthenian chair was established at Lemberg University, but Austria never granted a separate Ruthenian university, in spite of agitation.

After the war the largest body of Ruthenes, those in East Galicia, claimed the right of self-determination, but their short-lived state was soon absorbed in Poland (see GALICIA). The Ruthenes in the N.E. Carpathians were attributed to Czechoslovakia, special guarantees being laid down for their national autonomy. They were formed into the province of Sub-Carpathian Russia (see CZECHOSLOVAKIA). The Ruthenes of Bessarabia and the Bukovina came under Rumanian rule (where the state religion was orthodox), with the protection of the Rumanian Minorities treaty.

The population of Transcarpathian Oblast, formerly known as Ruthenia (*q.v.*) and bounded on the northwest by Poland, west by Czechoslovakia, south by Rumania and southwest by Hungary, was estimated at 900,000 in 1947. The 5,000-mi. region had been controlled briefly by Czechoslovakia during World War II before it was secured to the Soviet Union in Sept. 1945. It became an administrative unit of the Ukrainian S.S.R. See UKRAINE, POLAND, RUSSIA, etc.

See also the publications of the League for Ukrainian National Independence (Geneva 1919-22).

RUTHENIUM, (symbol Ru, atomic number 44, atomic weight 101.7, stable isotopes 102, 104, 101, 99, 100, 96, 98), a metal, member of the platinum group.

Ruthenium, the last member of the platinum family to be discovered, was definitely established as a new element by C. Claus in 1845. A previous announcement by G. Osann in 1828 of a new element of the platinum group, the discovery of which was never

confirmed, had suggested the name ruthenium from Ruthenia, Little Russia. Claus retained the name.

Ruthenium, like osmium, forms a tetroxide RuO_4 , less stable than OsO_4 but which can likewise be distilled from aqueous solution. The tendency to form the tetroxide is far less strong than it is with osmium and the solutions of ruthenium are consequently easier to handle.

In analytical procedures osmium and ruthenium may be distilled together or, by changing the conditions of the solution, the two may be separated. Osmium is best distilled from a solution containing nitric acid, while ruthenium is best distilled from a solution of its sulphate in sulphuric acid to which sodium bromate is added.

Ruthenium and osmium form a natural alloy with iridium and it is from this portion of crude platinum, insoluble in aqua regia, that they are obtained. They are brought into soluble form, Na_2RuO_4 and Na_2OsO_4 , by fusing the crude material with an alkaline oxidizing flux. It is customary to remove osmium first by distilling from the solution acidified with nitric acid, and then to distil the ruthenium tetroxide after making the solution alkaline again and saturating it with chlorine. In preparing pure ruthenium the metal, isolated by distillation as the tetroxide, is absorbed in hydrochloric acid diluted with four volumes of water. After removing excess acid by evaporation on a steam bath, ammonium chloride is added to precipitate a salt, probably $(\text{NH}_4)_2[\text{RuCl}_2\text{OH}]$ or $(\text{NH}_4)_2[\text{RuCl}_6]$. Reduction of the salt in hydrogen gives metallic ruthenium. If the absorbent solution is treated with nitric acid, the salt obtained will be $(\text{NH}_4)_2[\text{RuCl}_2\text{NO}]$.

The behaviour of the nitroschloride on hydrolysis differs markedly from that of $(\text{NH}_4)_2[\text{RuCl}_2\text{OH}]$ or $(\text{NH}_4)_2[\text{RuCl}_6]$. The tightly bound nitro group prevents the precipitation of a hydrated oxide so that one is able to separate the ruthenium contained in the two types of compounds.

Considerable confusion existed from the time the discoverer C. Claus, in 1845, prepared two chloro salts of ruthenium to which he assigned the formulas K_2RuCl_6 and K_2RuCl_4 . Later it was shown that the supposed K_2RuCl_4 was a nitroso salt, $\text{K}_2\text{RuCl}_4\text{NO}$. The first salt has, since the time of Claus, passed for K_2RuCl_6 , which was considered a pentachlororuthenite. Efforts to oxidize this salt to K_2RuCl_6 have been of no avail. In 1904 James Lewis Howe described a monohydrate of K_2RuCl_4 which differed markedly from the former salt in properties, especially in stability toward hydrolysis and in being converted into K_2RuCl_6 by the action of chlorine. It was formed from the earlier K_2RuCl_6 by boiling with dilute alcohol in acid solution and was called an aquo salt. The corresponding rubidium and cesium salts were also prepared, as well as similar salts with bromine in the place of chlorine. It was thought that there might be an instance of isomerism between these two series of pentachlororuthenites.

The explanation of this anomaly depended upon ascertaining the state of valency of the ruthenium in the two types of compounds and in determining the composition of the salts, particularly with respect to water. Raymond Cheronnet in 1925 suggested that the true formula for the ordinary pentachlororuthenite is $\text{K}_4[\text{RuCl}_5\text{OH}]$, basing his view on the action of this salt on potassium iodide, and on the formation of the aquo salt by the action of hydrochloric acid on the oxalato compound $\text{K}_4[\text{Ru}(\text{C}_2\text{O}_4)_2]$. Howe concluded, in 1927, that no isomerism exists and that the explanation lies in the fact that Claus's K_2RuCl_4 is in reality $\text{K}_4[\text{RuCl}_5\text{OH}]$, in which the ruthenium is quadrivalent and that the aquo salt $\text{K}_2\text{RuCl}_4\text{H}_2\text{O}$ is $\text{K}_4[\text{RuCl}_5\text{OH}]$, in which the ruthenium is tervalent.

In reducing solutions with zinc, hydrogen sulfide and other agents, a conspicuous blue colour is formed. Claus had regarded the colour as that of bivalent ruthenium. In 1927 Heinrich Remy and T. Wagner considered it to be that of univalent ruthenium and based their opinion on its being formed when the valency of the ruthenium in K_2RuCl_4 was reduced two units, as measured by the action of sodium amalgam. E. Zintl and P. Zaitz also assumed the presence of univalent ruthenium in the blue solution, basing their view on the potentiometric titration of RuCl_4 with chromous or titanous sulphate where with one equivalent they obtained a pale yellow solution, while with the next drop the blue colour began to appear.

Ruthenium sulphate, $\text{Ru}(\text{SO}_4)_3$, is formed when ruthenium tetroxide is dissolved in sulphuric acid and the resulting orange-yellow solution is evaporated. Hydrogen sulphide does not produce the blue reaction obtained with a solution of the chloride.

Ruthenium shows its relationship to iron through the cyano and

nitroso complexes, as exemplified by $K_4[Fe(CN)_6]$ and $K_3[Fe(CN)_6]$ and by $K_4[Ru(CN)_6]$ and $K_3[Fe(CN)_6]$.

Ruthenium is rarely used in the elemental form. As a hardening constituent it is alloyed with platinum and with palladium. Platinum alloyed with 5% of its weight of ruthenium is equivalent in hardness to platinum with 10% of iridium. For this reason ruthenium-platinum alloys became popular as alternatives to iridioplatinum in the manufacture of jewellery. Ruthenium, usually in conjunction with rhodium, is used as a hardener for palladium intended for jewellery. It is also used in making hard alloys for tipping fountain pens and phonograph needles (See PLATINUM; PLATINUM METALS.)

(R. G.)

RUTHERFORD, ERNEST, 1ST BARON RUTHERFORD OF NELSON (1871–1937), British physicist, was born at Nelson, New Zealand on Aug. 30, 1871. Rutherford received his secondary training at Nelson college and, on graduation in 1889, gained a scholarship at the University of New Zealand. By 1893 he had taken his M.A. degree with a double first in mathematics and physical science.

In 1895 Rutherford won an 1851 exhibition scholarship which took him to Cambridge university. At the Cavendish laboratory his ability was recognized at once by J. J. Thomson. His earliest research there was a detector for electromagnetic waves, its essential feature being a small magnetizing coil containing a tiny bundle of magnetized iron wire. Rutherford's second piece of work, done jointly with Thomson, dealt with the temporary conduction in gases which results from ionization produced by X-rays.

In 1897 Rutherford worked with Thomson upon the mobility of ions and related topics, but especially upon the negative ions emitted when ultra-violet light falls upon a clean metal surface. The discovery of Becquerel rays and radium had aroused his curiosity as to just what kind of ions are emitted by radium. At this juncture, Rutherford accepted a call to McGill university in Canada. On reaching the Macdonald laboratory there, in the autumn of 1898, he at once set to work on the radiation from radium, and discovered in 1899 that it is quite complex, consisting first of all of easily absorbed rays—rays which are stopped by a few centimetres of air. These he called alpha-rays. Besides these, he found uranium giving a far more penetrating radiation, able to pass through a sheet of aluminium several millimetres thick. These he named beta-rays, and they proved to be high-speed electrons.

Rutherford's next work at Montreal was done jointly with R. B. Owens. It was a study of thorium emanation which led to the discovery of a new noble gas, later known as thoron. After Frederick Soddy came to McGill university in 1900, he and Rutherford created the modern theory of radioactivity, excellently set forth in Rutherford's *Radioactive Substances and their Radiations*.

In 1909 he accepted an invitation to succeed Sir Arthur Schuster in the Langworthy professorship at Manchester university. It was about this time that he and J. T. Royds proved that alpha-particles consist of helium atoms. The Nobel prize was presented to Rutherford on Dec. 11, 1908, some two years before he began thinking about the scattering of alpha-rays and the nature of a nucleus which could produce such scattering—his nuclear theory—the greatest of all his contributions to physics. In 1912 Niels Bohr came to work in the Manchester laboratory, and it was here that Bohr adapted the nuclear structure of Rutherford to the quantum theory of Max Planck and thus obtained an atomic structure which satisfied the experimental findings of J. R. Rydberg and other spectroscopists. About this time H. G. Moseley got in touch with Rutherford and worked with him during the year 1913. Moseley bombarded the atoms of various elements with cathode rays and proved that the inner structures of these atoms (with the positive charge on the Rutherford nucleus) respond in a group of lines which characterize the elements much as the natural numbers might do, so that each element can be assigned its atomic number. The importance of this discovery lies in the fact that the properties of an element are defined by its atomic number.

In 1919, Rutherford was invited to the Cavendish chair at Cambridge. Honours now came in rapid succession. Rutherford had been knighted in 1914. The Copley medal of the Royal society was bestowed on him in 1922; the presidency of the British Association for the Advancement of Science in 1923, to be followed, two years later, by the presidency of the Royal society. In 1931, he was created 1st Baron Rutherford of Nelson. He died Oct. 19, 1937. **BIBLIOGRAPHY**—E. R. Rutherford, J. Chadwick and C. Ellis, *Radioactive Matter from Radium to the Present* (1930) is a book so thoroughly documented that it serves every need in the way of a chronological list of Rutherford's published papers. (H. Cw.)

RUTHERFORD, MARK, the pen name of William Hale White (1829–1913), English author, born at Bedford, Eng. His

father, William White, a member of the nonconformist community of the Bunyan meeting, moved to London, where he was well known as a doorman of the house of commons; he wrote sketches of parliamentary life for the *Illustrated Times*, papers afterward collected by his son as *The Inner Life of the House of Commons* (1897). The son was educated at Chesham and New College for the Congregational ministry, but the development of his views prevented his following that career, and he became a clerk in the admiralty.

He had already served an apprenticeship to journalism before he made his name as a novelist by the three books "edited by Reuben Shapcott," *The Autobiography of Mark Rutherford* (1881), *Mark Rutherford's Deliverance* (1885), and *The Revolution in Tanner's Lane* (1887). Under his own name he translated Spinoza's *Ethics* (1883, new ed. 1894). Later books are *Miriam's Schooling*, and other papers (1890); *Catherine Furze*, 2 vol. (1893); *Clara Hogwood* (1896); *Pages from a Journal*, with other papers (1900); *John Bunyan* (1905); *More Pages from a Journal* (1910) and *Last Pages* (1915) which was edited by his wife. Though for a long time little appreciated by the public, his novels—particularly the earlier ones—have a power and style which must always give his works a place of their own in the literary history of their time. He died at Groombridge, Sussex, on March 14, 1913.

See A. E. Taylor, "The Novels of Mark Rutherford" in *Essays and Studies* by members of the English association (1913–14).

RUTHERFORD, a borough of Bergen county, New Jersey, U.S., on the Erie railroad, midway between Jersey City and Paterson. Pop. (1950) 17,411; in 1940, 15,466 by federal census. The combined population of Rutherford and the adjoining borough of East Rutherford (7,438 in 1950 and 7,268 in 1940) was 24,849 in 1950. Both boroughs are primarily residential communities, with little manufacturing.

RUTHERGLEN (locally pronounced *Rüglén*), royal and large burgh of Lanarkshire, Scotland. Pop. (1951) 24,225. Area 1.6 sq. mi. It is situated on left bank of the Clyde, 2½ mi. by the Scottish region railway S.E. of Glasgow, with the east of which it is connected by a bridge. The parish church stands near the spire of the ancient church where, according to tradition, the treaty was made in 1297 with Edward I, by which Sir John Menteith undertook to betray Wallace to the English. The industries include collieries, chemical works, dye works, paper mills, chair making, tube making, pottery, rope- and twine-works.

Rutherglen was erected into a royal burgh by David I in 1126. It then included a portion of Glasgow, but in 1226 the boundaries were rectified so as to exclude the whole of the city, and Rutherglen has continued to resist incorporation with Glasgow. In early times it had a castle, which was taken by Robert Bruce from the English in 1313. It was kept in good repair until after the battle of Langside (1568), when it was burned by order of the regent Moray. In 1679 the Covenanters published their "Declaration and Testimony" at Rutherglen prior to the battles of Drumclog and Bothwell Brig (1679).

RUTHIN, market town and municipal borough, Denbigh parliamentary division, Denbighshire, Wales, 27½ mi. N.W. of London by Western region railway. Pop. (1951) 3,599. Area 3.2 sq. mi. Ruthin (*Rhudd dain*, red fortress) stands on a hill above the river Clwyd. Apart from legends of Arthur, the first fact of note is its connection with the Grey de Ruthyn family (1282). Owen Glendower attacked the castle in 1400; it was later sold to Henry VII, and Elizabeth gave it to the earl of Warwick. In 1646 it was dismantled by the Parliamentarians but later a new castle was built on the site. The church of St. Peter has nearly 500 panels of carved oak. The incumbent is known as the warden.

RUTHVEN (rú'ven), name of a noble Scottish family tracing descent from a certain Thor, who settled in Scotland during the reign of David I. In 1488 one of its members, Sir William Ruthven (d. 1528), was created a lord of parliament as Lord Ruthven. Patrick, 3rd Lord Ruthven (c. 1520–1566), played an important part in the political intrigues of the 16th century as a strong Protestant and a supporter of the lords of the congregation. He favoured the marriage of Mary with Darnley, and was the leader of the band which murdered Rizzio. This event was followed by his flight into England, where he died. Ruthven wrote for Queen Elizabeth a *Relation* of the murder, which is preserved in manuscripts in the British museum.

A descendant of the 1st Lord Ruthven in a collateral line, also named Patrick Ruthven (c. 1573–1651), distinguished himself in the service of Sweden, which he entered about 1606. After leaving the Swedish service he was employed by Charles I. in Scotland. He defended Edinburgh castle for the king in 1640, and when the Civil War broke out he joined Charles at Shrewsbury. He led the left wing at the battle of Edgehill, and after this engagement was appointed general-in-chief of the Royalist army. For his services he was created Lord Ruthven of Ettrick in 1639, earl of Forth in 1642 and earl of Brentford in 1644. The earl compelled Essex to surrender Lowestoft, and was wounded at both battles of Newbury. In 1644 he was superseded in his command by Prince Rupert. After visiting Sweden on a mission for Charles II, Brentford died at Dundee on Feb. 2, 1651. He left no sons and his titles became extinct.

Patrick, 3rd Lord Ruthven, was succeeded as 4th lord by his son William (c. 1541–1584), who like his father was prominent in the political intrigues of the period and was also concerned in the Rizzio murder. In 1582 he devised the plot to seize King James VI, known as the raid of Ruthven, and he was the fastidious custodian of the famous silver casket containing the letters alleged to have been written by Mary, queen of Scots, to Bothwell. In 1581 he was created earl of Gowrie, but all his honours were forfeited when he was attainted and executed in May 1584 (See GOWRIE, 3RD EARL OF.)

In 1853 the barony descended to Mary Elizabeth Thornton (c. 1784–1864), the wife of Walter Hore (d. 1878). She and her husband took the name of Hore-Ruthven, borne by later barons.

See the *Ruthven Correspondence*, edited with introduction by the Rev. W. D. Macray (1868) ; J. H. Round, "The Barony of Ruthven of Freeland" in *Joseph Foster's Collectanea Genealogica* (1887–88) ; and Sir R. Douglas, *The Peerage of Scotland* (new ed. by Sir J. B. Paul).

RUTILE, the most abundant of the three native forms of titanium dioxide, TiO_2 ; the others being anatase and brookite (q.v.). Like anatase, it crystallizes in the tetragonal system, but with different angles and cleavages, it being crystallographically related to cassiterite, with which it is isomorphous. The crystals resemble cassiterite in their prismatic habit and terminal pyramid planes and also in the twinning; the prism planes are striated vertically. Acicular crystals are sometimes twinned together to form reticulated skeletal plates to which the name "sagenite" (Gr. *σάγινη* a net), is applied. At the same time, the colour is usually reddish-brown, though yellowish in the very fine needles, and black in the ferruginous varieties ("nigrine" and "limonitine"); the streak is pale brown. The name rutile, given by A. G. Werner in 1803, refers to the colour (Lat. *ruſſſus*, red). Crystals are transparent to opaque, and have a brilliant metallic-adamantine lustre. The hardness is 6–5; specific gravity 4.2, ranging up to 5.2 in varieties containing 10% of ferric oxide.

Rutile occurs as a primary constituent in eruptive rocks, but more frequently in schistose rocks. As delicate acicular crystals it is often enclosed in mica and quartz; in mica (q.v.) it gives rise to the phenomenon of asterism; and clear transparent quartz (rock-crystal) enclosing rutile is often cut as a gem under the name of "Venus' hair stone" (Pliny's *Veneris crinis*). As a secondary mineral rutile in the form of minute needles is of wide distribution in various sedimentary rocks, especially clays and slates. As rounded grains it is often met with in auriferous sands and gravels. The mineral has little economic value; it has been used for imparting a yellow colour to glass and porcelain, and for this purpose is mined at Risør and other places in Norway

(L. J. S.)

RUTILIUS CLAUDIUS NAMATIUS, Roman poet, flourished at the beginning of the 5th century A.D. He was the author of a Latin poem, *De Reditu Sui*, in elegiac metre, describing a coast voyage from Rome to Gaul in A.D. 416. The literary excellence of the work, and the flashes of light which it throws across a momentous but dark epoch of history, combine to give it exceptional importance among the relics of late Roman literature. The poem was in two books; the exordium of the first and the greater part of the second have been lost. What remains consists of about seven hundred lines.

The author is a native of S. Gaul (Toulouse or perhaps Poitiers), and belonged like Sidorius, to one of the great governing families of the Gaulish provinces. His father was an imperial official with a distinguished career, and Rutilius himself was secretary of State and *praefectus urbi*. After reaching manhood, he passed through the tempestuous period between the death of Theodosius (395) and the fall of the usurper Attalus, which occurred near the date when his poem was written. Undoubtedly the sympathies of Rutilius were with those who during this period dissented from and, when they could, opposed the general tendencies of the imperial policy. We know from himself that he was the intimate of those who belonged to the circle of the great orator Symmachus—men who scouted Stilicho's compact with the Goths, and led the Roman senate to support the pretenders Eugenius and Attalus in the vain hope of reinstating the gods whom Julian had failed to save.

Perhaps the most interesting lines in the whole poem are those in which Rutilius assails the memory of "dire Stilicho," as he names him. Stilicho, "fearing to suffer all that had caused himself to be feared," planted the cruel Goths, his "skin-clad" minions in the very sanctuary of the empire. May Nero rest from all the torments of the damned, that they may seize on Stilicho; for Nero smote his own mother, but Stilicho the mother of the world!

We shall not err in supposing that we have here (what we find nowhere else) an authentic expression of the feeling entertained by a majority of the Roman senate concerning Stilicho. He had but imitated the policy of Theodosius with regard to the barbarians; but even that great emperor had met with passive opposition from the old Roman families. It is noteworthy that Rutilius speaks of the crime of Stilicho in terms far different from those used by Orosius and the historians of the lower empire. They believed that Stilicho was plotting to make his son emperor, and that he called in the Goths in order to climb higher. Rutilius holds that he used the barbarians merely to save himself from impending ruin. The Christian historians assert that Stilicho designed to restore paganism. To Rutilius he is the most uncompromising foe of paganism.

With regard to the form of the poem, Rutilius handles the elegiac couplet with great metrical purity and freedom, and betrays many signs of long study in the elegiac poetry of the Augustan era. The Latin is unusually clean for the times, and is generally fairly classical both in vocabulary and construction. The taste of Rutilius, too, is comparatively pure. It is common to call Claudian the last of the Roman poets. That title might fairly be claimed for Rutilius, unless it be reserved for Meropaeus. At any rate, in passing from Rutilius to Sidorius no reader can fail to feel that he has left the region of Latin poetry for the region of Latin verse.

BIBLIOGRAPHY.—All existing mss. of Rutilius are later than 1494, and are copies from a lost copy of an ancient ms. once at the monastery of Bobbio, which disappeared about 1700. The *editio princeps* is that by J. B. Pius (Bologna, 1520), and the principal editions since have been those by Barth (1623), P. Burman (1731, in his edition of the minor Latin poets), Wernsdorff (1778, part of a similar collection), Zumpt (1840), and the critical edition by Lucian Müller (Teubner, Leipzig, 1870), and another by Vessereau (1904); also an annotated edition by Keene, with a translation by G. F. Savage-Armstrong (1906). Müller writes the poet's name as Claudius Rutilius Namatianus, instead of the usual Rutilius Claudius Namatianus; but if the identification of the poet's father with the Claudius mentioned in the Theodosian Code (2, 4, 5) be correct, Müller is probably wrong. Rutilius receives more or less attention from all writers on the history or literature of the times, but a lucid chapter in Beugnot, *Histoire de la destruction du Paganisme en Occident* (1835), may be especially mentioned, and one in Pichon's *Derniers écrivains profanes* (1906). See also O. Schissel von Fleckenberg, *Rutilius Namatianus* (Vienna and Leipzig, 1920).

(J. S. R.)

RUTLAND, EARLS AND DUKES OF. The 1st earl of Rutland was Edward Plantagenet (1373–1415), son of Edmund, duke of York, and grandson of King Edward III. In 1390 he was created earl of Rutland, but was to hold the title only during the lifetime of his father, on whose death in 1402 the earldom accordingly became extinct, the earl then becoming duke of York. The title earl of Rutland seems to have been assumed subsequently by different members of the house of York, though it does not appear that any of them had a legal right to it. One of these

was the 1st earl's nephew, Richard Plantagenet, duke of York, father of King Edward IV. Richard's daughter Anne married for her second husband Sir Thomas St. Leger, and their daughter Anne married George Manners, 12th Baron Ros, or Roos (d. 1513). Their son, Thomas Manners (d. 1543), was therefore great-grandson of Richard Plantagenet, who had styled himself earl of Rutland among other titles. In 1525 Thomas Manners was created earl of Rutland, and his descendants have held this title to the present day.

Thomas was a favourite of Henry VIII., who conferred on him many offices and extensive grants of land, including Belvoir Castle, in Leicestershire, which became henceforth the chief residence of his family. He was succeeded in the earldom by his son Henry (c. 1516-1563); and his second son, Sir John Manners, acquired Haddon Hall, Derbyshire, by his marriage with Dorothy, daughter of Sir George Vernon, called "the king of the Peak." Henry, the 2nd earl, was an admiral of the fleet in the reign of Queen Mary, and later enjoyed the favour of Queen Elizabeth.

John, 9th earl (1638-1711), a partisan of the Revolution of 1688, received the Princess Anne at Belvoir Castle on her flight from London; after the accession of Anne to the throne she created him marquess of Granby and duke of Rutland in 1703. The 1st duke was three times married; the divorce in 1670, while he was still known as Lord Ros, of his first wife, Anne, daughter of the marquess of Dorchester, was a very celebrated legal case, being the first instance of divorce *a vinculo* by act of parliament, a divorce *a mensa et thoro* having previously been granted by the ecclesiastical courts. His grandson John, the 3rd duke (1696-1779), was the father of John Manners, marquess of Granby (q.v.), a distinguished soldier, whose son Charles, 4th duke of Rutland (1754-1787), succeeded his grandfather. When marquess of Granby he represented Cambridge university in the House of Commons, and hotly opposed the policy that led to war with the American colonies. He helped to procure the entrance of the younger Pitt to the House of Commons, and remained through life Pitt's intimate friend. After succeeding to the dukedom in 1779, he sat in the cabinets of Shelburne and of Pitt, and became lord lieutenant of Ireland in 1784.

He was one of the earliest to advocate a legislative union between Ireland and Great Britain, which he recommended in a letter to Pitt in June 1784. The poet Crabbe was for some time private chaplain to the duke at Belvoir. His wife, Mary Isabella (1756-1831), "the beautiful duchess," whose portrait was four times painted by Sir Joshua Reynolds, was a daughter of the 4th duke of Beaufort. His eldest son, John Henry, 5th duke (1778-1857), was "the duke" in Disraeli's *Coningsby*; the latter's two sons, who succeeded in turn to the dukedom, the marquess of Granby and Lord John Manners, figuring in the same novel as "the marquis of Beaumanoir" and "Lord Henry Sidney" respectively. The 7th duke is noticed separately.

RUTLAND, JOHN JAMES ROBERT MANNERS, 7TH DUKE OF (1818-1906), English statesman, was born at Belvoir Castle on Dec. 13, 1818, the younger son of the 5th duke of Rutland by Lady Elizabeth Howard, daughter of the 5th earl of Carlisle. Lord John Manners, as he then was, was educated at Eton and Trinity College, Cambridge. In 1841 he was returned for Newark in the Tory interest, along with W. E. Gladstone, and sat for that borough until 1847. Subsequently he sat for Colchester, 1850-57; for North Leicestershire, 1857-85; and for East Leicestershire from 1885 until in 1888 he took his seat in the House of Lords upon succeeding to the dukedom.

In 1841 Manners definitely associated himself with the "Young England" party, under the leadership of Disraeli. This party sought to extinguish the predominance of the middle-class bourgeoisie, and to re-create the political prestige of the aristocracy by resolutely proving its capacity to ameliorate the social, intellectual, and material condition of the peasantry and the labouring classes. Manners made an extensive tour of inspection in the industrial parts of N. England, in the course of which he and his friend Smythe expounded their views with a brilliancy which frequently extorted compliments from the leaders of the Manchester school. In 1843 he supported Lord Grey's motion for an

inquiry into the condition of England, the serious disaffection of the working classes of the north being a subject to which he was constantly drawing the attention of parliament. Among other measures that he urged were the disestablishment of the Irish Church, the modification of the Mortmain Acts, and the resumption of regular diplomatic relations with the Vatican. In the same year he issued in pamphlet form a strong *Plea for National Holydays*. In 1844 Lord John vigorously supported the Ten-hours Bill, which, though strongly opposed by Bright, Cobden, and other members of the Manchester school, was passed in May 1847.

Manners figured as "Lord Henry Sidney" in Disraeli's *Coningsby*, and not a few of his ideas are represented as those of Egremont in *Sybil* and Walsingham in *Endymion*. But the disruption of the Young England party was already impending. Lord John's support to Peel's decision to increase the Maynooth grant in 1845 led to a difference with Disraeli. Divergences of opinion with regard to Newman's secession from the English Church produced further defections in the ranks, and the rupture was completed by Smythe acquiescing in Peel's conversion to Free Trade. Lord John produced another volume of verse, known as *English Ballads*, chiefly patriotic and historical, in 1850. During the three short administrations of Lord Derby (1851, 1858 and 1866) he sat in the cabinet as first commissioner of the office of works. On the return of the Conservatives to power in 1874 he became postmaster-general in Disraeli's administration, and was made G.C.B. on his retirement in 1880. He was again postmaster-general in Lord Salisbury's administration, 1885-86, and was head of the department when sixty penny telegrams were introduced. Finally, in the Conservative government of 1886-92 he was chancellor of the duchy of Lancaster. He had succeeded to the dukedom of Rutland in March 1888, upon the death of his elder brother. He died on Aug. 4, 1906 at Belvoir Castle.

RUTLAND, a midland county of England, bounded north and east by Lincolnshire, north and west by Leicestershire, and south-east by Northamptonshire. It is the smallest county in England, having an area of 152 sq. miles. The western portion is formed of the Jurassic beds, including Lias, inferior Oolites and great Oolites, which form the high ground. They dip gently to the east and are interrupted in places by faults, as in the Welland valley between Ketton and Duddington. The lower Lias occupies but a very small part in the extreme north-west. The middle Lias includes marlstone and ferruginous limestone yielding iron in workable quantities and forming the productive soil of the Catmose valley. The upper Lias forms the steep slopes below the Oolitic scarps, and furnishes materials for bricks and tiles. The inferior Oolite limestones and sands form the highland of the west and the dip slope to the east, where, in the north-east, they are overlain by great Oolite. All these deposits are covered with glacial deposits.

Rutland is drained by the tributaries of the Welland, which flows along its eastern boundary.

History.—Ancient stone implements have been found in the Oakham district and along the river Wash, and small late Bronze age hoards. At the time of the Roman invasion, this region was inhabited by a scanty population of the Coritani tribe. This is inferred by the absence of finds, although Ermine street passes through its eastern portion. Rutland was forested in pre-Norman days and only a few early settlements occurred, which were found on the belt of Northampton sands at its junction with the Lias clays, where dry sites could be found near springs, with pastures on the clay beds. These sites were occupied by a tribe of the Middle Angles in the 6th and 7th centuries, and the whole region was absorbed subsequently in the kingdom of Mercia.

Although mentioned by name in the will of Edward the Confessor, who bequeathed it to his queen Edith for life, with remainder to Westminster abbey, Rutland did not rank as a county at the time of the Domesday survey in which the term Rutland is applied only to that portion assessed under Nottinghamshire, while the south-east portion of the modern county is surveyed under Northamptonshire, where it appears as the wapentake of Wiclessa. Rutland is first mentioned as a distinct county under the administration of a separate sheriff in the pipe roll

of 1150, but as late as the 14th century it is designated "Rutland Soke," and the connection with Nottinghamshire, a county which does not adjoin it at any point, was maintained up to the reign of Henry III., when the sheriff of Nottingham was by statute appointed also escheator in Rutland.

Rutland was included in the diocese of Lincoln, and in 1291 it became a new rural deanery, within the archdeaconry of Northampton; but on the elevation of Peterborough to an episcopal see by Henry VIII., in 1541, the archdeaconry of Northampton, with the deanery of Rutland, was transferred to that diocese. In 1876 the deanery of Rutland was placed within the newly-founded archdeaconry of Oakham.

The Norman Walkelin de Ferrers was connected with this county, and founded Oakham castle in the 12th century. The castle was subsequently bestowed by Richard II., together with the earldom of Rutland, on Edward, son of Edmund, duke of York. Essendine (Essenden, or Essingdon) was purchased in 1545 by Richard Cecil of Burleigh, and the title of baron of Essenden bestowed on his grandson is retained by the earls of Salisbury. Burley-on-the-hill was held by Henry Despenser, the warlike bishop of Norwich, in the reign of Richard II., and was purchased by George Villiers, duke of Buckingham, who there entertained James I. During the Civil War, Rutland was on the side of the parliament.

The county returned two members to parliament from 1295 until 1885, when the number was reduced to one. It is joined with part of the Kesteven division of Lincolnshire.

Agriculture and Trade.—Rutland has always been mainly an agricultural county. The Domesday survey mentions numerous mills in Rutland, and a fishery at Ayston rendered 325 eels. In the 14th century the county exported wool. Stilton cheese has long been made in Leyfield forest and the vale of Catmose, and limestone is dug in many parts of the county. The development of the economic resources of Rutland was helped in 1793 by the extension of the Melton Mowbray canal to Oakham.

In the east and south-east districts of Rutland the soil is light and shallow, whilst in other districts it is a fertile loam, and in the vale of Catmose the soil is either clay or loam or a mixture of the two. The east part of the county is chiefly under tillage and the west in grass. Over 88% of the whole area, or 85,590 ac., was under cultivation in 1939; of this 26,425 ac. was arable land. Clover and rotation grasses for hay occupied 3,486 acres. The chief crops in 1939 were, in order of acreage occupied: barley, wheat, oats, turnips and swedes, sugar beets and mangolds. Many sheep (Leicesters and Southdowns) and cattle, mainly Shorthorns, were reared. Large quantities of cheese are manufactured and sold as Stilton. Agriculture is practically the only industry of importance, but there is some quarrying and bootmaking. The region producing iron is continued from Northampton into Rutland, and the working of the iron ore forms one of the industries of the county. The main line of the L.N.E. ry. intersects the northeastern corner of the county, and branches of that system, and of the L.M.S., serve the remainder. There were 300 miles of highways in 1941.

Population and Administration.—The area of the ancient and administrative county is 152 sq.mi., with a population of 17,860 (est. 1938). Between Sept. 1939 and Feb. 1940, however, wartime population movements, caused by evacuation and intensified industrial effort, caused an increase of 7%. The county contains five hundreds. Oakham (*q.v.*) is the county town and the only urban district. There are three rural districts. The county is in the Midland circuit, and assizes are held at Oakham. It has one court of quarter sessions, but is not divided for petty sessional purposes. The county is in the diocese of Peterborough.

See *Victoria County History, Rutland*; James Wright, *History and Antiquities of the County of Rutland* (London, 1684); T. Blore, *History and Antiquities of the County of Rutland*, vol. I, pt. 2 (containing the East hundred and including the hundred of Casterton Parva; Stamford, 1811); C. G. Smith, *A Translation of that portion of Domesday Book which relates to Lincolnshire and Rutland* (London, 1870).

RUTLAND, a city of Vermont, U.S., the county seat of Rutland county; on Otter creek, 95 mi. N.E. of Albany (New York). It is on federal highways 4 and 7 and is served by the

Delaware and Hudson and the Rutland railways. Pop. (1950) 17,659; 1940 federal census 17,082. Rutland has a beautiful site, 561 ft. above sea level, encircled by the Green mountains. Twenty peaks can be seen from the city hall, and there are 20 lakes within 20 mi. It is a summer resort and touring center. The famous Rutland marble (used for the memorial in Arlington National cemetery and for many public buildings throughout the country) is quarried in West Rutland and in Proctor (6 mi. N.W.) where there is a large marble display. Some of the underground quarries are 300 ft. below the surface. The manufacturing industries of the city include marble and monument works, and factories making stoneworking machinery, maple-sugar products and utensils and scales. Its morning newspaper, the *Herald*, was established in 1794. Rutland was settled in 1770, and from 1784 to 1804 it was one of the capitals of Vermont. The capitol (1784) is the second oldest building in the state.

The village was incorporated in 1847, and in 1892 a part of the town (including the village) was chartered as a city. Plymouth, a village 30 mi. S.E. of Rutland, was the birthplace of Calvin Coolidge.

RUTLEDGE, JOHN (1730–1800), an American jurist and politician, was born in Charleston (S.C.) in 1730. He studied law in London, and began to practise in Charleston in 1761. He was a delegate to the stamp act Congress in 1765 and to the Continental Congress in 1774–77 and 1782–83; he was chairman of the committee which framed the State Constitution of 1776, and the first "president" (governor) of South Carolina in 1776–78. He resigned in 1778, but was elected governor in the following year, and served until 1782. In the Constitutional Convention of 1787 he urged that the president and the Federal judges be chosen by the national legislature. He was associate justice of the U.S. Supreme Court in 1789–91, and chief justice of the supreme court of South Carolina in 1791–95. Nominated chief justice of the Supreme Court of the U.S. in 1795, he presided during the August term, but the Senate refused to confirm the nomination, apparently because of his opposition to the Jay treaty. He died in Charleston July 23, 1800.

His brother, **EDWARD RUTLEDGE** (1740–1800), a signatory of the Declaration of Independence, was born in Charleston on Nov. 23, 1740. He studied law in his brother's office, and in London in 1769–73, and practised in Charleston. He served in the Continental Congress in 1774–77, and was sent with John Adams and Benjamin Franklin to confer on terms of peace with Lord Howe on Staten Island in Sept. 1776. As captain of artillery and as lieutenant colonel he served against the British in South Carolina. He was a member of the State legislature from 1782 to 1798, and in 1791 drafted the act which abolished primogeniture in South Carolina. From 1798 until his death Jan. 23, 1800, he was governor of South Carolina.

RUTULI, a people of ancient Italy inhabiting Ardea and the district round it on the coast of Latium, at no very great distance from Aricia, and just west of the territory of the Volsci. They are ranked by the form of their name with the Siculi and Apuli (Apuli), probably also with the Itali, whose real Italic name would probably have been Vituli (*see ITALY*). This suggests that they belong to a fairly early stratum of the Indo-European population of Italy.

RUVIGNY, HENRI DE MASSUE, MARQUIS DE, afterwards EARL OF GALWAY (1648–1730), was born in Paris on April 9, 1648, the son of the 1st Marquis de Ruvigny. He saw service under Turenne, who thought very highly of him. He had English connections, and was selected in 1678 by Louis XIV. to carry out the secret negotiations for a compact with Charles II., a mission which he executed with great skill. Succeeding his father as "general of the Huguenots" he refused Louis's offer, at the revocation of the Edict of Nantes, to retain him in that office, and in 1690, having gone into exile with his fellow Huguenots, he entered the service of William III. of England as a major-general, forfeiting thereby his French estates. In July 1691 he distinguished himself at the battle of Aughrim, and in 1692 he was for a time commander-in-chief in Ireland. He was created Viscount Galway and Baron Portlannington, and received a large grant of forfeited

estates in Ireland

In 1693 Ruivigny fought at Neerwinden and was wounded, and in 1694, with the rank of lieutenant-general, he was sent to command a force in English pay which was to assist the duke of Savoy against the French, and at the same time to relieve the distressed Vaudois. But in 1695 the duke changed sides, the Italian peninsula was neutralized, and Galway's force was withdrawn to the Netherlands. From 1697 to 1701, a critical period of Irish history, the Earl of Galway (he was advanced to that rank in 1697) was practically in control of Irish affairs as lord justice of Ireland. After some years spent in retirement, he was appointed in 1704 to command the allied forces in Portugal, a post which he sustained with honour and success until the battle of Almanza in 1707, in which Galway, in spite of care and skill on his own part, was decisively defeated. But he scraped together a fresh army, and, although infirm, served in one more campaign. His last service was rendered in 1715, when he was sent as one of the lords justices to Ireland during the Jacobite insurrection. He died on Sept. 3, 1720.

RUVO DI PUGLIA, a town and episcopal see of Bari, Apulia, Italy, 21 mi. W. of the city of Bari by tramway, 853 ft. above sea-level. Pop. (1936) 24,748 (town), 25,452 (commune). The cathedral, a splendid basilica with a very lofty nave and two aisles, has three apses, a square campanile and a rich façade with three portals. It belongs to the early 13th century. The interior has a fine triforium. Ruvo occupies the site of the ancient Rubi.

RUWENZORI, also known as Rungoro or Kokora, a mountain range of Central Africa, 65 m. long and with a maximum breadth of 30 m., trending a little east of north, lying just north of the equator between lakes Edward and Albert. The range falls steeply on the west to the central African rift-valley traversed by the Semliki, the western head-stream of the Nile, while on the east the fall is somewhat more gradual towards the western Uganda uplands. The upper parts are separated by fairly low passes into six groups of snowy summits, lying a little west of the central line, rising in each case above 15,000 ft. and reaching, in the culminating point of the western group (Mount Stanley), about 16,800 ft.

The origin of the range seems connected with that of the rift-valley on the west. Ruwenzori is a fault block of the Archaean floor of the continent, bounded east and west by lines of fracture, and having a general dip from west to east. A further upheaval produced an ellipsoidal anticline, causing the strata to dip upwards at a high angle. Traces of volcanic action are almost non-existent. Composed in its outer parts of Archaean gneisses and mica-schists offering no great resistance to denudation, in its centre the range consists of much more refractory rocks (amphibolites, diorites, diabases, etc.), to which fact, coupled with the existence of vertical fractures, the persistence and separation of the higher summits is probably due. The snow-clad area does not now extend more than ten miles in any direction; the snow-line is 13,450 ft. but there is evidence of a former extension to as low as 4,600 ft.

The upper region is almost entirely enveloped by day in thick cloud, which descends on the east to about 9,000 ft., and lower still on the west. As a result, the climate is excessively humid, the northern slopes having a rainfall of 200 inches a year giving extremely damp conditions on the mountain. The rivers are raging torrents and have cut deep valleys between the outer spurs. From the innermost recesses between Mounts Stanley, Speke and Baker, the main branches of the Mobuku descend to the east, while the four principal streams on the west unite to form the Butagu, the drainage on both sides ultimately finding its way to the Semliki, either directly or through lakes George and Edward.

The vegetation displays well-marked zones, varying with the altitude; but owing to the lower level to which the cloud descends on the west the limits of the several zones reach a lower level on the west than on the east. They have been defined as follows by Mr. R. B. Woosnam (1907), as follows, the figures in brackets being the upper limit on the east side:—grass (6,500 ft.), forest (8,500), bamboos (10,000), tree heaths (12,500) and lobellias and senecios (14,500), above which is the summit region of snow and

bare rock. The boundaries between the zones merely indicate the levels between which the respective forms are specially characteristic. The forest zone is the best marked, but on the west it merges in part with the low-lying forest of the Semliki valley. Mosses, hepaticae and lichens are prevalent in several of the zones, while bogs, vaccinium and other low-growing plants, are common above the forest zone. Helichrysms are abundant in the zone immediately below the snow. The larger mammals are found chiefly on the lower slopes, but bushbuck, pigs, leopards, monkeys, a hyrax and a serval cat occur at higher altitudes. The birds include kites, buzzards, ravens, sun-birds, touraques, a large swift, and various warblers and other small kinds. The upper limit of human settlement, with cultivation of colocasias and beans, has been placed at 6,700 ft.

In modern times the existence of a snowy range in this part of Africa was first made known by Sir Henry Stanley during the Emin Pasha relief expedition of 1887-89. Stanley named the main mass Ruwenzori, and outlying eastern peaks he called Mt. Gordon Bennett, Mt. Lawson, Mt. Edwin Arnold, etc.—the last named lying north-east of Lake George. Subsequently Stanley's own name was given to the chief summit. One of Stanley's officers, Lieut. Stairs, ascended the western slopes to over 10,000 ft. in 1889, and partial ascents were afterwards made by Dr. Stuhlmann, Mr. Scott-Elliott, Mr. J. E. S. Moore, Sir Harry Johnston, Mr. Douglas Freshfield, and others. Early in 1906 some of the secondary ridges above the snow-line were scaled by Messrs. Grauer, Tegtart and Maddox, and by Dr. Wollaston and other members of the British Museum expedition, while later in the year the duke of Abruzzi led a well-equipped expedition to the upper parts of the range and ascended all the principal snow-clad peaks. The expedition produced for the first time a detailed map of the upper region, and threw much light on the geology and natural history of the range.

RUYSBROEK or **RUYSBROECK**, JAN VAN (1293?-1381?), Dutch mystic, was born at Ruysbroek, near Brussels, in 1293. In 1317 he was ordained priest and became vicar of St. Gudule, Brussels. When 60 years of age he withdrew with a few companions to the monastery of Groenendaal, near Waterloo, giving himself to meditation and mystical writing, and to a full share of the practical tasks of the society. He was known as the "Ecstatic Teacher," and formed a link between the Friends of God and the Brothers of the Common Life, sects which helped to bring about the Reformation. Ruysbroek insisted that "the soul finds God in its own depths," and noted three stages of progress in what he called "the spiritual ladder" of Christian attainment: (1) the active life, (2) the inward life, (3) the contemplative life. He did not teach the fusion of the self in God, but held that at the summit of the ascent the soul still preserves its identity. His works, of which the most important were *De vera contemplatione* and *De septem gradibus amoris*, were published in 1848 at Hanover; also *Reflections from the Mirror of a Mystic* (1906) and *Die Zierde der geistlichen Hochzeit* (1901).

BIBLIOGRAPHY.—A new edition of his works, *Alle de werken van J. van Ruysbroec de Wonderbare*, etc., was published at Bussum in 1912 seq. A translation of his works into French was begun by the Benedictines of St. Paul de Wisques in 1920 seq. The following single works have been translated: *The Book of the Twelve Beguines* (1913); *The Adornment of the Spiritual Marriage*, etc., trans. by C. A. Wynschenck, ed. with introd. and notes by E. Underhill (1916). See also R. M. Jones, *Studies in Mystical Religion*, pp. 308-14 (1909); M. Maeterlinck, *Ruysbroek and the Mystics, with selections from The Adornment of the Spiritual Marriage* (trans. by J. T. Stoddart, 1894); V. Scully, *A Medieval Mystic* (1910); E. Underhill, *Ruys-*

broeck (1915); Wautier d'Assalliers, *Ruyssbroeck l'admirable* (1923, Eng trans 1925).

RUYSDAEL (or RUISDAEL), JACOB VAN (c. 1628-1682), the most celebrated of the Dutch landscapists, was born at Haarlem. It is not known where he studied. His father, Isaack, was a framemaker, who also painted and it is suggested that Jacob studied first under him and that he was then under his uncle Solomon Ruisdael (c. 1600-1670) an able landscapist. The influence of Cornelius Vroom, another Haarlem landscapist, has also been traced in his early work; other authorities make him the pupil of Albert van Everdingen. The earliest date that appears on his paintings and etchings is 1646. Two years later he was admitted a member of the guild of St. Luke in Haarlem; in 1659 he obtained the freedom of the city of Amsterdam, and in 1668 his name appears there as a witness to the marriage of Hobbema. During his lifetime his works were little appreciated, and he seems to have suffered from poverty. In 1682 the sect of the Mennonites obtained his admission into the almshouse of the town, where he died on March 14, 1683.

The works of Ruysdael may be seen in the Louvre and the National Gallery, London, and in the collections at The Hague, Amsterdam, Berlin, and Dresden and Leningrad. His favourite subjects are simple woodland scenes, similar to those of Van Everdingen and Hobbema. He is especially noted as a painter of trees, and his rendering of foliage is characterized by the greatest spirit and precision. His views of distant cities, such as that of Haarlem in the possession of the marquess of Bute, and that of Katwijk in the Glasgow Corporation galleries, clearly indicate the influence of Rembrandt. He frequently paints coast-scenes and sea-pieces, but it is in his rendering of lonely forest glades (such as "The Pool in the Wood" at Leningrad) that we find him at his best. The subjects of certain of his mountain scenes seem to be taken from Norway, and have led to the supposition that he had travelled in that country. We have, however, no record of such a journey, and the works in question are probably merely adaptations from the landscapes of Van Everdingen, whose manner he copied at one period. Otto Beit owns a magnificent view of the "Castle of Benheim" (1653) from which it may be concluded that his wanderings extended to Germany, where he may have made studies for the waterfalls and torrents which appear in many of his pictures. Only a single architectural subject from his brush is known—an admirable interior of the New Church, Amsterdam, in the possession of the marquess of Bute. The prevailing hue of his landscapes is a full rich green, which, however, has darkened with time, while a clear grey tone is characteristic of his sea-pieces. The art of Ruysdael, while it shows little of the scientific knowledge of later landscapists, is sensitive and poetic in sentiment, and direct and skilful in technique. Figures are sparingly introduced into his compositions, and are believed to be from the brush of Adrian Vandevelde, Philip Wouerman, Nikolaas Berchem, Eglon van der Neer, Ostade and Jan Lingelbach.

Unlike the other great Dutch landscape painters, Ruysdael did not aim at a pictorial record of particular scenes, but he carefully thought out and arranged his compositions. He particularly excels in the painting of cloudy skies which are spanned dome-like over the landscape. A romantic and sometimes deeply poetic sentiment is expressed in his work, as in "The Jewish Burial Ground" at Dresden which is regarded as one of the greatest landscapes ever painted. The "Cornfield" and the "Travellers," etchings, are also significant expressions of landscape art.

See Hofstede de Groot, *Catalogue of Dutch Painters* (1912).

RYAN, JOHN DENIS (1864-1933), American capitalist, was born at Hancock, Mich., on Oct. 10, 1864. In 1889 he went to Denver, where he was employed as a salesman of lubricating oils. In 1901 he secured an interest in a bank at Butte. In 1904 he was made manager of the Amalgamated Copper Company in Montana, becoming president in 1908. He had been elected president of the Anaconda Copper Mining Company in 1905, and after the merging of the Amalgamated interests in the Anaconda in 1910 he continued as president of the latter until 1918. He developed large water powers in Montana, and in 1913 electrified the rail-

way between Butte and Anaconda (room.), the success of which led to a wide expansion of railway electrification. During 1917-18 Ryan was an executive of the American Red Cross. He was appointed, in April 1918, head of the aircraft board of the committee of national defence, and in August was appointed second assistant secretary of war and director of air service of the U.S. Army, which position he resigned in November. In 1919 he was elected chairman of the Anaconda Copper Mining Company.

RYAZAN, a region of the Russian S.F.S.R., surrounded by those of Moscow, Ivanovo, Gorky, Penza, Tambov and Tula, and not coinciding with the pre-1917 province of the same name. Area 19,613 sq. mi. Pop. (1939) 2,265,873, mainly Great Russians, with some Tatars, Poles and Jews in the towns. The province is drained by the Oka and its tributaries, the Pronya and Pra, and small lakes are numerous in the wide depression of the Oka. Forests cover about one-fifth of the area, conifers, especially pines, prevailing in the more forested north, and deciduous forest with birch, ash and oak appearing in scattered patches in the south. North of the Oka is gray forest soil of little value for agriculture, but south of that river the fertile black earth of the steppe begins. The climate is extreme, average February temperature 3.2° F., July 67° F., rainfall 16 to 18 in. per annum.

Industries.—The region is essentially agricultural, except for a coal mining belt extending along the railway west from Ryazhsk. Dairying is not much developed, as the land is not suitable for pasture, but grain growing gives a good guarantee for the peasant and the villages are large, averaging 534 inhabitants. There are some collective agricultural artels. The chief crops are rye (50%), oats (10%), millet (11.2%) and potatoes (10%). Buckwheat, grass, hemp and sunflower seed are sown. Orchard fruits, especially apples, and cucumbers, cabbages, onions and other vegetables are cultivated in the valley of the Oka. Sheep, working and milch cattle, horses, pigs and a few goats are bred.

Koustar (peasant) textile industries are widespread, as is the making of leather and felt footwear, and the district was once famous for its lacemaking and leather embroidery. The northern region has small industries of this type, including the making of wooden vessels, sledges and boats, the preparation of pitch and tar and basketwork from the reeds in the marshy northern areas which occupy 6% of the region. The electric plant of Ryazan works on peat fuel from these bog areas, and also on the local coal. Marshy areas near the Oka river have been successfully drained and are now pasture lands.

There is a comparatively good railway net and 57% of the rivers are available for steam navigation; a good deal of transit trade goes on throughout the region.

RYAZAN, chief town of the above region, situated on the elevated right bank of the Trubezh, a mile above its confluence with the Oka in 54° 0' N., 39° 43' E. Pop. (1939) 95,358. A wide prairie dotted with large villages, the bottom of a former lake, spreads out from the base of the crag on which Ryazan stands, and actually has the aspect of an immense lake when it is inundated in the spring. The town manufactures agricultural machinery, boots, shoes and leather goods, and bricks, and has a distilling industry. It is an important trading centre, on a navigable river, with four railways radiating from it and a good main road linking it with Moscow. The Krestovodvzvensk church contains tombs of the princes of the 15th and 16th centuries.

The capital of Ryazan principality was Ryazan—now Old Ryazan, a village close to Spassk, also on the Oka. It is mentioned in annals as early as 1097, but continued to be the chief town of the principality only until the 14th century. In the 11th century one of the Kiev princes founded, on the banks of a small lake, a fort which received the name of Pereyaslav-Ryazanskij. In 1294 (or in 1335) the bishop of Murom, compelled to leave his own town, settled in Pereyaslav-Ryazanskij. The princes of Ryazan followed his example, and by and by completely abandoned the old republican town of Ryazan. In 1300 a congress of Russian princes was held there, and in the following year the town was taken by the Moscow prince. It continued, however, to be the residence of the Ryazan princes until 1517.

RYAZHSK, a town and railway junction in Ryazan region, Russian S.F.S.R., S. of Ryazan, in $53^{\circ} 42' N$, $40^{\circ} 3' E$, on the Krupta river. Pop. 16,164. It is a grain collecting centre with an elevator, and manufactures *makhorka* tobacco and spirits.

RYBINSK, a town in Yaroslavl region, Russian S.F.S.R., in $58^{\circ} 3' N$, $38^{\circ} 47' E$, on the navigable Volga, opposite the mouth of the Sheksna, which connects the Volga system with Lake Ladoga. Pop. (1939) 139,011. There goods are transhipped from the large Volga boats to the smaller ones of the Marii system linking with Leningrad. There are ship yards, wire-drawing mills, nail, metal and match factories, flourmills, leather works and a brewery.

(2) A small settlement of Asiatic Russia on a left bank tributary of the Irtysh in $56^{\circ} 5' N$, $72^{\circ} 30' E$.

(3) A small town of Asiatic Russia south of the trans-Siberian railway, lying between Krasnoyarsk and Kansk, in $55^{\circ} 55' N$, $94^{\circ} 54' E$.

RYDBERG, ABRAHAM VIKTOR (1828–1895), Swedish author and publicist, was born in Jönköping on Dec. 18, 1828. In 1855 he joined the staff of the *Göteborgs Handels-och sjöfartstidning*, in which his romances successively appeared; he was editorially connected with it until 1876. *The Freebooter on the Baltic* (1857) and *The Last of the Athenians* (1859) gave Rydberg a place in the front rank of contemporary novelists. It was a surprise to his admirers to see him presently turn to theology, but with *The Bible's Teaching about Christ* (1862), in which the aspects of modern Biblical criticism were first placed before Swedish readers, he enjoyed a vast success. He was not elected to the Swedish Academy until 1877, when he had long been the first living author of Sweden. *Roman Days* is a series of archaeological essays on Italy (1876). He collected his poems in 1882; his version of *Faust* dates from 1876. In 1884 he was appointed professor of ecclesiastical history at Stockholm. He died, after a short illness, on Sept. 22, 1895. Rydberg was an idealist of the Romantic type which Sweden had known for three-quarters of a century; he was the last of that race, and, as a writer, perhaps the greatest.

See C. Warburg, *Victor Rydberg, hans levnad och diktning* (1913); L. Lundh, *Victor Rydberg* (Stockholm, 1918); V. Svanberg, *Rydbergs Singskåla* (Uppsala, 1923).

RYDBERG, PER AXEL (1860–1931), American botanist, was born at Odh, Sweden, on July 6, 1860. He graduated at the gymnasium in Skara, in 1881, and soon after went to the United States, where he continued further study at the University of Nebraska (B.S., 1891; M.S., 1895) and at Columbia (Ph.D., 1898). In the period 1884–98 he also taught natural sciences in several Swedish-American institutions, and during summers in 1891–96 he was field agent for the divisions of botany and agrostology of the U.S. Department of Agriculture. In 1899 he was made curator at the New York Botanical Garden. He made extensive taxonomic studies of the seed-plants of the Great Plains and the Rocky Mountain region.

He published *Catalogue of the Flora of Montana and the Yellowstone National Park* (1900), *Flora of Colorado* (1906), *Flora of the Rocky Mountains and Adjacent Plains* (1917; 2nd ed. 1922). He also wrote monographs on Saxifragaceae, Rosaceae, Carduaceae and other plant groups, and various contributions to botanical journals.

RYDE, a municipal borough and watering place in the Isle of Wight, England, 5 mi. S.W. of Portsmouth. Pop. (1951) 20,684. Beautifully situated on rising ground on the northeast coast, overlooking Spithead, it is on the site of a village called La Rye or La Riche, which was destroyed by the French in the reign of Edward II. At the close of the 18th century it was a small fishing hamlet, but it rapidly grew as a watering-place. Ryde is connected by rail with the other towns in the island, and also by boat with Portsmouth, Southampton, Southsea, Portsea and Stoke's bay. The pier is half a mile in length. The principal buildings are All Saints church, the market house and town hall, the Royal Victoria Yacht club-house, the pavilion and the Royal Isle of Wight Infirmary. There are golf links near the town. The town was incorporated in 1868. Area, 12.3 sq. mi.

RYDER, ALBERT PINKHAM (1847–1917), American artist, was born at New Bedford, Mass., on March 19, 1847. He

was a pupil of William E. Marshall and of the schools of the National Academy of Design. Among his better known paintings are: "Temple of the Mind," "Jonah and the Whale," "Christ appearing unto Mary," "The Flying Dutchman," "Charity" and "The Little Maid of Arcadia." He became a member of the Society of American Artists in 1878, and a National Academician in 1906. He died at Elmhurst, Long Island, N.Y., on March 28, 1917. In 1918 the Metropolitan Museum held a memorial exhibit of his work.

RYE, a market town and municipal borough in the Rye parliamentary division of Sussex, England, 11 mi. E.N.E. from Hastings, on the S.R. Pop. (1951) 4,511. Area, 16 sq. mi. In early times Rye (La Rye, Ric) was a fishing village and, as part of the manor of "Rameslie" was granted by Cnut to the abbot and convent of Fécamp, by whom it was retained until Henry III resumed it in 1247, when that part outside the liberty of the town, and therefore known as Rye Foreign, was probably joined to the abbey's manor of Brede. The town had become attached to the Cinque Port of Hastings by the time of Henry II, but the fluctuations of the sea and attacks of the French caused its decline in the 13th and 14th centuries, and the walls were built during the reign of Edward III. The decay of Winchelsea contributed to the partial revival of Rye in the 15th and 16th centuries, when it was a chief port of passage. Towards the end of the 16th century the decay of the port began, and notwithstanding frequent attempts to improve the harbour it never recovered its ancient prosperity. By the end of the 13th century Rye seems to have become a borough, with mayor, barons and bailiffs but it possesses no charter distinct from the Cinque Ports. As a member of the Cinque Ports it sent representatives to the parliament of 1265, and two members were returned from 1366 until 1832, when, jointly with Winchelsea, it returned one member until 1885. In 1290 Rye was granted a three days' fair in September altered in 1305 to March. Weekly markets on Wednesday and Friday were evidently held before 1405, as in that year the Friday market was changed to Saturday. Shipbuilding began here as early as the 13th century and is still carried on. The town is situated above the south of Romney marsh, which within historic times was an inlet of the English Channel. The sea began to recede in the 16th century, and now the river Rother forms a small estuary with its mouth 2 mi. from the town; this serves as a small harbour with a depth of 10 ft. at high tide. Fishing is the principal trade and there is a market for sheep, wool, grain and hops.

RYE, a city of Westchester county, New York, U.S., on Long Island sound, 24 mi. N.E. of New York city; served by the New York, New Haven and Hartford and electric railways. Pop. 11,721, 1950 federal census. It is a residential city with several yacht and country clubs and a number of 18th century houses. The municipal hall is an old inn (Haviland) where Washington and Lafayette were entertained. "Kirby's tide-mill," built before the Revolution, still stands. Rye was the home of John Jay, and his grave is there in the family burying ground. At Rye beach there is a seaside playground of 214 ac. owned and operated by the county. The village was incorporated in 1904, the city in 1942.

RYE. This cereal, known botanically as *Secale cereale*, is of less importance than any of the grain crops. While generally distributed over the world, rye is of major importance only on the poorer soils of the northern hemisphere.

The spike of the rye plant consists of alternately ranked spikelets attached to a rachis forming a fairly dense head or "ear." The spikelets are composed of two thin and narrow glumes that enclose two or more florets. Each of the florets consists of a lemma and palea which enclose a pistil and three stamens. The number of fertile florets depends a great deal upon the soil fertility and growth conditions. The lemmas taper into awns of about two to four centimetres in length. The ovary develops after pollination into a long one-seeded fruit known botanically as a caryopsis. The outer colour of the caryopsis varies, but grayish-green and light brown grains predominate. Some of the grains are almost white. Upon threshing, kernels are freed from the enclos-

ing lemma and palea. Sterile florets occur to the extent of 25% to 30% in field grown rye and this is enough to reduce yields. Cross-pollination occurs nearly 100% because the flowers are largely self-sterile. The leaves are long, narrow and thin. The first foliage is reddish or purplish brown. The ligule is short and the auricles are only moderate in size. The growing culms have a bluish-green bloom, and the height and number of culms depend upon growth conditions. Rye has the tallest and strongest straw of all of the small grain crops. Because the straw may attain a height of 7 to 8 ft. on fertile soils, harvesting is accomplished with difficulty. There are numerous fibrous roots, and they penetrate downward more deeply than in other small grains.

Rye probably originated in southwestern Asia, like several other important genera such as *Triticum*, *Avena* and *Hordeum*. The exact progenitor is not known, though some think that the brittle rachis type, *Secale fragile*, may be the correct ancestor. Early cultivation was likely in western Asia.

Volunteer *Secale montanum*, a plant some authors think is the progenitor of common rye, has been seen growing thickly near Tashkent in Turkestan. No traces of cultivated rye have been found in early Egyptian monuments, and likewise ancient writings contain no reference to this crop. However, the name occurs in northern European languages and this suggests early cultivation in this area.

Only one species of cultivated rye is recognized, *Secale cereale*, although several other species have been found growing wild. This plant has seven chromosomes in the haploid stage, and there is no evidence of a polyploid series which is characteristic of wheat and other small-grained cereals. Most rye is grown as a fall-sown annual, though a small amount is spring-sown with spring instead of winter varieties.

Rye grows primarily in the temperate and cool regions of the world and up to altitudes of 14,000 ft. Possessing the greatest winterhardiness of all small grains, rye culture extends to the more northerly parts of North America, Europe and Asia as far north as the Arctic circle. This crop ripens earliest of all the small grains, usually about a week earlier than winter wheat. Even though it is grown in warmer parts of the United States and southern Europe the cooler areas have much greater production. The type of soil has an important influence on geographic distribution. Usually rye is grown on the poorer non-chernozem soils of Europe and Russia. Sandier and poorer soils are used in the United States.

Rye culture follows the conventional methods used for other small grains. The crop may be drilled or sown broadcast at the rate of about six pecks per acre.

Rye is not used to any great extent as a nurse crop in establishing forage crops. Soil requirements are modest—even more so than for oats. Rye will produce well on fertile soils, but these types of soils are reserved for growing other crops. In certain areas where other crops fail to produce satisfactory yields because of low soil fertility, rye is often grown. It is frequently rotated with other crops, although it is grown continuously in certain areas. Seeding time is usually in the early fall and harvesting is done mostly in June and July in the northern hemisphere.

As a grain crop rye has two main uses, for breadmaking and for livestock feed. In making rye bread, various proportions of wheat flour may be used because the gluten of rye is less elastic than that of wheat. Rye stands next to wheat in use for milling and baking loaf bread. This type of bread is darker in colour and usually heavier than wheat bread. It is frequently referred to as black bread in Russian and central European areas, where considerable quantities are consumed. In the United States it is of minor importance except where there are concentrations of racial stocks that consume large quantities of rye flour.

Livestock feed is one of the main uses of the rye crop. For most classes of livestock it is usually fed in mixtures of other feeds. It has less fats than has wheat, about the same protein content, and is about the highest in carbohydrates of all the cereal crops. Vitamin B₁ content is slightly lower than in barley and wheat, and much lower than in oats. Rye is used also in the making of alcoholic beverages.

Rye straw is fibrous and tough and, therefore, is of less use as a feed than as litter or bedding. The straw is used for thatching in certain areas of the world, and also in the manufacture of hats, paper, saddles and horse collars.

Rye has considerable use for fall and spring cattle grazing. As a spring pasture it is available before permanent pastures have made sufficient growth for grazing livestock. The leaves are high in vitamin A content. In warmer areas rye is used for fall grazing and cover cropping. It is also used as a green manure crop, being plowed under in the spring and followed by a crop of greater economic value.

Ergot is one of the by-products of rye used in medicinal preparations. Ergot is caused from ovary infection by the fungus *Claviceps purpurea*. The developing young kernel is penetrated by the fungus and produces a large bluish-brown body called a sclerotium. Ergot sclerotia contain pharmaceutical compounds such as ergosterol, ergotoxin, ergotamin, ergostriene, ergoclarin, etc. Ergot fed in large quantities may cause abortion.

Other diseases attack rye; but most of them cause only minor yield reduction. There are many leaf and stem diseases, such as leaf and stem rust, stalk and head smut, scald and blotch, and some root rots. On the whole, if ergot is omitted, disease losses in rye are less than in other small grains.

Improvement of the rye plant by breeding is difficult because of the high degree of self-sterility. Most improvement can be attributed to the mass selection method of breeding rather than the pure line method. Because of the necessity of cross-pollination, varieties are genetically impure. Inbred lines have been produced and their fertility raised to a point where they can be perpetuated without difficulty. Certain crosses between selected inbred lines are known to exhibit hybrid vigor and greater productivity than open-pollinated varieties. No method has been found to utilize this biologic principle. Since rye is thrifty and winter-hardy it has been hybridized with wheat; in some cases the more winter-hardy types of selections having wheat quality have been developed. However, the amount of wheat-rye hybrids in commercial production is rather small.

In the United States the following varieties of rye have been grown to a considerable extent: Schlanstedt, Petkus, Swedish, Dakold, Imperial, Raritan, Rosen and Abruzzese. Some exceptional characteristics are the winter-hardiness of Dakold, and the white kernels of Imperial. Most of these varieties have come from stocks of European and Russian origin.

In other countries some important varieties not already mentioned are Aland, Azov, Abyssinian, Erzerum, Hanna, Ivanov, Probstetier and Russian Giant.

Production and Trade.—World production of rye averages about 1,500,000,000 to 1,800,000,000 bushels. Of the total, Russian and European production ordinarily account for perhaps more than 90%. Russian production alone is about half that of the world. Other important growers are Germany and Poland. The United States grew about 57,000,000 bushels in 1942. Countries of still lesser importance in planting rye are Hungary and France. The frequent low yield—about 12 bushels per acre—is partly due to the fact that rye is grown on poorer soils. The leading states for production in the United States are North Dakota, Minnesota, South Dakota and Nebraska.

Trade in rye has always been rather limited when compared with other grains.

International Trade in Rye, 1938

Country	Exports 1,000 bu.	Imports 1,000 bu.
Poland	17,603	3
Canada	1,121	14
Argentina	2,983	0
Germany	6	5,712
Denmark	463	2,760
Norway	0	4,951
Czechoslovakia	237	2,173
Netherlands	2,093	2,982
Belgium	455	1,282

From 1925 to 1930 the United States, U.S.S.R., Germany, Poland, Hungary and Argentina were the major exporters of rye, with German imports almost as much as exports.

From 1930 to 1935 the United States, Germany, Denmark and the Netherlands were the largest importers.

Belgium was the leading importer of rye in 1938

(H. L. Ss.)

RYKOV, ALEXEI IVANOVICH (1881-1938), Russian politician, was born in Saratov, the son of a peasant. Saratov was a place of banishment for revolutionaries, and Rykov came under their influence. When he went to Kazan he was already taking part in social democratic organizations. He was imprisoned and sent back to Saratov to remain under police supervision. Continuing his revolutionary work he was rearrested, but escaped abroad before his trial. He visited Lenin at Geneva, and returned to Russia as a propagandist in various industrial districts. In 1904 he was in Moscow, and in 1905 attended a congress of the Communist party which elected him a member of the party's central committee. On returning from the congress he was arrested in St. Petersburg (Leningrad). He was freed by the revolution of 1905, was a representative of the Bolsheviks in the St. Petersburg workmen's soviet and escaped from the capital when the soviet was arrested. He took part in the December revolt and the fighting on the barricades in Moscow, escaped to Odessa after the failure of that revolt, but presently was again working in Moscow, where he was arrested, but once more succeeded in escaping.

In 1907 he was arrested and banished to Samara, but went abroad to visit Lenin. He was arrested on returning and exiled to the province of Archangel for three years. He escaped shortly before the end of his term of exile, and went to Paris. He returned to Russia to organize a congress, was arrested in 1911 and remained in prison till 1913, when in October he was sentenced to exile to the Naryn district for four years. In 1915 he escaped, went to Samara, was recaptured and sent back to the Naryn district, where he remained until the revolution of 1917, after which he worked in the Moscow Bolshevik organization. He was active in the November revolution, became president of the supreme economic council, and succeeded Lenin as president of the council of people's commissars. After 1929 his influence waned. Expelled in March 1937, he was shot following a trial in March 1938.

RYLANDS, JOHN (1801-1888), English manufacturer and merchant, was born at St. Helens, Lancashire, on Feb. 7, 1801, and was educated at the grammar school in that town. In 1819 he, his elder brothers and his father, a manufacturer of cotton goods, founded the firm of Rylands and Sons, cotton goods and linen manufacturers, at Wigan. The business rapidly increased, dye-works and bleach-works were added, and the discovery of coal under some of the firm's property added materially to its wealth. In 1825 the partners became merchants as well as manufacturers, and subsequently acquired spinning mills at Bolton and elsewhere. In 1847, his father being dead and his brothers having retired, John Rylands assumed entire control of the business, which in 1873 was turned into a limited liability company. John Rylands was a benefactor to various charities, and was one of the original financiers of the Manchester Ship canal. He died at Stretford on Dec. 11, 1888. A permanent memorial, the John Rylands Library, was erected by his widow in Manchester in 1899.

RYLANDS, SIR (WILLIAM) PETER (1868-1948), English industrialist, was born on Oct. 23, 1868, and educated at Charterhouse and at Trinity college, Cambridge. He studied law and was called to the bar in 1894, but four years later became managing director of Rylands Brothers. In 1900 he was made president of the Iron and Steel Wire Manufacturers association, retaining this post for almost a half century. After World War I he became president of the Federation of British Industries (1919-21), the Iron and Steel Institute (1926-27) and the National Federation of Iron and Steel Manufacturers (1930). In 1935-36 he was high sheriff of Cheshire.

He was knighted in 1921, created baronet in 1939 and was a commander of the Royal Order of Vasa. He died at Thelwall, Cheshire, England on Oct. 22, 1948.

RYMER, THOMAS (1641-1713), English historiographer royal, was the younger son of Ralph Rymer, lord of the manor of Brafferton in Yorkshire, executed for his share in the "Presbyterian rising" of 1663. Thomas was probably born at Yafforth Hall early in 1641, and was educated at a private school kept at Danby-Wishe by Thomas Smelt, a noted Royalist, and at Sidney Sussex college, Cambridge. He left the university without taking a degree. On May 2, 1666, he became a member of Gray's Inn, and was called to the bar on June 16, 1673. Rymer executed translations, wrote plays, prefaces and complimentary pieces. In 1692 Rymer became historiographer royal.

Within eight months of his official appointment Rymer was directed (Aug. 26, 1693) to carry out that great national undertaking with which his name will always be honourably connected, and of which there is reason to believe that Lords Somers and Halifax were the original promoters. The *Codex Juris Gentium Diplomaticus* (1693) of Leibniz was taken by the editor as the model of the *Foedera*. The plan was to publish all records of alliances and other transactions in which England was concerned with foreign powers from 1101 to the time of publication, limiting the collection to original documents in the royal archives and the great national libraries. Unfortunately, this was not uniformly carried out, and the work contains some extracts from printed chronicles. From 1694 Rymer corresponded with Leibniz, by whom he was greatly influenced with respect to the plan and formation of the *Foedera*. While collecting materials, Rymer unwisely engraved a spurious charter of King Malcolm, acknowledging that Scotland was held in homage from Edward the Confessor. When this came to be known the Scottish antiquaries were extremely indignant, and a controversy arose, the documents in which are now rare and valuable.

At last, on Nov. 20, 1704, was issued the first folio volume of the *Foedera, Conventiones, Litterae et consensuum generis Acta Publica inter reges Angliae et alios quorundam imperatores, reges, etc.*, ab A.D. 1101 ad nostra usque tempora habita aut tractata. The publication proceeded with rapidity, and 15 volumes were brought out in nine years. Rymer died after the appearance of the last volume, but he had prepared materials for carrying the work down to the end of the reign of James I. These were placed in the hands of Robert Sanderson, his assistant, who produced the remaining five volumes (1715-17 and 1726-35).

Rymer died at Aundel Street, Strand, on Dec. 14, 1713, and was buried in the church of St. Clement Danes. His will was dated July 10, 1713.

In 1810 the Record Commissioners authorized Dr. Adam Clarke to prepare a new and improved edition of the *Foedera*. Six parts, large folio, edited by Clarke, Caley and Holbrooks, were published between 1816 and 1830. Considerable additions were made, but the editing was performed in so unsatisfactory a manner that the publication was suspended in the middle of printing a seventh part. The latter portion, bringing the work down to 1383, was ultimately issued in 1869. A general introduction to the *Foedera* was issued by the Record Commission in 1817, 4to.

The best account of Rymer is to be found in the prefaces to Sir T. D. Hardy's *Syllabus* (1869-85, 3 vols. 8vo).

RYNCHOPIDAE: see SKIMMER.

RYOT or RAYAT, properly a subject, then a tenant of the soil (from the Arabic *ra'a*, "to pasture"). The word is used throughout India for the general body of cultivators; but it has a special meaning in different provinces. The *ryotwari* tenure is one of the two main revenue systems in India. Where the land revenue is imposed on an individual or community owning an estate, and occupying a position analogous to that of a landlord, the assessment is known as *zamindari*; and where the land revenue is imposed on individuals who are the actual occupants, the assessment is known as *ryotwari*. (See ZAMINDAR.)

RYSWICK, TREATY OF, the treaty of peace which in 1697 ended the war which had begun in 1689 between France on the one side and the Empire, England, Spain and Holland on the other (see GRAND ALLIANCE, WAR OF THE). The treaty was signed by all the Powers concerned except the Empire on Sept. 20, 1697, a treaty being concluded between France and the Emperor on Oct. 30.

The basis of the peace was that all towns and districts seized

since the treaty of Nijmegen in 1679 should be restored. Thus France surrendered Freiburg, Breisach and Philippsburg to Germany, although she kept Strasbourg. On the other hand, she regained Pondicherry and Nova Scotia, while Spain recovered Catalonia, and the barrier fortresses of Mons, Luxemburg and Courtrai. The duchy of Lorraine, which for many years had been in the possession of France, was restored to Leopold Joseph, a son of duke Charles V., and the Dutch were to be allowed to garrison some of the chief fortresses in the Netherlands, including Namur and Ypres. Louis undertook to recognize William as king of England, and promised to give no further assistance to James II.; he abandoned his interference in the electorate of Cologne and also the claim which he had put forward to some of the lands of the Rhenish palatinate.

RYÜKYŪ ARCHIPELAGO (called also **LUCHU**), a long chain of islands forming Okinawa prefecture of Japan, stretching from a point 80 mi. S. of Kyushu to a point 73 mi. from the N.E. coast of Formosa, and lying between 24° and 30° N. and 123° and 130° E. Japanese cartographers reckon the Luchu islands as 55, having a total coastline of 768 mi., an area of 935 sq.mi., and a population (1940) of 574,579. They divide them into three main groups, of which the northern is called Oshima-shoto; the central, Okinawa-gunto; and the southern, Sakishima-shoto. The terms *shoto*, *gunto* and *retto* signify "archipelago," "cluster of islands" and "string of islands" respectively. The last-named group is subdivided into Miyako-gunto and Yagayama-gunto.

Almost at the extreme north of the chain are two islands with active volcanoes; Nakano-shima (3,485 ft.) and Suwanose-shima (2,697 ft.), but the remaining members of the group give no volcanic indications, and the only other mountain of any size is Yawan-dake (2,499 ft.) in Amami-Oshima. The capital is Shuri in Okinawa, with a picturesque castle. The more modern town of Naha, on the same island, possesses the principal harbour and has considerable trade.

Though so close to the tropics, the islands cannot be said to present tropical features: the bamboo is rare; there is no high grass or tangled undergrowth; open plains are numerous; the trees are not crowded together; lakes are wanting; the rivers are insignificant; and an unusual aspect is imparted to the scenery by numerous coral crags. The temperature in Naha ranges from a mean of 82° F. in July to 60° in January.

The fauna includes wild boars and deer, rats and bats. Excellent small ponies are kept, together with cattle, pigs and goats. The majority of the islands are infested with venomous snakes called *habu* (*Trimeresurus*), which attain a length of 6 to 7 ft. and a diameter of from 2½ to 3 in. Their bite generally causes speedy death, and in the island of Amami-Oshima they claim many victims every year. The most important cultivated plant is the sugar-cane, which provides the principal staple of trade.

Luchu is noted for the production of particularly durable vermilion-coloured lacquer, which is much esteemed for table utensils in Japan. The islands also manufacture fabrics.

People.—Although the upper classes in Luchu and China closely resemble each other, there are palpable differences between the lower classes, the Luchuan being shorter and better proportioned than the Japanese; having higher foreheads, eyes not so deeply set, faces less flattened, arched and thicker eyebrows, better noses, less marked cheek-bones and much greater hairiness. The last characteristic has been attributed to the presence of Ainu blood, and has suggested a theory that when the Japanese race entered south-western Japan from Korea, they drove the Ainu northwards and southwards, one portion of the latter finding their way to Luchu, the other to Yezo. Women of the upper class never appear in public in Luchu, and are not even alluded to in conversation,

but women of the lower orders go about freely with uncovered faces. The Luchu costume resembles that of Japan. The chief staple of the people's diet is the sweet potato, and pork is the principal luxury. An ancient law, still in force, requires each family to keep four pigs. In times of scarcity a species of sago (obtained from the *Cycas revoluta*) is eaten.

History.—Tsinshih, "Grandson of Heaven," is the mythical founder of the Luchu monarchy. Towards the close of the 12th century his descendants were driven from the throne, but the old national party soon found a victorious leader in Shunten, son of Tametomo, a member of the famous Minamoto family, who, having been expelled from Japan, had come to Luchu and married there. The introduction of the arts of reading and writing are assigned to Shunten's reign. Chinese invasions of Luchu were traced back to A.D. 605, but they did not result in annexation; and it was in 1372 that China first obtained from the Luchuan recognition of supremacy. Luchuan relations with Japan had long been friendly, but at the end of the 16th century the king refused Japan assistance against Korea, and in 1609 the prince of Satsuma invaded the islands with 3,000 men, took the capital by storm, captured the king and carried him off to Kagoshima. A few years later he was restored to his throne on condition of acknowledging Japanese suzerainty and paying tribute. The Luchuan nevertheless continued to pay tribute to China also.

The Chinese government, however, though taking a benevolent interest in the welfare of the islanders, never attempted to bring them under military sway. The incongruity of this state of affairs did not force itself upon Japan's attention so long as her own empire was divided into a number of semi-independent principalities. But in 1879 the Japanese government, treating Luchu as an integral part of the mikado's dominions, dethroned its prince, pensioned him as the other feudal chiefs had been pensioned, and converted Luchu into a prefecture under the name of Okinawa. China remonstrating, a conference was held in Peking, when plenipotentiaries of the two empires signed an agreement to the effect that the archipelago should be divided equally between the claimants. The Chinese government, however, refused to ratify this compromise, and the Japanese continued their measures for the effective administration of all the islands. Ultimately (1895) Formosa also came into Japan's possession, and her title to the whole chain of islands ceased to be disputed.

RZESZÓW, a town of Poland, in the province of Lwow, situated on the river Wisłok, half-way between Lwow and Cracow. Pop. (1931), 27,499. It was founded by Casimir the Great and became the seat of a great family, taking their name from the town and dying out in 1583. The old church shows traces of the original structure built by King Casimir in the 14th century. Ordinarily it is a prosperous town in an agricultural and pastoral district. It was captured by Germany in Sept. 1939.

RZHEV or RZHOV, a town in the Kalinin region of the Russian S.F.S.R., in 56° 20' N., 34° 19' E., lying on both sides of the Volga river, here 350 ft. wide, and navigable for steamers. It is a centre for four branch railway lines and a telegraph line, and has a radio station. Pop. (1939) 54,081, mainly employed in saw-milling, leather work, oil pressing, silk spinning, distilling, brewing and the making of machinery. In the 12th century it was part of the principality of Smolensk, which from 1225 was a dependency of Novgorod. In the 15th century the parts of the town on the left and right banks of the river were governed separately under the rule of independent princes.

STHIS letter corresponds to the Semitic **W** (*sin*). The Greek treatment of the sibilants that occur in the Semitic alphabet is somewhat complicated. Semitic **𐤅** (*samech*) appears in Greek as **Ξ** (*hsi*) with the value in early times of *ss*, later and more generally of *s* or *ks*. The name *samech*, however, which through its Aramean form became in Greek *sigma*, was applied to the letter **Σ** which corresponded to Semitic **W** (*sin*) and stood for *s*. In certain Greek alphabets the letter was called by the name *san*. Semitic *ssade* appears in the early alphabets of Thera and Corinth in the form **Μ** representing *s*. These alphabets have no *sigma*, while those that have *sigma* do not have **Μ**.

Greek forms of the letter were **Σ**, **Ϻ**, **ϣ**, **ϛ**. The rounded form appears in the Chalcidic alphabet and from this it was taken

occurs, the left hand oblique stroke being really part of a ligature with a preceding letter.

The letter represents an unvoiced fricative. This has become voiced in English when intervocalic (e.g., *houses*, *nose*). In most other positions it remains unvoiced (e.g., *sing*, *save*, *stamp*, *speak*, *aspect*). When doubled the letter represents the unvoiced sound in all positions (e.g., *grasses*, *miss*, *assess*). (B. F. C. A.)

SAADIA, BEN JOSEPH (892-942): see **SEADIAI**.

SAALE, a river of Germany, a tributary of the Elbe, 226 m. long, rises between Bayreuth and Hof in the Fichtelgebirge. It joins the Elbe just above Barby. It is navigable from Naumburg, 100 m., with the help of sluices, and is connected with the Elster near Leipzig by a canal. Its chief affluents are the Elster, Regnitz and Orla (right), and the Ilm, Unstrut, Salza, Wipper and Bode (left). Its upper course is rapid. It is sometimes called the Thuringian or Saxon Saale, to distinguish it from another Saale (70 m. long), a right-bank tributary of the Main.

SAALFELD, a town of Germany, in the *Land* of Thuringia, situated on the left bank of the Saale, 24 m. S. of Weimar and 77 S.W. of Leipzig by rail. Pop. (1939) 23,325. Saalfeld grew up around the abbey founded in 1075 by Anno, archbishop of Cologne, and the palace built up by the emperor Frederick I. In 1389 it was purchased by the landgrave of Thuringia, and with this district it formed part of Saxony. In 1680 it became the capital of a separate duchy, but in 1699 it was united with Saxe-Coburg, passing to Saxe-Meiningen in 1826. One of the most ancient towns in Thuringia, Saalfeld is still partly surrounded by old walls and bastions, and contains some interesting mediaeval buildings, among them a palace, built in 1679 on the site of the Benedictine abbey of St. Peter, which was destroyed during the Peasants' War; the Gothic church of St. John, dating from the beginning of the 13th century; the Gothic town hall, completed in 1537; the Kitzerstein, a palace standing on an eminence above the river, probably first erected by the German king Henry I., although the present building is not older than the 16th century; and the ruin of the Hoher Schwarm, called later the Sorbenburg, said to have been erected in the 7th century. Saalfeld has a number of prosperous industries, and there are ochre and iron mines in the neighbourhood.

SAAR, a right-bank tributary of the Moselle. It rises in the Donon, an eminence of the Vosges, and flows generally northward through the Saar coalfield to its junction with the Moselle at Konz. The principal towns on the Saar are Saarguemines, Saarbrücken and St. Johann, Saarlouis and Saarburg. The river is navigable up to Saarguemines, a distance of 75 m., where there is connection with the Rhine-Marne canal.

SAARBRÜCKEN, a town in the Saarland (*q.v.*), on the Saar, 49 mi. by rail N.E. of Metz. Pop. (1950) 105,391. Saarbrücken owes its name to a bridge which existed in Roman times. Its early lords were the bishops of Metz, the counts of

THE DEVELOPMENT OF THE LETTER "S" FROM THE PHOENICIAN, THROUGH THE CLASSICAL, DOWN TO MODERN TIMES

into Latin. Etruscan had no rounded form, but it appears in Umbrian and Faliscan. In Latin cursive writing of the 6th century the form was **Ϻ**, and from this descended the Irish and Saxon forms **f**. The Carolingian form on the other hand was extended above the line instead of below, e.g., **f**. In England in the 17th century the form was **f** and this is occasionally still seen in handwriting when followed by another *s*. The form **ſ** also

the lower Saargau, and the counts of the Ardennes. From 1381 to 1793 it belonged to the counts of Nassau-Saarbrücken, and then, after having been in the possession of France from 1801 to 1815, it passed to Prussia. St. Johann, Malstatt-Burbach and Saarbrücken were united in 1909. The trade of Saarbrücken is chiefly connected with coal, iron and glass. The coal fields extend more than 70 sq. mi. Saarbrücken was heavily bombed during World War II.

SAARBURG, in Alsace-Lorraine: see SARREBOURG.

SAAREMAA (formerly ÖSEL), an island of Estonia, lying in the Baltic sea across the mouth of the Gulf of Riga. Pop. (1934) 55,851. It has a length of 45 mi., and an area of 1,010 sq. mi. The chief town, Arensburg, on the south coast, is the place of 4,339 inhabitants (1938), with summer sea bathing and mud baths. In 1227 Ösel was conquered by the Knights of the Sword, and was governed by its own bishops till 1561 when it passed into the hands of the Danes. By them it was surrendered to the Swedes in 1645. Along with Livonia, it was united to Russia in 1721, passing to Estonia in 1918. In 1940 soviet Russia took possession, and Germany conquered it in 1941.

SAARGEMUND: see SARREGEUMINES.

SAARLAND, an industrial and mining region on the Franco-German frontier, north of Lorraine, near the iron ore of Briey. Area 991 sq. mi.; pop. (1939) 863,726 (est. pop. 1949, 926,000). Chief town, Arensburg, pop. (1939) 135,080 (est. pop. 1950, 105,391). The basic industry is coal, good for industrial purposes and gas production and moderate for coke.

The Saar is largely dependent on imports for certain commodities (including food supplies). Bombing during World War II destroyed 76,000 buildings.

History.—For more than a millennium the inhabitants of France and Germany struggled for the zone to which the Saar belongs. The treaty of Versailles (q.v.) stipulated that as compensation for the destruction of the coal mines in northern France, and as part payment toward the reparation due from Germany, the latter had to cede to France the Saar coal mines. Germany had to renounce the government of the Saar territory in favour of the League of Nations, in the capacity as trustee. At the end of 15 yr. a plebiscite was to be held and the inhabitants were to indicate the sovereignty under which they desired to be placed. In the event of a union of the territory with Germany, France's rights of ownership in the mines were to be repurchased by Germany at a price payable in gold, to be fixed by three experts. Some stipulations of the treaty were designed to guarantee France complete freedom in working the mines, while others attempted to assure the rights and welfare of the population. The Saarlanders retained, for example, their local assemblies, religious liberties, schools, language and nationality. A local *gendarmierie* was to maintain order. The territory was to be subjected to the French customs regime; but certain receipts from customs duties were to be included in the local budget. A governing commission was to consist of five members chosen by the council of the League and was to include one citizen of France, one native of the Saar (non-French) and three members belonging to three countries other than France and Germany. Though in some respects an executive body, this commission had broad legislative powers. It had merely to hear an electoral assembly before introducing a new tax measure; the opinion of the representatives was not binding. In making the Saar government an object of international responsibility annexationist tendencies had been checked.

From 1918-23 the Saar, nevertheless, was an object of French expansionism. French troops occupied the territory even until 1927; and this meant at times the existence of French courts-martial besides the neutral court that the treaty established. On June 1, 1923, French money was declared sole legal tender and 60% of the heavy industry of the country passed into the hands of French capitalists. In the spring of 1923, all Saar miners downed tools for 100 days and the French chairman of the governing-commission, Victor Rault, issued a decree which considered any criticism of the Versailles treaty as a misdemeanor.

Between 1923 and 1933 the Saarlanders enjoyed peace, because after the occupation of the Ruhr French imperialism retreated.

Rault's administration was gradually replaced by that of more impartial officials who adopted a conciliatory policy. The mutually somewhat unsympathetic attitude of the Saarlanders toward the imposed governing body did not prevent the latter from caring for the inhabitants' welfare.

In the years 1933-35 the plebiscite dominated the life of the Saarland. The liberty front—German exiles, Saar socialists, Communists, unionists, Catholics, Jews and Francophiles—defended the Saar against annexation by imperialist Germany, which was favoured by the German front led by the National Socialists. Hitlerite methods influenced the vote which was held on Jan. 13, 1935, and it does not seem impossible that the ballot itself was manipulated. Nearly 98% of all qualified voters appeared at the polls, an unprecedented showing, although the weather was bad and about 135,000 voters cast their ballots in a location other than the one in which they were living. During the 18 hours in which the ballots were stored, National Socialists had access to them. This fact was concealed by the official reports, which also overlooked discrepancies in the returns. Nine and three-tenths per cent declared for union with Germany, 8.8% for continued autonomy under the League and 0.4% for French annexation. On March 1, 1935, the Saar territory was handed over to the third reich.

In 1945 the Saar was occupied by Allied troops. In 1947 the representative Saar assembly, against the pro-German Communists, adopted a constitution which made the (somewhat enlarged) Saarland an autonomous state under French protection and within France's economy. In 1950 France was given a lease on the mines by a Franco-Saar convention.

SARLOUIS, a town in the Saarland (q.v.), situated on the left bank of the Saar and on the railway from Saarbrücken to Trier, 40 mi. south of the latter. Pop. (1939) 33,356. Sarlouis was founded in 1681 by Louis XIV of France, and was fortified by Vauban in 1680-85. By the peace of Paris, in 1815, it was ceded to the Allies and by them was made over to Prussia. Marshal Ney was born there. It contains a town hall in which are hung Gobclins, the gift of Louis XIV. There are coal mines in the vicinity, and the town has foundries and large manufactures. During the national socialist regime the city was named Saarlautern.

SAAVEDRA FAJARDO, DIEGO DE (1584-1648), Spanish diplomatist and man of letters, showed himself master of an excellent prose style in his *Idea de un principio politico cristiano* (1640), of which there is an English translation by Asty (1700). His most interesting work is the *República literaria*, published in 1655 as the *Juicio de Artes y Ciencias* under the name of Claudio Antonio de Cabrera.

SABAC, a town in Serbia, Yugoslavia. Pop. (1931) 12,563, many of whom are Jews. It is a busy river port on the Sava, exporting cereals, prunes, cattle and pigs, with a large weekly market for livestock, cheeses and grain. It is the seat of a bishop, a prefecture and a tribunal. The fortress was built by Mohammed II in 1470 to facilitate incursions into Slavonia. In the Austro-Turkish wars of 1788-91 the Serbs captured the town, and in the first Serbo-Turkish rising, Kara George, in 1806, defeated the Turks at Misher, near Sabac. In World War I the Serbs took the town and drove the Austrians back across the Sava. Germans occupied the town in World War II.

SABADELL, a town of northeastern Spain, in the province of Barcelona; on the river Ripoll and on the Barcelona-Saragossa railway. Pop. (1940) 45,931 (mun. 47,831). Cloth, linen, paper, flour and brandy are manufactured, and there are iron foundries and sawmills. About half the inhabitants are employed in the textile factories. Sabadell is said to be the Roman *Sabundunum*, but in Spanish annals it is not noticed until the 13th century.

SABAEANS. This name is used loosely for the ancient dwellers in southwest Arabia, in the parts now called Yemen, Hadhramaut and Asir. Strictly it belongs to one tribe and one state only. The chief source of information about these peoples is their inscriptions, found in their own land and elsewhere; other sources are the Greek geographers, Babylonian and Ethiopic inscriptions, the Bible and the record of Aelius Gallus' expedition. The Arab tradition is not of much value and only for the latest period of the history.

History.—The land produced spices and incense and was a stage on the trade road from India, the Malay archipelago and Africa. At an early date men from Arabia migrated to Abyssinia. The oldest State in Yemen of which anything is known was Ma'in or Ma'an, the Minaeans of the Greeks. Its chief towns, Karnawu, Kaminahu and Yathil (the modern Barākhish) lay in the southern Jōf, about 120 km. N.N.E. of Sanaa. Though the names of 20 kings are known the history of Ma'in cannot be written. Relations with Hadramaut were friendly, indeed they "almost suggest a personal union," and there was a colony or outpost at Ma'in Mus-rān (now El 'Ola) to guard the trade road to Egypt and Palestine. Later the State of Ḳatabān began to encroach on Minaean territory, and after fighting with and becoming a vassal or ally of Saba, it joined with that State in destroying Ma'in about 700 B.C. Taking all things into account, the extent of the State, the number of kings, the highly developed script and language, the beginning of the Minaean kingdom cannot be put later than about 1500 B.C. The Sabaeans are mentioned in a Minaean inscription as nomads who raided the caravan road to El 'Ola. This suggests that they may have migrated south to Yemen and founded the kingdom of Saba which bears their name. Perhaps the queen of Sheba lived in the north of Arabia though she has been decorated with the wealth of the kingdom in Yemen. Marib, 100 km. east of Sanaa was its capital. An inscription of Sargon (c. 715 B.C.) refers to It'i-amara the Sabaean, and one of Sennacherib (c. 685 B.C.) to Ka-ri-bi-lu, king of Saba'i. More than once the second successor of a Yt' 'Mr was a Krb'l. Most probably the pair referred to by the Assyrian kings was Yt' 'mr'Byn, who completed the Marib dam, so famous in Arab story, and defeated Ma'in, killing 45,000 of its inhabitants, and his grandson Krb'l Wtr, who finished the overthrow of Ma'in and pacified the country. Sennacherib speaks of receiving a present from Saba; even court flattery did not dare to call it tribute. About the same time Ausan, which had been a vassal of Ḳatabān, was crushed along with its ally and neighbour Datinat.

Krb'l Wtr was one of the last of a line of rulers who bore the title Mkrb. It was used also by the earlier lords of Ḳatabān. Not long after, the title of king was adopted by the ruler of Saba and used till 115 A.D. This period is marked by the rise of noble clans and ended with the incorporation of Ḳatabān after war both civil and foreign. At home the Hamdān clan tried for the throne and Himyar appears for the first time among the external enemies with Gedarot which had taken the place of the older Ausan. This year 115 is the first of an era by which some of the later monuments are dated. Now began a serious attack on the trade supremacy of the Sabaeans. The Nabataeans fixed themselves across the trade road to Syria and from Egypt as a base Rome tried to control the sea traffic, besides sending Gallus to attack by land. The royal title now became king of Saba and Du Raidān. About A.D. 300 Hadramaut was conquered and the style became king of Saba, Du Raidān, Hadramaut and Yamnat. This change coincided with a slackening of the Roman effort to control the eastern trade. In the middle of the century Abyssinia conquered the land but already in A.D. 375 there was a native king again. His immediate successor adopted the Jewish religion, a mark of an anti-Roman policy, and in A.D. 525 Du Nuwās, the last Jewish king, was killed and an Abyssinian governor ruled the land. The failure of the dam at Marib was at once an effect and a cause of the national decay. In A.D. 579 Persia conquered the country and in A.D. 628 the governor turned Muslim and submitted to the prophet. Ḳatabān was ruled at first by Mkrb and then by kings who may have been foreigners. The capital Tmna lay some 110 km. S.E. of Marib. The capital of Hadramaut was Sabwat, the Sabota of the ancients.

Government and Social Conditions.—The States were built up of tribes mostly held together by local ties not by blood bonds. A tribe contained an aristocracy, tenant vassals, resident aliens and serfs. The name Ḳatabān stood for the kingdom and for the tribes composing it; all were children of the god 'Amm. In Saba the tribe of that name stood apart from the others and held a commanding position in the kingdom. The common phrase is "Saba and the tribes." Saba alone is the child of 'Imkh. Later it was put on a level with the other tribes, and was merged in the

militia. The king, tribal aristocrats and the temples were the great landholders. Under the form of government in Ḳatabān (probably much the same in the other States) the king was helped and to some extent controlled by a council of elders, though general policy was decided by the assembly of the tribes. In this the serfs had of course no place. At a later time in Saba the government became feudal, no longer did the tribal assembly decide the allocation of the land, the king granted fiefs. The change may have been helped by the example of the temples, where the retainers had to obey the orders of the god whose land they tilled. The offices of Mkrb and king were hereditary and the latter seems often to have associated his son with himself. The land paid three taxes which are never mentioned separately. The amount paid is not known but it was assessed while the crops were standing. Taxes were paid to the temples also; the tithe is named. Public works were done by forced labour. No list of customs, duties or tolls has been found. In early times the title Kbr is given to the chief of a tribe or clan, the governor of a town or district, the chief of the king's serfs and the head of a college of officials; thus there were many offices with one name. Down to the latest times a Kbr was the eponym after whom the year was named. Kyl is first heard of as the name of a leading section of a tribe in the territory of the god Ta'lab Riyam. The ancestors of a petty king are also called Kyl. So it is probable that he was part of the tribal organisation and took the place of the Kbr. The Kyn was an administrative officer to serve princes, temples or cities. One was a priest. The name suggests that he was not a part of the tribal organisation.

Trade and the Arts.—Monuments of the south Arabians have been found in Kuwait and Mesopotamia; a coffin of a dealer in spices was found in Egypt and an altar with a bi-lingual dedication to Wadd in Delos. Spices and incense were the chief exports and re-exports. The road from Hadramaut ran through the capitals of the other three States, so it is not surprising that one tried to make itself supreme. The returning caravans certainly brought back female slaves for the temple service; women from Gaza and Yathrib (Medina) are mentioned. The production of incense was in the hands of the nobles, 3,000 families Pliny says, and was surrounded with various tabus, besides a tithe paid to the temple at Sabwat. Great care was given to irrigation and the terracing of the hills into fields. The people were fine masons and stonecutters. The dam at Marib is now in much the same condition as when Hamdān (A.D. 848) saw it. The buildings were made of stone so carefully dressed that often the joints are scarcely visible; the stones are held together by leaden dowels and pillars are strengthened by mortise and tenon joints. Big buildings were often elaborately decorated and several forms of pillars and capitals were in use. The Arab tales of lofty houses with windows of translucent stone are not much exaggerated. The pointed arch was known. Many of the old cisterns are still in use. Many of the inscriptions are beautiful and testify to the skill of the stone-cutters, who were successful with the figures of animals and conventional foliage in low relief. Figures in the round were less good and in statues of men the body is usually a mere block while the face is wooden and expressionless and often out of proportion. Stone pots and jars for household use are simple but neat and well shaped. Most of the metal work that survives is figures of animals and tablets with inscriptions. The figures are generally crude. One can never be sure that the jewellery, pottery and similar small articles really belong to the land and the period. The best things suggest foreign influence or even origin. At first the coins followed Athenian models and the workmanship is very good in some. Later they degenerated till the owl looks like a jar with two round handles. Curiously the standard is Babylonian. The latest coins are weak imitations of Roman coins.

Inscriptions and Language.—The inscriptions are all on stone or metal. Words are separated by a divider and the letters are never joined. In early times the characters are angular but later the corners are rounded and curves appear. The alphabet is connected with the Phoenician; some of the letters are exactly alike, some look as if they had been purposely altered by

those who understood the art of carving in stone, and some not found in Phoenician are formed by differentiation from those that are. Short inscriptions have been found in Mesopotamia in which Sabaeen letters are combined with others resembling the Phoenician and Greek forms. It is not certain whether this is an early form of the alphabet or merely a freak. There are 29 letters, the 28 of Arabic and the second form of *š* which is found in Hebrew. The language is classified with Abyssinian as south Semitic and is split into several dialects which differ in grammatical forms and vocabulary. In Ma'in and Katabān *š* is used in the pronoun of the third person and in the causative form of the verb where Sabaeen has *k*. Hadramaut has forms which are phonetically later than the other dialects. The vowels are not indicated so the pronunciation of all words is a matter of guesswork. The writing is usually from right to left but some of the oldest inscriptions read alternately from right to left and from left to right. This is occasionally found in later ones but then for special reasons. Presumably there was a literature but it has disappeared. Sabaeen inscriptions have been found in Abyssinia and the Ethiopic alphabet is derived from the south Arabian. Inscriptions in various alphabets derived from the Sabaeen are found in different parts of Arabia as far north as Damascus and testify to the widespread influence of the south Arabian kingdoms. Many of the south Arabian inscriptions are hard to interpret and the sense highly problematical.

Religion.—Over 100 gods and many temples are named but next to nothing is known about them. Certain deities are common to the whole land. Sams, the sun, is feminine and perhaps all goddesses are forms of it. 'Aitar, the star Venus, is masculine but corresponds philologically with the Babylonian Ishtar and the Canaanite Ashtoreth. The moon, Warāḥ, Sahr or Sin, occurs occasionally and Il or Ilan is the name of a god as well as a common noun. Each country had its own god; Ma'in had Wadd, Katabān had 'Amm, Saba had Ilmukah and the clan of Hamdān had Ta'lab Riyam. Perhaps these tribal gods are all forms of the moon. There are indications that the moon, sun and Venus formed a divine family. Others are Anbal, Du Samawi, the enigmatic Nakrah and Atīrat (the Hebrew Ashera). Other divine names are clearly descriptive; Hawbas "the drier" is the moon according to Hamdānī, Kahlil "the old," Sa'd "luck" the giver of good fortune and Fukm "judgment" the judge. At times kings seem to have been worshipped (after death?). Springs and water courses were inhabited by spirits. The bull, the bull's horns and the crescent were symbols of the moon and a disc stood for both the sun and Venus. Often one cannot decide which of the two is meant. The people were the offspring and the king the first-born of the god, so the formula runs "god, king and people." There were no images of the gods. To obtain success in one's undertakings it was the custom to dedicate to the god a statue of oneself in stone or figures of men or animals in gold (? gilt). Sacrifices and incense were offered to them. The names for altar and sacrifice are the common Semitic terms, and the altar of incense has among other names that of *miktār* as in Hebrew. A variety of spices (the wealth of the land) are named on these altars, as rind, ladanum, costus, tarum, frankincense and others not yet interpreted. Pilgrimages were made at certain seasons and the pilgrim month was named Du Hijjat or Du Mahajjat. There are many names for the months, some of which refer to agriculture. The name for priest is *š-š-w* (which may mean giver) and in the El 'Ola texts comes the word *l-w-*, both masculine and feminine, which looks very like *Levi*. In later times the name Rahmān for God suggests Jewish influence. Christianity was introduced into South Arabia but it was not favoured because of its association with Abyssinia and the famous church in Sanaa was looked on as a sign of foreign domination. The massacre of Christians in Nejran had political causes as well as religious.

The ruins of the temple at Marib are an open space surrounded by an elliptical wall with the main door at one end of the shorter axis and a smaller at one end of the longer axis. Columns flanked the main door. Outside are several groups of pillars and a set of four may have held a canopy over a throne. The temple at

Sirwah is an oblong building with two sets of pillars inside it. One set held up the roof of the sanctuary and the other surrounded a light well. Another at Ycha in Abyssinia is an oblong building with the door at one end. It seems to have been of three stories (A. S. T.).

SABAKI, a river, 400 mi. long, in Kenya Colony, Africa, which enters the Indian ocean north of Malinda. As the Athi, it rises north of Nairobi, flows across the Kapote and Athi plains, and turns south under the Yatta ridge. Navigation is interrupted by the Lugard falls, 100 mi. from its mouth.

SABANG, a free port situated on the island of Pulau Weh, about 20 mi. N. of Kota Raja, the capital of Achin (Atjeh), in north Sumatra, Netherlands Indies, 308 mi. from Penang (from which it lies due west), 608 mi. from Singapore and 1,100 mi. from Batavia. Pop. 8,706.

Sabang is the first port of call in the Malay archipelago for vessels proceeding from Europe eastward, being the westernmost point at the entrance to the Straits of Malacca. The harbour, built in 1887, principally as a coaling station, is sheltered from the heavy swell of the Indian ocean and strong winds by mountains and high stretches of coast line. Coal wharves extend 1,700 ft. the coal being conveyed to vessels by electric transporters, and vessels drawing 30 ft. can moor alongside; coal is also conveyed to vessels at anchor in Sabang bay (which is extensive) by lighters. There is a dry dock of 5,000 tons' capacity and slipways for the construction of small ships and lighters up to 1,000 tons.

On the eastern side of the bay there is a petroleum wharf and two tanks, with a capacity of 4,000 tons. Goods destined for northern Sumatra are landed at Sabang, a ferry service being maintained with Oleh Leh, the harbour for Kota Raja.

There is a Dutch settlement at the head of the bay, with a post, telegraph and harbourmaster's office, and there is a cable to Oleh Leh and a wireless station. In 1939 the port was visited by 918 ships, measuring 9,393,697 cu.yd. net. Sabang was occupied by the Japanese in 1942.

SABAR KANTHA, a political agency in India, in the Western India States Agency, with headquarters at Sadra. It comprises 64 petty jurisdictional states, 13 non-jurisdictional talukas, and a number of estates grouped in 9 thanas. The thakors, or chiefs, are for the most part Rajputs or Kolis and were formerly feudatory to Baroda. Many of the inhabitants belong to Bhil tribes and other aboriginal stock. Area 5,408 sq.mi. Pop. (1941) 457,813.

SABATIER, LOUIS AUGUSTE (1839-1901), French Protestant theologian, was born at Vallon (Ardèche), in the Cévennes, on Oct. 22, 1839, and was educated at the Protestant theological faculty of Montauban and the universities of Tübingen and Heidelberg. After four years' work as a pastor he became professor of reformed dogmatics at Strasbourg. His markedly French sympathies during the war of 1870 led to his expulsion from Strasbourg in 1871. After five years' effort he established a Protestant theological faculty in Paris, and became professor and then dean. In 1886 he became a teacher in the newly founded religious science department of the École des Hautes Études of the Sorbonne. He died on April 12, 1901.

Among his chief works were *The Apostle Paul* (3rd ed., 1896); *Mémoire sur la notion hébraïque de l'Esprit* (1879); *Les Origines Historiques de l'Apocalypse* (1888); *The Vitality of Christian Dogmas and their Power of Evolution* (1890); *Religion and Modern Culture* (1897); *Historical Evolution of the Doctrine of the Atonement* (1903); *Outlines of a Philosophy of Religion* (1897); and his posthumous *Religions of Authority and the Religion of the Spirit* (1904), to which his colleague Jean Réville prefixed a short memoir. On his theology see E. Ménégoz in *Expository Times*, xv, 30, and G. B. Stevens in *Hibbert Journal* (April 1903).

SABATIER, PAUL (1858-1928), French historian, the younger brother of Louis Auguste Sabatier (q.v.), was born at Chabrillanoux, in the Cévennes, on Aug. 3, 1858. He studied at the Faculty of Theology in Paris, and in 1885 became vicar of St. Nicholas, Strasbourg, from which he was expelled on declining the German government's offer of preferment which was conditional on his becoming a German subject. He was then appointed

pastor of St. Cierge, but being compelled by ill-health to give up his cure, he devoted himself to historical research. The appearance of his *Life of St. Francis*, in 1893, made his name, and his reputation was enhanced by the publication of *Collection d'études et de documents*, in 1898. In this work were incorporated the texts of the *Speculum Perfectionis seu Sancti Francisci Assisiensis legenda antiquissima*, an early life of St. Francis written by his disciple, Brother Leo, in 1227, the *Tractatus de Indulgentia Portuiculae*, and the *Actus B. Francisci et sociorum eius*; but Sabatier's criticism and interpretation of the documents were widely challenged. In 1902 Sabatier founded the International Society of Franciscan Studies, and soon after he organized at Assisi *La Rofessione Scolastica* for feeding necessitous children, in support of which he delivered a brilliant lecture on Modernism in France at London (1905). In 1914 he sent a striking letter to the president of the International Society of Franciscan Studies in reply to a resolution in favour of peace which had been passed by the council, in which he eloquently set forward the ideals of France in the World War. This was published in *The Times*, Jan. 22, 1915, and was later reprinted as a pamphlet. In 1919 Sabatier became professor of Protestant theology at Strasbourg, which post he held until his death in March 1928.

SABAZIUS, a Phrygian or Thracian deity, frequently identified with Dionysus, sometimes (but less frequently) with Zeus. His worship was closely connected with that of Cybele and Attis and was chthonian and mystic in character. It reached Greece in the 5th century B.C. A few passages state that the Jews worshipped him (confusion with Heb. *sabāoth*?) see Val. Max. I, 3, 2. The true etymology of the name is unknown. Whether he was the same as Sozon, a marine deity of Southern Asia Minor, is doubtful. His image and name are often found on "votive bands," a kind of talisman adorned with emblems, the nature of which is obscure. His ritual and mysteries (*Sacra Savadia*) gained a firm footing in Rome during the 2nd century A.D.

See Eisele in Roscher's *Lexikon*, s.v. (bibl.).

SABBATAI SEBI (1626-1676), Jewish mystic, who claimed to be the Messiah, was born in Smyrna, of Spanish descent. As a lad he was attracted by the mysticism of Luria (*q.v.*), which impelled him to adopt the ascetic life. He passed his days and nights in a condition of ecstasy. He began to dream of the fulfilment of Messianic hopes, being supported in his vision by the outbreak of English Millenarianism. Christian visionaries fixed the year 1666 for the millennium. Sabbatai's father (Mordecai) was the Smyrna agent for an English house, and often heard of the expectations of the English Fifth Monarchy men. In 1648 (the year which Kabbalists had calculated as the year of salvation) Sabbatai proclaimed himself Messiah, and in Constantinople came across a man, who pretended that he had been warned by a prophetic voice that Sabbatai was indeed the long-awaited Redeemer. At first his adherents were a small circle of devotees who kept their faith a secret. He charmed men by his sweet singing of Psalms, and children were always fascinated by him. He journeyed to Jerusalem, where a local pasha was opposing the Jews, and Sabbatai secured help for them from Cairo. At Cairo Sabbatai married, and secured the support of Raphael Halebi. With a retinue of believers, a charming wife and considerable funds, Sabbatai returned in triumph to the Holy Land. Nathan of Gaza assumed the rôle of Elijah, the Messiah's forerunner, proclaimed the coming restoration of Israel and the salvation of the world through the bloodless victory of Sabbatai "riding on a lion with a seven-headed dragon in his jaws" (Graetz). Again 1666 was given as the apocalyptic year.

Threatened with excommunication by the Rabbis of Jerusalem, Sabbatai returned to Smyrna (autumn of 1665). Here he was received with wild enthusiasm. From the Levant the Sabbataean movement spread to Venice, Amsterdam, Hamburg and London. Sabbatai no longer doubted the reality of his mission. Day by day he was hailed from all the world as king of the Jews. At the beginning of the fateful year 1666 Sabbatai went (or was summoned) to Constantinople. Here he was arrested, but reports of miracles continued, and many of the Turks were inclined to become converts. Soon he was transferred to Abydos. In September

Sabbatai was brought before the Sultan, and he had not the courage to refuse to accept Islam. The Messianic imposture ended in the apostasy of Sabbatai. In 1676 he died in obscurity in Albania. A sect of Sabbataeans—the Dornhe of Salonica—survived him and for many years the controversy for and against his claims left an echo in Jewish life.

See Graetz, *History of the Jews*, vol. v. ch. iv. 1. Zangwill has a brilliant sketch of Sabbatai's career in his *Dreamers of the Ghetto*.

SABBATH, the seventh and especially sacred day of the week among the Jews.

Observance.—How tenaciously the Jews held to the observance of the Sabbath may be seen from the fact that on this account the Romans found themselves compelled to exempt them from military service. The rules of the Scribes enumerated thirty-nine main kinds of work forbidden on the Sabbath, and each of these prohibitions gave rise to new subtleties. When the disciples of Jesus plucked ears of corn on the Sabbath they had, according to the Rabbinical views, violated the third of the thirty-nine rules, which forbade harvesting; and in healing the sick Jesus himself broke the rule that a sick man should not receive medical aid unless his life was in danger. In fact, as Jesus put it, the Rabbinical theory seemed to be that the Sabbath was not made for man but for the Sabbath, the observance of which was so much an end in itself that the rules prescribed for it did not require to be justified by appeal to any larger principle of religion or humanity. The precepts of the law were valuable in the eyes of the Scribes because they were the seal of Jewish particularism, the barrier erected between the world at large and the exclusive community of Yahweh's grace. The ideal at which these rules aimed was absolute rest on the Sabbath from everything that could be called work; and even the exercise of those offices of humanity which the strictest Christian Sabbatarians regard as service to God, and therefore as specially appropriate to his day, was looked on as work. To save life was allowed; danger to life "superseded the Sabbath." The positive duties of its observance were to wear one's best clothes, eat, drink and be glad (justified from Isaiah lviii. 13). A more directly religious element, it is true, was introduced by the practice of attending the synagogue service, but even this service was regarded as a meeting for instruction in the law rather than as an act of worship.

Attitude of Jesus and Early Christian Church.—The general position which Jesus takes up, that "the Sabbath was made for man and not man for the Sabbath," is only a special application of the wider principle that the law is not an end in itself but a help towards the realization in life of the great ideal of love to God and man, which is the sum of all true religion. But Jesus further maintains that this view of the law as a whole, and the interpretation of the Sabbath law which it involves, can be historically justified from the Old Testament. In this connection He introduces two of the main methods to which historical criticism of the Old Testament has resorted in modern times: He appeals to the oldest history rather than to the Pentateuchal code as proving that the later conception of the law was unknown in ancient times (Matthew xii. 3 seq.), and to the exceptions to the Sabbath law which the Scribes themselves allowed in the interests of worship (v. 5) or humanity (v. 11), as showing that the Sabbath must originally have been devoted to purposes of worship and humanity, and was not always the purposeless arbitrary thing which the Scribes made it to be. Modern criticism of the history of Sabbath observance among the Hebrews has done little more than follow out these arguments in detail, and show that the result is in agreement with what is known as to the dates of the several component parts of the Pentateuch.

In the early Christian church Jewish Christians continued to keep the Sabbath, like other points of the old law. Eusebius records that the Ebionites observed both the Sabbath and the Lord's day, the weekly celebration of the resurrection. This practice obtained to some extent in wider circles, for the *Apostolic Constitutions* recommend that the Sabbath shall be kept as a memorial feast of the creation, as well as the Lord's day as a memorial of the resurrection. The festival character of the Sabbath was long recognized in a modified form in the Eastern

church by a prohibition of fasting on that day, which was also a point in the Jewish Sabbath¹ law. On the other hand Paul from the first days of Gentile Christianity, laid it down definitely that the Jewish Sabbath was not binding on Christians. Controversy with Judaizers led in process of time to direct condemnation of those who still kept the Jewish day (*e.g.*, Co. of Laodicea, A.D. 363). For discussion of the difficult problem when and how the Christian Sunday superseded and took on some characteristics of the Jewish Sabbath see SUNDAY. (W. R. S.; S. A. C.)

Origin.—What was the origin of the Sabbath? What part did it play in the life of the Israelite nation before the exile? To these questions confident answers have been given, but the material upon which we can base our conclusions is not sufficiently extensive or clear to warrant dogmatism. It is a noteworthy fact that there is no evidence of Sabbath observance in the patriarchal period; there is, indeed, very little material that can be reckoned as pre-exilic.

There are four passages which seem to point to the conclusion that in the earlier times a close connection existed between the Sabbath and the new-moon festival. In 2 Kings iv. 23 the Shunammite's husband asks, when she proposes to visit the prophet, "Wherefore wilt thou go to him to-day? it is neither new moon nor sabbath." Among the religious observances which Isaiah names as offensive to Yahweh he links together (i. 13) "new moon and sabbath." In Hosea ii. 11 Yahweh says of Israel "I will cause all her mirth to cease, her feasts, her new moons, her sabbaths, and all her solemn assemblies." Amos (viii 5) denounces the traders who say "When will the new moon be gone, that we may sell corn? and the sabbath, that we may set forth wheat?" The reference in Hosea would make it probable that the Sabbath was a season of festal joy, and that in Amos makes it clear that there was at any rate some cessation of ordinary business activities on that day. By inference this latter conclusion may be deduced from the passage in Kings. The question of the Shunammite's husband suggests that the ass for which she had asked in order to make her journey would have been available, even in harvest time, had the day been a new moon or a Sabbath: the inference surely is that on those days the work of harvesting stood still, so that the beasts would not be required for labour on the farm. This combination of new moon and Sabbath suggested to Meinhold (*Sabbat und Woche im Alten Testament*, 1905) that originally the Sabbath must have been the day of the full moon. This theory is very plausible, though Meinhold's endeavour to explain how the full moon feast came to be transformed into the regular seventh day Sabbath of abstinence is not convincing. Kittel has attacked the fundamental hypothesis on which the theory rests. He contends that the existence of a full moon feast in ancient Israel is nowhere demonstrable, and points out that while the new moon festival has maintained itself in later Judaism there is no survival of a full moon festival. This last argument, however, might easily be countered, for if it be a fact that the full moon festival was converted into the weekly Sabbath the disappearance of the former would be amply accounted for.

Meinhold regards the Decalogue as dating, at the earliest, from the exile, and rejects decidedly the idea that before the exile the Hebrews had a seven day week running throughout the year. Many critics, however, tend distinctly towards the belief that the Decalogue in some simple form may very well go back to the time of Moses. The story of the manna in Exodus xvi. in its original form may represent Moses as the discoverer of the Sabbath; and if so, this would be evidence that in certain streams of tradition Moses was regarded as the sponsor in Israel of the Sabbath. If the kernel of the commandments be accepted as Mosaic the institution of the Sabbath goes back to the very beginnings of the history of Israel. In the decalogue of Exodus xx. 8-11 the command "remember the sabbath day" follows immediately upon the commandments which are concerned with Yahweh and Yahweh's name. This shows how great must have been the importance of the Sabbath, and suggests that it was regarded as in an especial sense Yahweh's day, a fact for which the Old Testament offers abundant confirmation. The emphasis on the Sabbath in this form of the Decalogue is the more noteworthy

in view of the fact that it ignores all the other feasts and rites. It is highly probable, considering the close association between Yahweh and the Sabbath, that the celebration of the latter as a festival goes back to the time when Yahweh first became the national deity. This does not, of course, conflict with the theory that it was connected also with the changes of the moon, which, indeed, seems to be the most probable hypothesis. Whether originally it was the day of the full moon only, or whether the half-moon days were also Sabbaths, it is difficult to say.

It has been objected that a regular rest day like the Sabbath could be celebrated only by a settled agricultural people. Apart from the fact that the ancestors of the Israelite nation were not all nomads it may be urged that even the life of the desert was much more artificial than we have been accustomed to suppose. The wandering herdsmen have many trades. Some of them breed cattle. Slaves and artisans have always been known in the desert. At the uses corn and fruit are cultivated. And the nomads in a comparatively primitive state of culture observe rest-days, though these are not as a rule periodic, and are not necessarily consecrated to a particular deity or employed for religious purposes. Hutton Webster (*Rest Days*, 1911), regards the restrictions which characterize them as being in the nature of tabus. Such days are observed at critical seasons, among which are the changes of the moon. He instances in particular the custom of Hawaii, according to which on a strict tabu day there must be no fire or light, and general gloom and silence prevail. No canoes may be launched, no one may bathe, or even be seen out of doors unless his presence is required at the temple. The old Hawaiian system included a remarkable approximation to the institution of a weekly Sabbath. In each lunar month four periods were tabu, the 3rd to the 6th nights, the time of the full moon, including the 14th and 15th nights, the 24th and 25th nights, and the 27th and 28th nights. On the other hand among some peoples such seasons of abstinence developed into joyous festivals and holidays. "Among many peoples in the lower culture," says Hutton Webster, "the time of the new moon and full moon, much less commonly each half moon, is a season of restriction and abstinence." Such days may be dedicated to a god, or may simply be regarded as unlucky days.

A theory that the Jewish Sabbath, name and institution, alike, is derived from Babylonian sources was propounded by Friedrich Delitzsch (*Babel und Bibel*) and has been widely accepted. To quote Delitzsch, "Since the Babylonians also had a Sabbath (*shabattu*) on which, for the purpose of conciliating the gods, there was a festival—that is to say, no work was to be done—and since the 7th, 14th, 21st and 28th days of the month are marked on a calendar of sacrifices and festivals dug up in Babylon as days on which 'the shepherd of the great nations' (*i.e.*, the king) shall eat no roast flesh, shall not change his dress, shall not offer sacrifice, as days on which the king shall not mount the chariot, or pronounce judgment, the magus shall not prophesy, even the physician shall not lay his hand upon the sick, in short, as days which are not suitable for any affair, it is scarcely possible for us to doubt that we owe the blessings decreed in the Sabbath or Sunday day of rest in the last resort to that ancient and civilized race on the Euphrates and Tigris."

The evidence adduced by Delitzsch, plausible as it seems, is not however, conclusive. The inscription he quotes—which, though it comes from the "library" of Assurbanipal, is evidently of Babylonian origin—refers only to a particular month, the intercalary Elul, and it is not shown that these special days occurred in the other months. Further, the prohibitions apply only to particular persons such as the king and the physician. It should be noted, too, that the calendar specifies in addition to the 7th, 14th, 21st and 28th days also the 19th as an "evil day" on which the restrictions apply. It is explained that the 19th is the 49th day from the beginning of the preceding month, that is, the end of the seventh week from that starting-point. But even if this explanation is correct the fact would remain that the day of restriction occurs oftener than at the end of each week. In order to discover whether there is evidence of a general restriction of business in Babylon on particular days C. H. W. Johns (*Ency. Brit.* 11th ed. vol. xxiii. 961 *seq.*) analyzed a great many business

contracts, classifying them according to the day of the week on which they were dated. The result showed that on all these "evil days" business was carried on, though, if the documents may be taken as fairly representative, there was a marked diminution of business on the 15th day of the month. During the First Dynasty of Babylon, and in the seventh century B.C., all these days show a falling off in the number of trading transactions. But, on the other hand, during the Kassite period trade went on much as usual on all days, including even the 15th day of the month. In any case these "evil days" seem different from the early Hebrew Sabbath; the latter was just the day when the Shumamite woman might actually have been expected to go on a journey, whereas the former were just the days when the king might not ride in his chariot.

It is true that the Babylonians had a day called *shabattum* or *shapattum*. This seems, however, to be distinct from the days of restriction dealt with in the calendar tablet. In a syllabary *shapattum* is equated to *um nuh libbi*, that is, "day of the rest of the heart." It has been urged that here is a proof that the Babylonians had a Sabbath which, like that of the Hebrews, was a rest day. But it is clear from the Babylonian penitential psalms that the real meaning of the words is "day when the heart (of the gods) is propitiated." A tablet discovered by Pinches shows that the *shapattum* was the 15th day of the month. A passage in the astronomical poem of the Babylonian epic *Enuma elish* quite clearly shows that the *shapattum* is the day of the full moon. The verb *shapatus* is elsewhere explained as equivalent to the verb *gamaru*, meaning "to be complete, full." None of the attempted etymologies for Sabbath from the Hebrew is successful, probably for the reason that the word is older than the Hebrew language. It is not unreasonable to suppose that both *shapattum* and *sabbath* are descended from a word belonging to the older tongue from which both the Babylonian language and the Hebrew developed, and that its prime meaning is "full moon day." This would confirm Meinhold's theory that among the Hebrews the Sabbath was originally the full moon day. But the fact that the name is derived from a common source, and that the day itself among both peoples is originally the day of the full moon, must not blind us to the truth that the Babylonians had no real equivalent to the Jewish Sabbath at regular seven-day intervals. Had there been any great likeness between the ways in which the *shapattum* and the Sabbath were celebrated the latter could hardly have been insisted on as a distinctive mark of the Jews.

Sabbatical Year.—An ancient Hebrew law enjoined that in every seventh year the land should lie fallow (Exodus xxiii. 11); vineyard and olive garden, too, are to remain uncultivated. Whatever may be produced under these conditions is to be for the poor and the wild beasts. It is extremely unlikely that this was meant to apply to all cultivated land in the same year. If any attempt were made to carry out this injunction the Sabbatical year must have varied from plot to plot. The later Law of Holiness does, however prescribe one definite year for all land. According to Josephus the Sabbatical year was a close time for warlike operations. From the same authority we learn that the Jews requested Alexander to remit tribute during the Sabbatical year, and that Tacitus complained that the Jews devoted every seventh year to idleness. Similar is the rule that there should be release of debtors from their debts in each seventh year.

The term has been adopted in universities for a period of freedom from academic duties every seventh year.

BIBLIOGRAPHY.—See, besides the literature already cited, Hehn, *Siebenwöch. u. Sabbat bei den Babyloniern u. im Alten Testament* (1907); "Sabbath" in E.R.E. and Wardle, *Israel and Babylon*, pp. 236 sqq. (W.L.W.)

SABBATION or **SAMBATYON**, a river (ז) natural and (2) supernatural. (1) The Targum pseudo-Jonathan to Exod. xxiv. 10 states that the Ten Tribes were exiled beyond the Sambatyon: this is repeated in Gen. Rabba lxxiii. Num. Rab. xvi. and Yalqut Genesis 984. This is therefore a river in Media, identified by Ramban (Deut. xxxii. 26) with the Gozan (II Kings xvii. 6) and a natural stream. Fuenn (*Pirke 'Etsin* ii. 133) identifies this with the Zab in Adiabene which Xenophon calls Sabatos and which

became corrupted to Sabbath. This river must be sharply distinguished from that mentioned by Josephus (*War*, vii. v. 1) who makes Titus on his return from the destruction of Jerusalem pass, near Beirut, a river which, flowing only on one day in seven, is called after the Sabbath. It will be noted that this river is in Palestine, not in Media and that it is periodic.

(2) With Pliny (*Hist. Nat.* xxxi., 2) two supernatural elements enter the story. First the river rests one day in seven instead of flowing on that day and secondly that day is the Sabbath. A variant of the miracle occurs in Gen. Rabba xi. In the 9th century the mysterious Eldad the Danite carried the wonder still further. In his chronicle the river is waterless but full of sand and stones which roll with a great noise during the week-days but rest on the Sabbath. Th. Noeike (*Beiträge zur Gesch. d. Alexanderromans*, 48) traces the Sambatyon in the Alexander legend. The river of sand (*Wadi ar-Raml*) is mentioned by Kazwini (*Cosmography* ed. Wüstenfeld, ii. 17) and by Mas'udi. Benjamin of Tudela mentions the ten tribes and the Gozan river but he ascribes no miraculous properties to it, save that David Alroy crossed it on his mantle. In the 17th century the miracles have increased. Travellers from India relate that the sand or water is curative of leprosy. Menasch ben Israel states that the sand, if kept in a bottle moves about during the week but rests on Sabbath. It has been suggested that the sand element in the story is to be explained by a confusion of a Hebrew name *ne'ar* (*Ne'ar Höl*) which could mean either "weekday river" or "river of sand."

See *Jew. Enc.* s.v. and A. Neubauer, *Jew. Quart. Rev.* I., "Where are the Ten Tribes?"

SABELLIC (from Latin *Sabellus*, Samnite) has often been used of a minor group of the Italic dialects, namely the pre-Latin dialects of the Paeligni, Marrucini and Vesuni (better called North Oscan), of the Volsci, and of the Marsi, Aequi, Sabini and other central Italian tribes (conveniently called Latinian); these dialects are all closely related to Oscan (*q.v.*). The same name, or sometimes Old Sabellic, is also used, but inaccurately, to describe two small but distinct groups of inscriptions from various sites near the east coast of central Italy (1) from Novilara and Fano (near Pesaro); (2) from Belmonte Piceno, Cupra Marittima, Castignano, Bellante, Greccio and Supercure. These may be better designated, by "East Italic."

The second group, not more recent in date than the 6th century B.C., are doubtless the oldest written documents known from Italian soil. The lines of writing run alternately left to right and right to left, the positions of the letters being both reversed and inverted in the lines written right to left. Their alphabet is clearly of the same Chalcid-Etruscan origin as that of all the other alphabets of ancient Italy (except the Greek and Phoenician), but shows some peculiarities which suggest direct Greek influence; the language, still untranslated, will probably prove to be an Indo-European (two I.-E. stems, *pater* father, *mater* mother have been identified) and ancient Illyrian dialect (*meitimo* is an Illyrian name). For it is known from the elder Pliny (*N.H.* 3.110, *cf.* 113), from the Iguvine tables (*Iguvium Iapydian*, i.e. belonging to the Illyrian Iapydes), and from archaeological evidence, that there were Illyrian settlers in or near that district, the ancient Picenum, where these inscriptions were discovered.

But the documents of the Novilara group are later in date, distinct in alphabet—this is perhaps of Etruscan origin, but shows certain resemblances both to the Umbrian and to the Oscan alphabets—and probably also in dialect. The suggestion that the dialect, however, is allied to Etruscan itself, is quite unsupported by the evidence; the decorative motifs, for example the spiral, which appear on all three of the inscriptions of this group, point rather to the opposite coast of the Adriatic, where similar motifs occur, especially round Nesusio, on contemporary monuments; and there is nothing in the word-forms of these documents which may not be Indo-European, while the characteristic Etruscan syncope and elision (at least in the writing) are entirely lacking.

BIBLIOGRAPHY.—R. von Planta, *Grammatik der ostitalischen Dialekte*, vol. II, pp. 551 sqq., 664 sqq. (1897); two new inscriptions discovered since 1897 were reported in *Rendiconti d. R. Acc. dei*

was probably not very closely determined. The traditions connect them closely with the beginning of Rome, and with a large number of its early institutions, such as the worship of Jupiter, Mars, and Quirinus, and the patrician form of marriage (*confarreatio*).

Of their language as distinct from that of the Latins no articulate memorial has survived, but we have a large number of single words attributed to them by Latin writers, among which such forms as (1) *frinus*, *Lat. hircus*; (2) *ausum*, *Lat. aurum*; (3) *novensiles*, *Lat. novensides* ("gods of the nine seats"); (4) the river name *Farfarus*, beside pure *Lat. Faboris* (Servius, *ad Aen. vii. 715*); and (5) the traditional name of the Sabine king, *Numa Pompilius* (contrasted with *Lat. Quincilius*), indicate clearly certain peculiarities in Sabine phonology: namely, (1) the representation of the Indo-European palatal aspirate *gh* by *f* instead of *h*; (2) the retention of *s* between vowels; (3) the change of medial and initial *d* to *l*; (4) the retention of medial *f* which became in Latin *b* or *d*; and (5) the change of Ind.-Eur. *q* to *p*. The tradition (e.g., *Paul. ex Fest.* 327 M.) that the Sabines were the parent stock of the Samnites is directly confirmed by the name which the Samnites apparently used for themselves, which, with a Latinized ending, would be *Safini* (see *SAMNITES* and the other articles there cited, dealing with the minor Samnite tribes).

To determine the ethnological relation of these tribes, whom we may call "Safine," to the people of Rome on the one hand, and the earlier stratum or strata of population in Italy on the other, linguistic and archaeological material must be examined. Archaeological evidence connects the Sabines with the patricians of Rome, (see *ROME, Ancient History*). What language did the Sabines speak? Was it most nearly akin to Latin or to Oscan or again to Umbrian and Volscian? Festus, though he continually cites the *Lingua Osca*, never spoke of *Lingua Sabina*, but simply of Sabini, and the same is practically true of Varro, who never refers to the language of the Sabines as a living speech, though he does imply (v. 66 and 74) that the dialect used in the district differed somewhat from urban Latin. The speech therefore of the Sabines by Varro's time had become too Latinized to give us more than scanty indications of what it had once been. The language of the Samnites was that which is now known by the name of Oscan.

It appears that in, say, the 7th century, B.C., the Safines spoke a language not differing in any important particulars from that of the Samnites, generally known as Oscan; and that when this warlike tribe combined with the people of the Latian plain to found or fortify or enlarge the city of Rome, and at the end of the 6th century to drive out from it the Etruscans, who had in that century become its masters, they imposed upon the new community many of their own usages, especially within the sphere of politics, but in the end adopted the language of Latium henceforth known as *lingua Latina*.

See R. S. Conway, *Italic Dialects* p. 351 (Cambridge, 1897). For the history of the Sabine district see Mommsen, *C.I.L.* ix. p. 396; and Beloch, "Der Italische Bund unter römischer Hegemonie" (Leipzig, 1880) and "La Conquista Romana della regione Sabina," in the *Rivista di storia antica* ix. p. 269 (1905).

SABINIANUS, pope from 604 to 606, the successor of St. Gregory the Great.

SABLE, the name of a small quadruped, closely akin to the martens, and known by the zoological name of *Martes sibirica*. It is a native of Siberia and famous for its fur. The name appears to be Slavonic in origin, whence it has been adapted into various languages. The Eng. and Med. *Lat. sabelum* are from the O.Fr. *sable* or *saible* (see *MARTEN* and *FUR*). "Sable" in English is a rhetorical or poetical synonym for "black." This comes from its usage in heraldry (first in French) for the colour equivalent to black.

SABLE ANTELOPE, a large and handsome South African antelope (*Hippotragus niger*), exhibiting the rare feature of blackness or dark colour in both sexes. The sable and the roan antelope (*H. equinus*) belong to a genus nearly related to the oryxes (*g.v.*), but distinguished by the stout, thickly ringed horns (present in both sexes) rising vertically from a ridge over the eyes at an obtuse angle to the plane of the lower part of the face, and then

sweeping backwards in a bold curve. The muzzle is hairy; there is no gland below the eye; the tail is long and tufted. Sable antelopes are among the handsomest of South African antelopes, and are endowed with great speed and staying power. They are commonly met with in herds including from 10 to 20 individuals. Forest-clad highlands are their favourite resorts. The roan antelope is a larger animal, with shorter horns, strawberry-roan in colour in both sexes.

SABLE ISLAND, an island of Nova Scotia, Canada, 110 m S.E. of Cape Canso, in 43° 56' N. and 60° W. It is composed of shifting sand, and is about 20 m. in length by 1 m. in breadth, rising in places to a height of 85 feet. In the interior is a lake about 10 m. in length. At either end dangerous sandbars run out about 17 m. into the ocean. It has long been known as "the graveyard of the Atlantic"; over 200 known wrecks have been catalogued, and those unrecorded are believed greatly to exceed this number. The coast is without a harbour and liable to fogs and storms; irregular ocean currents of great strength sweep round it, and its colour makes it indistinguishable until close at hand. Since 1873 an efficient lighthouse system and life-saving station has been maintained by the Canadian Government, and the danger has been much lessened. Since 1904 it has been connected with the mainland by wireless telegraphy. Sable Island is the home of the Ipswich sparrow (*Passerculus princeps*).

Sable Island was known to the early navigators as Santa Cruz. See G. A. England, *Isles of Romance* (1929); Harold St. John, "Sable Island," with history, zoology and botany, *Boston Soc. Nat. Hist.*, vol. 36, no. 1 (1917).

SABORAIM; see *GAON*.

SABOTAGE, systematic working in such a manner as to delay production, or to injure the quality of the product, a policy sometimes advocated, especially by syndicalists, either to remedy a particular grievance or as part of a general revolutionary program. Sabotage of this kind may conveniently be discussed under two headings:

(1) Exceedingly slow work. This may be either *ca'* canny (*g.v.*), deliberately slow work, whose extreme form is the "stay-in strike" when the workers enter the factory but do no work at all, or it may take the form of elaborately careful work. Apart from the "stay-in strike" or "sit-down" in the U.S., the only generally effective use of this kind of sabotage has been "working to rule" by railwaymen. The procedure consists in following exactly the rule books, which, if rigorously applied, forthwith disorganize the service, as they generally contain items either obsolete or merely entered for formal purposes of record. An example of the former is the British regulation that every ticket must always be examined on both sides, the latter the Italian regulation that a driver must satisfy himself that he crosses all bridges at or about a certain speed, both of which items have been used for "working to rule" strikes. The first disorganizes the "City rush," the second the long-distance expresses.

(2) Injury to product or other obstruction. The anarchist "propaganda by deed" (i.e., assassination of oppressors; see *ANARCHISM*) is not strictly included in this, though in polemical writers the two types of action are often confused. The commonest form is destruction of machinery, but the doing of very bad work, deliberately designed to break down, is also frequent. Destruction of the tools of blacklegs is an allied form of sabotage (it was common in Sheffield in the '60s under the name of "ratting"); and, like sabotage in general, is only common when peaceful picketing is forbidden.

Sabotage as a policy has been advocated by the French trade unions and the (mainly American) Industrial Workers of the World. In both cases the reason given is that the workers are engaged in a class struggle in which the capitalist class shrinks from no methods however brutal, and that the workers cannot afford to abstain from any weapon for sentimental reasons. Its chief advocates, the French *syndicats* and the I.W.W., emerged from the war of 1914-18 and the ensuing crisis much weakened, and the Russian Revolution of Nov. 1917 had injured the general case for sabotage.

Sabotage is also, of course, a weapon commonly employed in

war time, or even in peace, against the essential industries of a hostile power. It may be the results of spy action (probably uncommenced) or due to the action of nationally oppressed workers. It is commonly supposed that the Czech workers employed in the armaments took effective and extensive sabotage action after the invasion by Germany in March 1939. But facts about such sabotage are naturally unobtainable, it being to the interest of both sides to conceal them.

See Georges Sorel, *Reflexions sur la violence* (1910); E. Pataud and E. Pouget, *Comment nous ferons la Revolution* (Eng. tr. 1913); E. Pouget, *Le sabotage* (1910); and DIRECT ACTION AND INDUSTRIAL WORKERS OF THE WORLD; SYNDICALISM, TRADE UNIONS.

(R. W. P.)

SABRATHA, an ancient city of Africa Proconsularis (Tripoli), founded in the 7th-6th century B.C. by Tyrian settlers as a factory on the shore of a flat and inhospitable coast, mod. Sabratha Vulpia, 48 mi. W. of Tripoli by rail. Towards the end of the 2nd century A.D. its prosperity began to increase: Antoninus Pius built two temples, the tribunal before which Apuleius (q.v.) was tried met here, and under Commodus the Sabratenses had a *statio* (or office) at Ostia (q.v.). Towards the end of the 4th century there occurred fiscal exactions, religious disputes and attempts at invasion by the tribes of the interior (the most destructive being that of the Austuriani in A.D. 363), after which, as inscriptions show, the building of Sabratha, and notably the baths, were rebuilt. The Vandals themselves, who only occupied Tripolitania in A.D. 455, were defeated by a native rebellion, and after the destruction of their power by the Byzantines the very natives who had invited the aid of the latter rose against them also. During the years of peace following 548 new fortifications were made. Justinian's death, in 565, brought a renewal of the native risings. The Arabs took Tripoli in 643, and Sabratha was surprised in the night and sacked. Excavations have revealed the east gate of the Roman walls, while Byzantine fortifications surround the western portion of the city, where are situated the forum, the *curia* or council hall, a temple of Jupiter (of whom a fine bust was found), and another temple (perhaps the Capitulum), both of the time of Antoninus Pius, two Christian basilicas (one, erected by Justinian, with fine mosaics), a baptistery. The theatre and the amphitheatre, fairly well preserved and recently carefully restored, lie farther away, near the quarries. The streets are wide and well laid, and the houses are numerous and closely built, without courtyards. There were no less than 12 fountains, supplied by an aqueduct. The Roman harbour was constructed by joining the rocks with masses of concrete, so as to form two moles with a narrow entrance between them; while along the shore were cisterns and storehouses.

SABRE FENCING. Toward the end of the 19th century, prior to the founding of the Scuola Magistrale di Roma, which was to modernize Italian fencing, the Italian government sent out experts, who later became the leaders of the school, to various parts of the world to study the different styles and methods of swordplay. At this time sabre fencing was done with heavy cavalry sabres almost exclusively by the military, mainly cavalry men. In Europe in this game the French style was generally predominant. The main characteristics of this style were the handling of the sword from the wrist, making great "moulinets" (F.), while slashing at the opponent, and parries were executed by countercuts.

From the observation of these experts a new style of sabre fencing was evolved whose basic principle was the cutting from the elbow instead of from the wrist and parrying by interposing the blade at right angles to the plane of the cut. In sabre fencing the majority of touches are made with the cutting edges in preference to the point. This is due to the fact that the sabre lends itself better to cutting. The cut is executed with weapon and forearm moving as one from the elbow to give complete control, speed and precision to the movement. Gradually fencing sabres were made lighter in order to be more easily and skilfully used in making feints and parries.

The maximum allowed weight of the modern sabre, everything included, is 500 grams (18 oz.); the total length of the sabre must be less than 1,050 mm. (41½ in.) and the blade shall have a maximum length of 880 mm. (34½ in.). The guard must be able to pass through a rectangular gauge 150 mm. (5½ in.) by 140 mm. (5½ in.), the flat of the blade being parallel to the 150-mm. side. The modern fencing sabre blade is straight and flexible. The regu-

lations as to ground dimensions are the same as for duelling sword (see *EPEE FENCING*). The target for sabre is the entire body with the exception of the legs, the limits of the target being the groin line in front and a horizontal line passing across the top of the hip bones in back. A touch on the legs does not count but annuls any subsequent touch on the valid target.

The sabre is held with the thumb resting on the back edge of the handle about one-half inch from the guard, while the other fingers are curled around the handle holding it securely against the heel of the palm.

ADAPTED FROM J. MARTINEZ CASTELLO'S "THEORY AND PRACTICE OF FENCING"
FIG. 1.—HOW TO HOLD THE SABRE

The footwork is similar to that used in foil except that as head and arms are valid targets the lunges in attacks against such advanced targets are shorter. Short attacks in general prevent too great vulnerability in case the attacks fail. The stance of the sabreman is somewhat higher than the foinman; in other words, the legs are bent less. The opponents fence at a greater distance from each other than in foil.

ADAPTED FROM J. MARTINEZ CASTELLO'S "THEORY AND PRACTICE OF FENCING"
FIG. 2.—FRONT AND PROFILE VIEWS OF THE PARRY OF HIGH FIRST

Therefore, direct lunges are seldom used, lunges having to be preceded usually by advances, beats and binds. The combinations of attacks are innumerable and greater training is necessary for

ADAPTED FROM J. MARTINEZ CASTELLO'S "THEORY AND PRACTICE OF FENCING"
FIG. 3.—PARRY OF LOW FIRST

sabre than for other weapons.

Parries of cuts are made not by beating the attacker's blade aside but by interposing the blade at right angles to the direction of the cut. The force of the blow is taken by the strong part of the blade. Once the defender so meets the blade he gains an opportunity to return or riposte the blow.

The lines of foil fencing (see *FOIL FENCING*) are called planes in sabre fencing and are the same as in foil. There are six parries in sabre. First to fifth parries are generally used; sixth is used only occasionally.

The parries in sabre are slightly different from the corresponding guards. In the guard position the point is more in line and the arm straighter so as to be able to make a quick counter-

attack and to engage the opponent's blade if desired. In the parries the point must be a little out of plane, with arm slightly bent so that the opponent's cut cannot be forced through the weak part of the blade to the target as would be the case if the point were more in line.

ADAPTED FROM J. MARTINEZ CASTELLO'S "THEORY AND PRACTICE OF FENCING"
FIG. 4.—POSITION OF ARM AND WEAPON AT THE COMPLETION OF THE PARRY OF SECOND

In the first (prime) parry the sword arm is held out at shoulder level with the hand to the left of the body and the blade pointing diagonally downward; it is used to protect the chest. The second parry is made with hand at waist height to the right of the body and with weapon pointing downward. This parry pro-

ADAPTED FROM J. MARTINEZ CASTELLO'S "THEORY AND PRACTICE OF FENCING"
FIG. 5.—PARRY OF THIRD

protects the flank. The third parry (tierce) is made with hand at hip height or slightly higher, to the right of the body with the weapon pointing upward. It protects the right cheek, wrist, sword arm and flank. The fourth parry is made with hand in plane with the extreme left side of the chest, close to the body.

ADAPTED FROM J. MARTINEZ CASTELLO'S "THEORY AND PRACTICE OF FENCING"
FIG. 6.—POSITION OF ARM AND WEAPON IN THE PARRY OF HIGH FOURTH

The weapon points upward and slightly outward. This parry is used to protect the chest and sword arm.

The first and fourth parries are used to cover the whole inside plane; the second and third parries protect the entire outside plane.

In the fifth parry the hand is to the right of the head and slightly above the eyes and the weapon is almost horizontal, pointing slightly upward. It is used against cuts to the head. In the little-used sixth parry the hand is to the left of the head in line with the eyes, and the weapon is almost horizontal pointing slightly upward. Like the fifth parry, it protects the head.

The second, fifth and first parries are enough to protect the

ADAPTED FROM J. MARTINEZ CASTELLO'S "THEORY AND PRACTICE OF FENCING"
FIG. 7.—PARRY OF LOW FOURTH

whole target, just as are the third, fourth and fifth. Some fencers are inclined to favour one or the other of these groups of parries but one should make use of all of them.

In close quarters third and fourth are preferable to second and first, while at regular distance second and first are better.

A sabre bout is a matter of speed, timing and judgment of distance. False attacks to fool the opponent and force him out of position so that he is less able to defend himself are basic. Flèche attacks (running attacks) are characteristic of the weapon.

The functions of the director and judges are the same for

ADAPTED FROM J. MARTINEZ CASTELLO'S "THEORY AND PRACTICE OF FENCING"
FIG. 8.—POSITION OF ARM AND WEAPON AT THE COMPLETION OF THE PARRY OF FIFTH

sabre as for foil.

The Italian sabre school became so superior to others that many countries adopted it. To do so they invited Italian fencing masters, the foremost of which was Italo Santelli, who in the 1890s was called to Hungary. Mainly through his efforts the Hungarians became supreme in international competitions and frequently excelled the Italians.

The Italian school places emphasis on classicism and form. Foremost among the sabre teachers of the 20th century in Italy was Beppe Nadi of Leghorn, whose pupils established amazing records in national and international competitions.

The Hungarian school is an elaboration of the Italian school and discards all academic flourishes to bring the game more in line with the exigencies of modern competitiveness.

The Magyar temperament, the specialization in one weapon only and the popularity of the game, which is of national importance, account for the extraordinary development of sabre fencing in Hungary. The rivalry between Hungary and Italy pro-

PARRY OF SIXTH

vided exciting fencing competition particularly at the Olympic games.

(L. G. N.; X.)

SACAGAWEA or **SACAJAWEA** (1790?–1884?), the "Bird Woman," a Shoshone Indian girl who, in 1805–06, accompanied the Lewis and Clark expedition. She has been widely but erroneously credited with guiding the expedition across the Rocky and Cascade mountains to the Pacific coast. Actually her geographical knowledge and usefulness as a guide were limited to her native region of western Montana. Nevertheless, with her French-Sioux mate, Toussaint Charbonneau, Sacagawea did accompany the expedition all the way from Fort Mandan, N.D., to the Pacific coast and back. First-hand accounts of the expedition, by Meriwether Lewis, William Clark, Patrick Gass and others, praise her courage, resourcefulness and good humour, while indicating that Charbonneau mistreated her and was not worthy of his hire. Charbonneau was engaged as a guide in the autumn of 1804 and insisted upon bringing along Sacagawea, one of two wives he had purchased from Indian slave traders. A son, Jean-Baptiste Charbonneau, was born to Sacagawea Feb. 11, 1805, at Fort Mandan, and the baby, too, made the entire journey. Toussaint Charbonneau was paid \$500.33 for his services to the expedition, but Sacagawea received no remuneration. Their son was later taken to St. Louis, where Clark sponsored his education. The later history of the "Bird Woman" is obscure. An old Indian woman, who called herself Sacagawea and displayed a remarkably intimate and accurate knowledge of the Lewis and Clark expedition, died in Dakota territory in 1884.

See John Bakeless, *Lewis and Clark, Partners in Discovery* (1947); Charles Morrow Wilson, *Meriwether Lewis of Lewis and Clark* (1934).

SACCHARIN is a name applied to several organic substances. These comprise (1) derivatives of toluene and (2) derivatives of certain naturally occurring sugars, including milk sugar.

The commonly known saccharin of commerce is derived from toluene. Commercial saccharin is marketed as insoluble saccharin—the imide of ortho-sulphobenzoic acid—and as soluble saccharin—the sodium salt of the acid. Pharmaceutical manufacturers who compound saccharin for consumer use commonly tablet saccharin into tiny pellets containing $\frac{1}{2}$, $\frac{3}{4}$ or 1 gr. of U.S.P. saccharin. The pellets may contain the saccharin as the soluble sodium salt or in the acid form combined with sodium bicarbonate which converts the acid to the sodium salt upon dissolving.

Commercial saccharin is a sweetening agent; it possesses no food value at all. The sweetening power of the commercial powder is estimated at 425 times the sweetening power of ordinary sugar; the commercial crystals, which contain some water of crystallization, are estimated to have a sweetening power 375 times that of sugar. A $\frac{1}{4}$ gr. pellet has roughly the same sweetening power as a level teaspoon of sugar.

Saccharin, scientifically referred to as ortho-benzoisulphimide, was discovered by Ira Remsen and C. Fahlberg in 1879 in the course of investigations at The Johns Hopkins university on the oxidation o-toluene-sulphonamide. Fahlberg noticed an unac-

countable sweet taste to his food and found that this sweetness was present on his hands and arms, despite his having washed thoroughly after leaving the laboratory. Checking over his laboratory apparatus by taste tests, Fahlberg was led to the discovery of the source of this sweetness—saccharin.

Saccharin (1) is a white powder, mildly acidic, and forms neutral salts. It is relatively insoluble in water, chloroform and ether. The melting point of the commercial product is approximately 226° C.

Much of the saccharin in commerce is the white crystalline sodium salt (II). The sodium salt or soluble saccharin normally contains two molecules of water, and the crystals are readily soluble in water. The crystals may be of very small particle size or they may be of a size resembling granulated sugar. Crystalline sodium saccharin is efflorescent, so for easier handling, commercial sodium saccharin may be partially dehydrated, leaving less than one molecule of water in the compound. The partially dried sodium saccharin does not change weight so easily on exposure to the air. In this form it is termed powdered soluble saccharin.

Saccharin is made by treating toluene with chlorosulphonic acid. The reaction produces ortho- and para-toluene sulphonylchlorides. The two products are separated and the ortho-toluene sulphonylchloride is treated with ammonia to form the amide. The amide is then oxidized to saccharin.

Saccharin is used all over the world as a sweetener. It cannot be considered as a substitute for sugar, since it offers no nourishment. However, saccharin is used as part of the diets of people who must avoid excessive sugar intake, such as diabetics. It is also used in the preparation of dietetic foods, dentifrices, mouthwashes, cosmetics and for sweetening tobacco and medicinal preparations, particularly where the presence of sugar might lead to spoilage by fermentation or mould growth. Saccharin is not metabolized; it is excreted unchanged from the body in the urine.

In a number of countries the use of saccharin in food products is discouraged or even prohibited. Prohibition of the use of saccharin is not based on any harmfulness in the substance, but rather because of its lack of food value, persons using saccharin-sweetened foods might be unaware that they were depriving themselves of sugar which might be needed for its high food value.

An authoritative report by C. A. Hertel and O. Folin entitled *Influence of Saccharin on the Nutrition and Health of Man*, published by the U.S. department of agriculture in 1911, was studied and reported on in 1912 by a referee board of consulting scientific experts: Ira Remsen, Russell H. Chittenden, John H. Long and A. E. Taylor. After thorough consideration of facts contained in the report, the board concluded that ingestion of saccharin in quantities up to .3 g. per day is without deleterious or poisonous action and is not injurious to health.

Saccharins derived from sugars are lactones of saccharinic acids. When either dextrin or laevulose is boiled with lime, a lactone of the formula $\text{CH}_2\text{OH}.\text{CH}.\text{CH}(\text{OH}).\text{C}(\text{OH}).\text{CH}_2$ is obtained. It

crystallizes in prisms soluble in hot water and possesses a bitter taste.

Isosaccharin and metasaccharin, melting points 95° C. and 142° C. respectively, are formed by the action of lime on milk sugar. The sugar derived saccharins are of little commercial importance.

SACCHETTI, FRANCO (c. 1330–c. 1400). Italian poet and novelist, was a member of the noble and ancient Florentine family of the Sacchetti (comp. Dante, *Par.*, c. xvi).

While still a young man he achieved repute as a poet, and he appears to have travelled on affairs of more or less importance as far as Genoa, Milan and "Ischiavonia." When a sentence of banishment was passed upon the rest of the house of Sacchetti by the Florentine authorities in 1380, it appears that Franco was expressly exempted, *per esser tanto uomo buono*, and in 1383 he was one of the "eight," discharging the office of prior for the months of March and April.

In 1385 he was chosen ambassador to Genoa, but he preferred to go as podestà to Bibbiena in Casentino. In 1392 he was podestà at San Miniato, and in 1396 he held a similar office at Faenza. In 1398 he received from his fellow citizens the post of captain of their then province of Romagna, having his residence at Portico. Sacchetti left a considerable number of *sonnetti*, *canzoni*, *ballate*, *madrigali*, etc. His *Novelle*, based on real incidents of Tuscan life, are valuable for the light they throw on the manners of that age.

See N. Sapegno, *Il Trecento* (Milan, 1934).

SACCHI, ANDREA (c. 1600–1661), Italian painter of the later Roman school, was born at Nettuno near Rome in 1600, or perhaps as early as 1598. His father, Benedetto, a painter, gave him his earliest instruction in the art; Andrea then passed into the studio of Albani, of whom he was the last and the most eminent pupil. Sacchi was one of the most learned designers and one of the soundest colourists of the Roman school. He went to Venice and to Parma to study Venetian colour and the style of Correggio. His principal painting—in the Vatican gallery—is "St. Romuald Relating his Vision to Five Monks of his Order." The Vatican gallery contains also an early painting of the master—the "Miracle of St. Gregory," executed in 1624; a mosaic of it was made in 1771 and placed in St. Peter's. Other leading examples are the "Death of St. Anna," in S. Carlo di Catinari; also frescoes in the Palazzo Barberini—"Divine Wisdom." There are pictures by the master in the galleries of Perugia, Madrid and Dresden. He had a flourishing school: Nicholas Poussin and Carlo Maratta were his scholars.

See Hans Posse, *Der Römische Maler Andrea Sacchi* (Leipzig, 1925).

SACCHINI, ANTONIO MARIA GASPARE (1734–1786), Italian composer, was born at Pozzuoli, It., on July 23, 1734. He was the son of a poor fisherman and was heard singing on the sands by Francesco Durante, who undertook his education at the Conservatorio di Sant' Onofrio at Naples. Durante and Nicola Piccinni taught him composition and Nicola Fiorenza, the violin. The intermezzo *Fra Donato* was written for the theatre of the conservatorio in 1756, but his first serious opera was produced at Rome in 1762, and was followed by many others.

In 1769 he went to Venice, and as a result of the great success achieved there by the production of his opera *Alessandro nell' Indie* he was appointed director of the Conservatorio dell' Ospedaleto, where he trained singers and wrote church music.

In 1772 he visited London, where he was also successful, especially with his four new operas, *Tamerlano*, *Lucio Vero*, *Nitelli e Perso* and *Il Gran Cid*. His *Rinaldo* was produced in 1783 in Paris under the patronage of Queen Marie Antoinette, to whom he had been recommended by Emperor Joseph II. But neither in England nor in France did his reputation continue to the end of his visit. Even Marie Antoinette was not able to support his cause in the face of the general outcry against the favour shown to foreigners; by her command his last opera, *Edipo à Colone*, was set aside in 1786 to make room for Jean Baptiste Lemoigne's *Phédre*. After Sacchini died on Oct. 7 (or 8), 1786, *Edipo* became popular.

SACCO-VANZETTI CASE, THE, a murder trial in Massachusetts, extending over seven years, 1920–27, and resulting in the execution of the defendants, Nicola Sacco and Bartolomeo Vanzetti. The trial resulted from the murder in South Braintree, Mass., on April 15, 1920, of F. A. Parmenter, paymaster of a shoe factory, and Alessandro Berardelli, the guard accompanying him, in order to secure the pay roll they were carrying. On May 5

Sacco and Vanzetti, two Italians who had immigrated to the United States in 1908, one a shoe worker and the other a fish pedlar, were arrested for the crime. On May 31, 1921, they were brought to trial before Judge Webster Thayer of the Massachusetts superior court and, on July 14, were both found guilty by verdict of the jury. The verdict was disputed by Socialists and other radicals on the ground that the men had not received a fair trial because of their radical affiliations. Motion for a new trial, on grounds that the identification was not complete, failed. Further motions for a new trial were made from time to time but also failed on grounds that the evidence submitted did not justify it. On Nov. 18, 1925, the confession of Celestino Madeiros that he had participated in the crime, and that neither Sacco nor Vanzetti was present, added a new complication. Motion for a retrial on the basis of this confession was also denied by Judge Thayer who claimed that Madeiros, already sentenced to execution for another crime, was motivated in assuming the guilt in the hope that the giving of testimony would delay his own death. A motion of appeal to the state supreme court failed, the court taking the position that the trial judge had the final power to determine the matter of retrial on grounds of additional evidence. On April 9, 1927, Judge Thayer sentenced the two defendants to the electric chair.

It was at this point that the storm of protest broke loose. Newspapers in both Europe and America gave large amounts of space to the proceedings, mass meetings were held, and the officials connected with the case were flooded with petitions mingled with threats. The defense carried the case to Governor Fuller, holder of the power of clemency, who in addition to a personal investigation appointed President Lowell of Harvard university, President Stratton of the Massachusetts Institute of Technology and Robert Grant, a former judge, to investigate the case independently. On Aug. 3, Governor Fuller announced that he had found against the plea, and that his advisory committee had also come to the conclusion that a new trial was not warranted. Successive stays postponed the execution while further vain appeals were made to Judge Thayer, to the supreme judicial court, and finally to members of the U.S. supreme court, the attorney-general and the president. During the days following Governor Fuller's denial of clemency, demonstrations were made in many cities in America and abroad, bombs were set off in New York city and Philadelphia and guards were set up against other threats of violence. The two men were executed on Aug. 23, 1927, both maintaining their innocence.

SACHAU, CARL EDUARD (1845–1930), German scholar, was born on July 20, 1845 at Neumünster in Holstein. In 1869 he was appointed professor of Semitic languages at the University of Vienna, and in 1876 professor of oriental languages at Berlin, where he became director of the school of oriental languages. In 1879–80 he travelled extensively in Syria and Mesopotamia, and in 1897–98 in Babylonia and Assyria. He wrote *Syrisch-römisches Rechtsbuch aus dem 5. Jahrhundert* (1890); *Reise in Syrien und Mesopotamien* (1883); *Neuarabische Volkslieder aus Mesopotamien* (1889); *Katalog persischer Handschriften* (1889); *Muhammedanisches Erbrecht von Zansibar und Ost-Afrika* (1894); *Am Enphrat und Tigris* (1900); *Syrische Rechtsbücher* (1907–14).

For a complete bibliography of the works of Sachau, see S. Weill, *Die Festschrift zu Ehren Ed. Sachaus* (1915).

SACHEVERELL, HENRY (1674–1724), English ecclesiastic and politician, was the son of Joshua Sacheverell, rector of St. Peter's, Marlborough. He was adopted by his godfather, Edward Hearst, and his wife, and was sent to Magdalen college, Oxford, in 1689, was demy of his college from 1689 to 1701 and fellow from 1701 to 1713. Sacheverell took his degree of B.A. in 1693, and became M.A. in 1695 and D.D. in 1708. His first preferment was the small vicarage of Cannock in Staffordshire; and in 1705 he was elected to the chaplaincy of St. Saviour's, Southwark. In 1709 he leapt into notoriety by his famous sermons attacking the Whig ministry on the charge of

neglecting to watch over the interests of the church. These sermons were delivered, one in Derby on Aug. 15, the other in St. Paul's cathedral; and both, especially the latter, were delivered in excessively violent language. They were immediately printed, and made the preacher the idol of the Tory party.

The attention of the House of Commons was drawn to the two sermons by John Dolben in Dec. 1709, and were denounced as "malicious, scandalous and seditious libels." The Whig ministry, then slowly but surely losing the support of the country, were divided in opinion as to the propriety of prosecuting Sacheverell. Somers was against such a measure; but Godolphin urged the necessity of a prosecution, and gained the day. The trial lasted from Feb. 27 to March 23, 1710, and the verdict was that Sacheverell should be suspended for three years and that the two sermons should be burnt at the Royal Exchange. Popular resentment over the trial resulted in the downfall of the ministry, Godolphin being dismissed in August and the other ministers in November. Immediately on the expiration of his sentence (April 13, 1713) Sacheverell was instituted to the valuable rectory of St. Andrew's, Holborn, by the new Tory ministry. He died at the Grove, Highgate, on June 5, 1724 (See also ENGLISH HISTORY).

See Hearne's *Diaries*, Bloxam's *Register of Magdalen* and Hill Burton's *Queen Anne*, vol. ii. There is an excellent bibliography by Falconer Madan (1887).

SACHEVERELL, WILLIAM (1638-1691), English statesman, son of Henry Sacheverell, a country gentleman, entered parliament in 1670 for Derbyshire. He was an opponent of the court policy, especially of the secret treaty with France. In 1678 he was one of the most active investigators of the "Popish Plot," and one of the managers of the impeachment of the five Catholic peers. He also served as a manager in the impeachment of Danby. He made the first suggestion of the Exclusion Bill on Nov. 4, 1678, in a debate raised by Lord Russell with the object of removing the duke from the King's Council. He vigorously promoted the bill in the House of Commons and opposed granting supplies till it should pass.

At the general election following the death of Charles II. in 1685 Sacheverell lost his seat, but he was an active member of the convention parliament. He died on Oct. 9, 1691. In the judgment of Speaker Onslow, Sacheverell was the "ablest parliament man" of the reign of Charles II. He was one of the earliest of English parliamentary orators; his speeches greatly impressed his contemporaries, and in a later generation, as Macaulay observes, they were "a favourite theme of old men who lived to see the conflicts of Walpole and Pulteney."

BIBLIOGRAPHY.—Many of Sacheverell's speeches are reported in Archibell Grey's *Debates of the House of Commons, 1669-1694* (10 vols., London, 1760). See also Sir George Sitwell, *The First Whig* (Scarborough, 1894).

SACHS, HANS (1494-1576), German poet and dramatist, was born at Nuremberg on Nov. 5, 1494. His father was a tailor, and he himself was trained to the calling of a shoemaker. Before this, however, he received a good education at the Latin school of Nuremberg. In 1509 he began his apprenticeship, and was initiated into the art of the Meistersingers by a weaver, Leonhard Nummenpeck. In 1511 he set out on his *Wanderjahre*, and worked at his craft in many towns, including Regensburg, Passau, Salzburg, Munich, Osnabrück, Lübeck and Leipzig. In 1516 he returned to Nuremberg, where he remained during the rest of his life, working steadily at his handiwork and devoting his leisure time to literature. In 1517 he became master of his guild and in 1519 married. Sachs became an ardent adherent of Luther, and in 1523 wrote in Luther's honour the poem beginning *Die wittenbergisch Nachtigall*, *die man jetzt höret überall*, and four dialogues in prose, in which his warm sympathy with the reformer is tempered by counsels of moderation. The town council of Nuremberg then forbade him to publish any more *Büchlein oder Reimen*. Before long, however, the council itself declared for the Reformation. Sachs died on Jan. 19, 1576.

By the year 1567 Sachs had composed, according to his own account, 4,275 *Meisterlieder*, 1,700 tales and fables in verse, and

208 dramas, which filled no fewer than 34 large manuscript volumes; and this was not all, for he continued writing until 1573. The *Meisterlieder* were not printed, being intended solely for the use of the Nuremberg Meistersinger school, of which Sachs was the leading spirit. His fame rests mainly on the *Spruchgedichte*, which include his dramatic writings. His "tragedies" and "comedies" are, however, little more than stories told in dialogue, and divided at convenient pauses into a varying number of acts. The subjects are drawn from the Bible, the classics, the Italian novelists and elsewhere. He succeeds best in the short anecdotal *Fastnachtspiel* or Shrove-tide play, where characterization and humorous situation are of more importance than dramatic form or construction. Farces like *Der fahrende Schüler im Paradies* (1550), *Das Wildbad* (1550), *Das heisse Eisen* (1551), *Der Bauer im Fegfeuer* (1552), are inimitable in their way, and have even been played with success on the modern stage.

Hans Sachs himself made a beginning to an edition of his collected writings by publishing three large folio volumes (1558-61); after his death two other volumes appeared (1579, 1579). A critical edition has been published by the Stuttgart *Litterarischer Verein*, edited by A. von Keller and E. Goetze (23 vols., 1870-96); *Sämtliche Fastnachtspiele*, ed. by E. Goetze (7 vols., 1880-87); *Sämtliche Fabeln und Schwänke*, by the same (3 vols., 1893). There are also editions of selected writings by J. Tittmann (3 vols., 1870-71; new ed., 1883-85) and B. Arnold (2 vols., 1885). See E. K. J. Lüdtke, *Hans Sachs* (1870); C. Schweitzer, *Étude sur la vie et les oeuvres de Hans Sachs* (1887); K. Drescher, *Hans Sachs Studien* (1890, 1891); E. Goetze, *Hans Sachs* (1891); A. L. Stiefel, *Hans Sachs-Forschungen* (1894); R. Genée, *Hans Sachs und seine Zeit* (1894); 2nd ed., 1902; E. Geiger, *Hans Sachs als Dichter in seinen Fastnachtspielen* (1904).

SACHS, JULIUS VON (1832-1897), German botanist, was born at Breslau on Oct. 2, 1832. On leaving school in 1851 he became assistant to the physiologist J. E. Purkinje at Prague. In 1856 he graduated as doctor of philosophy, and established himself as *Privatdozent* for plant physiology in the university of Prague. In 1859 he was appointed physiological assistant to the Agricultural Academy of Tharandt in Saxony; and in 1861 he went to the Agricultural Academy at Poppelsdorf, near Bonn, where he remained until 1867, when he was nominated professor of botany in the university of Freiburg-im-Breisgau. In 1868 he accepted the chair of botany in the university of Würzburg, which he continued to occupy until his death on May 29, 1897.

Sachs was especially associated with the development of plant physiology which marked the latter half of the 19th century, though he contributed to every branch of botany. His earlier papers, in botanical journals and publications of learned societies, are of interest. Prominent among them is the series of "Keimungs-geschichten," which laid the foundation of our knowledge of microchemical methods, and the morphological and physiological details of germination. Then there is his resuscitation of the method of "water-culture," and its application to problems of nutrition; and further, his discovery that the starch-grains to be found in chloroplasts are the first visible product of their assimilatory activity. His later papers were published in the three volumes of the *Arbeiten des botanischen Instituts in Würzburg* (1871-88). Among these are his investigation of the periodicity of growth in length; his researches on heliotropism and geotropism, in which he introduced the "clinostat"; his work on the structure and arrangement of cells in growing-points; the evidence upon which he based his "imbibition-theory" of the transpiration-current; his studies of the assimilatory activity of the green leaf; and other papers.

Sachs' works are: *Handbuch der Experimentalphysiologie der Pflanzen* (1865; French edition, 1868); *Lehrbuch der Botanik* (1868, Eng. ed., 1875 and 1882); a comprehensive work, giving a summary of the botanical science of the period, including the results of original investigations; *Vorlesungen über Pflanzenphysiologie* (1st ed., 1882; 2nd ed., 1887; Eng. ed., Oxford, 1887); *Geschichte der Botanik* (1875, Eng. ed., 1890).

A full account of Sachs' life and work was given by E. C. Pringheim, *Julius Sachs* (1932); see also *Flora*, lxxiii (1897); *Allg. Deutsch. Biogr.*, lili (1907); *Proc. Roy. Soc.*, lxi (1897); *Naturwiss. Rundschau* (Braunschweig, 1898).

SACHS, MICHAEL (1808-1864), German Rabbi, one of the first of Jewish graduates of the modern universities, was appointed Rabbi in Prague in 1836, and in Berlin in 1844. He took

the conservative side against the Reform agitation, and retired from the Rabbinate rather than acquiesce in the use of the organ in the synagogue. Sachs co-operated with Zunz in a new translation of the Bible. He is best remembered for his work on Hebrew poetry, *Religiöse Poesie der Juden in Spanien* (1845).

SACKBUT, SHAKBUSSHE, SAGBUT, DRAW or DRAWING TRUMPET, the earliest form of slide trumpet, derived from the Roman buccina, which afterwards developed into the trombone. As soon as the effect of the slide in lengthening the main tube and therefore proportionally deepening the pitch of the instrument was understood, and its capabilities had been realized, the development of a family of powerful tenor and bass instruments followed as a matter of course. The transformation of the busine (*buccina*) into the sackbut involved two or three processes, the addition of the slide being accomplished in at least two stages, the extending portion of the tube being at first straight and later bent or folded to make the instrument less unwieldy. (See also *TROMBONE*, *TRUMPET* and *BUCCINA*.)

SACKETS HARBOR, a village in Jefferson county, New York, U.S.A., at the eastern end of Lake Ontario, on the south shore of Black River bay, about 1 mi. from its mouth, and about 10 mi. W. by S. of Watertown. Pop. (1940) 1,962; (1950) 1,247. Sackets Harbor is served by the New York Central railway. It is built on low land, around a small, nearly enclosed harbour, the northern shore of which is formed by Navy Point, a narrow tongue of land extending about ¼ mi. nearly due eastward from the mainland. In the military cemetery is the grave of Gen. Zebulon M. Pike (q.v.), killed at York (Toronto) on April 27, 1813.

The first settlement was made in 1801 by Augustus Sacket and the village was incorporated in 1814. In the war of 1812 Sackets Harbor, important strategic point for the Americans, was the base for naval operations on the Great Lakes. In July 1812 it was attacked by a Canadian provincial squadron and again in May 1813, by a British squadron under Commander Yeo and troops under General Sir George Prevost, on both occasions unsuccessfully.

For many years it boasted the world's smallest navy yard, under four acres. It continues to be occupied by Naval Reserves. For several years the property was in charge of the shipkeeper's widow and thus was commanded by a woman. The first steamship on the Great Lakes was launched at Sackets Harbor in 1817. Von Schultz and 700 men sailed from the port in Nov. 1838, to invade Canada, were captured near Prescott and Von Schultz was executed at Kingston after the trial.

See A. T. Mahan, *Sea-Power in Its Relation to the War of 1812* (Boston, 1905); and W. Kingsford, *The History of Canada*, vol. viii. (Toronto, 1895).

SACKING AND SACK MANUFACTURE

Sacking is a heavy closely-woven fabric, originally made of flax, but now almost exclusively made of jute or of hemp. The more expensive kinds, such as are used for coal sacks for government and other vessels, are made of hemp, but the jute fibre is extensively used for the same purpose, and almost entirely for coal-sacks for local house supplies. The same type of fabric is used for wool sacks, cement bags, ore bags, pea sacks and for any heavy substance; it is also made up into a special form of bag for packing cops and rolls of jute and flax yarns for delivery from spinners to manufacturers. Proper sacking is essentially a twilled fabric, in which the number of warp threads per inch greatly exceeds the number per inch of weft. The illustration shows a typical kind of three-leaf twill, double warp sacking. All three-leaf twill sack-

ings are double in the warp, but four-leaf sackings are usually single; special kinds may be double in the warp. In all cases the warp is comparatively thin, say 6lb. to 8lb. per spyndle, whereas the weft is thick and single from 16lb. to 48lb. per spyndle. Cloths are usually 27 in. wide, but other widths are made.

The lower part of the illustration shows four repeats of the three-leaf twill, while the lines drawn to the plan of the fabric show that each line of the design is reproduced in the cloth by two warp threads. Large quantities of cotton sacks are made for flour, sugar and similar produce; these sacks are usually plain cloth, some woven circular in the loom, others made from the piece.

Large quantities of seamless bags or sacks for light substances are woven in the loom, but these are almost invariably made with what is termed the double plain weave; i.e., the cloth, although circular except at the end, is perfectly plain on both sides, and similar in structure to, but wider than hose-give (q.v.). Circular bags have been made both with three-leaf and four-leaf twills, but it is found much more convenient and economical to make the piece, and then to make it up into sacks by one or other of the many types of sewing machines. The pieces are first cut up into definite lengths by special machinery, which may be perfectly automatic or semi-automatic—usually the latter, as many thicknesses may be cut at the same time, each of the exact length. The lengths of cloth are then separately doubled up, the sides sewn by special sewing machines.

The chief centres for jute bags are Dundee and Calcutta, all varieties of sacks and bags being made in and around the former city. For paper sacks see *PAPER* and *PAPER MANUFACTURE*.

See T. Woodhouse, *The Finishing of Jute and Linen Fabrics* (1928).

SACKVILLE, GEORGE, 1ST VISCOUNT (1715–1785), generally remembered as Lord George Sackville or Lord George Germain, third son of Lionel Cranfield Sackville, 1st duke of Dorset, was born on Jan. 26, 1716. Educated at Westminster School and Trinity College, Dublin, he was gazetted captain in 1737, and saw active service in the German campaign. Wounded in the charge of Cumberland's infantry column at Fontenoy, he was taken to the tent of King Louis XV. to have his wound dressed, and was soon released. He received rapid military promotion, and was gazetted major-general in 1755 and lieutenant-general in 1757. Meanwhile he filled the offices of first secretary to his father, the lord-lieutenant of Ireland, and Irish secretary of war, and sat in each of the two Houses of Commons at Westminster and Dublin. In 1758, under the duke of Marlborough, he shared in the ineffective raid on Cancale Bay, and the troops, after a short sojourn in the Isle of Wight, were sent to join the allied army of Duke Ferdinand of Brunswick in Germany. Marlborough died shortly after they landed, and Sackville succeeded him as commander-in-chief of the British contingent. His haughty and domineering temper estranged him both from his second-in-command, Lord Granby, and the commander-in-chief, Prince Ferdinand. This culminated on the day of Minden (August 1, 1758). The British infantry, aided by some of the Hanoverians, had won a brilliant success, and every man in the army looked to the British cavalry to charge and to make it a decisive victory. But Sackville, in spite of repeated orders from Prince Ferdinand, sullenly refused to allow Granby's squadrons to advance. The crisis passed, and the victory remained an indecisive success. A court-martial in 1760 pronounced him guilty of disobedience, and adjudged him "unfit to serve his Majesty in any military capacity whatsoever." In 1763 his name was restored to the list of the Privy Council. In 1769 he allied himself with Lord North. To this period belong the famous Junius Letters, with the authorship of which Sackville was erroneously credited. In 1770, under the terms of a will, he assumed the name of Germain. In 1775, having meantime taken an active part in politics, he became secretary of state for the colonies in the North cabinet, and he was practically the director of the war for the suppression of the revolt in the American colonies. Germain and the North cabinet misunderstood the situation and there was constant friction with the generals and the army in the theatre of war. Nevertheless he received a peerage. He died at Stoneland Lodge (Buckhurst Park) Sussex, on Aug. 26, 1785.

WEAVE AND CLOTH PLANS

Bottom: black squares show unit weave, black circles show three repeats of unit weave: top: plan of 8 units of the weave structure of cloth showing 12 double threads of warp and 6 picks of weft.

SACKVILLE, THOMAS 1st EARL OF DORSET (c. 1530-1608), English statesman and poet, son of Sir Richard Sackville, was born at Buckhurst, Sussex, took his M.A. at Cambridge and was called to the bar at the Inner Temple. He married Cicely, daughter of Sir John Baker of Sissinghurst, Kent; in 1558 he entered parliament as member for Westminster, in 1559 he sat for East Grinstead, Sussex, and in 1563 for Aylesbury, Buckinghamshire. During a visit to the continent in 1566 he was imprisoned for a rash declaration of Protestant opinions. The news of his father's death on April 21, 1566, recalled him to England. On his return he was knighted in the queen's presence, receiving at the same time the title of baron of Buckhurst. In 1571 he was sent to France to congratulate Charles IX on his marriage with Elizabeth of Austria, and he took part in the negotiations for the projected marriage of Elizabeth to the duke of Anjou. In 1572 he was one of the peers who tried Thomas Howard, duke of Norfolk, and in 1586 he was selected to convey the sentence of death to Mary queen of Scots. He was sent in 1587 as ambassador to The Hague and carried out under protest the foolish and often contradictory orders he received. His plain speaking on Leicester's action in the Netherlands displeased the queen. His return was followed by a short period of disgrace, but he was sent again to the Netherlands in 1589 and 1598. He was elected chancellor of the University of Oxford in 1597, and in 1599 succeeded Lord Burghley as lord high treasurer. In 1601 as high steward he pronounced sentence on Essex, his rival for the chancellorship and his opponent in politics. James I confirmed him in the office of lord treasurer. He was created earl of Dorset in 1604, and died suddenly at the council table on April 19, 1608. His eldest son, Robert, the 2nd earl (1561-1609), was a member of parliament and a man of great learning. Two other sons were William (c. 1568-91), a soldier killed in the service of Henry IV of France, and Thomas (1571-1646), also a soldier. Sackville is remembered, not by his distinguished political career, but by his share in two works, each of which was, in its way, a new departure in English literature. To the second edition (1563) of the *Myrroure for Magistrates*, edited by William Baldwin, Sackville contributed the *Complaint of Henry Stafford*, duke of Buckingham, to which he prefixed an *Induction*. This induction was arbitrarily transposed (1610) to the beginning of the collection by a later editor, Richard Nicolls, a proceeding which led to the attribution of the general design to Sackville, an error repeated by Thomas Warton. The originators were certainly Baldwin and his "printer" who designed the *Myrroure* as a continuation of John Lydgate's *Falls of Princes* in the form of laments of the ghosts of great men written by various laids. Fragments of the earliest edition entitled *A Memoriall of such princes as . . . have been unfortunate . . .* are sometimes found bound up with Lydgate's book.

Sackville's *Induction* opens with a description of the oncoming of winter. The poet meets Sorrow, who offers to lead him to the infernal regions that he may see the sad estate of those ruined by their ambition, and thus learn the transient character of earthly joy. At the approaches of Hell he sees a group of terrible abstractions, Remorse of Conscience, Dread, Misery, Revenge, Care, etc., each vividly described. The last of these was War, on whose shield he saw depicted the great battles of antiquity. Finally, penetrating to the realm of Pluto, he is surrounded by the shades, of whom the duke of Buckingham is the first to advance, thus introducing the *Complaint*. Sackville's models were Gavin Douglas and Virgil. The dignity and artistic quality of the narrative of the fall of Buckingham make the work one of the most important between the *Canterbury Tales* and the *Faerie Queene*.

Sackville has also the credit of being part author with Thomas Norton of the first legitimate tragedy in English. This was *Gorboduc* or *Ferrex and Porrex*, performed at Christmas 1560 by the society of the Inner Temple, and on Jan. 18, 1561, before Elizabeth at Whitehall. The argument is as follows:

"Gorboduc, king of Brittain, devided his Realme in his lyfe time to his Sonnes, Ferrex and Porrex. The Sonnes fell to dyvisiion and discention. The yonger kyllled the elder. The Mother, that more dearly loved thelder, fr revenge kyllled the yonger. The people, moved with the Crueltie of the fact, rose in Rebellion and

Slew both father and mother. The Nobilitie assembled, and most terribly destroyed the Rebelles. And afterwards for want of Issue of the Prince, wherby the Succession of the Crowne became uncertayne, they fell to Cuill warre, in which both they and many of their Issues were slayne, and the Lande for a longe tyme almost desolate, and miserably wasted."

The story is taken from book ii, chap. xvi, of Geoffrey of Monmouth's history. It was first printed (1565) in an unauthorized edition as *The Tragedie of Gorboduc* "whereof three Actes were written by Thomas Nortone, and the two laste by Thomas Sackvyle." In 1570 appeared an authentic edition, *The Tragedie of Ferrex and Porrex*. The tragedies of Seneca were now being translated, and the play is conceived on Senecan lines. The paucity of action is eked out by a dumb show to precede each act, and the place of the chorus is supplied by four "ancient and sage men of Brittain." In the variety of incident, however, the authors departed from the classical model. The play is in blank verse, and is the first example of the application of Henry Howard, earl of Surrey's innovation to drama. Jasper Heywood in the poetical address prefixed to his translation of the *Thyestes* alludes to "Sackvylde's Sonnets sweetly saute," but only one, prefixed to Sir T. Hoby's translation of Castiglione's *Courtier*, has survived.

The best edition of *A Mirror for Magistrates* is that of Joseph Haslewood (1815). *Gorboduc* was edited for the Shakespeare society by W. D. Cooper in 1847; in 1885 by L. Toulmin Smith for C. Vollmüller's *Englische Sprach und Literaturdenkmale* (Heidelberg, 1885) and by J. Q. Adams, *Chief Pre-Shakespearean Dramas* (1924). The *Works of Sackville* were edited by C. Chapple (1830) and by R. Sackville-West (1899). See also *A Mirror for Magistrates* (1898) by W. F. Trench; and accounts in W. J. Courthope's *History of English Poetry*, vol. i, and in the *Cambridge History of English Literature*, vol. iii.

SACO, a city of York county, Me., U.S., on the Saco river and the Atlantic ocean, opposite Biddeford and 14 mi. S.W. of Portland. It is on federal highway 1 and is served by the Boston and Maine railroad. Pop. (1950) 10,324; (1940) 8,631. There is abundant water power, and the city has cotton mills and various other factories. The adjoining town of Old Orchard Beach, with one of the finest beaches on the coast (a wide crescent 10 mi. long), has long been a popular summer resort and was a starting point for several early transatlantic flights. Saco was founded by settlers from Plymouth colony in 1629 through a grant of land which included the present site of the city. The first permanent settlement, however, is recorded as 1623, when Thomas Lewis and Richard Bonython arrived. It was made a part of Massachusetts in 1653 and became represented in the general court in 1659. It was incorporated as Biddeford in 1718. Later it was divided, and that part north of the Saco river was incorporated as Pepperellboro in 1763 in memory of Gen. Sir William Pepperell. In 1805 the name was changed to Saco. It was incorporated as a city and a charter was adopted in 1867.

SACRAMENT, the title given by Christians to an external rite or ceremony regarded as the instrument, or at least a symbol, of the reception by those who participate in it of a spiritual benefit whereby Christ is the author. As the conception of a spiritual benefit received through participation in an external rite is by no means peculiar to Christianity, the expression is often applied also to rites in other religions more or less analogous to those designated sacraments by Christians, and sometimes to any instance of the use of material objects as instruments whereby spiritual benefits may be conveyed or appropriated, even although no religious doctrine or ritual be associated with such conveyance or appropriation. The present article, however, will be mainly concerned with the Christian conception of a sacrament, and rather with the content and significance of that conception than with its history.

In the *Sentences* of Peter Lombard, bishop of Paris 1159-60, which served for centuries as the theological textbook of western Christendom, *sacramentum* in the most general use of the word is defined (5 Sent. dist. 1 B. following Augustine Ep. 138 § 8, *signa quas, cum ad res divinas pertinent, sacramenta appellantur*) as *sacrae rei signum*; and, more precisely, as *invisibilibus gratias visibilibus forma*; but in its strictest acceptation, wherein it is applicable only to certain Christian rites, as *quod est sacramentum* and

gratiae Dei et invisibilis gratiae forma ut ipsius imaginem gerat et causa existat—an outward and visible sign of an inward divine grace, which it both apply represents (as immersion in baptismal water represents cleansing from sin, or eating and drinking eucharistic bread and wine the maintenance and strengthening of spiritual life) and also actually imparts to the recipient

The word *sacramentum* is used in classical Latin literature of the pledge deposited in a temple by the parties to a lawsuit, and also of the soldier's oath of allegiance to his commander; and neither of the senses has been without influence on its employment by Christian theologians. But the far less restricted sense given to it by the Latin-speaking Fathers and their choice of it to render the Greek *μυστήριον* point to its having had a more general signification, corresponding to its etymology, such as is suggested by St. Thomas Aquinas when he says that that may be called *sacramentum* whereby anything is made sacred (*sacratum*) as that whereby anything is adorned (*ornatur*) is called *ornamentum* (in 4 Sent. i. 1; cf. *Summ. Theol.* q. u. ix. art. 1: *Sacramentum dicitur a sacratio, sicut medicamentum a medicando*). Thus, behind the conception of a sacrament lies the notion, common to all peoples, of a "sacred" sphere or world, distinct from, but in close contact with, that of everyday life, so that particular persons, things, places and times can, by recognized methods of "consecration" or "desecration," be removed from one to the other.

The word *μυστήριον*, employed by the Greek-speaking Church, was associated with the same notion, being the regular designation of religious ceremonies of initiation. These ceremonies distinguished the initiated from those not counted worthy of such translation from the sphere of ordinary life to communion with denizens of a higher world, and suggested the *secrecy* with which "sacred" rites were invested, in order to secure their performance from the intrusion of profane or unconsecrated persons or things. In the New Testament *μυστήριον* is almost exclusively used of the divine secrets (e.g., of God's purpose to include all nations in the covenant made by him at first with Israel alone) which are described as now at length divulged to the world by the preaching of Christ's apostles. It is not applied to the solemn rites of initiation and communion which were nevertheless already regarded as "means of grace," and came, with the spread of Christianity in the Graeco-Roman world, to be treated as corresponding in the new faith to the ceremonies there denoted by the name, in which Christians from Justin onwards, were accustomed to see a diabolical travesty of the Christian "sacraments." Nor for a long time was the word *sacramentum*, by which the earliest Latin translators of the Scriptures rendered *μυστήριον* limited to those outward "means of grace" to which it came eventually to be appropriated; and, even after it had been thus appropriated, it was only gradually that among a host of ceremonies and things used in ceremonies, all supposed to convey divine grace in some manner or degree, a certain number were definitely acknowledged as properly entitled to the name of sacraments.

THE SEVEN SACRAMENTS

Seven rites were recognized in the west, from Peter Lombard onwards, as sacraments in the strict sense: Baptism, Confirmation, the Eucharist, Penance, Extreme Unction, Orders and Marriage; the Councils of Trent and of the Vatican endorsed this list which has also been adopted by the orthodox Church of the east. The Churches of the Reformation, on the other hand, acknowledged only baptism and the eucharist, to which indeed a certain pre-eminence was universally allowed, as entitled to be called sacraments in the proper sense; mainly on the ground that these alone could be proved from Scripture to have been instituted by Christ himself as external ceremonies effecting, or at least attesting and sealing, the conveyance of an inward spiritual grace to worshippers qualified to receive it by faith in the promise expressly associated with its performance by its divine Founder. In demanding that a sacrament in the proper sense must be able to claim institution by Christ the Reformers did not differ from the Roman Church. But they refused to accept inferences from the words of Scripture, though supported by ecclesiastical tra-

dition, as evidence of such institution equivalent to the direct commands to be found for baptism in Matt. xxviii. and for the eucharist especially in 1 Cor. xi.

The Scriptural texts alleged to suggest a like institution for the other rites recognized by the Roman Church as sacraments seemed to them either to be inapplicable to them or else to make no such provision for a particular outward symbol of the promised grace as was necessary to constitute a "sacrament," while the traditional rendering of *μυστήριον* by *sacramentum* in the application of the word to marriage in Eph. v. 32 could hardly be said to warrant the interpretation of the word there, as intended in a very specialized sense otherwise unknown to the New Testament. Where, however, there was, as with baptism and the eucharist, express scriptural authority for the institution by Christ of an outward and visible sign of an inward spiritual grace, of the bestowal whereof it was to be, to a believer in his promise, at least the assurance, if not the instrument, there the Protestant as well as the Catholic, recognized a genuine sacrament.

There was, however, an important point of difference between them, in respect of such ceremonies as they agreed in regarding as "sacraments." The former denied, and the latter affirmed that they confer grace *ex opere operato*. This phrase seems to have been originally intended to express the belief that sacraments do not depend for their efficacy on the moral character or even on the private beliefs of the individual minister; that where an otherwise qualified person, though wicked or unbelieving, yet intending "to do what the Church does," observes the appointed forms, the recipient need not be afraid that the promised grace is not received; the human minister being no more than an instrument in the hand of the true Giver, Christ Himself. This the Churches of the Reformation for the most part did not deny; the view of Wyclif that only one himself in a state of grace could administer a valid sacrament obtained little acceptance. But the Reformers objected to the phrase *ex opere operato*, which was solemnly reaffirmed against their objections by the Council of Trent. It seemed to them inconsistent with the supreme place assigned in their theology to faith as the sole means of justification. Catholics did not indeed deny that the absence of personal faith in a recipient in whom it could be present (as it could not be, for example, in infants brought to baptism) would present an impediment to this profiting by the grace offered in a sacrament, and on their side, Protestants, in allowing infant baptism, were constrained to admit that the requisite faith was not necessarily that of the individual recipient, but might be that of his parents or of the Church.

Nevertheless, the difference between Catholic and Protestant in that the one laid stress upon the necessity to salvation of sacraments where they could be had, and the other on the indispensableness of faith, which could justify without sacraments, while without it sacraments could not justify, profoundly affected their respective attitudes towards an institution which the Protestant as little intended to disparage as the Catholic. In respect of the eucharist, whereas Luther, Calvin, and the Reformers generally had hoped, by abolishing celebrations at which the priest alone communicated, to restore the primitive frequency of communions, the actual result of the changes introduced by them was to deprive that service in any form of the central place in the public worship of the Church which it had held from the very beginnings of Christianity. Catholics on the other hand were driven by the necessity of maintaining the efficacy of sacraments *ex opere operato* into placing and encouraging a reliance on sacraments which exposed them to the charge of allowing their religion to degenerate in practice into magic.

SYMBOLISM

It cannot be denied that the use of sacraments presents a certain resemblance to some kinds of magic. There is in both the employment of material objects and of bodily gestures in conjunction with a particular form of words to produce effects which, apart from such conjunction, they could not have accomplished. But sacraments resemble far more closely facts of human life which no one would think of describing as magical in any disparaging

ing sense; such as the operation of words, spoken or written, in creating states of feeling, inspiring action, or revealing personality. Here the necessity of intelligent acceptance by those affected of the conventional meaning of the sounds or words employed, the limitation of the effect produced to a certain social context, and the quality (not merely physical, but intellectual or spiritual) of the result obtained distinguish verbal communication (though, as certainly not fully explicable on the principles recognized in the natural sciences, it may fairly be called *mysterious*) from what is usually meant by magic. And in these respects, sacraments must be classed with verbal communication. No Christian theologian would allow that these are effective altogether outside of the context of that agreement as to the meaning of the signs and formulas used which exists among Christians, or for the production of merely physical effects according to any law which, like those called "natural," operates irrespectively of the consciousness of those in whose bodies they are produced.

Attempts to treat sacraments as thus effective for "magical" purposes have not been unknown; but they have always been denounced by ecclesiastical authority and regarded as wrong and profane. Without entering into details as to charges of the magical use of sacraments made by theological opponents against particular groups of Christians, it may be observed, in reference to one of special historical importance that, while it is quite arguable that to use the eucharist as a focus of adoring devotion apart from communion is an unwarrantable departure from its original intention, both parties to the controversy here indicated would agree in disapproving as illegitimate any use of it for purposes really other than that or those (whatever it or they may be) for the sake of which it was originally instituted.

Wherever sacraments are used at all (and few Christian denominations have, like the Society of Friends, abandoned the use even of the two which undoubtedly date back to New Testament times), although there may be no crude abuse of them for confessedly magical purposes, quite other than those which the Church holds them to be intended to secure, it is possible to assimilate them to magical performances, by losing sight of their function as vehicles for communicating to individuals a life essentially social and, like all social life, requiring a conventional or ceremonial mode of expression, and of the essentially ethical character of the life which they are thus designed to communicate. The use of material objects or of bodily gestures in the communication of spiritual grace is not alien to the religion of the New Testament, but it is never there taken out of the context of a moral and social life in the imparting and maintaining of which the whole purpose of such use of objects and gestures consists. It is in a firm grasp of the social character of sacraments and of the moral quality of the life which they are designed to serve as instruments in communicating that the true safeguard against the very real danger of a degeneration of sacramentalism into magic-mongering should be sought rather than in the elimination of sacramentalism from religion, with the whole history of which it is intimately bound up, and by which, as has been well said, "the higher gifts are made accessible to persons of all stages of culture."

"The principle that spiritual values and forces are mediated through material processes," the same writer observes, "runs through nature as a whole." The very production of a new personality is only possible through "a material process the most liable . . . to carnal misuse." "Truth, beauty, goodness . . . become effective only through material forms." There are "natural sacraments"—the kiss, the handshake, the flag—outside of religion. The admittedly important part which these and their like play in our common social life the sacraments play in religion; and in Christianity in particular, "we are bidden to act as sons of God and sharers in Christ, knowing by an outward sign that we are so. Our reliance is to be on the word and act of God, while the joy of responsive emotion comes and goes." (Gore, *The Holy Spirit and the Church*, pp. 24, 146, 148.)

To the value of sacramentalism to human life Goethe (*Wahrheit u. Dichtung*, Th. ii., B. 7) and Comte, who devised an elaborate system of symbolic rites for his new Religion of Humanity, may

be cited as witnesses. That in the early stages of civilization the magical and the sacramental are not easily discriminated is no more than may be said of the magical and the religious in general, or indeed of the magical and the scientific. Primitive magic owes its disappearance at a higher level of culture to its confusion (arising at first from lack of experience, afterwards from the persistence of uncriticized tradition) of different kinds of causation; the supposition, for instance, that the utterance of a name may affect an animal, thing, or unconscious person as it may a person who hears himself called; or that the moral healing of a soul may be effected by external actions without a change in the direction of the will. We still know too little about the interaction of mind and body to despise our ancestors or undeveloped contemporaries for making mistakes in this department, which it has taken centuries of progress, religious and scientific, to render us inexcusable in making. But neither need these ancient errors, even though they may, here as elsewhere, have left traces of themselves, interesting to the archaeologist in conventions and customs which have survived the false beliefs in which they originated, be supposed to render trivial or illusory the higher activities and experiences in connection with which these traces are retained.

THE ARGUMENT OF CONTINUITY

But while we may speak of "natural sacraments" the word is strictly appropriate only where a distinction is drawn between the everyday world and a "sacred" world transcending this, although not necessarily separated from it in space or time. Where the use of the term is extended to the communication of spiritual illumination or power through material symbols apart from religion, we have to do either with a metaphor or, more usually, with a conviction that what is experienced in religion may be employed as a key to the true or ultimate nature of the world as a whole, including those features of it which are revealed to us in that part of our experience which is not in itself specifically religious. For Christians the "sacred" sphere is that which is directly related to Christ, and accordingly nothing can be properly called a "sacrament" which cannot claim authorization by Christ as a vehicle of Divine grace. While a statement in the Bible was taken as, by its presence there, guaranteed to be, when rightly understood, free from error, the undoubted occurrence in Scripture of direct statements that Christ instituted baptism and the eucharist was sufficient to establish their claim. Critical study of the Bible has here, however, altered the situation. Few scholars would now be prepared to regard Matt. xxvii. 19, and 1 Cor. xi. 23 *sqq.* as putting it beyond doubt that the historical Jesus actually prescribed the permanent observance of these rites by his followers. Thus the old question as to the number of sacraments cannot be argued on the old grounds, but rather on that of the continuity between any rite now in use and a rite observed in the primitive Christian community from which the New Testament proceeded; and of the degree in which that community regarded it as intimately bound up with that fellowship with the crucified and risen Saviour which this community existed to offer to all who would join themselves with it.

That baptism and the eucharist were regarded as very intimately bound up with it is certain. Converts were always initiated by a ceremonial washing in Christ's name; such a washing, symbolical of cleansing from sin, being (whether or no actually practised or enjoined by Jesus) familiar to Jews as used in the admission of proselytes and specially associated with Christ's own baptism by John the Baptist, whose mission Christians believed to have been preparatory to their Master's. From the first the followers of Jesus continued the custom, which had plainly been characteristic of his daily intercourse with his disciples, of the solemn blessing and breaking of bread at their social meals; a custom invested with specially solemn associations by the circumstances of His last supper whereat he was believed to have used words identifying the bread and cup shared among his companions with his own body and blood, which were so soon after to be broken and shed upon the cross.

The credentials of the other rites acknowledged by many Christians as sacraments were more doubtful. A laying on of hands

symbolical of the gift of the Spirit seems usually from the beginning to have formed part of the initiatory rite, though sometimes detached from the baptism proper; but no tradition connected it with any injunction of Jesus; the gift imparted was associated in the New Testament with extraordinary manifestations not destined to be permanent; of the anointing which later became the chief feature of "confirmation" Scripture says nothing. Jesus had been wont to forgive sins, and sins were believed to be washed away in baptism; but no ceremony or fixed formula is recorded to have been used by Jesus in this connection; only gradually was it realized that sin after baptism would be a normal feature of the Christian's life; nor can scriptural authority be claimed for the system of penitential discipline which was gradually developed in the Church. The unction of the sick mentioned in James was not, like the later rite which appealed to its precedent, intended to be "extreme"; its primary purpose was not the imparting of a spiritual gift, but bodily healing, which alone is mentioned as the object of unction in the only scriptural passage (Mark vi, 13) which appears to represent it as performed by Christ's direction. The setting apart of office-bearers in the Christian community by laying on of hands is certainly apostolical; but this symbolic mode of appointment is nowhere stated in Scripture to have been used or enjoined by Jesus himself. Lastly, the only claim of the immemorial and universal institution of marriage to be a "sacrament of the new law" appears, as said above, to be the incidental observation of St. Paul (doubtless suggested by the prophetic use of it as a symbol of the bond between Yahweh and Israel) that it is a "great mystery" or "sacrament" as representing the union of Christ with his Church. But though only certain rites may be reckoned as sacraments in a prerogative sense, the whole system through which individual members of a religious group are placed, through symbols, conventionally recognized therein as instruments of its communication, in contact with the spiritual life which gives unity to the group may be regarded as sacramental. In Christianity—and the associations of the word "sacrament" are Christian—this is the divine life historically manifested in the person and work of Jesus Christ and believed to be continued in the community which, as inspired by His Spirit, may be called His "mystical body." Here those rites, the continuous experience of grace received through which throughout the history of the community attest the unbroken presence therein of the same source of spiritual life are entitled to the name of sacraments. It is clear that only where there exists faith in the reality of this divine life and in the organic relation of the community thereto, can any significance or efficacy be attributed to these; but also that such faith can only be other than an illusion if this life and this relation are in fact real. (See also BAPTISM, EUCHARIST.)

SACRAMENTALS, in the Roman Catholic Church, signs of ecclesiastical institution which differ from sacraments in that they do not give grace of themselves, but only prepare men to receive more worthily the grace of the sacraments. Typical sacramentals are the sign of the cross, holy water, blessed candles, ashes, palms, crucifixes and rosaries. Their special effect derives from the power of the church's prayer. It is conditioned in the concrete by the dispositions of the user. (Cf. *Codex Iuris Canonici*, cc. 1144 ff.)

SACRAMENTARIANS, the name given to those who during the Reformation controversies not only denied the Roman Catholic doctrine of "transubstantiation," but also the Lutheran "consubstantiation." They admitted a spiritual presence of Christ which the devout soul can receive and enjoy, but denied any physical or corporeal presence. Finally accepting the Confession of Augsburg, they were merged in the general body of Lutherans; with the exception of the Swiss followers of Huldreich Zwingli, whose position was incorporated in the Helvetic Confession. It is a curious inversion of terms that in recent years has led to the name Sacramentarians being applied to those who hold a high or

extreme view of the efficacy of the sacraments.

SACRAMENTO, the capital city of California, U.S., and the county seat of Sacramento county, is located at the confluence of the American and Sacramento rivers midway between the Sierra Nevada range and the Pacific ocean. It is on the hub of federal highways 40, 50 and 90, and major routes of the state highway system. It has a municipal airport and several private airports and is served by transcontinental and other air lines serving the Pacific coast area. Railroads serving Sacramento are the Southern Pacific, Western Pacific, Sacramento Northern and Central California Traction company. Facilities are available for the handling of freight traffic from the San Francisco bay area via the Sacramento river to Sacramento. Under construction at mid-20th century was the port of Sacramento, to provide a deep-water port for ocean-going vessels.

The population of Sacramento was 135,761 in 1950, 105,958 in 1940 and 93,750 in 1930. The city occupies 16.7 sq.mi. and is about 30 ft. above sea level. The mean annual temperature is 60° F., and the mean annual rainfall is 18.02 in. The state capitol (built 1860-69 with later addition) stands in a park of 40 ac (owned by the state) in the heart of the city. A mile east of the capitol (in another state-owned park) is old Fort Sutter, restored and maintained by the state as a historic museum. Within the city limits are the state fairgrounds of 210 ac. The city park system covers 1,337 ac.; a municipal vacation camp is maintained in the mountains; the municipal auditorium (completed 1927) seats 5,000, and the athletic stadium (1928) 25,000. Zoning ordinances are in effect, and a city-planning board was created in 1926. The public-school system provides instruction from the kindergarten through the ninth grade. The Sacramento Junior college and the Sacramento State college provide instruction at the college level. At Davis, 14 mi. W. of Sacramento, is the college of agriculture of the University of California. The State library (427,197 vol.) has a fine law department and the most complete collection in existence on the history of California, and the Crocker art gallery houses one of the largest and most valuable collections in the west. In 1921 the city adopted a council-manager form of government. The assessed valuation of property in 1950 was \$190,859,400.

Industries and Commerce.—Sacramento is an important distributing centre and the trading area of 17 counties, a highly productive agricultural, mining and lumbering region. The immediate vicinity produces pears, peaches, plums, apricots, oranges, olives, cherries, strawberries, asparagus, celery, spinach, almonds and Tokay grapes, and harvests some fruit or vegetable every month in the year. Canning and preserving is the city's chief industry. The railroad shops employ more than 6,000 men.

Among the other major industries are can-manufacturing plants, meat-packing plants, rice and flour mills, olive-pickling plants, bean and rice cleaners and polishers, brick and pottery works, box factories and an almond-shelling plant.

History.—On Aug. 12, 1839, Capt. John Augustus Sutter (1803-80), a Swiss army officer, with three companions, landed at the confluence of the American and the Sacramento rivers, coming by rowboat from the port of San Francisco, then known as Yerba Buena. With the help of a few Indians they built an adobe house, roofed with tules, fortified it and surrounded it with a protecting adobe wall. Sutter had obtained from Gov. Juan Alvarado a grant of 11 square leagues of land. Settlers came, whom he welcomed, and his hospitality and prosperity made "Fort Sutter" famous. Situated as it was on the main line of overland travel, it soon became the greatest trading post in the west. Captain Sutter employed several hundred men, had 13,000 head of stock on his ranges, a vast acreage of wheat and a large mercantile business. In 1847 he sent James W. Marshall to find a good site for a new sawmill. A spot was selected on the south fork of the American river, 35 mi. N.E. of the fort at Coloma, and work had begun on the mill when, on Jan. 24, 1848, Marshall picked up in the millrace the first gold nugget found in California. The discovery of gold on his own land by his own man was, ironically, the cause of Sutter's ruin, for his men deserted him, the newcomers pillaged his property and he died in the east a poor man; but it

was the foundation of the city's development and of the rapid settlement of the whole state. The site of the present city was surveyed in 1848 and the name Sacramento (already in common use) was adopted. The first sale of town lots was held in Jan. 1849. The federal census reported a population of 6,820 in 1850, and the city was incorporated in that year. For some time conditions were chaotic, as in most new mining towns. Trouble with "squatters" almost led to local war in 1850. In 1849 the city offered \$7,000,000 for the honour of being the state capital. The legislature met there in 1852, and in 1854 it was chosen as the permanent seat of government. Three times between 1849 and 1853, and again in 1862, the city suffered from devastating floods, and in 1852 two-thirds of it was destroyed by fire. Further danger from flood has been averted by strong levees and by filling in the low land along the river. By 1856 the Sacramento Valley railroad (the first steam railway in California, built to accommodate the business developed in the gold mines) was completed to Folsom, 23 mi. N.E. of Sacramento. Its chief engineer, Theodore D. Judah, took plans for a feasible route across the mountains to the capitalists in San Francisco and was laughed at as a dreamer. In Sacramento, however, he found four merchants (Leland Stanford, Mark Hopkins, Charles Crocker and Collis P. Huntington) who pledged their personal fortunes to secure the undertaking of the enterprise, and on Feb. 22, 1863, in Sacramento, the construction of the Central Pacific railroad across the Sierras was begun. On May 10, 1869, at Promontory Point, Utah, Stanford drove the golden spike that united the section of road built from the west with the section built from the east, and later in the month the first through train from the Atlantic coast reached the city. Through the rest of the 19th century the growth of Sacramento was steady and gradual, and in 1900 the population was 29,282.

Subsequently, accompanying the increasing productivity of its tributary territory (largely because of irrigation and completion of the great levee system), there was a rapid commercial and industrial expansion.

Between 1900 and 1920 the population considerably more than doubled.

Between 1939 and 1949 postal receipts increased 211%; bank deposits 361%; and building permits 261%.

SACRARIUM, a term used in classical Latin for the place where sacred things were kept in a temple or private house. In mediæval ecclesiology the term is used in various senses; e.g., choir or chancel of a church (usually called sanctuary or presbytery), tabernacle, sacristy, etc.

SACRED HEART. Devotion to the Sacred Heart of Jesus is a cult peculiar to the modern Roman Catholic Church. The principal object of this devotion is the Saviour Himself. Saint Marguerite Marie Alacoque (q.v.), assisted by her director, the Venerable Claude de la Colombière, S.J. (1641–82), spread the devotion. This devotion was strongly opposed by the Jansenists, who claimed that the Heart of Christ was being adored as separate from the rest of His Being. Some of those within the church, led by the Jansenists, also opposed the devotion. The Jansenist synod of Pistoia, assembled by Scipio de Ricci, bishop of Pistoia (1780–91), which formulated this objection against the devotion, was condemned by Pope Pius VII in the Bull *Auctorem Fidei*, Aug. 28, 1794. In May 1805, De Ricci submitted to the papal condemnation of the synod. In 1856 Pius IX introduced the feast into the general calendar of the Roman Catholic Church, fixing the Friday after the Octave of Corpus Christi for its celebration. The Beatification of Blessed M.M. Alacoque in 1864 gave a new impetus to the devotion.

III, col. 271–351.

SACRIFICE, the ritual destruction of an object, or more commonly, the slaughter of a victim by effusion of blood, suffo-

cation, fire or other means (from Lat. *sacrificium*; *sacer*, holy, and *facere*, to make). While the Hebrew for sacrifice, *q̄n̄*, makes the killing of the victim the central feature, the Latin word brings out sacralization (see TABU) as an essential element in many cases. The sacrifice of desacralization is also found; hence MM. Hubert and Mauss describe a sacrifice as "a religious act, which, by the consecration of a victim, modifies the moral state of the sacrificer or of certain material objects which he has in view"; i.e., it either confers sanctity or removes it and its analogue, impurity. It is, in fact, "a procedure whereby communication is established between the sacred and profane spheres by a victim, that is to say by an object destroyed in the course of the ceremony."

Principles of Classification.—It is possible to classify sacrifices according to (1) the occasion of the rite, (2) the end to be achieved, (3) the material object to be effected or (4) the form of the rite. (1) The division into periodical and occasional is important in Hindu and other higher religions; the former class is obligatory, the latter facultative. In less developed creeds the difference tends to remain in the background; but where sacrifices are found, solemn annual rites, communal, purificatory or expiatory, are celebrated, and are obligatory. (2) The end to be achieved is sometimes sacralization, sometimes desacralization. In the former case the sacrificer is raised to a higher level; he enters into closer communion with the gods. In the latter either some material object, not necessarily animate, is deprived of a portion of its sanctity and made fit for human use, or the sacrificer himself loses a portion of his sanctity or impurity. In the sacrifice of sacralization the sanctity passes from the victim to the object; in that of desacralization, from the object to the victim. (3) Sacrifices may be classified into (a) subjective or personal, where the sacrificer himself gains or loses sanctity or impurity; (b) objective, where the current of *mana* (see TABU) is directed upon some other person or object, and only a secondary effect is produced on the sacrificer himself.

Ritual.—The necessary elements of a Hindu sacrifice are: (1) the *sacrificer*, who provides the victim, and is affected, directly or indirectly, by the sacrifice, he may or may not be identical with (2) the *officiant*, who performs the rite; we have further (3) the *place*, (4) the *instruments* of sacrifice and (5) the *victim*; where the sacrificer enjoys only the secondary results, the direct influence of the sacrifice is directed toward (6) the *object*; finally, we may distinguish (7) *three moments of the rite*—(a) the *entry*, (b) the *slaughter*, (c) the *exit*.

Sacralization and desacralization, sometimes performed by means of subsidiary sacrifices, were the essential elements of the preparation for sacrifice and the subsequent lustration. In developed forms, such as the offering of *soma*, they assumed a great importance; (1) the sacrificer had to pass from the world of man into a world of the gods; consequently he was separated from the common herd of mankind and purified; he underwent ceremonies emblematic of rebirth and was then subject to numberless taboos imposed for the purpose of maintaining his ceremonial purity. In like manner (2) the officiant prepared himself for his task; but in his case the natural sanctity of the priest relieved him of the necessity of undergoing all that the common man had to pass through; in fact, this was one of the causes which brought him into existence, the other being the need of a functionary familiar with the ritual, who would avoid disastrous errors of procedure, destructive of the efficacy of the sacrifice. (3) Where there was an appointed place of sacrifice there was no need of preparation of a place of sacrifice. (4) The necessary rites included (a) the establishment of the fires, friction being the only permitted method of kindling, (b) the tracing on the ground of the *vedi*, or magical circle, to destroy impurities, (c) the digging of the hole which constituted the real altar, (d) the preparation of the post which represented the sacrificer and to which the victim was tied, and other minor details. (5) The victim might be naturally sacred or might have to undergo sanctification. In the former case (a) individual animals might be distinguished by certain marks, or, (b) the whole species might be allied to the god. In the latter case the victim had to be with-

out blemish; (c) the age, colour or sex of the victim might differ according to the purpose of the sacrifice. It reached a degree of sanctity when only the priest might touch it. Finally, the priest made three turns round it with a lighted torch in his hand, which finally separated it from the world and fitted it for its high purpose. The sacrificer had to remain in contact with the victim, either personally, or, to avoid ritual perils, by the intermediary of the priest. After excuses made to the animal or to the species in general, the victim was placed in position, and silence observed by all who were present. The cord was drawn tight and the victim ceased to breathe; its spirit passed into the world of the gods. It remained to dispose of the corpse. After a rite intended to secure its perfect ceremonial purity, a part of the victim was removed, held over the fire and finally cast into it. The remainder, divided into portions, was cooked; a certain number of these portions fell to the sacrificer, after an invocation, which made them sacred by calling the deity to descend into the offering and thus sanctify the sacrificer. (6) Then followed the rites of de-sacralization. Finally the priest, the sacrificer, and his wife performed a lustration and the ceremonies were at an end.

With present knowledge the problem of the original form of sacrifice, if there be a single primary form, is insoluble. It is impossible to give a general survey of the purposes of sacrifice; they are too numerous, and it is rare to find any but mixed forms.

Cathartic Sacrifice.—In primitive cults the distinction between sacred and unclean is not well defined (see TABU); consequently we find two types of cathartic sacrifice—(i.) one to cleanse of impurity and make fit for common use, (ii.) the other to rid of sanctity and in like manner render suitable for human use or intercourse.

(i.) The best example of the first class is the scapegoat, where a more concrete idea of expulsion of evil (see DEMONOLOGY, EXORCISM) is present among primitive peoples, such as the Australians.

(ii.) As an example of the second class may be taken the sacrifice of the bull to Rudra, which exemplifies the concentration of holiness in a single animal as representative of its species (see ANIMAL WORSHIP).

Communal Sacrifice.—The common meal is not a primitive rite of adoption. The custom of eating the body of the victim does not necessarily spring from any idea of communion with the god; it may also arise from a desire to incorporate the sanctity which has been imparted to it—an idea on a level with many other food customs (see COUVADE), and based on the idea that eating anything causes its qualities to pass into the eater. Where the victim is an animal specially associated with a god (the most conspicuous case is perhaps that of the corn spirit), it may be granted that the god is eaten; but precisely in these cases there is no custom of giving a portion of the victim to the god.

Deificatory Sacrifice.—The object of certain sacrifices is to provide a tutelary deity of a house, town or frontier. (a) In many countries, those who die a violent death are held to haunt the place where they met their fate; consequently, when a town is built living men are interred beneath the ramparts and the pillars of the gates. (b) In parts of North America the *nagual* or *manitu* animal, of which the Indian dreams during the initiation fast and which is to be his tutelary spirit, is killed with certain rites. (c) Human representatives of the corn or vegetation spirits are killed; in these, as in other cases of the sacrifice of the man-god, the killing of the old god is at the same time the making of a new god. (d) Suicide is treated as a means of raising a human being to the rank of a god. (e) Gods may be sacrificed (in theriomorphic form) to themselves as a means of renewing the life of the god. (f) The method of creating a fetish (see FETTERISM) on the Congo resembles deificatory sacrifice: but here there is no actual slaughter of a human being; magical means are alone relied upon.

Honorific Sacrifices.—Sacrifices tend to be interpreted as gifts to the god. Man seeks to influence his fellow men in various ways, and it is quite natural to find the same ideas in the sphere of religion. Food is often given to a god because he is be-

lieved to take pleasure in eating; the germ of this idea may have been to nourish the divine life. With the spiritualization of the god, comes a refinement of the tastes attributed to him, and the finer parts of the sacrifice, finally it may be only its savour, are alone regarded as acceptable offerings. Just as attendants are provided for the dead, so the god receives sacrifices intended to put slaves at his disposal. The gift theory of sacrifice is closely associated with that of the god as the ruler or king to whom man brings a tribute, just as he had to appear before his earthly king bearing gifts in his hands. The honorific sacrifice is essentially a propitiation but must be distinguished from the *piaculum* (see (below)).

Mortuary Sacrifice.—Sacrifices, especially of human beings, are offered immediately after a death or at a longer interval. Their object may be (a) to provide a guide to the other world; (b) to provide the dead with servants or a retinue suitable to his rank; (c) to send messengers to keep the dead informed of the things of this world; (d) to strengthen the dead by the blood or life of a living being, in the same way that food is offered to them or blood rituals enjoined on mourners.

Piacular Sacrifice.—Whereas the god receives a gift in the honorific sacrifice, he demands a life in the piacular. The essential feature of the *piaculum* is that it is an expiation for wrong-doing, and the victim is often human.

Human Sacrifice.—If tradition is any guide, human sacrifice seems in many important areas to be of secondary character; in spite of the great development of the rite among the Aztecs, tradition says that it was unknown till 200 years before the conquest; in Polynesia human sacrifices seem to be comparatively modern; and in India they appear to have been rare among the Vedic peoples. On the whole, human sacrifice is far commoner among the semi-civilized and barbarous races than in still lower stages of culture. In Australia, however, where sacrifice of the ordinary type is unknown, the ritual killing of a child is practised in connection with the initiation of a magician.

Among the forms of human sacrifice must be reckoned religious suicide, mainly found in India but not unknown in Africa and other parts of the world.

Sacrifice in Greece and Rome.—Both on the mainland of Greece and in the Greek colonies human sacrifice was practised, usually as a means towards expulsion of evil. (See GREEK RELIGION.)

At Rome the scapegoat did not suffer death; but in the Saturnalia a human victim seems to have been slain till the 4th century A.D. Many forms of animal sacrifice were found. (See ROMAN RELIGION.)

Sacrifice in Egypt.—Of Egyptian ritual little is known. (See EGYPT: Religion.)

Sacrifice in India.—Among human sacrifices may be mentioned the *suttee*, or custom of immolating a widow on the funeral pyre of the husband, and the Khond sacrifice of the Meriah, who was either purchased or the son of a victim father. Some days before the sacrifice, the victim, who was often kept in captivity for long periods, was devoted and his sanctity was increased; finally he was put to death by strangulation or pressure. The remains were dismembered and distributed among the fields, excepting the portion offered to the earth goddess, which was buried.

Sacrifice in Africa.—Especially in West Africa, many forms of sacrifice are found. Three main forms of human sacrifice existed: (1) the scapegoat; (2) the messenger; and (3) the expiation; but combinations were not infrequent. On the Congo, if a man committed a murder, the community voted whether he should die or be expelled; if the latter, a victim was killed, of which all partook; this is not a *piaculum* for re-establishment of the tribal bond, for the criminal is driven out of the community.

Sacrifice in America.—The Pawnees had an elaborate ritual, in which a human victim was sacrificed to the Morning Star; the blood of the victims was sprinkled on the fields, and the details of the rite are not unlike those of the Khond custom. The Iroquois sacrifice of the white dog bore in later times the character of a scapegoat festival. In Mexico human sacrifices were very

common, the number being estimated at 20,000 a year.

"Sacrificia."* The sections of the article "Sacrifice" in *Encyclopædia of Religion and Ethics* contain references to bibliography and details of importance.

THE IDEA OF SACRIFICE IN THE CHRISTIAN CHURCH

There can be no doubt that the idea of sacrifice occupied an important place in early Christianity. It had been a fundamental element of both Jewish and Gentile religions, and Christianity tended rather to absorb and modify such elements than to abolish them. To a great extent the idea had been modified already. Among the Jews the preaching of the prophets had been a constant protest against the grosser forms of sacrifice, and there are indications that when Christianity arose bloody sacrifices were already beginning to fall into disuse; a saying which was attributed by the Ebionites to Christ repeats this protest in a strong form, "I have come to abolish the sacrifices; and if ye do not cease from sacrificing the wrath of God will not cease from you" (Epiph. xxx. 16). Among the Greeks the philosophers had come to use both argument and ridicule against the idea that the offering of material things could be needed by or acceptable to the Maker of them all. Among both Jews and Greeks the earlier forms of the idea had been rationalized into the belief that the most appropriate offering to God is that of a pure and penitent heart, and that the vocal expression of contrition in prayer or of gratitude in praise is also acceptable.

The best instances of these ideas in the Old Testament are in Psalms i. and li., and in Greek literature the striking words which Porphyry quotes from an earlier writer, "We ought, then, having been united and made like to God, to offer our own conduct as a holy sacrifice to Him, the same being also a hymn and our salvation in passionless excellence of soul" (Euseb. *Dem. Ev.*, 3). The ideas are also found both in the New Testament and in early Christian literature: "Let us offer up a sacrifice of praise to God continually, that is, the fruit of lips which make confession to His name" (Heb. xiii. 15); "That prayers and thanksgivings, made by worthy persons, are the only perfect and acceptable sacrifices I also admit" (Just. Mart. *Trypho*, c. 117); "We honour God in prayer, and offer this as the best and holiest sacrifice with righteousness to the righteous Word" (Clem. Alex. *Strom.*, vii. 6).

But among the Jews two other forms of the idea expressed themselves in usages which have been perpetuated in Christianity, and one of which has had a singular importance for the Christian world. The one form, which probably arose from the conception of Yahweh as in an especial sense the protector of the poor, was that gifts to God may properly be bestowed on the needy, and that consequently alms have the virtue of a sacrifice. Biblical instances of this idea are—"He who doeth alms is offering a sacrifice of praise" (Ecclus. xxxii. 2); "To do good and to communicate forget not, for with such sacrifices God is well pleased" (Heb. xiii. 16); so the offerings sent by the Philippians to Paul when a prisoner at Rome are "an odour of a sweet smell, a sacrifice acceptable, well pleasing to God" (Phil. iv. 18). The other form, which was probably a relic of the conception of Yahweh as the author of natural fertility, was that part of the fruits of the earth should be offered to God in acknowledgment of His bounty, and that what was so offered was especially blessed and brought a blessing upon both those who offered it and those who afterwards partook of it. The persistence of this form of the idea of sacrifice constitutes so marked a feature of the history of Christianity as to require a detailed account of it.

Meals as Thank-offerings.—In the first instance it is probable that among Christians, as among Jews, every meal, and especially every social meal, was regarded as being in some sense a thank-offering. Thanksgiving, blessing and offering were co-ordinate terms. Hence the Talmudic rule, "A man shall not taste anything before blessing it" (*Tosephta Berachoth*, c. 4), and hence St.

Paul's words, "He that eateth, eateth unto the Lord, for he giveth God thanks" (Rom. xiv. 6; cf. 1 Tim. iv. 4). But the most important offering was the solemn oblation in the assembly on the Lord's day.

The points in relation to this offering which are clearly demonstrable from the Christian writers of the first two centuries, but which subsequent theories have tended to confuse, are these (1) It was regarded as a true offering or sacrifice; for in the *Teaching of the Twelve Apostles*, in Justin Martyr and in Irenæus it is designated by each of the terms which are used to designate sacrifices in the Old Testament. (2) It was primarily an offering of the fruits of the earth to the Creator; this is clear from both Justin Martyr and Irenæus, the latter of whom not only explicitly states that such oblations are continued among Christians, but also meets the current objection to them by arguing that they are offered to God not as though He needed anything but to show the gratitude of the offerer (Iren. iv. 17, 18). (3) It was offered as a thanksgiving partly for creation and preservation and partly for redemption; the latter is the special purpose mentioned (e.g.) in the *Teaching of the Twelve Apostles*; the former is that upon which Irenæus chiefly dwells; both are mentioned together in Justin Martyr (*Trypho*, c. 41). (4) Those who offered it were required to be not only baptized Christians but also "in love and charity one with another"; there is an indication of this latter requirement in the Sermon on the Mount (Matt. v. 23, 24, where the word translated "gift" is the usual word for a sacrificial offering, and is so used elsewhere in the same Gospel, viz. Matt. viii. 4, xxiii. 19), and still more explicitly in the *Teaching*, c. 14, "Let not any one who has a dispute with his fellow come together with you (i.e. on the Lord's day) until they have been reconciled, that your sacrifice be not defiled." This brotherly unity was symbolized by the kiss of peace. (5) It was offered in the assembly by the hands of the president; this is stated by Justin Martyr (*Apol.* i. 65, 67), and implied by Clement of Rome (*Ep.* i. 44, 4).

Sacred Meals.—Combined with this sacrifice of the fruits of the earth to the Creator in memory of creation and redemption, and probably always immediately following it, was the sacred meal at which part of the offerings was eaten. Such a sacred meal had always, or almost always, formed part of the rites of sacrifice. There was the idea that what had been solemnly offered to God was especially hallowed by Him, and that the partaking of it united the partakers in a special bond both to Him, and to one another. In the case of the bread and wine of the Christian sacrifice, it was believed that, after having been offered and blessed, they became to those who partook of them the body and blood of Christ. This "communion of the body and blood of Christ," which in early writings is clearly distinguished from the thank-offering which preceded it, and which furnished the materials for it, gradually came to supersede the thank-offering in importance, and to exercise a reflex influence upon it. In the time of Cyprian, though not before, we begin to find the idea that the body and blood of Christ were not merely partaken of by the worshippers but also offered in sacrifice, and that the Eucharist was not so much a thank-offering for creation and redemption as a repetition or a showing forth anew of the self-sacrifice of Christ.

This idea is repeated in Ambrose and Augustine, and has since been a dominant idea of both Eastern and Western Christendom. But, though dominant, it has not been universal, nor did it become dominant until several centuries after its first promulgation. The history of it has yet to be written. For, in spite of the important controversies to which it has given birth, no one has taken the pains to distinguish between (i.) the theories which have been from time to time put forth by eminent writers, and which, though they have in some cases ultimately won a general acceptance, have for a long period remained as merely individual opinions, and (ii.) the current beliefs of the great body of Christians which are expressed in recognized formularies. A catena of opinions may be produced in favour of almost any theory; but formularies express the collective or average belief of any given period, and changes in them are a sure indication that there has

been a general change in ideas.

It is clear from the evidence of the early Western liturgies that, for at least six centuries, the primitive conception of the nature of the Christian sacrifice remained. There is a clear distinction between the sacrifice and the communion which followed it, and that which is offered consists of the fruits of the earth and not of the body and blood of Christ. Other ideas no doubt attached themselves to the primitive conception, of which there is no certain evidence in primitive times, e.g. the idea of the propitiatory character of the offering, but these ideas rather confirm than disprove the persistence of those primitive conceptions themselves. All Eastern liturgies, in their present form, are of later date than the surviving fragments of the earlier Western liturgies, and cannot form the basis of so sure an induction; but they entirely confirm the conclusions to which the Western liturgies lead.

In the course of the 8th and 9th centuries, by the operation of causes which have not yet been fully investigated, the theory which is first found in Cyprian became the dominant belief of Western Christendom. The central point of the sacrificial idea was shifted from the offering of the fruits of the earth to the offering of the body and blood of Christ. The change is marked in the rituals by the duplication of the liturgical forms. The prayers of intercession and oblation, which in earlier times are found only in connection with the former offering, are repeated in the course of the same service in connection with the latter. The designations and epithets which are in earlier times applied to the fruits of the earth are applied to the body and blood. From that time until the Reformation the Christian sacrifice was all but universally regarded as the offering of the body and blood of Christ. The innumerable theories which were framed as to the precise nature of the offering and as to the precise change in the elements all implied that conception of it. It still remains as the accepted doctrine of the Church of Rome. For, although the council of Trent recognized fully the distinction which has been mentioned above between the Eucharist and the sacrifice of the mass, and treated of them in separate sessions (the former in Session xiii., the latter in Session xxii.), it continued the mediaeval theory of the nature of the latter.

The reaction against the mediaeval theory at the time of the Reformation took the form of a return to what had no doubt been an early belief,—the idea that the Christian sacrifice consists in the offering of a pure heart and of vocal thanksgiving. Luther at one period (in his treatise *De captivitate Babylonica*) maintained, though not on historical grounds, that the offering of the oblations of the people was the real origin of the conception of the sacrifice of the Mass; but he directed all the force of his vehement polemic against the idea that any other sacrifice could be efficacious besides the sacrifice of Christ. In the majority of Protestant communities the idea of a sacrifice has almost lapsed. That which among Catholics is most commonly regarded in its aspect as an offering and spoken of as the "mass" is usually regarded in its aspect as a participation in the symbols of Christ's death and spoken of as the "communion." But it may be inferred from the considerable progress of the Anglo-Catholic revival in most English-speaking countries that the idea of sacrifice has not yet ceased to be an important element in the general conception of religion.

See J. H. Srawley and H. Watt, art. "Eucharist" in Hastings, *Encyclopaedia of Religion and Ethics*, vol. v.; R. A. S. Macalister, art. "Sacrifice (Semitic)," *ibid.* vol. ix, p. 31; M. Gaster, art. "Sacrifice, Jewish," *ibid.* p. 24; G. F. Moore, art. "Sacrifice" in the *Encyclopaedia Biblica*; W. R. Smith, *Religion of the Semites* (1889; reprint of 2nd ed., 1907); J. G. Frazer, *The Golden Bough*, pt. vi., "The Scapegoat," and *Folklore in the Old Testament*.

SACRILEGE, the violation or profanation of sacred things. The word comes from the Lat. *sacrilegium*, which originally meant merely the theft of sacred things, although already in Cicero's time it had grown to include in popular speech any insult or injury to them.

In primitive religions inclusive of almost every serious offence even in fields now regarded as merely social or political, its scope is gradually lessened to a single part of one section of ecclesiastical

criminology, following inversely the development of the idea of holiness from the concrete to the abstract, from fetishism to mysticism. The primitive defence against sacrilege lay directly in the nature of sacred things, those that held a curse for any violation or profanation (see TABU). Early criminal law brought a measure of physical sanction into consideration. The Levitical code exacted of the offender reparation for the damage with the addition of one-fifth of the amount, and an expiatory sacrifice (Lev. v. 15, 16). The tragic story of the stoning of Achan, who stole some of the spoils of Jericho which Joshua had consecrated to the treasury of Yahweh, is one of the most graphic details of Old Testament history (cf. Joshua vii. 20-25).

No religion was more prodigal in rules to safeguard that which was holy or consecrated than the Jewish, especially in its temple laws; violation of them often led to mob violence as well as divine chastisement. The temple rules do not apply to synagogues, however, and unseemly conduct in them is liable only to civil action.

While the Roman cults were amply protected by tabus, there was no comprehensive term in Roman law for religious violations and profanations in general. *Sacrilegium* was narrowly construed as the theft of sacred things from a sacred place. According to Ulpian the punishment for *sacrilegium* varied according to the position and standing of the culprit and the circumstances under which the crime was committed. For the lower classes it was crucifixion, burning or the wild beasts. The latter penalty was also attached to theft of sacred things by night, but stealing by day from a temple objects of little value brought only sentence to the mines. People of higher rank were deported. During classical times the law kept to the narrow meaning of *sacrilegium*, but in popular usage it had grown to mean about the same as the English word. Traces of this usage are frequent in Augustan writers. The early church Fathers use the word most frequently in the restricted sense, although an effort has been made to read the wider meaning in Tertullian. But by the middle of the 4th century the narrower meaning had disappeared. In Ambrose, Augustine and Leo I., *sacrilegium* means sacrilege. The wider meaning had invaded the law as well. Mommsen was of the opinion that *sacrilegium* had no settled meaning in the laws of the 4th century. But it was rather that an enlarged application of the idea of sacredness made the crime of sacrilege in the sense of *violatio sacri* a more general one. This was partly due to the influence of Christianity, which sought to include as objects of sacrilege all forms of church property, rather than merely those things consecrated in pagan cults, partly to the efforts of the later emperors to surround themselves and everything emanating from them with highest sanctions. In the Theodosian Code the various crimes which are accounted sacrilege include—apostasy, heresy, schism, Judaism, paganism, attempts against the immunity of churches and clergy or privileges of church courts, the desecration of sacraments, etc., and even Sunday. Along with these crimes against religion went treason to the emperor, offences against the laws, especially counterfeiting, defraudation in taxes, seizure of confiscated property, evil conduct of imperial officers, etc. There is no formal definition of sacrilege in the code of Justinian but the conception remains as wide.

The penitentials (*q.v.*), or early collections of disciplinary canons, gave much attention to sacrilege. The Frankish synods emphasize the crime of seizing church property of every kind, including the vast estates so envied by the lay nobility. The worst sacrilege of all, defiling the Host, is mentioned frequently, and generally brought the death penalty accompanied by the cruellest and most ignominious tortures. The period of the Reformation naturally increased the commonness of the crime. Under the emperor Charles V. the penalty for stealing the Host was the stake; that for other crimes was graded accordingly. In France, in 1561, under Charles IX., it was forbidden under penalty of death to demolish crosses and images and to commit other acts of scandal and impious sedition. In the declaration of 1682, Louis XIV. decreed the same penalty for sacrilege joined to superstition and impiety, and in the somewhat belated religious persecution of the duke of Bourbon in 1724 those convicted of larceny in churches, together with their accomplices, were condemned, the men to the galleys for life or for a term of years, the

women to be branded with the letter V and imprisoned for life, or for a term. The trial of La Barre in 1766 at Abbeville is the most famous sacrilege case in modern times. Convicted of wearing his hat while a religious procession was passing—as well as of blasphemy—he was accused as well of having mutilated a crucifix standing on the town bridge. Declared guilty, after torture, he was sentenced to have his tongue cut out, to be beheaded and the body to be burned, a sentence which was confirmed by the parlement of Paris and the bigoted king Louis XV. In the midst of the French Revolution respect for *civic* festivals was sternly enacted, but sacrilege was an almost daily matter of state policy. In 1825 the reactionary parlement once more brought back the middle ages, by decreeing the death penalty for public profanation, the execution to be preceded by the *amende honorable* before the church doors. "Theft sacrilege" was treated in a separate series of equally savage clauses. This ferocious legislation was expressly and summarily abrogated in 1830.

English Law.—In English law, sacrilege is the breaking into a place of worship and stealing therefrom. At common law benefit of clergy was denied to robbers of churches. A statute of 1553 made the breaking or defacing of an altar, crucifix or cross in any church, chapel or churchyard punishable with three months' imprisonment on conviction before two justices, the imprisonment to be continued unless the offender entered into surety for good behaviour at quarter sessions. The tendency of the later law has been to put the offence of sacrilege in the same position as if the offence had not been committed in a sacred building. Thus breaking into a place of worship at night, says Coke, is burglary, for the church is the mansion house of Almighty God. The Larceny Act of 1861 punishes the breaking into, or out of, a place of divine worship in the same way as burglary, and the theft of things sacred in the same way as larceny. Now by the Malicious Damage Act 1861 the unlawful and malicious destroying or damaging any picture, statue, monument or other memorial of the dead, painted glass or other monument or work of art, in any church, chapel, meeting-place or other place of divine worship, is a misdemeanour punishable by imprisonment.

SACRISTY, in ecclesiastical architecture, the room or hall in a church wherein are kept the vestments and utensils (*sacra*) used in the services and celebrations.

SADDLE, a seat, usually of leather, fixed by girths to the back of a horse for riding; also a padded cushion for the back of a draught horse, fastened by girths and crupper; to it are attached the supports for the shafts, and rings for the reins. (See **SADDLERY AND HARNESS**.) The word is also applied to many objects resembling a saddle in shape or function, such as a block to support a spar in a ship, or in machinery to support a rod.

In architecture, a saddle is a piece of wood, metal, marble, etc., at the bottom of a door opening. It is usually raised slightly above the floor on either side, and is used not only to cover the space or joint between the flooring of two adjacent rooms or spaces, but also to raise the bottom of the door sufficiently to clear carpets, rugs, etc. The word saddle is usually restricted to such a member in interior doorways; sill (*g.n.*) is used similarly in the case of exterior doorways. The term is also applied to a saddle-shaped stone used as a coping.

Saddle bars are small, horizontal bars of iron or bronze running across a stained glass window, and fastened to the stone or frame on each side, not only bracing the window structure, but forming a rigid basis to which the leading of the stained glass can be attached.

SADDLERY AND HARNESS. These two terms embrace the equipment for the horse when used for riding or driving. "Harness" was originally a general term for equipment, e.g., the body armour of a soldier. It is now usually confined to the work and driving horse's equipment, "saddle and bridle" being applied to that of the riding horse.

Saddlery is principally a leather trade, and the craft has been

established in England as a separate trade since the 13th century, when the London Saddlers' Company received its charter from Edward I. There is evidence also of its early prosperity at Birmingham; the principal seat of the British harness and saddlery trade is now at Walsall. Saddlers' ironmongery embraces the making of buckles, rings, chains, stirrups, spurs, bits, hames.

The "bridle" is the combination of straps, bits, rings, chains and buckles which fits on the horse's head. The headstall consists of the headpiece passing behind the ears and joining the head-band over the forehead; the cheek-straps run down the sides of the head to the bit to which they are fastened; in the "blind" type of driving bridle the "blinkers," rectangular or round leather flaps which prevent the horse from seeing anything except what lies in front, are attached to the cheek-straps; the nose-band passes round the front of the nose just above the nostrils; and the throat-latch extends from the top of the cheek-straps underneath the head. The "martingale," an attachment sometimes used on riding horses, passes between the horse's forelegs, with one end fastened to the saddle girth and the other to the bridle. It keeps the horse from throwing up his head. The bit is the metal contrivance inserted in the mouth to which the reins are attached. There are innumerable patterns of bits, but they may be roughly divided into the straight bar, "snaffle" and "curb." The "snaffle" for the riding horse generally has a smooth, jointed steel mouthpiece, with straight cheek-bars, the rings for the reins and cheek-pieces of the headstall being fixed in the bars at the junction with the mouthpiece. A severer snaffle has the mouthpiece twisted and fluted. The bars prevent the horse's pulling the bit through its mouth. The snaffle without bars is generally termed a "bridoon." The commonest form of bit used in driving is the double-ring snaffle, in which the rings work one within the other, the headstall straps fastening to one and the reins to the other, or, if the horse is driven on the double ring, the reins are buckled to both rings. The curb-bit (*Fr. courbe*, *Lat. curvus*, bent, crooked) is one to which a curb-chain or strap is generally attached, fastened to hooks on the upper ends of the cheek-bars of the bit and passing under the horse's lower jaw in the chin groove. The reins are attached to rings at the lower ends of the cheek-bars, the leverage thus pressing the curb-chain against the jaw. The mouthpiece of the curb-bit is unjointed and commonly has in the centre a "port," i.e., a raised curve allowing liberty for the tongue and bringing the pressure on the base of the horse's jaw. The curb-bit and the bridoon can be used together with separate headstalls and reins, and there are many combination bits.

Saddles.—The riding saddle is composed of the "tree," the framework, the parts of which are the pommel or head, the projection which fits over the withers, and the side bars which curve round into the cantle or hind-bow. The tree in the best saddles is made of beechwood split with the grain; thin canvas is glued over the wood to prevent splitting, and iron or steel plates then riveted on the head and on the cantle. Linen webs are fastened lengthwise and across, over which is nailed canvas and serge between which the padding is stuffed. To the tree are fastened the stirrup-bars. The leather covering of the tree should be of pig-skin; cheap saddles are made of sheep-skin stamped to imitate pig-skin. The various parts of the man's saddle are the seat, the skirt, i.e., the fold or pad of leather on either side of the head, and the hanging flaps; knee-rods are not used as much as they were, except where roughly broken-in horses are ridden. The saddle is cut straight over the withers with a square-ended cantle, as in the hunting saddle, or cut back over the withers with a round-ended cantle, as in the polo saddle. The saddles in use on the continent of Europe still retain the high pommel and cantle and heavy knee-rods discarded by riders trained in the British school and the hunting-field. The saddles of the East and of the Arabs keep their primitive shape, and they are really seats *in* which rather than *on* which the rider sits. The Mexican saddle, with its silver adornments and embossed leather, is a characteristic type. It has a very high padded pommel and a round-headed projecting cantle.

Harness.—Space forbids the discussion of the varieties of harness for the pair-horse carriage, the four-horse coach, the farm wagon, etc., or the different kinds of ornamentation that are or

SADDLE IN ARCHITECTURE: (LEFT) IN DOOR OPENING, (RIGHT) STONE COPING

have been lavished upon it. The leather collar, heavily padded, passes over the head and rests firmly on the shoulders; the hames, linked pieces of metal, fit tightly round it and are fastened at the top and bottom by the hame-straps; they bear the traces, or straps which pass along the horse's sides and the shafts, and are attached to the whiffletree. Where the collar is dispensed with, the traces are attached to a breast-strap against which the horse works. This breast harness is much used for the lightly harnessed American trotting horses, and for military draught horses. The saddle pad is a narrow leather cushion resting on the back and girthed under the belly and held in position by the back-band and crupper, a loop strap passing under the tail. The saddle supports the shafts by straps fitted with shaft loop-holes. The reins pass from the bit through "terrets" or rings on the hames and pad. The harness on the horse's hind-quarters consists of the breeching, passing round behind the horse and helping in backing and stopping the vehicle and the hip-strap fastened to the breeching and passing over the hind-quarters. The bearing rein, or check-rein, when used as a support to the head, or as help to the paces, consists of a separate bridle-bit with the reins passing through rings on the throat-band and thence slipped over a hook on the pad.

Historical Sketch.—Questions as to the epoch in the history of mankind when the horse was first trained for draught and riding are for archaeologists and anthropologists to discuss (see *HORSE: Origin and History*). With the domestication of the horse came the development of the bit; first a halter of hide bound the muzzle, then a thong slipped into the mouth, finally replaced by wood or bone. Stone age objects have been found in lake-dwellings, such as that at Robenhausen, near Zürich, which may have been bits; one is slightly curved, with two knobs grooved at either end for the reins. Bits from the bronze age and the iron age can be seen in most museums showing that the forms have changed little. In the late iron age burial of a Gaulish chief with his chariot at Somme-Bionne were two horses' bits of the jointed snaffle type.

In ancient Greece and Rome the bit and bridle were used during historic times, and allusions to riding without them refer to exhibitions of horsemanship. On Trajan's column the Numidians ride without bridles or bits, and various North African tribes trained their horses to obey their voice alone (cf. Claudian, *Epiq.* i. 10, of the Gaulish *essedarii*, driving without bridle and reins). The *locus classicus* for the bridling and saddling of the Greek horse is Xenophon, *Περὶ ἵππων*. The Greek name for the bridle bit and reins collectively is *χαλινός* (Lat. *frenum*), the bit proper *στόμασιον*, in Lat. *frenum* is also used of the bit itself. The headstall (*κορυφαία*) and cheek-straps (*παραίτια*) were richly decorated. In Homer (*Il.* iv. 142) the latter are ornamented with ivory plates stained with purple, and such have been found on the site of Troy (Schliemann, *Ilios*, 476, 631). The head-band also bore a crest (*νοῦδος, crista*), and in front the *ἀμρυξ* (*frontale*) might be extended down the face to serve as a defence, as in the mediaeval *châufrein*. This frontal was a special subject of decoration. Of the two principal types of ancient bits, the unjointed and the jointed mouthpiece, the latter is the most common form. There are also other forms of bits; those with sharp points were called *lupata* (Virg. *Georg.* iii. 208). There is a Greek bit in the British Museum with revolving discs, a device which occurs in mediaeval bits, to give the horse something to keep turning in his mouth. The curb was also used: Xenophon distinguishes between the snaffle (*λεῖος χαλινός*) and the curb. The curb-strap or chain was termed *τροχαλινίδα* or *ψάλλον*, which, however, may mean a muzzle. A bronze bit found at Pompeii has a twisted and jointed metal mouthpiece and a plain curved bar acting as a curb-strap. The cheek-bars of the bit take a variety of forms: straight bars, circles with rays, square or oblong plaques, triangles and the swan-necked or S-shaped type are all found. In medieval times complicated and severe bits were used, and heavy bits with cruel mouthpieces and long elaborately curved cheek-bars are still used by Arabs and the riders of Central and South America.

The saddle was not used in Egypt; the Assyrian monuments show decorated saddle-cloths rather than the saddle. The harness of the chariots of Egypt and Assyria are also illustrated on the

monuments (see especially Sir J. G. Wilkinson, *Manners and Customs of the Ancient Egyptians* revised ed. 1878). The ancient Greeks rode bare-backed as in the Panathenaic frieze of the Parthenon or used a saddle-cloth (*ἐπιπριον*, Lat. *ephippium*; *sella* as applied to a saddle is quite late). Even the saddle-cloth does not appear to have been in use till the 5th century. A 6th-century vase, found at Daphnae, Lower Egypt (Flinders-Petrie and Murray, *Tanis*, 1838, ii. Pl. xxix.), shows a woman riding astride on a cloth, with fully developed headstall and powerful bit. A black-figured sarcophagus, now in the British Museum, from Clazomenae, shows a long pointed *ephippium* with a chest-strap. These indicate Asiatic influence, for Daphnae was an Ionian and Carian settlement of the 7th century B.C. In Xenophon (*l.c.*) we find that the saddle-cloth had been adopted by the Athenian cavalry, and from his advice as to the seat to be adopted pads or rolls seem to have been added. There were no stirrups (till the time of the emperor Maurice, A.D. 602), and the rider mounted at a vault or by blocks; mounting by the spear used as a vaulting pole was also practised as an athletic feat. On a funeral monument of the time of Nero in the museum at Mainz is the figure of a horseman on a saddle-cloth with something resembling the pomel and cantle of a saddle, but the first saddle proper is found in the so-called column of Theodosius at Constantinople (usually ascribed to the end of the 4th century A.D., though it may be more than 100 years earlier), where two figures are riding on high-peaked saddles resting on embroidered saddle-cloths. In mediaeval times the saddle was much like that of the Oriental saddle of to-day with high peaks before and behind. In the military saddle of the 14th and 15th century the high front parts of the saddle were armoured and extended to protect the legs of the rider. The jousting saddle (cf. the example in the Tower of London) becomes almost a box into which the rider is fixed; the high cantle fits round the rider's loins and when charging he lifted himself into practically a standing position in the stirrups. The saddle for use on the road or hunting was much like the Arab saddle of to-day, and similar forms are in use in Europe and elsewhere where the British saddle has not been adopted. Women rode astride or on a pillion behind a male rider. The side-saddle is said to date from the end of the 12th century. For the harness of the ancient draught horse see CHARIOT. (C. Wk.)

SADDUCEES, the name of a party which was opposed to the Pharisees down to the destruction of Jerusalem in A.D. 70. The Sadducees have been represented, not so much an organized party, as the lax and worldly-minded aristocrats, who were primarily interested in maintaining their own privileged position; who favoured Greco-Roman culture. Their attitude towards religious questions was purely negative; indeed, they were not a religious party at all. This view, championed by G. Hölcher, is not supported by the early sources. Both in Josephus and the N.T. Sadduceism is represented as associated with certain definite religious positions; they represented the conservative tendency in matters of religion.

The most probable explanation of the name Sadducees is that proposed by A. Geiger, viz., that it is equivalent to "Zadokites," i.e., "the adherents of the Sons of Zadok." The latter were a priestly family who claimed descent from Zadok, who was head of the priesthood in the days of Solomon (cf. 1 Kings i. 34; and ii. 35); Ezekiel (xlv. 10-15) selected this family as worthy of being invested with the control of the Temple; and in fact members of this family formed the Temple hierarchy down to the time of Ben Sira (cf. Sirach. ii. 12, Hebrew text). Later this priestly line became tainted with Hellenism, and ultimately the high priesthood was usurped by others. After the disappearance of the legitimate high priest of the house of Zadok the title "Zadokites" may well have been assumed by conservative elements in the priesthood, to preserve the earlier traditions of their order.

Unfortunately, we possess no statement from the Sadducean side of their beliefs and principles, unless the "Zadokite" work

discovered by Schechter represents, as is possible, the views of a section of the party. There are many controversial references in the Rabbinical literature to the Sadducees on points connected with the interpretation of the law. The main principle that divided the two parties was concerned with the written Torah (the Pentateuch). The supremacy of the law was common ground to both parties, but whereas the Pharisees assigned to the oral tradition a place of authority side by side with the written law, and determining its interpretation, the Sadducees refused to accept any ordinance as binding, unless it was based directly on the written word. The rest of Scripture (the Prophets and the Hagiographa) they regarded as mere Kabbalah "tradition." The Pharisaic device of harmonizing apparent contradictions between the Law and the Prophets by exegetical expedients was not accepted by the Sadducees, who refused to sanction doctrines and practices which could not be based on the written law. Thus the doctrine of a Davidic Messiah was rejected because it was considered that the prophetic teaching on this subject was in conflict with the Torah.

R. Leszynsky suggests that the Sadducees, or a section of them, accepted the hope of a priestly Messiah (cf. Ex. xix. 6), from which passage it might be inferred that a priestly line was destined to possess the Kingdom. There was also the example of the Priest King Melchizedek, which might easily suggest "Zadok King," or "Sadducean King." According to Acts xxiii. 8, the Sadducees denied the existence of angels and spirits, as well as the doctrine of the resurrection. This probably means that they did not accept the fully developed angelology of later times, while in the latter case the point of controversy was not whether the resurrection was true, but whether it could be proved from the Pentateuch. Another interesting point of difference is concerned with the date of Pentecost. The Sadducean hierarchy had its stronghold in the Temple, and it was only during the last 10 or 20 years of the Temple's existence that the Pharisees finally got control. With the destruction of the Temple in A.D. 70 their power as an organized party disappeared.

See R. Leszynsky, *Die Sadduceer*, (1912); Art. "Sadducees" E.R.E. where further literature is cited. Cf. also Burkhitt "Jews and the Pharisees" in *J. Th. St.* xviii, 392-397. (G. H. B.)

SADE, DONATIEN ALPHONSE FRANÇOIS, COUNT [usually called the MARQUIS DE SADE] (1740-1814), French writer, was born in Paris on June 2, 1740. He entered the light horse at fourteen and saw considerable military service before returning to Paris in 1766. Here his vicious practices became notorious, and in 1772 he was condemned to death at Aix for an unnatural offence, and for poisoning. He fled to Italy, but in 1777 he was arrested in Paris, removed to Aix for trial, and there found guilty. In 1778 he escaped from prison, but was soon re-arrested and finally committed to the Bastille. Here he began to write plays and obscene novels. In 1789 he was removed to the Charenton Lunatic Asylum, but was discharged in 1790, only to be recommitted as incurable in 1803. He died there on Dec. 2, 1814. Among his works, all of the type indicated, were *Justine* (1791), *Juliette* (1792), *Philosophie dans le boudoir* (1793) and *Les Crimes de l'amour* (1800). The word Sadism is derived from his name.

See C. R. Dawes, *The Marquis de Sade: his Life and Works* (1927).

SÁ DE MIRANDA, FRANCISCO DE (1485?-1558), Portuguese poet, was the son of a canon of Coimbra belonging to the ancient and noble family of Sá. He probably made his first studies of Greek, Latin and philosophy in one of the colleges of the Old City, and in 1505 went to Lisbon university. He seems to have resided for the most part in the capital down to 1521, dividing his time between the palace and the university, in the latter of which he had taken the degree of doctor of law by 1516.

In the middle of July 1520 he set out across Spain for Italy, and spent the years 1521 to 1525 abroad, visiting Milan, Venice, Florence, Rome, Naples and Sicily "with leisure and curiosity." He enjoyed intimacy with Giovanni Rucellai, Lattanzio Tolomei and Sannazaro; he saluted the illustrious Vittoria Colonna, a distant connection of his family, and in her house he probably talked with Bembo and Ariosto, and perhaps met Machiavelli and Guicciardini. He brought home with him (ca. 1525) the

sonnet and canzone of Petrarch, the tercet of Dante, the *ottava rima* of Ariosto, the eclogue in the manner of Sannazaro and Italian hendecasyllabic verse. He did not, however, abandon the short national meter, but carried it to perfection in his *Cartas*.

His *Os Estrangeiros*, produced in 1527-28, was the first Portuguese prose comedy, as his *Cleopatra* (c. 1530) is recognised to be the first Portuguese classical tragedy. In 1528 Miranda made his first real attempt to introduce the new forms of verse by writing in Spanish a canzone entitled *Fábula do Mondego*, and in 1530-32 he followed it up with the eclogue *Aleixo*.

The year 1532 had marked his passage from the active to the contemplative life, and the eclogue *Basto*, in the form of a pastoral dialogue written in *redondilhas*, opened his new manner. It has a pronounced personal note, and its episodes are described in a genuinely popular tone. The same epoch saw the composition of his *Cartas* or sententious letters in *quintilhas* which, with *Basto* and his satires, make up the most original, if not the most valuable, portion of his legacy. A more lyrical vein is apparent in the *quintilhas* of *A. Egípiaca Santa Maria*.

In 1538 he wrote his second classical prose comedy *Os Vilhalpandos*, which was played before the Cardinal Infant Henry. He died on March 15, 1558.

Sá de Miranda led the way in a revolution in literature, and especially in poetry, which under his influence became higher in aim, purer in tone and broader in sympathy. He introduced the Renaissance into Portugal and at the same time made an austere stand against materialism. Some of his sonnets are admirable, and display a grave tenderness of feeling, a refinement of thought and a simplicity of expression which give them a high value. He wrote much and successfully in Castilian, several of his best eclogues being in that language.

Sá de Miranda's works were first published in 1595, but the admirable critical edition of Madame Michéls de Vasconcellos (Haile, 1884) containing life, notes and glosses, surpasses all others. His plays can best be read in the 1784 edition of the collected works. *A. Egípiaca Santa Maria* was edited by T. Braga (Oporto, 1913). See Sousa Viterbo, *Estudos sobre Sá de Miranda* (3 parts, Coimbra, 1895-96); Decio Carneiro, *Sá de Miranda e a sua obra* (Lisbon, 1895); Theophilus Braga, *Sá de Miranda* (Oporto, 1896); C. Michéls de Vasconcellos, *Novos estudos sobre Sá de Miranda* (vol. v, 1912) of the *Boletim da Segunda Classe* of the Lisbon Academy of Sciences.

SA'DI (c. 1184-1201), MUŠLIH-UD-DIN, or more correctly MUŠHARRIF-UD-DIN b. MUŠLIH-UD-DIN, the greatest didactic poet and the most popular writer of Persia, was born about 1184 (A.H. 580) in Shiraz. His early youth was spent in study at the Nizāmiyya in Baghdad and he returned to Isfahan just at the time of the inroads of the Mongols, when the atābeg Sa'd (in whose honour Sa'di took his pen name) had been deposed by the victorious Khwarizm ruler of Ghiyāss-ud-din (1226). Distressed by the misfortune of his patron and disgusted with the miserable condition of Persia, Sa'di quitted Shiraz and entered upon the second period of his life—that of his wanderings (1226-1256).

He proceeded via Balkh, Ghazni and the Punjab to Gujrat, on the western coast of which he visited the famous shrine of Siva in Somnath. After a prolonged stay in Delhi, where he learned Hindustani, he sailed for Yemen. Overcome with grief at the loss of a beloved child (when he had married is not known), he undertook an expedition into Abyssinia and a pilgrimage to Mecca and Medina. From there he directed his steps toward Syria and lived as a renowned sheikh for a considerable time in Damascus, which he had once already visited. There and in Baalbek he added to his literary renown that of a first-rate pulpit orator. Weary of Damascus, he withdrew into the desert near Jerusalem and led a solitary wandering life, till one day he was taken captive by a troop of Frankish soldiers, brought to Tripoli, and condemned to forced labour in the trenches of the fortress. After enduring countless hardships, he was eventually rescued by a rich friend in Aleppo, who paid his ransom, and gave him his daughter in marriage. But Sa'di, unable to live with his quarrelsome wife, set out on fresh travels, first to North Africa and then through the length and breadth of Asia Minor and the adjoining countries. Not until he had passed his 70th year did he return to Shiraz (about 1256; A.H. 653). Finding the place of his birth tranquil and prosperous under the wise rule of Abūbakr b. Sa'd, the son of his old patron (1226-1260; A.H. 623-658), the aged poet took up his permanent abode, interrupted only by repeated pilgrimages to Mecca, and devoted the remainder of his life to Sūfī contemplation and poetical composition. He died at Shiraz in 1256 (A.H. 691) according to Hamdallāh Mustawfi (who wrote only 40 years later), or in Dec. 1291 (A.H. 690), at the age of 120 lunar years.

His *Bāstān* or "Fruit garden" (1357) and *Gulistān* or "Rosegarden" (1358), both dedicated to the reigning atabeg Abū Bekr, acquired great popularity in both the east and the west, owing to their easy, varied style and their happy *bons mots*. But Sadī's *Diyāna*, or collection of lyrical poetry, far surpasses the *Bāstān* and *Gulistān*, at any rate in quantity, and perhaps in quality. Minor works are the Arabic *qasidas*, the first of which laments the destruction of the Arabian caliphate by the Mongols in 1258 (A.H. 656); the Persian *qasidas*, partly panegyric, partly didactic; the *marāṭī*, or elegies, beginning with one on the death of Abū Bekr and ending with one on the defeat and demise of the last caliph, Mostā'sim; the *madmūnāt*, or poems with alternating Persian and Arabic verses of a rather artificial character; the *lar'fāt*, or refrain-poems; the *ghazals*, or odes; the *shāhībiyāh* and *muḥatta'āt*, or moral aphorisms and epigrams; the *rubā'iyāt*, or quatrains; and the *muḥadḍāt*, or distichs. Sadī's lyrical poems possess neither the easy grace and melodious charm of Hāfiz's songs nor the overpowering grandeur of Jelāl and Rūmī; but they are full of the finest feelings, and are full of deep pathos and show a fearless love of truth.

The first who collected and arranged his works was 'Alī b. Ahmad b. Bisutūn (1326-1334; A.H. 726-734). The most exact information about Sadī's life and works is found in the introduction to W. Bacher's *Sadī's Aphorismen und Sinngedichte* (Sāhībīyāh) (Strassburg, 1879; a complete metrical translation of the epigrammatic poems), and in the same author's "Sadī-Studien," in *Zeitschrift der morgenländischen Gesellschaft*, xxx, pp. 81-106; see also H. Ebbé in W. Geiger's *Grundriss der iranischen Philologie*, II, pp. 202-206, with full bibliography; and E. G. Bionne, *Literary History of Persia*, pp. 525-530. Sadī's *Kulīyyāt* or complete works have been edited by Harrington (Calcutta, 1791-1795) with an English translation of some of the prose treatises

and by Platts (London, 1874), the best translations into English by Eastwick (1852) and by Platts (1873), the first four *bāds* in prose and verse by Sir Edwin Arnold (1899); into French by Defrémery (1858); into German by Graf (1846); see also S. Robinson's *Persian Poetry for English Readers* (1883), pp. 245-306.

SADIYA, the extreme northeast frontier station of British India, headquarters of the Sadiya Frontier Tract of Assam. Pop. (1941) 2,056. It stands high on a grassy plain, nearly surrounded by forest-clad mountains, on the right bank of what is locally (but erroneously) considered the main stream of the Brahmaputra. A railway on the opposite bank connects with the Assam-Bengal line. There is a bazaar, to which the hillmen beyond the frontier—Mishmis, Abors and Khamtis—bring down rubber, wax, ivory and musk, to barter for cotton cloth and salt.

The Sadiya Frontier Tract covers an area of 35,307 sq.mi. extending to Tibet on the north and east and to Burma on the south and southeast, but only 3,309 sq.mi. are under regular administration.

SADLER, MICHAEL THOMAS (1780-1835). English social reformer and economist was born at Snelston, Derbyshire, on Jan. 3, 1780. Entering business in Leeds in 1800, he took an active part in politics, devoting himself particularly to the administration of the poor law. In 1829 he was elected M.P. for Newark and thenceforward, until he was deprived of his seat, he was the leader of factory reform in parliament. He died in Belfast July 29, 1835.

SADLER (OF SADLER), SIR RALPH (1507-1587), English statesman, the son of Henry Sadler, steward of the manor of Cilney, near Great Hadham, Hertfordshire, was born at Hackney, Middlesex, in 1507. While a child he was placed in the family of Thomas Cromwell, afterward earl of Essex, whose secretary he eventually became. Sadler held many positions under Henry VIII, but he is best known for his employment under Elizabeth I in connection with the affair of Mary, Queen of Scots. Elizabeth sent him (1559) to Scotland, ostensibly to settle the border disputes, but in reality to secure a union with the Protestant party there, and he helped to arrange the treaty of Leith, July 6, 1560.

In 1568 Sadler was appointed chancellor of the duchy of Lancaster, and in the same year was one of the English commis-

sioners employed in treating on the matters arising from the flight of the Queen of Scots. From this time he seems to have been continually engaged as a discreet and trusty servant in connection with Mary's captivity, and was frequently sent with messages to her. On Aug. 25, 1584, when, owing to the imputations made by his countess, George 6th earl of Shrewsbury resigned his guardianship of the queen, Sadler succeeded him. In September Mary was removed from Sheffield to Wingfield and early in 1585 to Tutbury.

In April, Sadler, after numerous petitions on his part, was permitted to resign his distasteful charge. On March 30, 1587, Sadler died at Standon, and was buried there. His letters on Scottish affairs are most interesting.

Biography.—*Letters and Negotiations of Sir Ralph Sadler* (Edinburgh, 1720); *The State Papers and Letters of Sir R. Sadler*, ed. by Arthur Chiford, with a memoir by Sir Walter Scott, 3 vol. (Edinburgh, 1809).

SADO, a Japanese island in the Niigata prefecture, lying 32 mi. W. of Niigata (q.v.), in 38° N. 138° 30' E. It has a circumference of 130 mi., an area of 331 sq.mi. and a population (1950) of 125,597. The port is Ebisa, on the east coast; and at a distance of 161 mi. near the west coast, is the town of Aikawa, having in its vicinity gold and silver mines, for which Sado is famous.

SADOWA, a village of Bohemia, 4 mi. N.W. of Königrätz. Sadowa, with the small adjoining wood, was one of the principal Prussian positions in the decisive battle of July 3, 1866, now usually called Königrätz (see SEVEN WEEKS' WAR).

SAFED KOH, in many respects the most remarkable range of mountains on the northwest frontier of India, extending like a 14,000 ft. wall, straight and rigid, towering above all surrounding hills, from the mass of mountains which overlook Kabul on the southeast to the frontiers of India, and preserving a strike which—being more or less perpendicular to the border line—is in strange contrast to the usual frontier conformation. The highest peak, Sikaram, is 15,600 ft. above sea level, and yet it is not a conspicuous point on this unusually straight-backed range. Geographically the Safed Koh is not an isolated range, for there is no break in the continuity of water divide which connects it with the great Shandur offshoot of the Hindu Kush except the narrow trough of the Kabul river, which cuts a deep waterway across where it makes its way from Dikka into the Peshawar plains.

The same name is often used for the mountain range north of the Hari Rud river in its upper course.

SAFES, STRONG ROOMS AND VAULTS. Although boxes provided with locks or coffers must have followed closely on the development of locks (q.v.) and been in use in ancient Egypt, no examples remain of earlier date than the middle ages. The earliest examples extant were constructed of hard wood banded with hammered iron, and subsequent development took place rather on artistic than on practical lines up to the time of the introduction of boxes entirely of iron. On the continent of Europe the iron box was developed to a very high standard of artistic beauty and craftsmanship, but with no real increase of security. Several specimens of these coffers supposed to be of 17th-century workmanship are preserved in the museum at Marlborough house.

Milner's Work.—Up to that time no attempt had been made to make coffers fireproof, for though a patent for fireproofing had been taken out in 1801 by Richard Scott, it does not appear to have been used. In 1834, however, a patent was obtained by William Marr for the application of nonconducting linings, followed about four years later by a similar patent in the name of Charles Chubb. The foundation, however, of the modern safe industry was laid by Thomas Milner, originally a tinsmith of Sheffield, who after a few years' business in Manchester established, in 1830, works at Liverpool for the manufacture of tinplate and sheet iron boxes and who later made plate iron chests or coffers and, probably the earliest, safes about the year 1846.

Chatwood's Patent, 1860.—Concurrently with the increase of strength in safes and probably with the increased value of articles preserved in safes, the skill of the professional thief had also increased, and this went on for some years until the Cornhill burglary of 1865 called general attention to the question. In 1860

a patent was taken out by Samuel Chatwood for a safe constructed of an outer and inner body with the intervening space filled with ferro-manganese or spiegeleisen in a molten state, the total thickness being 2 in.

It is about this period (1860-1870), perhaps the most important in the history of safes, that the opening of safes by wedges seems to have become prominent. The effect of wedges was to bend out the side of the safe sufficiently to allow of the insertion of a crowbar between the body and the edge of the door, and various devices were adopted by different makers with the object of resisting this mode of attack.

To prevent safes from being opened by the drilling of one or two small holes in such positions as to destroy the security of the lock itself, advantage was taken of the improvements in the manufacture of high carbon steel, and even in what is to-day called the "fire-proof" safe a plate of steel which offers considerable resistance to drilling is placed between the outer door plate and the lock.

About 1888 the "solid" safe was introduced. In this the top, bottom and two sides of the safe, together with the flanges at the back only or at both back and front, are bent from a single steel plate. This construction, with solid corners, only became practicable in consequence of the great improvements which had been made in the quality of steel plates.

The Modern Safe.—The requirements of a modern safe may be briefly summarized as follows:

For fire resisting safes, the safe body must be constructed of steel plate of sufficient thickness, this varying with the dimensions of the safe, to withstand the effect of a fall from an upper floor in the event of a fire and to resist the crushing effect of falling masonry, displaced girders, etc., as safes are frequently buried by falling debris in the ruins of office buildings. The crucial test of the fire resisting capacity of a safe is fully applied under these conditions, *i.e.*, when buried under a red hot mass of ruins, often for a period of several days, before it can be dug out and removed from the collapsed building. The "proofing" of the safe must be of sufficient quantity, packed around the whole area of the body and door to preserve the heat resistance over a long period, otherwise when this reserve is exhausted the safe would become a slow oven and its contents charred and completely destroyed.

Safes which are intended to resist burglars, as well as fire, must be made with greater constructional strength successfully to resist brute force and destructive violence. In addition, they need to be formed from such a combination of metals and alloys as will withstand all forms of cutting and piercing tools and appliances, in addition to the oxy-acetylene cutting blow-pipe. This appliance, which is now in wide industrial use, will cut through practically all known steels, so that modern safe makers have had to resort to the metallurgist for the production of ferrous alloys which possess the power to resist the cutting effect of the gas flame, and are impervious to all drilling methods. The more successful of these alloys, although they can be heated by the gas flame to their melting point, cannot be cut, like steel, by the application of a stream of pure oxygen when their melting temperature has been reached.

It is essential that the walls and doors of such safes should be of considerable thickness, as mass is of great importance in providing resistance to the blow-pipe method of attack. The doors of such safes must be closely and accurately fitted to the opening in the safe body and secured in the closed position by a number of suitable moving bolts operated by an external handle. The actual shape of the bolts is not of vital importance, provided they are of sufficient strength and rigidity to resist all forces that can be brought to bear against them in an effort to force the door away from the safe body. The majority of safe manufacturers use bolts formed from either round or flat section steel bars, but others are of special shape and design.

In America, fire-resisting safes usually are not made burglar-proof; the highest standard of requirement being 20 minutes' protection against amateur attack through the door. Burglar-proof alloy steel chests are however frequently fitted into fire-

resisting safes. Most important are the locks used to control its operation. To provide the maximum amount of security and lengthen the period of resistance that a safe will offer to forcible entry, more than one lock should be employed and the locks need to be made as large as possible to increase the amount of material which has to be removed to expose the lock. It is also advisable to provide the lock with more than one moving bolt to engage with the bolting mechanism, as it is this moving lock bolt which prevents the bolt action being operated and the bolts retracted into the door.

When gunpowder was the only explosive available, it was possible to construct safe locks to resist its use, but with present day high power explosives other methods must be employed. In good quality safes these take the form of independent bolting actions which are brought into active operation only by the actual force of an explosive, when used to destroy the working lock; the effect of such an explosion being to substitute the dogging action of the special device for that of the lock which it was sought to destroy. To prevent the insertion of explosives in the keyholes it is the practice with work intended for bankers' use to provide a shutter, either in the form of a rotating disc or a sliding bar built into the door, to close the entrance to the locks after the keys have been used, the shutter action being in turn locked by a dial on the face of the door. In some instances, keyless combination locks only are used to control the bolting mechanism, but these locks are not in general use or favour in Great Britain, although their use is practically universal in the United States.

Time locks with two, three or four chronometer movements are frequently employed to control the hours for opening safes and vault doors. These locks are fitted in addition to either the key or dial operated locks, and are intended to prevent the door being opened at any other than the official times.

Strong-rooms and Vaults.—For the purpose of providing security for deeds, papers and books against the risk of fire, rooms are built either of brick or concrete, according to the conditions existing on the site and the amount to be expended on the construction, the thickness of the walls varying from 14 inches to 18 inches if built in brick, and from 8 to 14 inches in concrete. Bank vaults and strong-rooms for the custody of securities, cash, etc., are now mainly constructed of reinforced concrete or with a combination of brick and concrete, the thickness of the walls varying with their importance and the ground space available. Generally speaking, reinforced concrete walls can be built of less thickness than brickwork to provide equivalent security against penetration, but in all important vaults and strong-rooms it is advisable to reinforce the walls, roof and floor with linings of steel and flame resisting alloy, forming a self-contained safe inside the concrete shell.

The most effective method of employing steel to reinforce the concrete construction is to use it in the form of plates attached to the inner face of the walls by rag bolts or other suitable connections. The steel then has the protection of the full thickness of the concrete and itself prevents the breaking away of the inner face of the concrete in large sections into the void forming the strong-room, whereas if the steel reinforcement is distributed throughout the concrete walling in the form of bars or mesh work, it can be quickly and easily cut through with the blow-pipe.

In the design of strong-rooms and vaults, the formation of the roof and floor is frequently of more importance than that of the walls, the latter are usually subject to inspection (unless the room is built against an exterior or party wall, which should be avoided if possible), whereas the floor is liable to attack by means of tunnelling which can be carried out without any indication being given until the actual breaking through of the floor of the room. The highest degree of security is obtained when the vault is built as an island with an inspection or patrol passage entirely surrounding it, the floor of the vault being laid on sleeper lamps providing for full visibility below the floor level, with suitable lamps and switches for illumination.

Electrical devices are frequently installed to give an alarm in the event of a burglarious attempt upon strong-rooms, either

BY COURTESY OF (1, 2, 6, 9) MORRIS, HART AND COMPANY, LTD.; (2, 4, 6, 8) THE NOELAR SAFE COMPANY; (7, 10) THE NATIONAL CITY BANK OF NEW YORK

VARIOUS TYPES OF SAFES, STRONG ROOMS AND VAULTS

1. Closed vault door, English type. Only one combination lock used in this type of door
2. A strong room with the cash or security vault door open, showing complicated mechanism that operates bolts
3. English type of strong room door standing open. Seven large bolts seen in front
4. A circular vault door used almost exclusively for safety deposit vaults. It has two combination locks and one four-movement time lock
5. English type door to vault or strong room. Equipped with four separate combination locks (each combination is known to but one man, thus four men are needed to open this type of door)
6. Safety deposit vault of a large bank, showing thousands of small safe

deposit boxes that are rented by the year

7. Barred entrance to a safety deposit vault. Customer must first gain entrance through outer gate before entering vault
8. Steel filing safe equipped with safe-deposit boxes, an armored steel chest with steel circular door, and filing units. Designed especially for hotels, clubs, lodges, etc.
9. A complete burglar's outfit for opening safes and strong rooms from a photograph taken by the British police after the set had been abandoned by the foiled owners. Acetylene gas containers, hose, torch, bits, drills, levers, chisels and other instruments are shown
10. Safe deposit boxes of the larger types in a vault. Such types are used largely by bond, brokerage and insurance companies

upon the main structure or the door. In no case should they be regarded as a primary means of defense, for they may be put out of action through failure of an essential feature or neglect of maintenance and inspection duties.

A new type of bank vault that is said to be virtually immune to burglar attack through the use of copper in construction has been recently announced by the Copper and Brass Research association in the U.S. It is said that a burglar would require about six hours of uninterrupted effort with the oxy-acetylene torch to penetrate a modern vault door 20 in. thick, containing a 12 in. plate of pure copper. The high resistance of copper to torch attack is explained by the fact that this metal is a rapid conductor of heat, in contrast with other metals of low heat conductivity heretofore used in vault construction. A torch capable of developing a heat between 5,000° F. and 6,000° F. will penetrate the first few inches of a copper plate in a comparatively short time. However, the flame loses its efficiency as the copper conducts the heat rapidly away before the entire body of the metal can be raised to a fusing point, and the torch becomes ineffective.

The ductility of the metal makes it unsuited for successful attack with explosives.

SAFETY GLASS: see GLASS, SAFETY.

SAFETY LAMP. Toward the end of the 18th century mine explosions became increasingly common, and efforts were made to devise means of lighting which would be safe in the presence of gas. The explosive nature of a cloud of fine coal dust was not then recognized, and explosions were attributed wholly to gas. The explosions usually originated at the flame of a tallow candle. W. Reid Clanny invented a form of lamp in 1813 in which the external air was blown-by bellows through a small cistern of water and the products of combustion forced through a similar water seal. George Stephenson, who was experimenting with lamps for underground use in 1815, concluded that "if a lamp could be made to contain the burnt air above the flame, and permit the firedamp to come in below in small quantity to be burnt as it came in, the burnt air would prevent the passing of the explosion-upwards and the velocity of the current from below would also prevent its passing downwards." Though neither type of lamp was satisfactory, some of Clanny and Stephenson's ideas were incorporated in the Davy lamp as the latter was developed and improved. In Aug. 1815, the Sunderland Society of the Prevention of Accidents in Mines interested Sir Humphry Davy in the problem of mine explosion, and by the end of that year the first Davy lamp (*q.v.*) was ready for testing. It had a qualified success, but improvements were rapidly made to the original design and the type was accepted in all coal fields.

Great Britain.—In any mine comprised within the Coal Mines act of 1911, no lamp or light other than a locked safety lamp may be used in any seam in which the air current in the return airway from any ventilating district is normally found to contain more than 0.5% of inflammable gas; and wherever safety lamps are required by the act or by regulations under that act the type must be approved by the secretary of state. The safety lamps in use in the coal mines of Great Britain can be divided into two broad classes; viz., flame safety lamps and electric safety lamps. Flame safety lamps must be provided with double gauzes or some arrangement serving the same purpose.

Gauzes must be rigid in construction and made from suitable material. In lamps fitted with a metal chimney and only one gauze protecting the air outlets, the gauze must be made of wire of not less than 28 s.w.g. and must be secured with 18 s.w.g. to the frame. In lamps with two gauzes, the inner gauze must be made of wire of not less than 28 s.w.g. and the outer gauze of wire of not less than 26 s.w.g. The gauzes must be so constructed that they will not be displaced by the action of the flame, and must be so secured that they will not be displaced by the action of the flame, and must be so secured that they will not be displaced by the action of the flame.

quantity the lamp is filled with blue flame. For testing the presence of gas the flame of the lamp is lowered until the yellow part is at a minimum, when the gas will be discernible as a small blue cap to the flame. The size of cap and the percentage of gas present in the air have been correlated, and as little as 1% of firedamp in the air current can be detected.

The detector used with an electrical motor must be of the automatic type which gives visible warning of the presence of a gas-air mixture without manual manipulation. In other places the ordinary flame safety lamp suffices.

In addition to portable lamps, fixed lighting can be used on main roads or defined traffic centres. (J. A. S. R.)

United States.—The flame safety lamp, except for a few cases, had become by mid-20th century primarily a gas testing instrument and was not depended upon for illumination. U.S. usage, based on federal and state laws, recommended that a minimum of two flame safety lamps in good operating condition be available at all mines for testing the presence of methane or oxygen deficiency. U.S. specifications required that each lamp be equipped with double steel or brass gauzes constructed of wire between 20 and 27 American wire gauge (0.0113 to 0.017 in. in diameter), with mesh openings from 28 to 30 per lineal inch. There should be a shield or bonnet so constructed as to prevent injury to the gauzes and shield the gauzes from strong air currents. Lamp locks should be of the magnetic type and the relighting device simple and safe to use in the presence of explosive gas.

Portable electric lamps in the U.S. are chiefly gas cap variety using either a caustic or acid electrolyte solution. In addition, the permissible flashlight, a hand-held dry cell battery type, was tested and found safe to use under specified conditions.

Methane detectors, electrically operated, are used for special surveys or checks of return air courses, and methane alarms may be used under dangerous fluctuating conditions.

SAFETY RAZOR: see RAZOR.

SAFETY VALVE is a valve which lifts at a predetermined pressure and prevents the accumulation of a dangerous pressure in a steam boiler. The resistance to pressure is provided by a weight or by springs, the use of the latter being obligatory if the boiler is not a stationary one. The lever valve (*see drawing*) is loaded with a weight at the end, to keep the valve shut. A casing with lock may be fitted over to prevent tampering by an unauthorized person. Many boilers carry two safety valves as a precaution, one being locked up.

Marine boiler valves are of the direct spring-loaded type, the spring encircling the valve spindle. The pop valve blows off sharply with a pop, and is used for yacht and launch boilers. The valve closes again quickly when the pressure has been slightly reduced.

SAFFARIDS, a Persian dynasty of the 9th century, founded about 866 by Yakub ibn Laith al-Saffar ("the coppersmith"), who gained the command of a body of local troops and took control of his native province of Seistan. He soon added Herat, Fars, Balkh and Tabaristan to his possessions, overthrew the Tahirid governors of Khurasan, and, though still nominally dependent on the caliphs of Baghdad, established a dynasty in Seistan (*see* CALIPHATE: *The Abbasid Caliphs*; and *PERSIA: History*). In 900 Yakub's successor was defeated by the Samanids (*q.v.*), and few of the later Saffarids had any wide authority.

See T. Noldeke, *Sketches from Eastern History*, tr. by J. S. Black (London, 1895).

SAFFI: see SAFFI.

SAFFLOWER or **BASTARD SAFFRON** (*Carthamus tinctorius*), a plant of the family Compositae; its flowers form the basis of the safflower dye of commerce. The plant is a native of the East Indies, but is cultivated in Egypt and to some extent in southern Europe. To obtain the dyeing principle (carthamin, $C_{42}H_{64}O_{10}$) the flowers are first washed to free them from a soluble yellow colouring matter they contain; they are then dried and powdered, and digested in an alkaline solution in which pieces of clean white cotton are immersed. The alkaline solution having been neutralized with weak acetic acid, the cotton is removed and washed in another alkaline solution. When this second solution is neutralized with acid, carthamin in a pure condition is precipitated as a dark red powder. It forms a brilliant but fugitive scarlet dye for silk, but its principal use is in the preparation of toilet

DIAGRAM SHOWING WORKING OF SAFETY VALVE ON STEAM BOILER

rouge, for which it is mixed with powdered talc.

SAFFRON, a product manufactured from the dried stigmas and part of the style of the saffron crocus, a cultivated form of *Crocus sativus*; some of the wild forms are also employed. The purple flower, which blooms late in autumn, is very similar to that of the common spring crocus, and the stigmas, which protrude from the perianth, are of a characteristic orange-red colour; the fruit is rarely formed. The Egyptians, though acquainted with the bastard safflower (*Carthamus tinctorius*), often used to adulterate saffron, do not seem to have possessed the true saffron; but it is named in Canticles iv, 14 among other sweet-smelling herbs. It is also mentioned by Homer and Hippocrates.

Saffron has long been cultivated in Iran and Kashmir, and is supposed to have been introduced into China by the Mongol invasion. It is mentioned in the Chinese materia medica (*Pun tsaou*, 1552-78). The chief seat of cultivation in early times, however, was the town of Corycus (modern Korymbos) in Cilicia. According to Hehn, the town derived its name from the crocus; Raymond, on the other hand, with more probability, held that the name of the drug arose from that of the town. It was cultivated by the Arabs in Spain about 967, and is mentioned in an English leech-book of the 10th century, but seems to have disappeared from western Europe until reintroduced by the crusaders. According to Hakluyt, it was brought into England from Tripoli by a pilgrim, who had a stolen corm in the hollow of his staff. It was especially cultivated near Histon in Cambridgeshire and in Essex at Saffron Walden, its cultivators being called "crokers."

Saffron was used as an ingredient in many of the complicated medicines of early times; that it was very largely used in cookery is evidenced by many writers; the Chinese used to employ it largely, and the Iranians and Spaniards still mix it with their rice. As a perfume it was strewn in Greek halls, courts and theatres, and in the Roman baths. The streets of Rome were sprinkled with saffron when Nero made his entry into the city.

It was, however, mainly used as a dye. It was a royal colour in early Greek times, though afterward, perhaps from its abundant use in the baths and as a scented salve, it was especially appropriated by the hetairae. Saffron is chiefly cultivated in Spain, France, Sicily, on the lower spurs of the Apennines and in Iran and Kashmir. It occurs in the form of *cake saffron*, which consists of the stigmas and part of the style which have been "sweated" and pressed together into a cake, and also as *hay saffron*, which consists of the dried stigmas alone.

SAFFRON WALDEN, a market town and municipal borough in the Saffron Walden parliamentary division of Essex, Eng., 43½ mi. N.N.E. from London by the Eastern Region railway. Pop. (1951) 6,825. Area, 11.7 sq.mi. Of the old castle, dating probably from the 12th century, the keep and a few other portions still remain. Near it is a series of curious circular excavations in the chalk, called the Maze, of unknown date or purpose. The earthworks west and south of the town are of great extent; a large Saxon burial ground was there. The church of St. Mary the Virgin contains the tomb of Lord Audley, chancellor to Henry VIII. The town has a museum with good archaeological and natural history collections. In the neighbourhood is the fine mansion of Audley End, built by Thomas, 1st earl of Suffolk, in 1603 on the ruins of the abbey, converted in 1190 from a Benedictine priory founded by Geoffrey de Mandeville in 1136.

Saffron Walden (*Waldana*) was almost certainly fortified by the Britons, and probably by some earlier people. The town corporation grew out of the Guild of the Holy Trinity, which was incorporated under Henry VIII, the lord of the town, in 1514. It was dissolved under Edward VI, and a charter was obtained appointing a treasurer and chamberlain and 24 assistants, who, with the commonalty, formed the corporation. In 1694 William and Mary made Walden a free borough. The culture of saffron was the most characteristic industry at Walden from the reign of Edward III until its gradual extinction about 1768. Carnation growing is now important.

SAFFRON WOOD or **SAFFRONHOUT** (*Elaeodendron croceum*), a South African tree belonging to the staff-tree family (Celastraceae) and yielding valuable timber. The genus *Elaeo-*

dendron contains about 30 species, confined to the tropics and subtropics.

SAFI or **ASFI**, a seaport on the west coast of Morocco, in 32° 20' N, 9° 12' W., 106 mi. W.N.W. of Marrakesh. The old town, built on the rapid slope of a plateau toward the sea, is surrounded by crenellated ramparts dominated by an old Portuguese citadel, the Kechla. Safi is the chief town of the *contrôle civil* of Adba-Ahmar and the nearest port to Marrakesh. Trade reached 102,000,000 fr. in 1938 (imports 25,000,000, exports 77,000,000).

The population was (1936) 25,159, including 23,328 natives and 1,831 Europeans; (1944) 35,574, including 32,710 natives and 2,864 Europeans; (1947) 50,800.

In the early 1940s Safi became the second port of Morocco. The port was deepened, permitting eight ocean steamers to dock at one time. A rail line was built to the port from the Kowibga phosphate deposits, which became the most important item of export.

The town was the site of one of the U.S. landings on Nov. 8, 1942, and for many months of the North African campaign was an important port for the landing of war supplies.

SAGA. The word saga is used in Icelandic for any kind of narrative, written or oral, whether anecdote, story or history. But in English, as in other languages in which it has been borrowed, this word has a narrower sense and is applied to biographies written in Iceland, or occasionally in Norway, during the middle ages. The sagas are thus a branch of literature distinct from annals and summaries of history, many of which were also written in Iceland during the 12th and 13th centuries. Several classes of sagas are distinguished.

Kings' sagas are the oldest class. The heroes described in them were rulers of Norway and of dependencies of Norway who lived between the 9th and 13th centuries. The oldest of the kings' sagas now known is the so-called *First Saga of St. Olaf*, which is a life of St. Olaf, king of Norway (d. 1030), and was written about 1180. It survives only in fragments, but these are sufficient to show its form and style. In form it closely resembled the popular lives of European saints, many of which had been translated into Icelandic in the 12th century. The style was halting and unpractised. The sources were, for the most part, oral. They consisted partly of popular tales about miracles worked through Olaf's agency and partly of verses composed in honour of Olaf during his lifetime and handed down orally. In these verses the battles and great achievements of Olaf were commemorated and they provided an outline of his career, giving the saga its chief value as history. This *First Saga* was used as a source, directly or indirectly, by authors who wrote later lives of Olaf. The most important of these later lives was written by Snorri Sturluson (1179-1241), who incorporated it in his *Heimskringla* (Orb of the World), which is a collection of biographies of rulers of Norway from the 9th century to the 12th.

Sagas of several other Norse rulers were written late in the 12th century and early in the 13th. They included sagas about Olaf Trygvason (d. 1000), about Haakon the Good (d. c. 963), and about the earls of the Orkney Islands. The *Morkinskinna* (Rotten Skin) was written about 1220 and contains detailed sagas about kings who ruled Norway after the death of St. Olaf.

During the 13th and 14th centuries these early kings' sagas were often revised and combined with other works. The greatest of these compilations is the *Book of Flatey*, a magnificent manuscript written about 1390, which contains lives of the Norse kings combined with those of Icelandic heroes.

Icelanders' Sagas—The terms "Icelanders' sagas" (Icelandic: *Íslendinga sögur*) and "family sagas" are applied to biographies of heroes who are supposed to have lived in Iceland in the 10th and 11th centuries. Many of these heroes had visited the British Isles and lands as distant as Greece and Russia; some had emigrated to Greenland and others were said to have landed on Wineland the Good, as the Icelanders called the American continent.

The oldest of the Icelanders' sagas were written in the first years of the 13th century and were strongly influenced by the kings' sagas in structure, style and material. The sources were many

and varied, and included summaries of history and genealogies written in Iceland early in the 12th century, popular tales and poems preserved orally.

The value of Icelanders' sagas as history is difficult to assess. For a time they were accepted as trustworthy records, but it became widely agreed that they are, in the first place, works of art based upon historical and pseudohistorical sources. Such questions cannot, however, be discussed in general terms, for the aims and sources of the author of every saga must be considered separately.

Among the oldest of the Icelanders' sagas may be mentioned the *Fóstbrædra Saga* (Saga of the Foster-brothers), a great part of which is placed in the wastes of Greenland. *Hallfreðar Saga* (Saga of Hallfréð) is the tale of the favourite poet of King Ólaf Trygvason. The *Kormáks Saga* (Saga of Kormákr) and the *Bjarnar Saga Hítalækappa* (Saga of Björn) are early love stories.

These early Icelanders' sagas are somewhat primitive, but the art of saga writing developed rapidly during the 13th century, reaching its zenith soon after the middle of that century. The most perfect saga of this class in structure is the *Laxdæla Saga* (Saga of the Men of Laxárdal), a story in which women, love and romance play an unusually great part. The *Gísla Saga* (Saga of Gísli) belongs to the same period and is the story of an upright man, outlawed and unjustly persecuted. The *Grettis Saga* (Saga of Grettir the Strong), written rather later, is also an adventurous story of outlawry. Undoubtedly, the greatest of all sagas is the *Njáls Saga* (Saga of Burnt Njáll), written toward the end of the 13th century. There is no more moving tragedy in early Germanic literature and it is among the greatest prose narratives of the world.

Few of the Icelanders' sagas can be assigned to authors whose names are known. An exception is the *Egils Saga* (Saga of Egill), the story of the viking poet of the 10th century. It has lately been shown that this saga was probably written by Snorri Sturluson.

Bishops' Sagas.—At the beginning of the 13th century several sagas were written about bishops of the two Icelandic sees, Skálholt and Hólar. These included sagas about Þorlák (d. 1193) and Páll (d. 1211), bishops of Skálholt, and about Jón, bishop of Hólar (d. 1121). Later bishops' sagas were those about Bishop Árni of Skálholt (d. 1298) and Bishop Laurentius of Hólar (d. 1331).

Sagas of Later Times.—Numerous sagas were written about lay chieftains who lived in Iceland during the 12th and 13th centuries. Most of these were combined at the end of the 13th century in the *Sturlunga Saga* (Saga of the Sturlungar). The largest section of this compilation is the *Íslendinga Saga* (Saga of the Icelanders), a history of the Icelanders beginning with the year 1183 and covering a great part of the 13th century. The author of the *Íslendinga Saga* was Sturla Thórdarson (1214–84), nephew of Snorri Sturluson.

Heroic Sagas.—The term "Heroic sagas" (Icelandic: *Fornaldar sögur*) is applied to sagas about heroes of Scandinavia and continental Germania who lived before Iceland was peopled. The *Ynglinga Saga* (Saga of the Ynglingar) contains legends of the early kings of the Swedes and was written by Snorri Sturluson as an introduction to the *Heimskringla*. The *Skjöldunga Saga* (Saga of the Skjöldungar) was also written early in the 13th century and contained legendary tales about kings of the Danes.

Most sagas of this class date from the late 13th and 14th centuries. Their sources were often ancient heroic poems, such as those preserved in the *Poetic Edda* (see *EDDA*). One of the best known is the *Völsunga Saga* (Saga of the Völsungs), which contains a prose version of the legends of Sigurd and Brunhild. The *Hrólfs Saga* (Saga of Hrólfr Kraka) is also based partly on heroic poetry, and contains interesting legends about the Danes. The *Heiðreks Saga* (Saga of Heiðrekr) consists of numerous stories of devious origin, some of them about battles between Goths and Huns in the dark ages. Fantastic as they are, some of these heroic sagas preserve memories of historical events which would otherwise have been forgotten.

Romantic Sagas.—These are prose narratives based upon foreign

romances. Many of them were written in Norway under the patronage of King Haakon Haakonson (1217–63). They were later transcribed in Iceland and revised. They gained wide popularity and gave rise to original compositions in similar style. One of the best known, and perhaps the oldest, of the romantic sagas is the *Tristrams Saga* (Saga of Tristram), written in Norway in 1226, and based upon a French poem of the 12th century.

The *Karlamagnús Saga* (Saga of Charles the Great) contains prose versions of a number of French poems about Charles and his champions, including the *Chanson de Roland* (Song of Roland). Most of the romantic sagas are post-classical, dating from the 14th and later centuries.

(See ICELANDIC LITERATURE.)

SAGAING, a district and division of Burma, lying to the west of Mandalay on both sides of the Irrawaddy. The district has an area of 1,878 sq.mi.; pop. (1941) 387,270, showing an increase of 51,305 in the decade. The chief crops are sesame, millet, rice, peas, wheat and cotton. It lies in the heart of the dry belt, and the rainfall ranges from about 25 to 35 in. In the hot season the maximum shade temperature rises to a little more than 100° F. The lowest readings in the cold season average about 56° F.

Sagaing, the headquarters town, is opposite Ava, a few miles below Mandalay; pop. (1931) 14,127. It was formerly a capital of Burma. The Ava bridge (3,940 ft.), completed in 1934, with its western end at Sagaing, carries the Mandalay-Myittha railway and also road traffic. The steamers of the Irrawaddy Flotilla company call daily.

The Sagaing division includes the districts of Upper and Lower Chindwin, Shwebo, Sagaing, Katha, Bhamo, Myittha and Naga Hills.

SAGALLO, a small settlement on the north shore of the Gulf of Tajura, French Somaliland. In Jan. 1889 Sagallo was occupied by a Cossack chief named Achinov, who was accompanied by about 200 people, and the archimandrite Païsi, who had been entrusted by the metropolitan of Novgorod with an evangelistic mission to the Abyssinian church; while Achinov stated that he had a commission from the Negus for the purchase of arms and ammunition.

The presence of Achinov at Sagallo was regarded by the French government as an invasion of French territorial rights. The Russian foreign office having disavowed (Feb. 7) any connection with Achinov, instructions were sent from Paris to secure the removal of the Cossacks. On Feb. 17 French warships appeared off the port, and after an ultimatum which had no effect the fort was bombarded, and seven persons killed. The Cossacks then surrendered and were deported to Sué, whence they returned to Russia. Achinov was interned by the Russian government until Oct. 1889. In 1891 he returned to Abyssinia. Païsi was promoted by his ecclesiastical superiors. In Paris the incident caused great excitement among the Russophiles, and the consequent demonstrations led to the suppression of the League of Patriots and the prosecution of Paul Déroulède.

See *Vicomte de Constantin*, *L'Archimandrite Païsi et Pataman Achinov* (1891).

SAGAN (ZAGAN), formerly a town in Lower Silesia, Ger., and after 1945 in Zielona Gora province, western Poland, on the Bobr, or Bobrawa, river, a tributary of the Oder, 60 mi. S.S.E. of Frankfurt-on-Oder and 102 mi. S.E. of Berlin by the direct main line of railway to Breslau. The population was 4,359 in 1946 and 23,341 in 1939.

The mediate principality of Sagan, forming a portion of the Prussian governmental district of Liegnitz, was formed in 1397 out of a portion of the duchy of Glogau. One of its most famous possessors was Wallenstein.

In modern times the town was still partly surrounded by its old fortifications and numerous mediaeval houses survived. The palace of the dukes of Sagan was built there. During World War II Sagan suffered extensive damage. Industries include cloth weaving and wool spinning.

SAGASTA, PRÁXEDES MATEO (1827-1903), Spanish statesman, born July 21, 1827, at Torrecilla de Cameros, in the province of Logroño. From the first he displayed Liberal inclinations. He entered the Cortes in 1854 as a Progressist deputy for Zamora. Exiled after O'Donnell's *coup d'état* (1856), he returned to sit in the Cortes 1859-63. Exiled again after conspiring with Prim and the Progressists against Isabella, he took part in the rising at Cadiz which culminated in the revolution of Sept. 1868, was minister several times under Serrano and then under King Amadeo, 1868-72. Sagasta headed the most conservative groups of the revolutionary politicians against Ruiz Zorrilla and against the Federal republic in 1873; and in 1874 he vainly attempted to crush the Carlists and to check the Alphonist military conspiracy that overthrew Serrano (Dec. 1874). After the restoration of the Bourbons, Sagasta was premier in 1885-90 and again in 1892-95.

His attempt to conciliate both the Cubans and the United States by a tardy offer of colonial home rule, the recall of Weyler, and other concessions, did not avert the disastrous war with the United States, and his party was defeated (March, 1899). A trimmer *par excellence*, shier in opposition than in office, Sagasta returned with the Liberals to power in March 1901; in Dec. 1902 he was defeated on a vote of censure and resigned office, dying at Madrid on Jan. 15, 1903.

SAGE, MARGARET OLIVIA SLOCUM (1828-1918), American philanthropist, was born at Syracuse, N.Y., Sept. 8, 1828. She was educated at the Troy, N.Y., Female Seminary, afterwards known as the Emma Willard School. She married Russell Sage in 1869. Knowing her business ability and her interest in charity, her husband left her at his death over \$64,000 without restriction. In 1907 the Russell Sage Foundation was incorporated for the "improvement of social and living conditions of the United States of America." To it Mrs. Sage gave \$10,000,000. In 1912 Mrs. Sage bought Marsh Island, off the coast of Louisiana, and later turned it over to the State as a permanent refuge for birds. She died in New York city Nov. 4, 1918. By her will she left \$36,000,000 to be divided into 52 parts and distributed to various public institutions. It is estimated that during her life she made public gifts to the amount of \$40,000,000.

SAGE, RUSSELL (1816-1906), American financier, was born in Oneida county (N.Y.), on Aug. 4, 1816. He had a part interest in 1837-39 in a retail grocery in Troy, and in a wholesale store there in 1839-57. He was an alderman of Troy in 1841-48 and treasurer of Rensselaer county in 1845-49. In 1853-57 he was a Whig representative in Congress. He became an associate of Jay Gould in the development and sale of railroads; and in 1863 removed to New York city, where, besides speculating in railway stocks, he became a money-lender and a dealer in "puts" and "calls" and "privileges," and in 1874 bought a seat in the New York Stock Exchange. Sage died in New York on July 22, 1906. His wife, Margaret Olivia Slocum, inherited his fortune, and gave liberal benefactions to different institutions. See **RUSSELL SAGE FOUNDATION**; **SAGE, MARGARET OLIVIA SLOCUM**.

SAGE-BRUSH, the name given to various shrubby species of *Artemisia* (*g.v.*) native to plains and mountain slopes of western North America. The common sage-brush (*A. tridentata*) is a much-branched shrub, usually 3 ft. to 6 ft., but sometimes 12 ft. high, with silvery-green, bitter-aromatic foliage, the small, wedge-shaped leaves mostly with three teeth at the outer end. This shrub is very abundant on semi-arid plains, mainly between 1,500 ft. and 6,000 ft. altitude, where it is often a conspicuous and characteristic feature of the vegetation. It occurs from Montana and western Nebraska to British Columbia and California, growing usually on fertile soil.

SAGE HEN or **SAGE-GROUSE** (*Centrocercus urophasianus*), a long-tailed North American grouse. The male is 26 to 30 in. long; breeds in the sage-brush plains from Saskatchewan to Utah and California, feeding on grasshoppers and the leaves and buds of the sage-brush.

SAGINAW, a city of Michigan, U.S., 85 mi. N.W. of Detroit, on the Saginaw river, 15 mi. from its entrance into Saginaw bay (Lake Huron); a port of entry and the county seat of Saginaw

county. It is on federal highways 10 and 23, and is served by the Grand Trunk, the New York Central and the Chesapeake and Ohio railways and by Capital Airlines. Pop. (1950) 92,918. The city lies on both banks of the river, on level ground at an altitude of 581 ft. The area is 17 sq. mi. A council-manager form of government was adopted in 1936. There are 200 oil wells in the near vicinity, and the region raises large crops of sugar beets, grain, beans and other vegetables. Saginaw is the metropolis of a wide area, and has a large wholesale and distributing trade. Its manufacturing industries ordinarily employ 25,000 workers. Among the more important are foundries, machine shops and plants making auto parts, rules, sugar, furniture, baking equipment, seed cleaners, caskets, farm and dairy equipment, paper products, truck bodies, graphite products and boilers. Of interest to visitors are the federal building with its French Renaissance style of architecture and the Romanesque Hoyt library; the Schuch hotel with its collections of Indian relics and early Americana; Ojibway Island and Hoyt park. A Veterans Administration hospital was completed in 1950. In 1822 Saginaw City was founded on the west bank of the river, and in 1849 East Saginaw was laid out and financed by eastern capitalists. The two cities were chartered separately in 1859, and were consolidated in 1890. The lumber industry was at its height about 1880-90.

SAGITTARIUS ("the Archer"), in astronomy, the 9th sign of the zodiac denoted by the symbol \nearrow an arrow or dart. The Greeks represented this constellation as a centaur in the act of shooting an arrow, and professed it to be Crotus, son of Eupheme, the nurse of the Muses. On account of its southern declination the constellation is not well seen in the latitude of Great Britain; but it is one of the most interesting regions of the sky. A very bright arm of the Milky Way passes through it, and another part of the constellation is occupied by remarkable dark obscuring patches of nebulae. It contains the Trifid nebula and the Omega nebula, both fine examples of bright diffuse nebulae. Cepheid variables and globular clusters seem to congregate in this region, and it is now known that the centre of our galactic system lies in this direction, at a distance of the order of 30,000 light-years from the sun.

SAGO, a food-starch prepared from a deposit in the trunk of several palms, the principal source being the sago palms (*Metroxylon rumphii* and *M. sagu*), a native of the East Indian archipelago, the sago forests being especially extensive in the island of Ceram. The trees flourish only in low marshy situations, seldom attaining a height of 30 ft., with a thick-set trunk. They attain maturity and produce an inflorescence (flower spike) at the age of 15 years, when the enormous pith of the stem is gorged with starch. If the fruit is allowed to form and ripen, the whole of this starchy core material passes into the developing fruits, leaving the stem a mere hollow shell; and the tree after ripening its fruit dies. Accordingly the palms are cut down directly the inflorescence appears, the stems divided into sections and split up, and the starchy pith extracted and grated to a powder. The powder is then kneaded with water over a strainer, through which the starch passes, leaving the woody fibre behind. The starch settles in the bottom of a trough, in which it is floated, and after one or two washings is fit for use by the natives for cakes and soups. That intended for exportation is mixed into a paste with water and rubbed through sieves into small grains, from the size of a coriander seed and larger, whence it is known according to size as pearl sago, bullet sago, etc. A large proportion of the sago imported into Europe comes from Borneo, and the increasing demand has led to a large extension of sago-palm planting. Sago is also obtained from various other East Indian palms such as the Gomuti palm (*Arenga pinnata*), the Kitul palm (*Caryota urens*), the cabbage palm (*Corypha umbraculifera*), besides *Corypha utan*, *Raphia flabelliformis* and *Phoenix farinifera*, also from *Mauritia flexuosa* and *Guilielma gasipaes*, two South American species. It is also obtained from the pith of species of *Cycas*.

SAGUARO: see **SUWARO**.

SAGUENAY, a river of Quebec province, Canada, flowing into the St. Lawrence 120 m. north-east of Quebec. It drains Lake St. John, from which it issues by two canals, La Grande

and La Petite Décharge. It is a source of hydro-electric power, owing to its fall of 314 feet in its descent to sea-level, and the reduction of aluminum from its ores is carried on at the town of Arvida. From Chicoutimi the river is navigable by small steamers, and from Ha Ha Bay to the mouth by vessels of the largest size. It is indeed rather a fjord than a river, containing neither rock nor shoal, and having at its mouth a depth of some 600 ft. greater than that of the St. Lawrence. Its width varies from three-quarters of a mile to two miles, and the waters are blackened by the shadow of treeless cliffs, over 1,000 ft. in height, separated here and there by narrow wooded valleys, and culminating in Capes Trinity and Eternity, 1,600 and 1,800 ft. in height. Tadoussac, at its mouth, is the oldest European trading post in Canada.

Lake St. John is a shallow basin, 26 m. by 20, with an area of 365 sq.m. It receives the waters of the Ashuapmucuan, often spoken of as the upper course of the Saguenay, the Mistassini, the Peribonka and various other important streams. In it is found the *ouananiche*, or land-locked salmon, which attains a weight of about 6 lb.

SAGUNTO, formerly Murviedro, a Spanish town 18 mi. north of Valencia on the Valencia-Barcelona coast railway. Pop. (1940) 10,352 (mun., 20,253). The well-preserved Roman theatre looks across the Huerta de Valencia to the Mediterranean. Sagunto is the ancient Saguntum, an ancient Greek or Greek-Iberian town, founded by colonists from Zacynthus (whence its name). About the year 228 B.C. the Romans, disgusted by the enormous growth of Carthaginian power in Spain, concluded an alliance with Saguntum and further required the Carthaginian general, Hasdrubal, not to pass the Ebro. These conditions were observed until 219 when Hannibal judged it safe to begin the war by attacking Saguntum. Confident in Roman protection, the town made a desperate resistance for eight months, at the end of which it was taken by storm. Rome complained to Carthage, requiring the surrender of Hannibal and the members of the Council present with him; the Council, though doubtful of the wisdom of Hannibal's action, naturally refused, and the second Punic War began. Saguntum never recovered its old importance, and in 138 B.C. was definitely eclipsed by the foundation of Valencia by D. Iunius Brutus, and its population by Lusitanian war-captives who were given the Latin franchise.

SAHAPTIN or **SHAHAPTIN**, originally the name of a tribe also called Nez Percé, has become the usual designation of a family of Indians on middle Columbia and lower Snake river, in Idaho, Oregon and Washington. The principal tribes are the Nez Percé, Palos, Wallawalla, Umatilla, Tenino, Yakima, Klikitat. Subsistence was primarily on salmon and roots, residence likely to be shifting. The Sahaptin are now on Lapwai, Umatilla, Warm Springs and Yakima reservations, with remnants of other groups; the tribal lines are much blurred.

SAHARA, the great desert of North Africa. It forms the western part of a wide desert tract which extends from the Atlantic ocean through Egypt, across the Red sea and through Arabia to Mesopotamia. Its physical boundaries are in some directions clearly defined but in others vague, conventional and disputed. On the west the desert extends in many places to the Atlantic coast; on the north to the foot of the Atlas mountains and to the Mediterranean sea east of these ranges. The eastern part, the Libyan desert, is flanked by the Nile, but the Nubian desert beyond differs very little from it; whilst on the south the Sahara merges into the Sudan and the basin of the Niger and only in a few places does a natural boundary exist between them. The area of the desert is estimated at 3½ million square miles, about the area of Europe minus Scandinavia. Its greatest length along lat. 20° N. is 3,200 m. and its breadth from north to south varies from 800 to 1,400 miles.

In such a vast region as the Sahara desert a wide range of topographical forms must occur. Some small tracts lie below sea-level, but, on the other hand, approximately half the area stands above the 1,000 ft. contour line, the highest altitude (8,800 ft.) being reached in the volcanic cone of Tusiide (Tibesti massif). The horizontally bedded Cretaceous rocks form characteristic

plateaux and escarpments which are dissected by an ancient river system and form a sharp contrast with the volcanic cones.

The Sahara Proper.—This is the region which extends southward from the Atlas mountains as far as the highland tract of the central massif and down the western side of the latter to the basin of the Niger. For the most part it is a succession of low plateaux of Cretaceous rocks covered largely by dunes, locally called *erg* or *igidi*, although, in many parts of the west and south, Palaeozoic and Archaean rocks crop out. Along the Atlantic coast, in Mauritania, is a wide belt of dune country with recent deposits of salt and gypsum; inland the dunes give place to tracts of pebbles, the eastern continuation of which is the low plateau country of Adrar and El Juf again covered with dunes, which extend as far as the central massif. To the north are the districts of Rio de Oro, with a penneplained mass of Archaean and metamorphic rocks in the Wessat region; the plateaux of Dra'a and Taflelt of Cretaceous and newer rocks, at the foot of the Anti Atlas and drained by the Wad Dra'a; the desert of Igidi, a large part of which is covered by dunes; and the plateau of Tademaït formed of flat Cretaceous rocks and formerly the watershed of this region.

This plateau is continued eastward into the Hammada el Homra whilst to the north is the Great Erg, into which a spur of the hammada extends northward dividing it into the western and the eastern Erg.

The Central Tuareg Massif.—This comprises the Ahaggar plateau of Archaean and Palaeozoic rocks which occupies a central position in the desert and on which are several peaks of volcanic origin which do not rise above 8,000 ft. but are periodically snow-capped. The mass is flanked on the west, north-west and north-east by the lower plateaux of Ahnet, Moudir and the Tazili of the Asjer (5,000 ft.) respectively. The latter is continued south-eastward by a low range, the Tummo, into the Tibesti mass of Archaean rocks in which occurs the highest peak in the desert, Mt. Tusiide (8,800 ft.), an extinct volcano, and still farther south-eastward into the lower range of Ennedi.

The Libyan Desert.—This is triangular in shape, extending from the Mediterranean sea to the Sudan. In the north-west is the hammada country of the Fezzan (*q.v.*) in which are the mountains of Jebel es Soda (Black mts.) which are continued south-eastward towards Kufara by the Huruj es Soda. On the coast in the extreme north are the Jebel el Akhdar ranges, but the rest of the desert is a wide expanse of almost level country, over 500,000 sq.m. in extent, which consists of dunes and sandy wastes of unascertained limits, and across which there is only one known route, running from north to south through the oases of Kufara.

Geology and Structure.—Exact geological information about many parts of the Sahara is not known, but the main structure is now fairly well understood. In the central Tuareg massif we find Archaean gneisses, mica schists, granites, etc., which are flanked by folded Silurian rocks upon which rest Devonian and, in some places, Carboniferous strata. Permian, Trias, Jurassic and Lower Cretaceous rocks are apparently missing in the central Sahara, although the Jurassic crops out in south-west Algeria and along the Atlas borders, but a large area is covered by horizontally bedded Middle and Upper Cretaceous rocks, at the base of which is a variegated clay with gypsum. This latter, a typical lagoon formation, indicates the incoming of changed conditions which caused a widespread transgression in the Cenomanian epoch (lower chalk of Britain) and established an epi-continental sea on the stable mass of northern Africa. Miocene, Pliocene and Quaternary deposits occur locally, the Nummulitic limestone being important in the Libyan desert and Egypt. The Sahara is quite distinct from the folded Atlas mountains (*q.v.*), which tectonically belong to Europe and to which North Africa acted as hinterland during the period of Tertiary folding.

Water Supply.—The winds of the Sahara are very dry, and in consequence there is little or no precipitation, except in the highland region of the central massif, where there is a fall of a few inches per annum, and also along the coastal fringes. Nevertheless, the desert as a whole is not entirely without water, but possesses a skeleton of a regular river system. Inadequate streams radiate from the central massif, but they are soon lost in the sand

of the surrounding country. Similar streams flow down from the Atlas mountains, the Wād Dra' finally reaching the ocean, whilst in the Atlantic and Mediterranean coastal regions similar streams occur, some reaching the sea, others losing themselves in the desert. Irrigation has been attempted in various parts, and it has been found that in many places, especially south of the Atlas and in Algeria, the geological structure is such that artesian water has been obtained. The water so obtained is remarkably fresh, and by means of it agriculture has been made possible in several districts, but the arid hammada country must be abandoned as hopeless. How far such irrigation works can be extended is very uncertain for the detailed geological structure of the area is not yet sufficiently known.

Origin of the Sand.—Several theories have been put forward to explain the enormous quantity of sand in the Sahara. The theory of marine origin is now no longer tenable, for the sand is Quaternary, or at the oldest Pleistocene, in age, and there is no evidence of a marine transgression since pre-Tertiary times. During the great Ice age, when the southern limit of the ice-sheet extended across Central Europe, meteorological conditions were such that much, if not all, of the desert belt lay in a warm, moist, temperate or sub-tropical zone. Under such conditions rock disintegration and soil formation would proceed in the way normal to such regions, the soil being held in position by vegetation, as is still the case in parts of Mauritania, the regions of north of Timbuktu and round Lake Chad and the several oases. A mature river system also assisted in the disintegration and transportation of sediments. Later the soil lost its moisture and the winds became dry, consequent upon the changed meteorological conditions brought about by the retreat of the ice, and vegetation disappeared, leaving the dry soil at the mercy of the wind.

Climate.—The summer heat (June, July and August) is very great and is measured by Augeras in terms of the number of days on which a thermometer not directly exposed to the sun's rays reached 50° C (122° F). In 1913 the number was 33, in 1914 it was 37, in 1915 it was 11 and in 1916 it was 42. During the hottest night in 1916 the temperature did not go below 104°, but the average summer night temperature is about 77°. These figures are for the western Sahara; the central highlands are cooler. The highest recorded temperature for the western Sahara is 56° C (132.8° F). In the cool season the monthly average maxima are about 68°–78°, the minima about 41°–50°. On one or two nights of the year the ground in the west may freeze; there is more frost in the central highlands. In summer the soil-temperature may occasionally reach 175°, the relative humidity may be as low as 5% even in the oases; in the cooler season the relative humidity may increase to 48%. The winds in many parts are chiefly the north-east trades, but there may be summer centres of low pressure, and in the western Sahara the wind often blows from the west.

Flora.—The three chief trees are the date palm, *Acacia tortilis* (on the rocky areas), and *Tamarix articulata* (in beds of wadis). The small plants belong mostly to the Compositae, Cruciferae, Leguminosae and Gramineae, usually with small, often hard, leaves, and sometimes fleshy stems. Some desert plants have leaves grey with hairs, which immediately suck in any drop of dew, while others have salt incrustation that attracts any moisture, some plants (colocynths) have very deep roots. Many desert plants retain vitality in spite of years of "resting" while they wait for water; the rose of Jericho is famous in this connection.

Fauna.—The antelope and gazelle occur in the Sahara, and were formerly hunted by the lion, which is now nearly extinct in the desert. Jackal, fox, fennec, badger, jerboa, rat, isabelline hare and, near water, bats also occur. The hyena wanders near the desert border, and the mouflon is found here and there on the higher land. Ostriches survive in the Mauretanian Ergs, but must once have been abundant and widespread. Eagles are fairly numerous, and there are quails, with some ducks, flamingoes and herons near the wadis, where there is water occasionally. Horned vipers, several large lizards, scorpions, tarantulas, beetles, myriads of locusts and flies and many ticks are other members of the

fauna. A few crocodiles survive in some dwindling swamps of the west.

Peoples and Settlement.—It has been indicated above that what is now the desert of Sahara seems to have been open grass land or steppe land in the days of early man. Consequently, it is not surprising to find evidences of a more extensive human occupation of the region than its present climatic and physical conditions will allow.

Barth, in 1850, described drawings as representing a dense crowd of cattle all moving in one direction. Incised drawings are known in Tibesti, and in the region of North Tuareg (Adgor), and north of this, through Algeria to Morocco from Constantine by Ain Sefra to Figig. The animals represented on these drawings no longer inhabit these regions. Neolithic implements have been found at the base of the rocks. Rock drawings are rarer in the western Sahara; some occur at Meherrah 60 km. W. of Menakeb.

Attempts have been made to trace in certain of the existing inhabitants the remnants of an early race of negro affinities, which inhabited the Sahara before the arrival of the Berbers and Arabs. Gauthier thought that at a period as recent as the Roman conquest of North Africa the Sahara had still a Neolithic culture and people of negro affinities. Negro influence is undoubtedly seen in various parts of the Sahara, but it may date from a much more recent period than has been supposed. For example, the connection between many of the place-names in Fezzan and the language of Bornu is attributable to the northward extension of the influence of the Bornu-Kanem empire between the 11th and 14th centuries A.D. The allusions by classical writers to Ethiopians as inhabitants of the Sahara prove little, in view of the very vague and general meaning attached to the word. Caravans of negro slaves from time immemorial passed northwards along the main desert routes, and it is just in the oases on these routes that the dark element in the population is chiefly found. The oases are naturally the chief centres of population in the Sahara. They occupy positions where the underground water makes its way to the surface or is readily reached by boring; other centres of population are certain mountainous districts where the atmospheric moisture is condensed, and a moderate rainfall results.

The northern oases, such as Dra'a and Taflelt, are poor. In the east is the Zuzana group, near Tarhit. The Gurara oasis is probably an old lake floor watered by subterranean galleries made by man, and called *gogaras*, and is a rather rich settlement. Tuat is of the same type, but on a cliff top. Tinerkuk and Tarhuz are Erg oases. Tidikelt is the only artesian oasis. Ugarta, Zerhama and Bon Mahud are small "spring" oases. The Taflelt people meet in the Maider pass by the Daura, Bubut or Wahila, and move over the central plateau and pass Chech in the Tarhamant. The Dra'a meet at Tingut and go via Regbat and the edge of the Erg, and then across the central plateau to Tarhamant. Another raiding group are the Seguiet el Hamra. These people of the northern Sahara are nomads. The various confederations of the Tuareg, in the central Sahara, are grouped around hilly districts. The most important are the Awellimiden, on the left bank of the Middle Niger; and the Kel-Ui, grouped around the mountainous districts of Air or Asben, with Agades as centre; the two northern confederations, those of the Ahaggar and Asjer, being less powerful. North-west of Timbuktu, in the district or "kingdom" of Biru, is the oasis and town of Walata, a Tuareg settlement. The Tuareg are mostly a nomadic people of pre-Arab stock. All the men folk are veiled, and they have been known accordingly as the "People of the Veil." They were doubtless pushed into the fastnesses of the southern desert by Islamic invasions. Other mountainous districts in which a certain amount of rain falls regularly, and which contain a population above the average for the Sahara, are Tibesti and Borku, in the east centre, and Adrar in the west. Tibesti and Borku are peopled by Tibbus, once thought to be almost pure negroes. This has, however, been disproved. They are light or dark bronze in colour. Their language is related to that of the Kanuri in Bornu, but it appears that the language of the Tibbu is the older. The Tibbus are probably of Hamitic stock. The western Adrar are peopled

mainly by Moors (Berbers).

Commerce.—From the earliest times Saharan commerce has been the monopoly of the nomad peoples. Salt and ivory were carried across the desert in very early times. In the middle ages the Jews possessed great influence in this part of Africa as organizers of trade. In 1447 the Genoese merchant traveller, Antonio Malfaute, visited the Oasis of Tuat and pointed out its importance as a trade centre between the Muslim countries surrounding the desert. He mentions the large quantities of copper carried south to the negro kingdoms of the Sudan, and the vegetable butter there produced. There is evidence that the Venetians and Genoese both had considerable interests in African trade.

Salt and date palms are the chief products of the Sahara at the present time. The principal sources of the salt supply are the rock salt deposits of the Juf (especially Taoudeni), the lakes of Kufara and the rock salt and brine of Bilma (*q.v.*).

Trade routes run (1) from Morocco to Cairo by Insalah and Ghadames, the route of West African pilgrims to Mecca, now largely superseded by the sea route from Tangier to Alexandria, (2) from Kuka (Lake Chad) to Murzuk and Tripoli; (3) from Kano and Zinder to Tripoli by Air and Ghat; (4) from Timbuktu to Insalah, Ghadames and Tripoli; (5) from Timbuktu to Insalah and thence to Algeria and Tunisia; (6) from Algeria—through Tuat and Timbuktu to the Niger. The Senussi movement brought into prominence the desert routes between Wadi in the south and Jalo and Benghazi in the north, which partially superseded some of the older routes. The long-established route from Darfur to the Kharga and Dakhla oases fell into disuse on the closing of the eastern Sudan by the Mahdist troubles. The great route leading from Tripoli via Ghadames and Ghat, to Zinder, Kano, and other great centres of the Hausa States maintains its importance, but the opening of trade from the side of the Niger by the British in the early years of the 20th century affected its value. The route across the western Sahara to Timbuktu is less used than formerly owing to the establishment by the French of a route from Senegal via Niore to the Upper Niger. The old route, however, retains some importance on account of the salt trade from the Sahara, which centres at Timbuktu.

Railway Schemes.—Two principal routes for a railway across the desert have been suggested, the one taking an easterly line from Biskra through Warqala to Air (Agades) and Zinder, the other starting from the terminus of the most westerly railway already existing, and reaching Timbuktu via Igli and the Tuat oases. A third suggested route is one from Igli to the Senegal, still farther west.

Political Divisions.—The western Sahara, in the main, is administered within French West Africa while the eastern regions of the desert fall into Italian Libya, Egypt and Anglo-Egyptian Sudan. The French first acquired an interest in the Sahara by their conquest of Algiers (1830-45). They gradually extended their influence southward with the purpose of forming a junction with their possessions on the Senegal. The acquisition of Tunisia (1881) largely increased the hold of the French on the Sahara, and the work of French pioneers to the south of Algeria was recognized by the Anglo-French agreement of 1890, which assigned to France the whole central Sahara from Algeria to a line from Say, on the Niger, to Lake Chad. The southern limit of the territory was, however, not strictly defined until 1898, when a new agreement gave to France a rectangular block south of the line mentioned, including the important frontier town of Zinder. A further agreement in 1904 again modified the frontier in favour of France. To the north-east and east the boundary of the French sphere was made to run south-east from the intersection of 23° N. with 16° E., following this south to the western frontier of Darfur and the Anglo-Egyptian Sudan. French Sahara is thus connected with the French possessions in West Africa and with the Congo-Shari territories of France on the south-east. The Spanish possessions are known as Rio de Oro. In the south the French influence extends beyond the Sahara, reaching the coast in Senegal, French Guinea, Ivory coast, Togo and Dahomey. The French Sahara proper may be very roughly estimated at about 1,500,000 sq. miles. Over the whole of French West Africa

there is a governor-general, who is assisted by a council. The seat of the General Government is at Dakar. Under the governor-general the various colonies are administered by lieutenant-governors.

Exploration.—The Egyptians penetrated the Libyan and Nubian deserts at points, and Carthaginians and Phoenicians were acquainted with the northern fringe of the desert in the west. Jews and Genoese in the middle ages learned much about the Sahara in the course of trade, and their knowledge was mapped by Jewish cartographers in Majorca in the 14th and 15th centuries. In 1819 Capt. G. F. Lyon and Joseph Ritchie penetrated from Tripoli to Murzuk. In 1822 came the journey of Oudney, Clapperton and Denham, from Tripoli to Lake Chad, and a year or two later Maj. A. G. Laing reached Timbuktu, also from Tripoli. In 1828 René Caillié crossed from Timbuktu to Morocco. Heinrich Barth, in the course of his great journey (1849-1856), commenced from Tripoli under the leadership of James Richardson, traversed a considerable portion of the Sahara. Between 1859 and 1861 Henri Duveyrier explored parts of the Tuareg domain. Knowledge of the northern Sahara, from Morocco to Tripoli, was largely increased by the journeys of Gerhard Rohlfs, begun in 1861; Rohlfs subsequently crossing (1865) from Tripoli to Lake Chad by nearly the same route as that previously taken by Barth. In 1873-74 Rohlfs visited the oases in the north of the Libyan desert, and in 1878-79 reached the oasis of Kufara. In 1876-77 Erwin von Bary, made his way to Ghat and Air. A French expedition under Col. Paul Flatters, after penetrating far south of Algeria, was massacred (1881) by Tuareg. Farther west, in 1880, Dr. Oskar Lenz started from Morocco, partly by a new route, to Timbuktu. In 1892 the Sahara was crossed from Lake Chad to Tripoli by the French Colonel Montell.

In 1899 the central Sahara, from Algeria to Air, was traversed by Fernand Fourneau. The great desideratum was the opening up of a route to the Niger countries, which might in time divert the trade from Tripoli to Algeria. In 1890 Fourneau, who in 1883 had undertaken a first journey of exploration south of Warqala, reached the Tademait plateau in 28° N., fixing the position of many places, and in 1893-94 came the first of his long series of expeditions undertaken with a view of penetrating the country of the Azir Tuareg, the powerful confederacy which lay on the route to Air and Lake Chad. Fourneau finally reached Zinder, the important trade centre on the borders of Nigeria, in 1899.

In the central Sahara, French posts were gradually pushed farther south under a military organization. Subsequent travellers gathered much information respecting the mapping, geology, and other features of this part of the Sahara. Subsequent work in the Sahara is associated with the names of Laperrine, Arnaud, Cortier, Nègre, Villatte, Gautier and Chudeau, on the French side, while Vischer, Haywood, Hassanein Bey, Buchanan, Augières, Godefroy, Harding King, and F. R. Rodd have contributed much to our knowledge of the peoples and their environment.

SAHARANPUR, a city and district of British India, in the Meerut division of the United Provinces. The city is situated on a stream called the Damula Nadi, 998 mi. by rail from Calcutta. Pop. (1941) 108,263, of whom more than half are Mohammedans. It is an important railway junction. There are railway workshops, and a large wood-carving industry.

The DISTRICT of SAHARANPUR has an area of 2,134 sq. mi. It forms the most northerly portion of the Doab, or alluvial tableland between the Ganges and Jumna. The population in 1941 was 1,799,643. The district contains the towns of Roorkee and Hardwar.

SAHOS or SHOHOS, Africans of Hamitic stock living to the west of Massawa. Probably akin to the Gallas and Afars. They are mostly Mohammedans, some few being Christians.

SAID HALIM, PRINCE (1863-1921), Turkish statesman, the son of Halim Pasha and the grandson of Mohammed Ali, the founder of the present Egyptian dynasty, was born in Cairo and was educated in Turkey, completing his studies in Geneva. Exiled because of his sympathy with the Young Turkish movement, he affiliated himself to the Committee of Union and Progress in Paris. After the revolution of July 1908 he returned to Constantinople and was nominated senator. At various times from 1908 to 1918 he was president of the council of state, minister for foreign affairs and general secretary to the Union and Progress party. On June 17, 1913, he became Grand Vizier, in which capacity he endeavoured to settle the questions of Armenian reforms, Mosul oil and the participation of English, French and Russian capital in the Baghdad railway. He also endeavoured to establish close relations with Greece. Said Halim favoured a Turco-German alliance, but sought to keep Turkey neutral in World War I. On its entry into the war he tendered his resignation, which was refused, and he remained in office until Feb. 1917. After the Armistice of Mudros, Oct. 31, 1918, Said Halim was imprisoned by the British in Malta. Released in 1921, he was assassinated in Rome on Dec. 6, 1921.

SAID PASHA, MOHAMMED (d. 1928), Egyptian statesman, succeeded Boutros Pasha as prime minister of Egypt in 1910. He held office for four different years, in which he succeeded in carrying out various administrative reforms and an extension of provincial government. In May 1919 he formed a non-political ministry in the heat of the revolutionary movement. A bomb thrown at him in the street in September of that year exploded harmlessly in the roadway. In Nov. 1919, when he was informed of the coming of the Milner mission to Egypt, Said Pasha resigned with his cabinet. He was minister of education in Zaghlul's cabinet (1924), and he was acting prime minister during Zaghlul's absence in Europe. He resigned in Oct. 1924, and presently resigned his membership of the Ward party. He was returned to parliament as an independent member for Alexandria in Jan. 1925. Said Pasha died on July 20, 1928.

SAIGA (*Saiga tatarica*), a desert-dwelling antelope inhabiting the Khirgiz steppe. A century ago it extended as far west

as Poland. During the later Tertiary period the saiga was widely distributed in Europe and Alaska.

SAIGO TAKAMORI (1832-1877), Japanese patriot, was born in Satsuma in 1832. From early youth he took a prominent part in the politics of his clan, and owing to his extreme opinions with regard to the expediency of abolishing the Tokugawa administration, he was banished (1858) to the island of Oshima (Satsuma), where he attempted unsuccessfully to commit suicide. Ultimately he rose to high rank in the newly organized imperial government, but in 1873 he retired from the cabinet by way of protest against its decision not to take armed action against Korea. Thenceforth he became the rallying point of a large number of men dissatisfied with the new administration, and in 1877 he headed a rebellion which taxed all the resources of the central government. After several months of desperate fighting, Saigo and a small remnant of his followers made a swift retreat to Kagoshima, and fell fighting (Sept. 14) within sight of their homes.

SAIGON, capital of the colony of Cochinchina and of French Indo-China on the right bank of the river Saigon, 34 mi. from the sea. Pop. (1936) 111,000 of which 11,760 were French. The town is enclosed by the Saigon river, the Arroyo Chinoise and the Arroyo de l'Avalanche except on the southwest, where it adjoins the twin city of Cholon (q.v.). Double rows of trees along fine boulevards, with public gardens, cafes and other French features, make it the "Little Paris of the East." Buildings like the government house, law courts, theatres and cathedral are distinctly French. The well-equipped port was visited by 581 vessels in 1939, and exported 2,000,000 tons of rice, teak, rubber, hides, pepper, copra, gums, kapok, etc. The chief industries of Saigon and Cholon are rice and sawmilling, electric power, alcoholic beverages, textiles, soap and chemicals. The state railways connect Saigon with northern Indo-China, while highways extend to Tonkin and to Luang Prabang in Laos (q.v.).

Saigon is the seat of two chambers of the court of appeal of French Indo-China, of tribunals of first instance and of commerce, and of the vicar apostolic of Cochinchina.

Before the French conquest, Saigon, then known as *Gai-dinh-thanh*, was the capital of Lower Cochinchina, which consisted of the "six southern provinces" of the Annamese empire, and constituted a vice-royalty under the government of a *hinhluoc*. The French captured it in 1859, and it was part of the territory ceded in 1862.

SAILCLOTH AND SAILMAKING. Sailcloth, now more commonly called canvas (q.v.) or, in the United States, duck, is usually a double warp, single weft fabric of the same structure as bagging (see BAGGING AND BAGS) and tarpaulin, although it is sometimes made with single threads of warp. Hemp and ramie are occasionally used in the manufacture of this cloth, but flax and cotton are the chief fibres employed. Many of the sails of fishing smacks and similar vessels are made entirely of cotton—the fabric sometimes retaining its natural colour, but more often dyed or stained tan. Since most of the larger vessels are now driven by steam or oil, the quantity of cloth used for sails is comparatively small. A large quantity of cloth, however, is used on steamships for covers, and for coal bags, sailcloth buckets, etc.

The very best kind of sailcloth is made from long flax, as this fibre possesses flexibility, lightness and strength combined. The number of threads per inch of warp varies from 14 double threads to 48 double threads, and from 12 to 36 shots per inch of weft, while the usual widths are 18, 24, 30 and 36 inches. Cotton canvas has for its limits about 26 to 54 threads of warp per inch, and 15 to 46 shots per inch; the warp yarn for cottons may be 2, 3 or several ply.

Sailmaking.—This is a very ancient industry, but is naturally much less important than it was before the introduction of steamships. The operations of the sailmaker may be stated as follows. The dimensions of mast and yards and sail plan being supplied, the master sailmaker is enabled to determine the dimensions of each sail—after due allowance for stretching—in terms of cloths and depth in yards—if a square sail, the number of cloths in the head, number in the foot and the depth in yards; if a fore-

and-aft sail (triangular), the number of cloths in the foot and the depth in yards of the luff or stay and of leech or after-leech; if a fore-and-aft sail (trapezium form), the number of cloths in the head, number in foot and the depth of mast or luff and of after-leech. These particulars obtained, there is got out what is technically termed a "casting," which simply means the shape, length, etc., of each individual cloth in the sail. These figures are given to the cutter, who proceeds to cut out the sail cloth by cloth in consecutive order, numbering them 1, 2, 3, 4, etc.; the series of cloths thus cut out are handed over to the workman, who joins them together by carefully made double flat seams, sewn with twine specially prepared for the purpose, with about 120 stitches in a yard. In the heavy sails the seam is about 1½ in. in width, and in the British navy stuck or stitched in the middle of the seam to give additional strength; the seams in the lighter sails are about 1 in. wide. The whole of the cloths are then brought together, and spread out, and the tabling (or hemming, so to say) is turned in and finished off with about 72 stitches to a yard. Strengthening pieces or "linings" are affixed where considered necessary, in courses and top-sails such pieces as reef-bands, middle-bands, foot-bands, leech-linings, bunt-line cloths; in top-sails (only) a top-lining or brim; in other and lighter sails such pieces as mast-lining clew and head, tack and corner pieces; holes, such as head, reef, stay (luff), mast, cringle, bunt-line, etc., are also made where required, a grommet of line of suitable size being worked in them to prevent their being cut through. The next thing to be done is to secure the edges of the sail. Bolt-ropes, a comparatively soft rope made from the finer hemp yarn (Italian) is used for this purpose; in the British navy it ranges from 1 in. (increasing in size by quarter inches) up to 8 in. inclusive; it is then neatly sewn on with roping twine specially prepared, the needle and twine passing between and clear of every two strands of the rope in roping.

Where slack sail has to be taken in, it is the practice to leave it to the judgment of the sail-maker; but where possible it is better to set up the rope by means of a tackle to a strain approximate to what it will have to bear when in use, and whilst on the stretch mark it off in yards, as also the edge of the sail in yards, so that by bringing the marks together in roping the sail will stand flat. In the British navy the largest size of rope sewn on to a sail is six inches; sizes above this are used for foot and clew ropes of top-sails and courses, being first wormed, parcelled (that is, wound round with strips of worn canvas), tarred and served over with spun yarn; the foot of the sail is then secured to it by being marled in. Where two sizes of bolt-rope used in roping a sail have to be connected, it is effected by a tapered splice. Cringles (similar to the handle of a maund) formed by a strand of bolt-rope, mostly having a galvanized iron thimble in them as a protection, are then stuck where necessary, as at the corners, sides or leeches, mast or luff; they are required either for making stationary or hauling "taut" by tackle or otherwise certain parts of the sail when in use. Fore-and-aft sails, such as spankers, gaff-sails and storm try-sails, are reduced in size by reef-points made of stout line (four to 20 lb.), crow-footed in the middle, a hole being pierced through every seam; one-half of the point is passed through and the crowfoot sewn firmly to the sail; the number of reefs depends upon the size of the sail, and the reefs are placed parallel to the foot.

UNITED STATES

Sailcloth or canvas is better known by the American trade as numbered duck. England manufactures a great deal from flax, while the U.S. mostly uses cotton. It is a plain woven fabric of heavy construction which varies with its use and is usually of plied warp and filling yarns (although in some cases the warp yarn may be single and drawn two ends per dent). Duck is used for many purposes including sails, tents, tarpaulin, bags, awnings, fire hose, wearing apparel such as overalls, hunting coats, belts, etc. The number of warp ends per inch vary from 26 to 48 and may be 2 to 5 ply and from 16 to 34 filling picks per inch 2 to 8 ply.

Specifications adopted by the Cotton Duck Association specify that duck shall be made of cotton, free from waste and thoroughly

cleaned, evenly woven, free from all sizing and free from an excessive number of avoidable imperfections in manufacture. Duck is numbered as follows: No. 1 duck is 22 in. wide and weighs 18 oz. per linear yard and is taken as the basis. For each ounce under 18 the number is increased by one which would make a 17 oz. duck $\frac{1}{2}$, 16 oz. $\frac{3}{4}$ and so on up to $\frac{11}{12}$ which weighs 7 ounces. Duck heavier than 18 oz. per yard is numbered by ciphers, a cipher being added for each ounce increase in weight. Thus $\frac{1}{10}$ =19 oz. duck; $\frac{2}{10}$ =20 oz. duck. Duck is made as heavy as 20/0 which would weigh 38 oz. per yard. However, duck above 2/0 is very seldom used.

The numbering of duck conforms in England and the United States in number only. English specifications are based on a 24 in. fabric and on two ply yarn warp and filling for all numbers, while in the United States 22 in. is the standard width and designates that each number shall be more than two ply and varies with the number and the weight per running yard for specified widths in exact proportion. Thus a 24 in. duck would weigh $\frac{1}{10}$ more than the standard 22 in. goods, while 11 in. duck would weigh one-half as much as the standard width. Duck is made in widths from 14 to 120 in., but the most common widths are 22, 28 and 36 in., and are delivered in standard lengths of 110 to 120 yd. differing from the English requirements of 40 yd. lengths. Duck in the United States is known as hard, medium or soft texture. Hard duck is made from 2/0- $\frac{11}{12}$, and medium texture 2/0- $\frac{3}{4}$.

The English specifications for a $\frac{1}{10}$ duck specifies it should weigh 18.8 oz. per yard, 24 in. wide, be delivered in a 39 yd. bolt, to weigh 46 lb. containing 26 lb. of warp, 660 double ends (approximately 28 ends per inch) and 20 lb. of filling, breaking 340 lb. in the warp and 480 lb. in the filling, using the Avery method of breaking a 24x1 in. test strip. Comparing this with the U.S. Government specification a $\frac{1}{10}$ duck should weigh 18 oz. per linear yard, 22 in. wide, have as a minimum 26 ends and 19 picks per inch of 5 ply warp and filling, and specified widths should weigh in proportion to the 22 in. standard (that is, a $\frac{1}{10}$ duck 24 in. wide should weigh 19.6 oz. per yard). The fabric when tested by the 1x1x3 in. grab method, should break 440 lb. in the warp and 370 lb. in the filling. The difference in breaking strength is partially due to the method employed, therefore no comparison can be made.

(R. T. F.)

SAINFOIN (*Onobrychis viciifolia*) is a low-growing perennial plant of the pea family (Leguminosae), with a woody rootstock, whence proceed the stems, which are covered with fine hairs and bear numerous long pinnate leaves, the segments of which are elliptic. The flowers are borne in close pyramidal or cylindrical clusters on the end of long stalks. Each flower is about half an inch in length with lanceolate calyx-teeth shorter than the corolla, which latter is pink, with darker stripes of the same colour. The pods or legumes are flattened, wrinkled, somewhat sickle-shaped and crested, and contain a single olive-brown seed. In Great Britain the plant is a native of the calcareous districts of the southern counties. It is native through central Europe and Siberia and is sparingly naturalized in the eastern United States.

SAINT. The articles on the different Saints are to be found in their proper alphabetical places, followed not preceded by the word saint, as Peter, Saint; Patrick, Saint, etc.

The term was originally applied, e.g. in the New Testament and also in the most ancient monuments of Christian thought, to all believers. In ancient inscriptions it often means those souls who are enjoying eternal happiness, or the martyrs. For a long time, too, *sanctus* was an official title, particularly reserved for bishops (v. *Anaclea Bollantiana*, xviii. 410-417). It was not till almost the 6th century that the word became a title of honour specially given to the dead whose cult was publicly celebrated in the churches. It was to the martyrs that the Church first began to pay special honour. We find traces of this in the 2nd half of the 2nd century, in the *Martyrium Polycarpi* (xviii. 3) in connection with a meeting to celebrate the anniversary of the martyr's death. Another passage in the same document (xvii. 3) shows clearly that this was not an innovation, but a custom already established among the Christians. It does not follow that it was henceforth

universal. The Church of Rome does not seem to have inscribed in its calendar its martyrs of an earlier date than the 3rd century. The essential form of the cult of the martyrs was that of the honours paid to the illustrious dead; and these honours were officially paid by the community. Each church first confined itself to celebrating its own martyrs; but it was not long before it became customary to celebrate the anniversaries of martyrs of other churches. Finally the famous ascetics began to share in the honours paid to the martyrs.

The cult of the saints early met with opposition, in answer to which the Church Fathers had to defend its lawfulness and explain its nature. The Church of Smyrna had early to explain its position in this matter with regard to St. Polycarp: "We worship Christ, as the Son of God; as to the martyrs, we love them as the disciples and imitators of the Lord" (*Martyrium Polycarpi*, xvii. 3). St. Cyril of Alexandria defends the worship of the martyrs against Julian, St. Asterius and Theodoret against the pagans in general, and they all lay emphasis on the fact that the saints are not looked upon as gods by the Christians, and that the honours paid to them are of quite a different kind from the adoration reserved to God alone. St. Jerome argued against Vigilantius with his accustomed vehemence, and especially meets the objection based on the resemblance between these rites and those of the pagans. But it is above all St. Augustine who in his refutation of Faustus, as well as in his sermons and elsewhere, clearly defined the true character of the honours paid to the saints: "Non eis templa, non eis altaria, non sacrificia exhibemus. Non eis sacerdotes offerunt, absit, Deo praestantur. Etiam apud memorias sanctorum martyrum cum offerimus, nonne Deo offerimus? . . . Quando audisti cum apud memorias sancti Theogenis: offero tibi, sancte Theogenis, aut offero tibi Petre, aut offero tibi Paule?" (*Sermo*, 273, 7; cf. *Contra Faustum*, xx. 21). The undoubted abuses which grew up, especially during the middle ages, raised up, at the time of the Reformation, fresh adversaries of the cult of the saints. The council of Trent, while repudiating all superstitious practices in the invocation of the saints, the veneration of relics and the use of images, expresses as follows the doctrine of the Roman Church: "That the saints who reign with Christ offer to God their prayers for men; that it is good and useful to invoke them by supplication and to have recourse to their aid and assistance in order to obtain from God His benefits through His Son our Saviour Jesus Christ, who alone is our Saviour and Redeemer."

BIBLIOGRAPHY.—See H. Thurston, art. "Saints and Martyrs, Christian" in *Hastings, Encyclopedia of Religion and Ethics*, xi. 51 ff.; L. Duchesne, *Origines du culte chrétien*, 6th ed. (1925).

ST. AFFRIQUE, a town of France, in the department of Aveyron, on the Sorgues, 68 mi. N.N.W. of Beziers on the railway to Clermont Ferrand. Pop. (1936) 5,179. St. Afrique grew up in the 6th century around the tomb of St. African, bishop of Comminges. An old bridge over the Sorgues and some megaliths in the neighbourhood, especially the dolmen at Tiergues, are notable.

ST. ALBANS, EARLS OF. The English title of earl of St. Albans was first borne by Richard Bourke, or de Burgh, 4th earl of Clanricarde (d. 1635), who was made earl of St. Albans in 1628.

The second creation of an earl of St. Albans was in 1660, when Henry, Baron Jermy, was made an earl under this title. See below.

ST. ALBANS, CHARLES BEAUCLERK, 1ST DUKE OF, cr. 1684 (1670-1726), a natural son of Charles II. by Nell Gwynne. Born in London on May 8, 1670, Charles was made Baron Hedington and earl of Burford in Dec. 1676. He took service with the emperor Leopold I., being present at the siege of Belgrade in 1688. After the battle of Landen in 1693, William III. made him captain of the gentlemen pensioners, and four years later gentleman of the bedchamber. His Whig sentiments prevented his advancement under Anne, but he was restored to favour at the accession of George I. He died at Bath on May 10, 1726. His wife Diana, daughter and heiress of Aubrey de Vere, last earl of Oxford, was a well-known beauty, who became lady of the bedchamber to Caroline, princess of Wales, and survived until Jan. 15, 1742.

ST. ALBANS, HENRY JERMYN, EARL OF (c. 1604-1684), son of Sir Thomas Jermy of Rushbrooke, Suffolk, was vice chamberlain and then master of the horse to Queen Henrietta Maria. He accompanied Henrietta Maria in 1644 to France, where he continued to act as her secretary. In the same year he was made governor of Jersey, and conceived the idea of ceding the Channel Islands to France as the price of French aid to Charles against the parliament. When Charles II. went to Breda, Jermy remained in Paris with Henrietta Maria, who persuaded her son to create him earl of St. Albans in 1660. Gossip even asserted a secret marriage between the queen and Jermy. At the Restoration St. Albans received various appointments, and he contributed to the close secret understanding between Charles II. and Louis XIV., taking part in the preliminaries of the Treaty of Dover in 1669. In 1664 he obtained a grant of land in London near St. James's Palace, where Jermy street preserves the memory of his name, and where he built the St. Albans' market on a site afterwards cleared for the construction of Regent street and Waterloo place. The earl, who was a friend and patron of Abraham Cowley, died in January 1684.

ST. ALBANS, a city, municipal borough, and market town in the St. Albans parliamentary division of Hertfordshire, England, on the L.M.S. and L.N.E. railways, 20 mi. northwest of London. Pop. (est. 1938) 36,200. Area 8 sq.mi. St. Albans became the seat of a bishop in 1877; the diocese covering most of Hertfordshire and Bedfordshire, with very small portions of Buckinghamshire, Cambridgeshire and Middlesex. The great cathedral, or abbey church, is finely situated on the steep hill above the small river Ver.

History.—Shortly after the martyrdom of St. Alban, probably in 303, a church was built on the spot, and in 793 Offa, king of Mercia, who professed to have discovered the relics of the martyr, founded in his honour a monastery for Benedictines, which became one of the richest and most important houses of that order in the kingdom. The abbots, Ealdred and Ealmer, at the close of the 10th century began to break up the ruins of the old Roman city of Verulamium for materials to construct a new abbey church; but its erection was delayed till the time of William the Conqueror, when Paul of Caen, a relative of Archbishop Lanfranc, was in 1077 appointed abbot. The church was built on the model of St. Stephen's, Caen, but on a larger scale. It was consecrated in 1115, but had been finished some years before. Of the original Norman church the principal portions now remaining are the eastern bays of the nave, the tower and the transepts, but the main outlines of the building are still those planned by Paul. It is thus one of the most important specimens of Norman architecture in England, with the special characteristic that, owing to the use of the flat broad Roman tile, the Norman portions are peculiarly bare and stern.

About 1155 Robert de Gorham repaired and beautified the early shrine and rebuilt the chapter-house and part of the cloister; but nothing of his work now remains except part of a very beautiful doorway discovered in recent times. About 1200 Abbot John de Cella pulled down the west front and portions of the north and south aisles. He began the erection of the west front in a new and enriched form, and his work was continued by his successor William de Trumpington in a plainer manner. In 1257 the eastern portion was pulled down, and between the middle of the 13th and the beginning of the 14th century a sanctuary, ante-chapel and lady chapel were added, all remarkably fine specimens of the architecture of the period. In 1323 two great columns on the south side suddenly fell, and this necessitated the rebuilding of five bays of the south aisle and the Norman cloisters. Various incongruous additions were made during the perpendicular period, and much damage was also done during the dissolution of the abbey to the finer work in the interior. Structural dangers gave rise to an extensive restoration and partial rebuilding, begun under the direction of Sir Gilbert Scott, and completed in 1894 by Lord Grimthorpe, some of whose work was, and remains, the subject of much adverse criticism. The abbey's extreme length outside is 550 ft., which is exceeded by Winchester by 6 ft. The nave (292 ft.) is the longest Gothic

nave in the world and exceeds that of Winchester by about 20 ft. The length of the transepts is 175 ft. inside. The monastic buildings have all disappeared except the great gateway.

St. Michael's church (within the site of Verulamium) and St. Stephen's were originally constructed in the 10th century. Considerable portions of the Norman buildings remain. The former contains the tomb of Lord Chancellor Bacon. The restored clock-house in the market place was built by one of the abbots in the reign of Henry VIII.

To the southwest of St. Albans stood the ancient Verulamium (*g.v.*), one of the oldest towns in Britain, on Watling street. The corporation bought the site (104 a.c.) in 1929 and a museum was built. The ruins served as a quarry not only to the builders of the abbey, but also for the other churches and the monastic buildings of St. Albans, and Roman bricks are found even in the fabric of the churches of neighbouring villages, as at Sandridge, 2½ mi. northeast. After being burned by Boadicea (A.D. 61), Verulamium revived, and its church was famous early in the 8th century. The Saxon royal residence of Kingsbury is variously assigned to the 6th and 8th centuries. In the 9th and 10th centuries the abbots enlarged the town, which was confirmed to them as a borough by Henry II. In 1253 a charter gave borough jurisdiction to the goodmen of St. Albans; and there were several succeeding charters. In 1877 St. Albans became a city. The famous "model" parliament of 1295 was held at St. Albans. Two burgesses were returned to the parliament of 1306-07, but after 1336 such right fell into abeyance until its resumption in 1553. Its abolition, because of bribery, took place in 1852.

During Wat Tyler's insurrection the monastery was besieged by the townspeople, many of whom were executed in consequence. At St. Albans the Lancastrians were defeated on May 21, 1455, their leader, the duke of Somerset, being killed and Henry VI taken prisoner; here, too, Queen Margaret defeated the earl of Warwick on Feb. 17, 1461. During the civil wars the town was garrisoned for the parliament. One of the earliest printing presses in the kingdom was set up in the abbey, and a number of books were printed there in the late 15th century.

Battle of St. Albans, May 22, 1455. The first battle in the Wars of the Roses wherein the smaller Lancastrian force was defeated by the Yorkists and King Henry VI taken prisoner. A subsequent battle at the same place on Feb. 17, 1461, ended in the Lancastrians defeating Warwick and regaining possession of King Henry VI's person. See *ROSES, WARS OF THE*.

See *Victoria County History, Herts.*, vol. II.; Peter Newcome, *The History of the Abbey of St. Albans* (London, 1793); and *Chronica monasterii S. Albani*, ed. by H. T. Riley for "Rolls" series (1863-76).

SAINT ALBANS, a city of northwestern Vermont, U.S.A., a port of entry and county seat of Franklin county; 3 mi. from Lake Champlain (St. Albans bay) and 17 mi. from the Canadian border. It is on federal highway 7, and is served by the Central Vermont railway. Pop. (1950) 8,552. The city is 385 ft. above the level of the lake and is surrounded by hills with fine views of the Green mountains, Lake Champlain and the Adirondacks beyond.

St. Albans bay is a famous fishing ground. The city is a summer resort and touring centre; headquarters of the railway, which employs some 500 persons in its offices and shops, and of various activities of the federal government; and an important shipping point for maple sugar and dairy products, variegated marble and other products of the region and its factories. It is the headquarters of the customs district of Vermont. The first settlement was made in 1774.

The town was organized in 1788, incorporated in 1859 and chartered as a city in 1897. It has a mayor-city council form of government. On Oct. 19, 1864, it was raided from Canada by a party of Confederate soldiers (not in uniform), who looted three banks and wounded several citizens. They escaped to Canada, where the leader and 12 others were arrested, but not deprived of the \$208,000 they had taken. Later \$88,000 of this was refunded by the Canadian government. In 1866 and 1870 the Fenians made St. Albans a base for attacks on Canada, and U.S. troops were sent there to preserve neutrality.

ST. ALDWYN, MICHAEL EDWARD HICKS BEACH, 1st EARL (1837-1916), English statesman, son of Sir Michael Hicks Beach, 8th Bart., whom he succeeded in 1854, was born in London on Oct. 23, 1837, and was educated at Eton and Christ Church, Oxford. He entered parliament as Conservative M.P. for East Gloucestershire in 1864, and held various offices between 1868 and 1880. In 1885 he was elected for West Bristol, and the Conservative party having returned to power, became chancellor of the exchequer and leader of the house of commons. After Gladstone's brief Home Rule ministry in 1886 he entered Lord Salisbury's next cabinet again as Irish secretary, making way for Lord Randolph Churchill as leader of the house; but his eyesight compelled him to resign in 1887 and meanwhile Goschen replaced Lord Randolph as chancellor of the exchequer. From 1888 to 1892 Sir Michael Hicks Beach returned to active work as president of the board of trade, and in 1895—Goschen being transferred to the admiralty—he again became chancellor of the exchequer. In 1899 he lowered the fixed charge for the national debt from 25 to 23 millions—a reduction imperatively required, apart from other reasons, by the difficulties found in redeeming consols at their then inflated price. When compelled to find means for financing the war in South Africa, he insisted on combining the raising of loans with the imposition of fresh taxation; and besides raising the income tax each year, up to 1s. 3d. in 1902, he introduced taxes on sugar and exported coal (1901), and in 1902 proposed the reimposition of the registration duty on corn and flour which had been abolished in 1869 by Lowe. On Lord Salisbury's retirement in 1902 Sir Michael Hicks Beach also left the government.

He accepted the chairmanship of the Royal Commission on Ritualistic Practices in the Church, and he did valuable work as an arbitrator; he was a firm advocate of free trade and by his campaign against Joseph Chamberlain's protectionist programme did much to prevent Balfour from committing his party to that policy.

When Balfour resigned in 1905 he was raised to the peerage as Viscount St. Aldwyn (1906), and was created an earl in 1915. He died in London on April 30, 1916.

ST. AMAND-LES-EAUX, a town of northern France, in the department of Nord, at the junction of the Elnon with the Scarpe, 22 mi. S.E. of Lille by rail. Pop. (1946) 14,218. St. Amand owes its name to St. Amand, bishop of Tongres, who founded a monastery here in the 7th century. The abbey was laid waste by the Normans in 882 and by the count of Hainaut in 1340.

The town was captured by Mary of Burgundy in 1477, by the count of Ligne, Charles V's lieutenant, in 1521, and finally in 1667 by the French. The town has mineral waters and mud baths. The discovery of statues and coins in the mud shows that these must have been used during the Roman period.

ST. AMAND-MONT-ROD, a town of central France, capital of an arrondissement in the department of Cher, 39 mi. S.E. of Bourges on the railway to Montluçon. Pop. (1946) 10,990. The town grew up round a monastery founded by St. Amand, a follower of St. Columban, in the 7th century.

SAINT-AMANT, MARC ANTOINE DE GERARD, SEUR DE (1594-1661), French poet, was born near Rouen in the year 1594, the son of a merchant. He obtained a patent of nobility, and attached himself to different great noblemen—the duc de Retz and the comte d'Harcourt among others. He saw military service and sojourned at different times in Italy, in England—a sojourn which provoked from him a violent poetical attack on the country, *Albion* (1643)—in Poland, where he held a court appointment for two years, and elsewhere. Saint-Amant's later years were spent in France; and he died at Paris on Dec. 29, 1661. Saint-Amant has left a not inconsiderable body of poetry. His *Albion* and *Rome ridicule* set the fashion of the burlesque poem, a form in which he was excelled by his follower Paul Scarron. In his later years he devoted himself to serious subjects and produced an epic, *Moïse sauvé* (1653). His best work consists of Bacchanalian songs, his *Débauche* being one of the most remarkable convivial poems of his kind.

The standard edition is that in the *Bibliothèque Elzévirienne*, by M. C. L. Lévet (4 vols., 1855).

SAINT ANDRÉ, ANDRÉ JEANBON (1749-1813), French revolutionary, was born at Montauban (Tarn-et-Garonne) on Feb. 25, 1749. In July 1793 he became president of the Convention, entered the Committee of Public Safety and was sent on mission to the Armies of the East. On Sept. 20, 1793, he obtained a vote of one hundred million francs for constructing vessels, and reorganized the military harbours of Brest and Cherbourg. After a mission in the south (July 1794-March 1795) in which he showed great moderation, he was arrested on May 28, 1795, but was released by the amnesty of the year IV. He was then appointed consul at Algiers and Smyrna (1798), imprisoned by the Turks for three years, and subsequently became prefect of the department of Mont-Tonnerre (1801) and commissary-general of the three departments on the left bank of the Rhine. He died at Mainz on Dec. 10, 1813.

See Lévy-Schneider, *Le Conventionnel Jeanbon St. André* (1901).

ST. ANDREWS, city, royal burgh, university town and seaport of Fifeshire, Scotland. Pop. (1938) 8,383. It is situated on a bay of the North Sea, $1\frac{1}{2}$ mi. S.E. of Dundee by the L.N.E.R., *via* Leuchars junction. It occupies a plateau of sandstone rock about 50 ft. high, on the north breaking off in precipitous cliffs. The Eden enters St. Andrews bay N.W. of the golf links, which rank amongst the finest in the world. The Royal and Ancient Golf club, founded in 1754, is the legislative authority of the game. There is a marine biological station. The city was never surrounded by walls, and of its ancient gates the West Port only remains. The Martyrs' memorial, erected to the honour of martyrs of the Reformation epoch, stands at the west end of the Scores on a cliff overlooking the sea.

The cathedral originated partly in the priory of Canons Regular founded by Robert I. (1122-1159). At the end of the 17th century some of the priory buildings were still entire and considerable remains of others existed, but nearly all traces have now disappeared except portions of the wall and the archways. The wall is about three-quarters of a mile long, and bears turrets at intervals.

The cathedral was founded by Bishop Arnold (1159-1162), to supply more ample accommodation than was afforded by the church of St. Regulus. The principal portions extant, partly Norman and partly Early English, are the east and west gables and part of the nave and the south transept. The plan of the cathedral is marked out on the turf.

The castle, on a rocky promontory, is supposed to have been erected by Bishop Roger about the beginning of the 13th century as an episcopal residence, and was strongly fortified. It was destroyed, but rebuilt towards the close of the century. There remains a portion of the south wall enclosing a square tower, the "bottle dungeon" below the northwest tower, the kitchen tower and a subterranean passage. The grounds have been laid out as a public garden.

The town church, formerly the church of the Holy Trinity, was originally founded in 1112 by Bishop Turgot, but was rebuilt about 1800 with the exception of the square tower and spire, and was splendidly restored in 1907-09, the original lines being followed as closely as possible. In this church John Knox first preached in public, and in it, on June 4, 1559, he delivered the famous sermon which led to the stripping of the cathedral and the destruction of the monastic buildings. The church contains a monument to James Sharp, archbishop of St. Andrews (assassinated 1679). In South street is the ruin of the north transept of the chapel of the Blackfriars' monastery founded by Bishop Wishart in 1274; but the Observantine monastery, founded about 1450 by Bishop Kennedy, has disappeared, except the well.

The university of St. Andrews, the oldest in Scotland, owed its origin to a society formed in 1412 by Lawrence of Lindores, abbot of Scone, and others. A charter was issued in 1411 by Bishop Henry Wardlaw (d. 1440), and six bulls were obtained from Benedict XIII. in 1413 confirming the charter and constituting the society a university. The lectures were delivered in various parts of the town until 1430, when Wardlaw allowed the lecturers the use of a building called the Paedagogium, or St. John's. St.

Salvator's college was founded and richly endowed by Bishop Kennedy in 1456; seven years later it was granted the power to confer degrees in theology and philosophy, and by the end of the century was regarded as a constituent part of the university. In 1512 St. Leonard's college was founded, and the original Paedagogium nominally changed into a college, with the parish church of St. Michael of Tarvet annexed to it; but its actual erection into a college did not take place until 1537, when it was dedicated to the Blessed Virgin Mary of the Assumption. The outline of the ancient structure is preserved, but its general character has been much altered by various restorations. It forms two sides of a quadrangle. The University library, which includes the older college libraries, was founded before the middle of the 17th century and rebuilt in 1764. The lower hall in the older part of the building was used at times as a provincial meeting-place for the Scottish parliament. When the constitution of the colleges was remodelled in 1579 St. Mary's was set apart for theology; and in 1747 the colleges of St. Salvator and St. Leonard were formed into the United college. The buildings of St. Leonard's are now occupied as a school for girls. The college chapel is in ruins. The United college occupies the site of St. Salvator's college, but the old buildings have been removed, with the exception of the college chapel, now used as the university chapel and the parish church of St. Leonard's, a fine Gothic structure, containing an elaborate tomb of Bishop Kennedy and Knox's pulpit; the entrance gateway, with a square clock tower; and the janitor's house with some classrooms above. Younger hall is used for university functions. University college, Dundee, founded in 1881, was in 1897 affiliated to the university of St. Andrews. The Advanced Medical School of St. Andrews (1898) and the Dental school (1914) are in Dundee. In 1892 provision was made within the university for the instruction of women.

St. Andrews was probably the site of a Pictish stronghold, and tradition declares that Kenneth, the patron saint of Kennoway, established a Culdee monastery here in the 6th century. The foundations of the little church dedicated to the Virgin were discovered on the Kirkcubright in 1860. Another Culdee church of St. Mary on the Rock is supposed to have stood on the Lady's Craig, now covered by the sea. At that period the name of the place was Kilrymont (Gaelic, "The church of the king's mount") or Muckross. St. Andrews is said to have been made a bishopric in the 9th century, and when the Pictish and Scottish churches were united in 908, the primacy was transferred to it from Dunkeld, its bishops being thereafter known as bishops of Alban. It became an archbishopric during the primacy of Patrick Graham (1466-1478). The town was created a royal burgh in 1224. In the 16th century St. Andrews was one of the most important ports north of the Forth, but it fell into decay after the Civil War.

SAINT ARNAUD, JACQUES LEROY DE (1801-1854), marshal of France, was born at Paris on Aug. 20, 1801. He entered the army in 1817, retired from the service in 1827, and re-entered it at thirty as a sub-lieutenant. He took part in the suppression of the Vendée émeute, and was for a time on General (Marshal) Bugeaud's staff. But his debts and the scandals of his private life compelled him to go to Algeria as a captain in the Foreign Legion. In 1848 he was placed at the head of a brigade during the revolution in Paris. On his return to Africa, it is said because Louis Napoleon considered him suitable to be the military head of a *coup d'état*, an expedition was made into Little Kabylia, in which St. Arnaud provided his superiors with the pretext for bringing him home as a general of division (July 1851). He succeeded Marshal Magran as minister of war and superintended the military operations of the *coup d'état* of the 2nd of December (1851) which placed Napoleon III. on the throne. A year later he was made marshal of France and a senator, remaining at the head of the war office till 1854, when he set out to command the French in the Crimea, his British colleague being Lord Raglan. He died on board ship on Sept. 29, 1854, shortly after commanding at the battle of the Alma. His body was conveyed to France and buried in the Invalides.

See *Lettres du Maréchal de Saint Arnaud* (Paris, 1855; 2nd edition with memoir by Sainte-Beuve, 1858).

ST. ASAPH, a cathedral village-city of Flintshire, north Wales, on the Rhyl-Denbigh branch of the L.M.S. about 6 mi. from each of these towns. Pop. (1951) 9,858. Its Welsh name, Llanelwy, is derived from the Elwy, between which stream and the Clwyd it stands. Asaph, to whom the cathedral (the smallest in Great Britain, excluding converted parish churches) is dedicated, was bishop here in the 6th century. The small, irregularly built town has also a parish church, remains of a Perpendicular chapel near Ffynnon Fair (St. Mary's Well) and almshouses founded in 1678 by Bishop Barrow. The hill on which St. Asaph stands is Bryn Paulin, with early associations. The early cathedral, of wood, was burned by the English in 1247 and 1282; and that built by Bishop Anian in the 13th century (Decorated) was mostly destroyed during the raids of Owen Glendower (c. 1402). Bishop Redman's building (c. 1480) was completed by the erection of the choir about 1770. Further restoration took place in the 19th century. The church is plain, cruciform, chiefly Decorated but partly Early English, with a square tower; it has a library of nearly 2,000 volumes (some rare). In 1920 the then bishop of St. Asaph was enthroned in his cathedral as the first archbishop of the disestablished church in Wales.

SAINT AUGUSTINE, a city of northeastern Florida, U.S.A., on the coast, 38 mi. S.E. of Jacksonville; a port of entry and the county seat of St. Johns county. It is on federal highway 1 and the East Coast Inland waterway, and is served by the Florida East Coast railway.

The population in 1950 was 13,555; and in 1940 it was 12,090. The population is frequently doubled during tourist seasons.

The city occupies a narrow peninsula formed by the Matanzas and San Sebastian rivers, and is separated from the ocean by the northern end of Anastasia Island ($\frac{1}{2}$ mi. wide), where is located one of the world's best bathing beaches. It is the oldest city in the United States.

Many old houses remain, including the oldest house in the United States.

Pt. Marion (originally the Castle of San Marco), oldest standing fortification in the United States, is a well preserved specimen of Spanish architecture, built of coquina, begun about 1638 and finished in 1756. The old arsenal reconstructed in 1835 by the United States became state headquarters of the national guard. A

BY COURTESY OF THE ST. AUGUSTINE CHAMBER OF COMMERCE
COURTYARD OF FORT MARION, ST. AUGUSTINE, SHOWING THE INCLINED ARCH BUILT BY THE SPANIARDS FOR THE TRANSPORTATION OF CANNON FROM THE PLAZA TO THE TERREPLEIN. THE STEPS ARE MODERN

wall and moat formerly ran across the peninsula at the northern edge of the city, and the city gate which was in this wall still stands, a picturesque ruin, at the end of St. George street. The Roman Catholic church was built in 1791. The post office was the Spanish government building; the public library and the historical society both occupy buildings of historic interest. There is a beautiful modern church (Presbyterian) built in 1890 by Henry M. Flagler as a memorial to his daughter, St. Augustine is both a winter and a summer resort. The general offices and shops of the railway are there. In 1915 the city adopted a commission-

manager form of government.

On St. Augustine's day (Aug. 28), 1565, Pedro Menéndez de Avilés sighted this coast, and on Sept. 6 he landed with his band of colonists and began to fortify the peninsula. In 1586 Sir Francis Drake captured the fort and burned the town, and in 1665 it was pillaged by Capt. John Davis, an English freebooter. Conflicts with the English settlements in South Carolina and Georgia were frequent after 1681. When Florida was ceded to England in 1763 most of the Spanish population of St. Augustine went to Cuba; when in 1783 it came again under Spanish rule, most of the English left for the Carolinas, Georgia, or the West Indies; and when in 1821 it passed to the United States, the Spanish inhabitants remained. On Jan. 7, 1861, three days before Florida passed her Ordinance of Secession, a State force compelled the small garrison to evacuate the fort, but on March 11, 1862, it was retaken without bloodshed and was then held by the Federals until the close of the war.

ST. AUSTELL, market town, urban district, Penryn and Falmouth parliamentary division, Cornwall, England, 12 mi. N.E. of Truro, on G.W. railway. Pop. (1951) 23,634. Area 28.6 sq. mi. To the north the high ground on which St. Austell stands culminates in Hensbarrow Downs (1,034 ft.). Holy Trinity church is Perpendicular, with Decorated chancel, richly ornamented. The town is the centre of the china clay (kaolin) district, and some 3,000 persons are ordinarily employed in the industry, exports being mainly to the Potteries and Lancashire. Nearby is Menacuddle Well, a good example of an Early English baptistry.

ST. BARTHOLOMEW or ST. BARTHELEMY, French West Indian island, $17^{\circ} 55' N.$ and $63^{\circ} 60' W.$, about 130 mi. N.W. of Guadeloupe, of which it is a dependency. The horns of an irregular crescent enclose the bay of St. Jean, pointing north; the surface culminates in a central limestone hill 1,003 ft. high. It is 9 sq. mi. in area, and timberless. Gustavia, on the southwest coast has a small but safe harbour. Lorient is the only other town. The inhabitants, mainly of French and Negro descent, are English-speaking, and numbered 2,331 in 1946. St. Bartholomew was occupied by France in 1648 and ceded to Sweden in 1784. In 1877 it was again acquired by France at the cost of £11,000.

ST. BARTHOLOMEW, MASSACRE OF. This was the name given to the massacre of the Huguenots, which began in Paris on St. Bartholomew's Day, Aug. 24, 1572. The initiative for the crime rests with Catherine de' Medici. Disquieted by the growing influence of Admiral Coligny, who against her wishes was endeavouring to draw Charles IX. into a war with Spain, she resolved to have him assassinated. The attempt failed, however, and Catherine then determined to massacre all the Huguenot leaders.

After holding a council with the Catholic leaders, including the Duke of Anjou, Henry of Guise, the Marshal de Tavannes, the Duke of Nevers, and René de Biague, the keeper of the seals, she persuaded the king that the massacre was a measure of public safety, and on the evening of Aug. 23 succeeded in wringing authorization from him.

The massacre began on Sunday at daybreak, and continued in Paris till Sept. 17. Once let loose, it was impossible to restrain the populace. From Paris the massacre spread to the provinces till Oct. 3. The Duc de Longueville in Picardy, Chahot-Charny (son of Admiral Chabot) at Dijon, the Comte de Matignon (1545-97) in Normandy and other provincial governors refused to authorize the massacres. François Hotman estimates the number killed in the whole of France at 50,000. Catherine de' Medici received the congratulations of all the Catholic powers, and Pope Gregory XIII. commanded bonfires to be lighted and a medal to be struck.

See H. Mariéjol, "La Réforme et la Ligue" (1904), in vol. vi. of the *Histoire de France*, by E. Lavisse, which contains a complete bibliography of the subject.

ST. BENOÎT-SUR-LOIRE, a village of France, in the department of Loiret, on the Loire, 22 mi. E.S.E. of Orléans. Pop. (1946) 508. St. Benoît has a huge basilica, only survival of a 7th century monastery to which the relics of St. Benedict were brought from Monte Cassino. In the crypt is a modern shrine containing

the remains of St. Benedict, which still attract many pilgrims. The establishment was very important during the middle ages, owing partly to its school. In 1562 it was pillaged by the Protestants and, though the buildings were restored by Richelieu, the abbey declined. The basilica (1025-1218) has a narthex of two stories and two sets of transepts, surmounted by a square central tower.

SAINT BERNARD, a city of Hamilton county, Ohio, U.S., 15 mi. N.E. of Cincinnati; served by several railways for freight. Pop. (1950) 7,066; (1940) 7,387; (1930) 7,487 by federal census. It is a residential suburb of Cincinnati, and has various manufacturing industries.

ST. BERNARD PASSES, two passes across the main chain of the Alps, both traversed by motor roads. The Great St. Bernard (8,094 ft.) leads (53 mi.) from Martigny (anc. *Octodurum*) in the Rhone valley (Switzerland) to Aosta (anc. *Augusta Praetoria*) in Italy. It was known in Roman times. The hospice on the pass was founded (or perhaps refounded) by St. Bernard of Menthon (d. about 1081), and since the 12th or early 13th century has been in charge of a community of Austin canons, the mother-house being at Martigny. In former days the servants of the canons, and the famous dogs, saved many lives, especially of Italian workmen. In May 1800 Napoleon led his army over the pass, which was then traversed by a bridle road only. The Little St. Bernard (7,178 ft.) also was known in Roman times, and the hospice refounded by St. Bernard of Menthon, though it is now in charge of the military and religious order of SS. Maurice and Lazarus. The pass leads (39 mi.) from Bourg St. Maurice in the Isère valley (Savoie) to Aosta, but is much less frequented by travellers than its neighbour oppositely.

There is no certain mention of the road over the pass of the Great St. Bernard (*Alpis Poenina*, *Poeninus Mons*) before 57 B.C. when Julius Caesar sent Servius Galba over it. Even in Strabo's time it was impassable for wheeled traffic; we find that Augustus Praetoria originally had but two gates, one opening towards the Little St. Bernard (*Alpis Graia*), the other towards Eporedia (Ivrea), but none towards the *Alpis Poenina*. The military arrangement of the German provinces rendered the construction of the road necessary, and it is mentioned as existing in A.D. 69. Remains of it cut in the rock, some 12½ ft. in width, still exist near the lake at the top of the pass. On the plain at the top of the pass is the temple of Jupiter Poeninus (Penninus), remains of which were excavated in 1800-1803, though objects connected with it had long ago been found. The oldest of the votive-tablets which can be dated belongs to the time of Tiberius, and the temple may be attributed to the beginning of the empire; objects, however, of the first Iron age (4th or 5th century B.C.) were also found and many Gaulish coins. Other buildings, probably belonging to the post station at the top of the pass, were also discovered. Many of the objects found then and in previous years, including many votive-tablets, are in the museum at the hospice of the Great St. Bernard.

The Little St. Bernard was known to the Romans as *Alpis Graia*. It derived its name from the legend that Hercules, returning from Spain with the oxen of Geryon, crossed the Alps by this route, though the legend rather suits the route through the Maritime Alps. According to some modern scholars, Hannibal passed this way over the Alps (see HANNIBAL, and Partsch in Pauly-Wissowa, *Realencyklopädie* i, 1604). In any case it was the principal pass over the Alps into Gallia Comata until the pass of the *Alpis Cottia* (Mont Genève) was opened by Cn. Pompeius in 75 B.C., and became the principal route, though the road was only completed under Augustus by Cottius in 3 B.C. Various remains of the road are visible, and those of a building (possibly a temple of Jupiter) have been found on the summit of the pass.

See *Notitia degli scavi* (1883), 7 (1894), 46; and C. Promis, *Antichità di Aosta* (Turin, 1865), 115 sqq.

ST. BERTRAND-DE-COMMINGS, a village of S.W. France at the foot of the Pyrenees in the department of Haute-Garonne, about 70 mi. S.W. of Toulouse by rail and road. St. Bertrand-de-Comminges (*Lugdunum Convenarum*) was founded in 72 B.C. and by the end of the 5th century became the seat of a bishopric suppressed at the Revolution. The town was destroyed

towards the end of the 6th century by Guntrum, king of Burgundy. St. Bertrand stands about 1 mi. from the left bank of the Garonne on the slopes of an isolated hill crowned by its celebrated cathedral of Notre Dame. The façade of the church with its square tower and the first bay with its aisles are Romanesque, and belong to an 11th century church begun by Bishop Bertrand, afterward canonized. Pop. (1946) 243.

ST. BRIEUC, a town of western France, capital of the département of Côtes-du-Nord, 63 mi. N.W. of Rennes by the railway to Brest. Pop. (1946) 36,674. St. Brieuc owes its origin and its name to the missionary St. Bricius, who came from Wales in the 5th century, and whose tomb afterward attracted crowds of pilgrims. The place was defended in 1375 by Olivier de Clisson against the duke of Brittany, and later attacked by the same Clisson in 1394, the cathedral suffering greatly in both sieges.

In 1593 the town was pillaged by the Spaniards, in 1601 ravaged by the plague, and in 1628 surrounded by walls of which no traces remain. Between 1602 and 1768 the states of Brittany several times met at St. Brieuc. It stands 290 ft. above the sea, between 1 and 2 mi. from the English channel and less than a mile from the right bank of the Gouët, at the mouth of which is its seaport, Le Légué. St. Brieuc is the seat of a bishopric in the province of Rennes, and has a 13th-century cathedral, partially rebuilt in the 18th, and afterward restored.

ST. CATHARINES, a city of Ontario, Canada, and the capital of Lincoln county, on the Welland canal and the Canadian National and Niagara, St. Catharines and Toronto electric railways, 35 mi. S. of Toronto. Pop. (1951) 37,984. It is the centre of the Niagara fruit belt. Chief industries include wineries, paper and textile mills, automotive parts and mining machinery plants. It is the site of the annual Royal Canadian Henley regatta and Ontario's largest outdoor horseshow.

ST. CHAMOND, a manufacturing town of east-central France, in the département of Loire, 7½ mi. E.N.E. of St. Etienne, on the railway from St. Etienne to Lyons. Pop. (1946) 14,820. St. Chamond, founded in the 7th century by St. Ennemond or Chamond, archbishop of Lyons, became the chief town of the Jarret, a little principality formed by the valley of the Gier. Silk-milling was introduced in the town in the middle of the 16th century by Gayotti, a native of Bologna. There are remains of a Roman aqueduct.

SAINT CHARLES, a city of eastern Missouri, U.S.A., on the north bank of the Missouri river, 22 mi. N.W. of Saint Louis; county seat of St. Charles county. It is on federal highway 40, and is served by the Missouri-Kansas-Texas and the Wabash railways. Pop. (1950) 14,314. Saint Charles was settled in 1769 by Louis Blanchette, a Frenchman, and later came under Spanish rule. In 1849 it was incorporated as a city. In 1820 it became the first capital of the state and continued as such until 1826.

SAINT CLAIR, an anthracite-mining borough of Schuylkill county, Pennsylvania, U.S.A., on Mill creek, 3 mi. N. of Pottsville; served by the Pennsylvania and the Reading railways. Pop. (1950) 5,856. It was settled in 1825 and incorporated in 1850.

SAINT CLAIR RIVER, the outlet for Lake Huron, which in turn receives the waters from Lakes Superior and Michigan. Forming part of the boundary between the State of Michigan and the Province of Ontario, Canada, it flows in a southerly direction into Lake St. Clair with a fall of about 5.8 ft. in 40 miles. The river discharges through seven mouths, the one known as the south channel being used for deep-draught vessels, while several of the other channels are used for small craft. The south channel was improved by the dredging of separate channels for up-bound and down-bound traffic, extending from deep water in the river into Lake St. Clair.

In 1937 a project, not including compensating works improving the north channel outlet and adding to the width and depth of the southeast bend was completed. The U.S. congress authorized the widening of the channel at the southeast bend to 700 ft. in March 1945 and further improvements in both sections were authorized in July 1946. The river water level fluctuates with the levels of the lakes above and below. From about the year 1920 on, the difference between the highest and lowest monthly mean levels during the

navigation season has been about 4 ft. Occasional fluctuations due to winds of high velocity may be 3.5 ft. in six hours. Near the head of the river are the cities of Port Huron, Mich., and Sarnia, Ont., both of which handle some water-borne commerce but the great bulk of the traffic moves through the river without intermediate stop. This traffic is composed principally of iron ore, grain and limestone down-bound and coal up-bound.

ST. CLAUDE, a town of eastern France, capital of an arrondissement in the department of Jura, 42 mi. S.E. of Lons-le-Saunier by rail. Pop. (1946) 10,749. The town is situated 1,300 ft. above sea level at the western base of Mont Bayard, among the heights of the eastern Jura at the confluence of the Bièvre and the Tacon. The cathedral of St. Pierre, once the abbey-church, dates from the 14th to the 18th centuries.

ST. CLOUD, a town of northern France, in the department of Seine-et-Oise, on the left bank of the Seine, 2 mi. W. of the fortifications of Paris by road. Pop. (1946) 17,614. The town is named after Clodoald or Cloud, grandson of Clovis, whose tomb was discovered in a crypt near the present church. He had granted the domain to the bishops of Paris, who possessed it as a fief till the 18th century. At St. Cloud Henry III and the king of Navarre (Henry IV) established their camp during the league for the siege of Paris and there the former was assassinated. The castle, at that time a plain country house belonging to Pierre de Gondy, archbishop of Paris, was acquired in 1658 by the duke of Orleans, who built the palace which perished in 1870. It was at St. Cloud that Bonaparte executed the coup d'état of the 18th Brumaire (1799); after he became emperor the palace was his favourite residence, and there he celebrated his marriage with Marie Louise. In 1815 it was the scene of the signing of the capitulation of Paris. Seized by the Prussians at the beginning of the investment of Paris in 1870, St. Cloud was sacked during the siege. St. Cloud, built on a hill slope overlooking the river, the Bois de Boulogne and Paris, is one of the favourite resorts of the Parisians. Every September, at the time of the pilgrimage of St. Cloud, a fair lasting four weeks is held in the park, which is famous for its beauty. Within its precincts are situated the national Sèvres porcelain manufactory.

ST. CLOUD, a city in central Minnesota, U.S., on the Mississippi river, 70 mi. N.W. of Minneapolis, in the counties of Benton, Sherburne and Stearns, and county seat of the latter. It is on federal highways 10 and 52, is served by the Great Northern and Northern Pacific railways, and by air and bus. Pop. (1950) 28,410. The city ranks first in the nation in the production of coloured granite and second in the production and processing of all types of granite. A large car manufacturing shop of the Great Northern railway is located there. Other important industries include an optical works and factories for the production of floor-sanding machines, refrigerators, boats, playground equipment, brooms, airline tanks, neon signs, frost shields and many other products. The processing of dairy products is of major importance. Among the city's many institutions are the Minnesota State reformatory, the U.S. veterans hospital, Saint Cloud Orphanage, Saint Raphael's and Saint Joseph's homes for the aged, and a state teachers college, Saint John's university for men and Saint Benedict's college for women are within a few miles of the city. St. Cloud was settled in 1852, platted in 1854, incorporated as a village in 1868 and chartered as a city in 1889. In 1912 it adopted a commission-council form of government. Before the days of the railroads it was the terminus of the Hudson's Bay company for unloading the furs brought down from the Red river valley in wooden ox-carts.

ST. CROIX or SANTA CRUZ, the largest of the West Indian islands purchased from Denmark by the United States in 1917. It lies 65 mi. S.E. of Puerto Rico, in 17° 40' N. and 64° 14' W. is 32 mi. long, varies in breadth from 1 mi. to 6 mi. and has an area of 82 sq. mi. Pop. 12,003 (1950). Hills parallel with the

western coast culminate in Mount Eagle (1,164 ft.). The narrower part is also hilly, but the south shore has marshy tracts with brackish lagoons. Sugar is the staple product, but other crops are being encouraged. The capital, picturesque Christiansted (pop. 4,112) is situated at the head of an inlet on the north shore, but its harbour is largely choked with mud. The only other town, Føderiksted (pop. 1,961) stands on an open roadstead on the west coast. The climate is healthful, with a mean annual temperature of 74° F. and an average annual rainfall of 45.7 in.

St. Croix was discovered in 1493 by Columbus, and owned in turn by Dutch, English and Spanish. In 1651 it was taken by France, and was given to the Knights of Malta in 1653. Denmark purchased it in 1733. Slavery was abolished in 1848 after a violent insurrection. See ST. THOMAS; VIRGIN ISLANDS.

See annual Reports of the governor of the Virgin Islands.

ST. CYR-L'ÉCOLE, a town of France in the department of Seine-et-Oise, 3 mi. W. of Versailles at the end of the old park of Louis XIV. Pop. (1946) 4,458. Its importance is due to the famous military school (*École spéciale militaire*) in which officers for the cavalry and infantry are trained, established in 1808 in a convent where Racine's *Esther* and *Athalie* were first acted. The convent was suppressed at the Revolution.

ST. DAVID'S (TYDEWEN), a cathedral village-city of Pembrokeshire, Wales, situated near the sea to the south-east of St. David's head, the most westerly promontory of south Wales. Pop. (1931) 1,580. St. David's is 10 mi. from Nettleton G.W.R. station, and about 16 mi. S.W. from Fishguard. The little town, locally known as "the city," stands in a lofty position near the cathedral close, and consists of five streets focusing on the square, called Cross Keys, the ancient market place still possessing its market cross (restored 1873). The origin of the fine little cathedral and its village "city" in an area so remote under modern conditions is of special interest. North-west Pembrokeshire, like most western promontories of Britain, France and Spain, is remarkably rich in old stone monuments (menhirs, dolmens and stone circles), a fact pointing in all probability to its being on the coastwise and transpennine route frequented by prehistoric traders from the Mediterranean to Ireland. (See PEMBROKESHIRE.)

The little boats of old were driven hither and thither at the mercy of wind and tide, so the coastland of St. David's head became dotted with alternative landing places, e.g., Porth y Rhaw, St. Non's Bay, Porth Clais, Porth Stinian, Whitesand Bay, which seem to have made the neighbourhood important in pre-Christian times, as one may judge from folk tradition, monuments on the headland, etc.

The pre-Christian tradition was continued by the Celtic saints moving between Ireland and Wales. In early mediaeval days the same route grew important, as pilgrims moved to and from the shrine of St. Iago da Compostella in north-west Spain. (See Hartwell Jones, "Celtic Britain and the Pilgrim Movement," *Y Cymmrodor* 1912.) The little landing places on the shore now had Christian chapels, where prayers were possibly said for safe voyages. The most important ruins at present are those of St. Justinian. At a focus behind a group of these small ports, in the quiet sheltered, well-watered valley of the Alun, the fine cathedral of SS. David and Andrew was built, and on the high ground around, as if sheltering it still further, the "village-city" grew. Throughout the middle ages the cathedral was the centre of pilgrimage and the mediaeval roads (often marked by sacred wells) may be traced across Pembrokeshire focusing on St. David's. Two pilgrimages to St. David's were popularly thought to equal one to Rome itself. The early holders of the see ventured, while the central government was weak, to exercise metropolitan rights over much of south Wales, but the increasing power of the Norman penetration reached St. David's and Anselm's forcible appointment of Bernard—a Norman monk—to be bishop in 1115 made St. David's a suffragan see of Canterbury. A conciliatory step, it would appear, was the canonization of David about 1120. Gerald de Barri (Giraldus Cambrensis) strove vainly to regain the ancient power of St. David's from 1109-1203.

The cathedral church is partly built of a beautiful purple-hued

sandstone, quarried locally. Its proportions are: length (exclusive of the Trinity and Lady-chapels) 254½ ft.; breadth of nave and aisles, 51½ ft.; breadth of transepts, including tower, 116 ft.; and height of central tower, 116 feet. The earliest and main portion of the existing fabric was erected under Bishop Peter de Leir (1176-98) in the transitional Norman-English style. Bishop David Martin (1296-1328) built the Lady chapel; Bishop Henry de Gower (1328-47) made many additions in the Decorated style, including the stone roof screen and southern porch; and Bishop Edward Vaughan (1509-22) erected the Trinity chapel between the choir and Lady chapel. The cathedral suffered severely during the changes brought about by the Reformation and at the hands of Bishop William Barlow (1536-48) and again during the civil wars of the 17th century. Subsequent restorations took place. The interior of the nave, separated by six wide bays from the aisles, is imposing with its triforium and clerestory. It has an elaborate roof of Irish oak, the gift of Treasurer Owen Pole (c. 1500). The nave is divided from the choir by Bishop Gower's fine stone screen, while the choir contains the richly carved stalls erected by Bishop Tully (1460-81), the episcopal throne, and an oak screen that serves to separate choir and presbytery. Bishop Vaughan's chapel contains fine Tudor fan-vaulting, and the Lady chapel decorated sedilia. To the north of the cathedral is the ruined shell of the beautiful chapel with an adjoining tower, forming part of the college of St. Mary, founded by John of Gaunt and Bishop Adam Houghton in 1377. On the west bank of the Alun stand the ruins of the episcopal palace erected by Bishop Gower (c. 1342). The palace was built for residential purposes rather than for defense and occupies three sides of a quadrangle 120 ft. square, and, though roofless and deserted for nearly three centuries, retains most of its principal features. The great hall, 96 ft. by 33 ft., possesses a traceried wheel window; the chief portal is still imposing; and the chapel retains its curious bell turret; while the peculiar but graceful arcaded parapet of the roof extends intact throughout the whole length of the building. Partially dismantled by Bishop Barlow (c. 1540) the half-ruined palace was occasionally occupied by succeeding bishops prior to the civil wars. The Close contains the deanery and other residences of the cathedral clergy, mostly occupying the sites of ancient buildings. It formerly owned four gateways, of which the South or Tower gate alone remains.

ST. DENIS, a suburb ½ mi. north of Notre Dame de Paris, capital of an arrondissement in the department of Seine. Pop. (1946) 69,927. St. Denis, an important junction on the northern railway, stands in a plain on the right bank of the Seine, which is here joined by the canal of St. Denis. It has numerous metallurgical works, where railway material, naval engines and the like are constructed, distilleries of spirits, glassworks, potteries and manufactories of drugs, chemical products, oils, nickel plate and pianos. The name and fame of the town are derived from the abbey founded by Dagobert I on the spot where St. Denis, the apostle of Paris, was interred.

St. Denis, the ancient *Cauliacum*, was a town of no pretensions till the foundation of its abbey, which became one of the most powerful in France. The rebuilding of the church, begun in the 12th century by Suger, was completed in the 13th century. Among the many domains of the abbey was the French Vexin. It was held during the later middle ages by the French kings and vassals of the abbey, and to this fact is due their adoption of the oriflamme or red banner of St. Denis as the royal standard. Louis XIV reduced the abbey to the rank of a priory; and at the Revolution it was suppressed, the tombs being violated and the church sacked (1793). Louis XVIII caused all the articles belonging to St. Denis to be brought back to their original site, and added numerous other monuments from the suppressed abbeys. But it was not until after 1848 that, under the direction of Viollet-le-Duc, the basilica recovered its original appearance. St. Denis which was the key of Paris on the north, was more than once pillaged in the Hundred Years' War, suffering especially in 1358 and 1406. A sanguinary battle, in which the Catholic leader Constable Anne de Montmorency found victory and death, was fought between Huguenots and Catholics in the neighbourhood

on Nov. 10, 1567.

The church exhibits the transition from the Romanesque to the Gothic style. The west front was built between 1137 and 1140. The right-hand tower is almost pure Romanesque; that on the left was Gothic, but its spire was struck by lightning in 1837. The porch formed by the first three bays contains some remains of the basilica of Pippin the Short and Charlemagne, by whom the church was rebuilt. The nave proper (235 ft. long and 57 wide) has seven bays, and dates, as well as most of the choir and transepts, from the reign of St. Louis. The secondary apse (*rond-point*) and its semicircular chapels (consecrated in 1144) are considered as the first perfected attempt at Gothic. The transepts have fine façades, the north of the 12th, the south of the 13th century, each with two unfinished towers; if the plan had been fully carried out there would have been six towers beside a central spire in lead. The church contains a series of tombs of the kings and princes of the royal houses of France. The most remarkable are those of Louis XII and Anne of Brittany, executed from 1516 to 1532; of Henry II and Catherine de' Medici, a masterpiece by Germain Pilon (1564-1583); of Louis of Orleans and Valentine of Milan, from the old church of the Celestines at Paris (1502-1515); of Francis I and Claude of France, one of the most splendid tombs of the Renaissance, executed under the direction of Philibert Delorme (1550-1560); and that of Dagobert, which, though considerably dilapidated, ranks as one of the most curious of mediaeval (13th-century) works of art. In the apse some stained glass of the time of Suger remains.

The crypt dates partly from the 10th or 11th century. In the centre is the vault where the coffin of the king used to lie until, to make room for that of his successor, it was removed to its final resting place. It is at present occupied by the coffin of Louis XVIII, the last sovereign whose body was borne to St. Denis. Besides fine statues, the crypt contains the Bourbon vault, in which among other coffins are deposited the remains of Louis XVI and Marie Antoinette.

See F. de Guilhaume, *Monographie de l'église royale de St. Denis* (Paris, 1848).

ST. DIÉ, a town of eastern France, capital of an arrondissement in the department of Vosges, 38 mi. N.E. of Épinal by rail. Pop. (1940) 15,637. St. Dié (*Deodatum*, *Theodata*, *St. Deodati Fanum*) grew up round a monastery founded in the 7th century by St. Deodatus of Nevers, who retired to this place. In the 10th century the community became a chapter of canons. Among the privileges enjoyed by them was that of coining money. Though they co-operated in building the town walls, the canons and the dukes of Lorraine soon became rivals for the authority over St. Dié. The institution of a town council in 1628, and the establishment in 1777 of a bishopric which appropriated part of their spiritual jurisdiction, greatly diminished the influence of the canons; and with the Revolution they were swept away. During the wars of the 15th, 16th and 17th centuries the town was repeatedly sacked. It was also partially destroyed by fire in 1065, 1155, 1554, and 1757. St. Dié is on the Meurthe in a basin surrounded by well-wooded hills. The cathedral has a Romanesque nave (12th century) and a Gothic choir; the portal of red stone dates from the 18th century. A fine cloister (13th century), containing a stone pulpit, communicates with the Petite-Église or Notre-Dame, 12th-century Romanesque. St. Dié is the seat of a bishop and of a sub-prefect.

ST. DIZIER, a town of northeastern France, in the department of Haute-Marne, 45 mi. N.N.W. of Chaumont by rail, on the Marne and the Haute-Marne canal. Pop. (1940) 19,532. It is an important centre of the iron trade. It dates from the 3rd century, when the relics of Bishop St. Didier were brought there.

ST. DUNSTAN'S. St. Dunstan's is a charity for the treatment, training and lifelong aftercare of men and women blinded on war service. It was founded in 1915 by Sir Arthur Pearson, himself blind during the last ten years of his life. The work began in a house called "St. Dunstan's" in Regent's park, London. Its purpose then was the care of British soldiers, sailors and airmen blinded in or as a result of, World War I, of whom there were

nearly 3,000. During World War II, its benefits were extended to include men and women of the services subsidiary to the armed forces, and to policemen, firemen, members of the merchant navy and fishing fleet, and all personnel of the civil defense, nursing and medical services who might be blinded on duty. On the death of Sir Arthur Pearson, Lady (Arthur) Pearson, occupied the office of president of the organization, and in 1947 Sir Neville Pearson, their only son, took her place. The chairman of the council was Sir Jan Fraser, an officer blinded in 1916.

On completion of treatment, patients are transferred to the training centre for one to two years. The centre is residential and there is no charge for board, lodging, education or training in any of the regular occupations or professions, or special courses. St. Dunstan's also provides all necessary apparatus, books and equipment and makes grants for special needs, children's maintenance and education, etc. Early weeks are spent learning typewriting, braille reading, games and pastimes, learning to look after daily needs, walking alone, etc. Training for a career then follows. Subjects studied include public affairs, the law, the church, physiotherapy, telephone operating, public and commercial administration, shopkeeping, factory work including machine minding, lecturing, journalism and a variety of handicrafts. The St. Dunstan's then returns to his own home. Thereafter, until the end of his life, he remains under the organization's care.

St. Dunstan's is associated with the Scottish National Institution for the War-Blinded (Newington house, Edinburgh) in caring for war-blinded Scotsmen. St. Dunstan's, with Newington house, is recognized by the government departments concerned as the official centre for the training, re-education, settlement and aftercare of blinded service men and women, and has branches and affiliations throughout the commonwealth and empire. St. Dunstan's receives no state aid, but has considerable endowments and is supported by voluntary contributions. The administrative offices are at 191, Marylebone road, London, N.W. 1. (I. Fr.)

STE. ANNE DE BEAUPRÉ, pop. (1951) 1,827, a village of Montmorency county, Quebec, Canada, at the junction of the Ste. Anne river with the St. Lawrence, and on the Canadian National railway system 21 mi. northeast of the city of Quebec. It stands in a rolling agricultural country, with hills in the background; and near by on the Ste. Anne river, are beautiful falls and excellent fishing. Ste. Anne is a notable Roman Catholic place of pilgrimage; annual pilgrimages are made from all over Canada and the United States to see Ste. Anne's shrine and to participate in special religious services. Among the sights of interest is a huge panoramic painting of the "Day of Crucifixion" on a canvas 45 ft. high and 360 ft. in circumference. Ste. Anne is the headquarters of the French-Canadian Redemptorists and the seat of their college.

SAINTE-BEUVE, CHARLES AUGUSTIN (1804-1869), French critic, was born at Boulogne-sur-Mer on Dec. 23, 1804. He was a posthumous child. His father, a native of Picardy, and controller of town-dues at Boulogne, was a man of literary tastes; his mother was half English, her father, a mariner of Boulogne, having married an Englishwoman. Charles Augustin was sent to a boarding school in Paris to attend the classes of the Collège Charlemagne, and then of the Collège Bourbon. He then studied medicine, but after four years abandoned it to join the staff of the new Liberal newspaper, *The Globe*, in which he published the excellent articles on the French poetry of the 16th century afterwards separately published as *Tableau historique et critique de la poésie française au XVI^e siècle* (2nd ed., 1842). In 1829 he made his first venture as a poet with the *Vie, poésies, et pensées de Joseph Delorme*. His own name did not appear; but Joseph Delorme, that "Werther in the shape of Jacobin and medical student," as Guizot called him, was the Sainte-Beuve of those days himself. In 1830 came his second volume of poems, the *Consolations*. But the critic in him grew to prevail more and more and pushed out the poet. Sainte-Beuve was at this time a devoted Catholic and a little later for a very short period a disciple of Lamennais. But he gradually separated from his Catholic friends, and at the same time a coldness grew up between him and Victor Hugo, whose warm friendship he had won by an

early article on *Odes et Ballades*. He became the lover of Madame Hugo, and a definite separation between the former friends ensued in 1834. In 1831 the *Revue des deux mondes* was founded, and from the first Sainte-Beuve was one of the most active and important contributors. He brought out his novel of *Volupté* in 1834, his third and last volume of poetry, the *Pensées d'aède*, in 1837. He had long meditated work on Port-Royal, which took shape in a series of lectures delivered at Lausanne in 1838. The book occupied him at intervals until 1848—*Port Royal* (5 vols. 1840-48; 5th ed., 1888-91).

In 1840 Victor Cousin, then minister of public instruction, appointed him one of the keepers of the Mazarin library, an appointment which gave him rooms at the library, and a competence, and leisure for study. With a Greek teacher, M. Pantasides, he read and re-read the Greek poets. Articles on Homer, Theocritus, Apollonius of Rhodes, and Meleager in the *Revue des deux mondes* were fruits of his new Greek studies. But in general his subjects were taken from the great literature of his own country. Seven volumes of *Portraits*, contributed to the *Revue de Paris* and the *Revue des deux mondes*, exhibit his work in the years from 1832 to 1848, a work constantly increasing in range and value. In 1844 he was elected to the French Academy as successor to Casimir Delavigne, and was received there at the beginning of 1845 by Victor Hugo.

In March 1848 was published an account of secret-service money distributed in the late reign, and Sainte-Beuve was put down as having received the sum of one hundred francs. The sum appears to have been in reality paid for alterations to a smoky chimney in the library, but Sainte-Beuve was annoyed at the imputation and resigned his chair. He lectured for a time at Liège, but returned to Paris within a year. Dr. Véron, the editor of the *Constitutionnel*, proposed to him that he should supply that newspaper with a literary article for every Monday; and thus the famous *Causeries du lundi* were started. Sainte-Beuve now lived in the small house in the Rue Montparnasse (No. 11), which he occupied for the remainder of his life, and where in 1850 his mother, from whom he seems to have inherited his good sense, tact and finesse, died at the age of eighty-six. For three years he continued writing every Monday for the *Constitutionnel*; then he passed, with a similar engagement, to the *Moniteur*. In 1857 his Monday articles began to be published in volumes, and by 1862 formed a collection in 15 volumes; they afterwards were resumed under the title of *Nouveaux lundis*, which now make a collection of 13 volumes more.

In 1854 he was nominated to the chair of Latin poetry at the college of France. He was rudely interrupted by the students, and resigned; he was then appointed lecturer on French literature at the École Normale Supérieure. Here he lectured for four years. During this period his contributions to the *Moniteur* were intermittent. He now returned to a regular Monday article for the *Constitutionnel*.

The Empire was tardy in acknowledging his merits, and it was not until 1865 that he received the senatorship with its income sufficient to make him independent, and his health was failing him. He could seldom attend the meetings of the senate; the part he took there, however, on two famous occasions—when the nomination of Ernest Renan to the college of France came under discussion in 1867, and the law on the press in the year following—offended the majority in that conservative assembly and delighted those who "belonged" to use his own phrase, "to the diocese of free thought." He gave further pleasure in this diocese by leaving the *Moniteur* at the beginning of 1869, and contributing to a Liberal Journal, the *Temps*. This defection finally alienated him from the Bonapartists, and lost him the friendship of the Princess Mathilde. His literary activity suffered little abatement, but pain made him at last unable to sit to write; he could only stand or lie. He died in his house in the Rue Montparnasse on Oct. 31, 1869.

The root of Sainte-Beuve's criticism is his single-hearted devotion to truth. What he called "fictions" in literature, in politics, in religion, were not allowed to influence him. Some one had talked on his being tenacious of a certain set of literary opinions. "I hold very little," he answers, "to literary opinions; literary

opinions occupy very little place in my life and in my thoughts. What does occupy me seriously is life itself and the object of it." "I am accustomed incessantly to call my judgments in question anew, and to re-cast my opinions the moment I suspect them to be without validity." "What I have wished" (in *Port-Royal*) "is to say not a word more than I thought, to stop even a little short of what I believed in certain cases, in order that my words might acquire more weight as historical testimony." To all exaggeration and untruth, from whatever side it proceeded, he had an antipathy. "I turn my back upon the Michiels and Quinets, but I cannot hold out my hand to the Veuillots."

But Sainte-Beuve could not have been the great critic he was had he not had, at the service of this his love of truth and measure, the conscientious industry of a Benedictine. "I never have a holiday. On Monday towards noon I lift up my head, and breathe for about an hour; after that the wicket shuts again and I am in my prison cell for seven days." The *Causeries* were at this price. They came once a week, and to write one of them as he wrote it was indeed a week's work.

To mental independence, industry, measure and lucidity, his criticism adds the merit of happy temper and disposition. Sainte-Beuve has more, as a critic, than the external politeness which once at any rate distinguished his countrymen; he has a personal charm of manner due to a sweet and humane temper. He complained of *un peu de dureté*, "a certain dose of hardness," in the new generation of writers. The personality of an author had a peculiar importance for him; the poetical side of his subjects, however latent it might be, always attracted him and he always sought to extricate it. This was because he had the instincts of the true poetic nature. As a guide to bring us to a knowledge of the great personalities in French literature he is unrivalled.

SAINT-CLAIRE DEVILLE, ÉTIENNE HENRI (1818-1881), French chemist, was born on March 11, 1818, in the island of St. Thomas, West Indies, where his father was French consul. In 1844, having graduated as doctor of medicine and doctor of science, he was appointed to organize the new faculty of science at Besançon, where he acted as dean and professor of chemistry from 1845 to 1851. He succeeded A. J. Balard at the École Normale, Paris, in 1851, and in 1859 became professor at the Sorbonne in place of J. B. A. Dumas (*q.v.*). He died at Boulogne-sur-Seine on July 1, 1881.

He began his experimental work in 1841 with investigations of oil of turpentine and tolu balsam, in the course of which he discovered toluene (*q.v.*). His most important work was in inorganic and thermal chemistry. In 1849 he discovered nitrogen pentoxide, the first of the so-called anhydrides of the mono-basic acids to be isolated. In 1855 he devised a method by which aluminum (*q.v.*) could be prepared on a large scale by the aid of sodium, the manufacture of which he also developed. His best known contribution to chemistry is his work on the phenomena of reversible reactions (see *REACTION KINETICS*).

ST. ELMO'S FIRE, the glow accompanying the brushlike discharges of atmospheric electricity which usually appears as a tip of light on the extremities of pointed objects such as church towers or the masts of ships during stormy weather. It is commonly accompanied by a crackling or hissing noise.

St. Elmo's fire, or corona discharge, is commonly observed on the periphery of propellers, along the wing tips, windshield and nose of aircraft flying in dry snow, ice crystals, or in the vicinity of thunderstorms. The discharge may be sufficiently strong to cause a noisy disturbance in the radio, called static, which may obliterate all other signals. The corona discharge from an aircraft may initiate a lightning discharge which, striking the aeroplane, may cause small structural damage, impair the radio or temporarily blind the pilot. Various flight procedures, in addition to mechanical and electrical devices designed to reduce the charge accumu-

lation, are utilized as safeguards in preventing or minimizing discharges. The name St. Elmo is an Italian corruption, through *Sant' Ermo*, of St. Erasmus, the patron saint of Mediterranean sailors, who regard St. Elmo's fire as the visible sign of his guardianship.

See Hazlitt's edition of Brand's and Ellis's *Antiquities* (1905), s.v. "Castor and Pollux." (E. J. Mr.)

STE.-MARIE-AUX-MINES or MARKIRCH, a town of France in the department of Haut-Rhin intersected by the Lièpvrette, an affluent of the Rhine. Pop. (1946) 6,217. The once productive silver, copper and lead mines of the neighbourhood were worked from the 9th till the 19th century. The main industries of the place are weaving and dyeing. The river was at one time the boundary between the German and French languages, the German-speaking inhabitants on the right bank were Protestants and subject to the counts of Rappoltstein, while the French inhabitants were Roman Catholics and under the rule of the dukes of Lorraine.

ST. EMILION, a town of southwestern France, in the department of Gironde. 23 mi. from the right bank of the Dordogne and 27 mi. E.N.E. of Bordeaux by rail. Pop. (1946) 766. The town derived its name from a hermit who lived there in the 7th and 8th centuries. The town has remains of ramparts of the 12th and 13th centuries. The parish, once collegiate church, dates from the 12th and 13th centuries. A Gothic cloister adjoins the church. A belfry (12th, 13th and 15th centuries) commanding the town is built on the terrace, beneath which are hollowed in the rock the oratory and hermitage of St. Emilion, and adjoining them a large ancient monolithic church. Remains of a monastery of the Cordeliers (15th and 17th centuries) and of a building (13th century) known as the Palais Cardinal, are also to be seen. St. Emilion is celebrated for its wines.

SAINTES-PALAYE, JEAN BAPTISTE LA CURNE (or **LA CURNE**) DE (1697-1781), French scholar, was born at Auxerre on June 6, 1697. His father, Edme, had been gentleman of the bedchamber to the duke of Orleans, brother of Louis XIV, a position which descended to his son. In 1724 he had been elected an associate of the Académie des Inscriptions et Belles-Lettres, and from this time he devoted himself exclusively to the work of this society. He began a series of studies on the chroniclers of the middle ages for the *Historiens des Gaules et de la France* (edited by Dom Bouquet). Raoul Glaber, Helgaud, the *Gesta* of Louis VII, the chronicle of Morigny, Rigord and his continuator, William le Breton, the monk of St. Denis, Jean de Venette, Froissart and the Jouvencel. His *Glossaire de la langue française* was ready in 1756, but remained in manuscript for more than a century. He died on March 1, 1781.

See the biography of La Curne, with a list of his published works and those in manuscript, at the beginning of the tenth and last volume of the *Dictionnaire historique de l'ancien langage français, ou glossaire de la langue française depuis son origine jusqu'au siècle de Louis XIV*, published by Louis Favre (1875-82).

SAINTES, a town of western France, capital of an arrondissement in the department of Charente-Maritime, 47 mi. S.E. of La Rochelle by the railway from Nantes to Bordeaux. Pop. (1946) 23,441. Saintes (*Mediolanum* or *Mediolanum*), the capital of the Santones, was a flourishing town before Caesar's conquest of Gaul; in the middle ages it was capital of the Saintonge. Christianity was introduced by St. Eutropius, its first bishop, in the middle of the 3rd century. Charlemagne rebuilt its cathedral. The Normans burned the town in 845 and 854. Richard Coeur de Lion was besieged and captured there by his father Henry II. In 1242 St. Louis defeated the English there, but the town was not permanently recovered from the English until the reign of Charles V. It has Roman remains, of which the best preserved is the arch of Germanicus, dating from the reign of Tiberius. This formerly stood on a Roman bridge destroyed in 1843, when it was removed and reconstructed on the right bank of the river. Ruins of baths and of an amphitheatre are also to be seen. The large amphitheatre dates probably from the close of the 1st or beginning of the 2nd century and was capable of holding 20,000 spectators. Saintes was a bishop's see till 1790; the cathedral of St. Peter, built in the early 12th century, was rebuilt in the 15th

century and again after it had been almost destroyed by the Huguenots in 1568. It has a 15th century tower. The church of St. Eutropius (6th century, rebuilt in the 11th having had its nave destroyed in the Wars of Religion) stands above a large, well-lighted crypt adorned with richly sculptured capitals and containing the tomb of St. Eutropius (4th or 5th century). The fine stone spire dates from the 15th century. Notre-Dame (11th and 12th centuries) has a noble clock tower and is now desecrated. The old *hôtel de ville* (16th and 18th centuries) contains a library. Small vessels ascend the river as far as Saintes, which carries on trade in grain, brandy and wine, has iron foundries and railway works and manufactures earthenware and tiles.

ST. ÉTIENNE, an industrial town of east-central France, capital of the department of Loire, 310 mi. S.E.E. of Paris and 36 mi. S.W. of Lyons by rail. Pop. (1946) 177,966. At the close of the 12th century St. Étienne was a parish of the Pays de Gier belonging to the abbey of Valbenoite. By the middle of the 14th century the coal trade was developing, and in the early 15th century Charles VII allowed the town to build fortifications. The manufacture of firearms for the state was begun at St. Étienne under Francis I and was put under the surveillance of state inspectors early in the 18th century. The manufacture grew rapidly. The first railways opened in France were the line between St. Étienne and Andrézieux on the Loire in 1828 and that between St. Étienne and Lyons in 1831. In 1836 St. Étienne became the administrative centre of the department.

St. Étienne stands on the Furens, which flows through it from southeast to northwest, partly underground, and is important for the silk manufacture. The town is the seat of a prefect, of tribunals of first instance and of commerce, of a chamber of commerce and of a board of trade-arbitrators and has schools of mining, chemistry and dyeing, etc.

The town owes its importance chiefly to the coal basin which extends between Firminy and Rive-de Gier over an area 20 mi. long by 5 mi. wide and is second only to those of Nord and Pas-de-Calais in France. The mineral is of two kinds—smelting coal, said to be the best in France, and gas coal. There are manufactures of ribbons, trimmings and other goods made from silk and mixtures of cotton and silk. This industry dates from the early 17th century and is carried on chiefly in small factories (electricity supplying the motive power). The attendant industry of dyeing is carried on on a large scale. The manufacture of steel and iron and of heavy iron goods such as armour-plating is important. Firearms are manufactured at the national factory under the direction of artillery officers. Private firms make both military rifles and sporting-guns, revolvers, etc. Other industries are the manufacture of elastic fabrics, glass, cartridges, liqueurs, hemp cables, etc. Weaving machinery, cycles, automobiles and agricultural implements are also made.

ST. EUSTATIUS and SABA, two Netherlands West Indian islands located respectively 9 mi. and 16 mi. N.W. of St. Kitts. Politically, they are part of the colony of Curacao (q.v.). St. Eustatius (area: 7 sq.mi.; pop. 1950, 955) is composed of volcanic hills and intervening valleys. There is an open roadstead off Oranjestad on the west. Saba (5 sq.mi.; pop. 1950, 1,110) is a volcanic cone rising 2,851 ft. from the sea. Its town, Bottom, can be approached from the shore 800 ft. below only by steps in solid rock known as "the Ladder." Some of the best boats in the Caribbean are built there; the wood is imported and the vessels, when completed, are lowered over the face of the cliffs. Many men from both islands are employed as seamen on ships elsewhere, so that women predominate by 50% in Saba and more than 20% in St. Eustatius. Remittances home are an important factor in the islands' economy. (L. W. Bz.)

SAINT-ÉVREMOND, CHARLES DE MARGUETEL DE SAINT-DENIS, SEIGNEUR DE (1610-1703), was born at Saint-Denis-le-Guaist, near Coutances, on April 1, 1610. He served through a great part of the Thirty Years' War, distinguishing himself at the siege of Landrecies (1637), when he was made captain. During his campaigns he studied the works of Montaigne and the Spanish and Italian languages. In 1639 he met Gassendi in Paris, and became one of his disciples. He was present at Rocroy,

at Nordlingen and at Lerida. For a time he was personally attached to Condé, but offended him by a satirical remark and was deprived of his command in the prince's guards in 1648.

During the Fronde, Saint-Evremond was a steady royalist. The duke of Candale (of whom he has left a very severe portrait) gave him a command in Guienne, and Saint-Evremond, who had reached the grade of *maréchal de camp*, is said to have saved 50,000 livres in less than three years. He was one of the numerous victims involved in the fall of Fouquet. His letter to Marshal Créquy on the peace of the Pyrennes, which is said to have been discovered by Colbert's agents at the seizure of Fouquet's papers, seems a very inadequate cause for his disgrace. Saint-Evremond fled to Holland and to England, where he was kindly received by Charles II and was pensioned. After James II's flight to France Saint-Evremond was invited to return, but he declined. Hortense Mancini, the most attractive of Mazarin's attractive group of nieces, came to England in 1670, and set up a *salon* for love-making, gambling and witty conversation, and here Saint-Evremond was for many years at home. He died on Sept. 29, 1703, and was buried in Westminster abbey.

Saint-Evremond empowered Des Maizeaux to publish his works after his death, and they were published in London (2 vols., 1705), and often reprinted. His masterpiece in irony is the so-called *Conversation du maréchal d'Hocquincourt avec le père Canaye* (the latter a Jesuit and Saint-Evremond's master at school).

His *Oeuvres mêlées*, edited from the MSS. by Silvestre and Des Maizeaux, were printed by Jacob Tonson (London, 1705, 2 vols.; 2nd ed., 3 vols., 1709), with a notice by Des Maizeaux. His correspondence with Ninon de Lenclos, whose fast friend he was, was published in 1752; *Le Comédien des académiciens*, written in 1643, was printed in 1650. Modern editions of his works are by Hippéart (Paris, 1852), C. Giraud (Paris, 1865), and a selection (1881) with a notice by M. de Lescure.

ST. GALL, a canton in northeast Switzerland, bordered by the principality of Liechtenstein and by Vorarlberg (Austria). It entirely surrounds the canton of Appenzel, which formerly belonged to the abbots of St. Gall. Five other cantons lie along its north, west and south borders.

Its area is 777.2 sq.mi., of which about 88% are reckoned "productive," forests covering about 165 sq.mi. and vineyards only about 1 sq.mi. The altitude above sea level varies from 1,300 ft. (the Lake of Constance) to 10,667 ft. (the Ringelspiz) in the extreme south. There are nearly 3 sq.mi. of glaciers but slightly over one-quarter of the unproductive area consists of lakes, including portions of the Lake of Constance, of the Wallensee, and of the Lake of Zürich, together with several small lakes wholly within its limits. The canton is mountainous in the south near its borders with the Grisons and Glarus, but towards Thurgau the surface is characterized by hummocky hill country. Considerable low-lying alluvial plains occur along the courses of the Linth and Rhine, particularly in those sections of the rivers which form, in part, its frontiers on the east and southwest. Within the canton, the most important streams are the upper River Thur and the lower and middle portions of its principal tributary, the Sitter. It has ports on the Lake of Constance (Rorschach) and of Zürich (Rapperswil), while Weesen is the chief town on the Wallensee. Probably the most fashionable watering place is Ragatz, receiving the hot mineral waters (95° F.) of Pfäfers by means of a 3 mi. conduit. The main railway lines from Zürich past Sargans for Coire, and from Sargans past Rorschach for Constance skirt its borders, while the capital is on the direct railway line from Zürich past Wil to Rorschach, and communicates by rail with Appenzel and with towns in the Toggenburg (q.v.). In 1930 the population of the canton was 286,362 of whom 279,230 were German-speaking, 4,089 Italian-speaking and 903 French-speaking, while there were 170,445 Catholics, 214,545 Protestants and 704 Jews; in 1950 the population was 300,106. The capital of the canton is St. Gall, population (1950) 68,011; the other most populous places (1950 census) are Rorschach (pop. 11,325), Altstätten (pop. 8,603), Gossau (pop. 8,316) and Waltwil (6,336). In the southern and more Alpine portion of the canton the inhabitants mainly follow pas-

toral pursuits, while in the central and northern regions agriculture is frequently combined with manufactures.

The canton is one of the most industrial in Switzerland. Cotton spinning is widely spread, though the characteristic industry is the manufacture of muslin, embroidery and lace, chiefly at the capital and at Altstätten; the value of the embroidery and lace exported from the canton, though fluctuating, normally amounts to about one-seventh of the total export trade of Switzerland. Ores of iron and of manganese are raised in the Gonzen mine near Sargans. The canton is divided into 14 administrative districts, which comprise 91 communes.

The existing constitution dates from 1890. The legislature (*Grossrat*) of 174 deputies is elected on the principle of proportional representation. Each commune of 1,500 Swiss inhabitants or less has a right to one member, and as many more as the divisor 1,500 justifies. Members hold office for three years. The seven members of the executive (*Regierungsrat*) also hold office for three years and are elected by the combined communes. The two members of the federal *Ständerat* are named by the legislature, while the 13 members of the federal *Nationalrat* have, since 1911, been elected by a scheme of proportional representation, using the popular vote. The right of "facultative referendum" and of "initiative" as to legislative projects has, since 1875 and 1890 respectively, belonged to any 4,000 electors, but in case of "initiative" in constitutional matters (1861) 10,000 must sign the demand. The canton of St. Gall, a great part of which formerly belonged to the abbots of St. Gall, is one of the later political units, having been formed in 1803, from numerous districts, some of which, e.g., Gaster, Uznach and Gams, had been controlled by the adjacent and older cantons since the 15th century.

ST. GALL (Fr. **ST. GALL**), capital of the Swiss canton of that name, is situated in the upland valley of the Steinach, 2,195 ft. above sea-level. Its population is almost all German-speaking, while the Protestants and Catholics each comprise about half the population, with a small number of Jews. In 1920 the population was 70,437; in 1930 63,947, and in 1947 62,360, a decrease due partly to World Wars I and II.

St. Gallen owes its origin to St. Gall, an Irish hermit, who in 614, built his cell in the forest which then covered the site, and lived there till his death in 640. About the middle of the 8th century the collection of hermits' dwellings was transformed into a regularly organized Benedictine monastery. For the next three centuries this was one of the chief seats of learning and education in Europe. About 954 the monastery and its buildings were surrounded by walls as a protection against the Saracens, and this was the origin of the town.

In 1311 St. Gallen became a free imperial city, and about 1353 the guilds, headed by that of the cloth-weavers, obtained the control of the civic government, while in 1415 it bought its liberty from the German king Sigismund. This growing independence did not please the abbots, who had been made princes of the Empire in 1204, and there followed a long struggle between them and their rebellious subjects of St. Gallen and Appenzell. In 1421 the Appenzellers became "allies" of the Swiss confederation, as did the town of St. Gallen a few months later, this connection becoming an "everlasting" alliance in 1454, while in 1457 the town was finally freed from the abbot. After further conflicts, the abbot in 1490 concluded an alliance with the Swiss which reduced his position almost to that of a "subject district." The townsmen adopted the Reformation in 1524, and this new cause of difference further envenomed their relations with the abbots. Both abbot and town were admitted regularly to the Swiss diet, but neither succeeded in its attempts to be received a full member of the Confederation. In 1798 and finally in 1805 the abbey was secularized, while out of part of its domains and those of the town the canton *Santis* (now St. Gall) was formed, with St. Gallen as capital.

St. Gallen is by rail 9 m. S.W. of Rorschach, its port on the lake of Constance, and 53 m. E. of Zürich. The older or central portion of the town retains the air of a small rural capital, but the newer quarters present the aspect of a modern commercial

centre. Its chief building is the abbey church of the celebrate old monastery (dating in its present form from 1756-1765). It has been a cathedral church (Catholic) since 1846. The famous library is housed in the former palace of the abbot, and is one of the most renowned in Europe by reason of its rich treasure of early mss. and printed books. Other portions of the monastic buildings are used as the offices of the cantonal authorities, and contain the extensive archives both of this monastery and of the of Pfäfers.

See *Dict. géogr. de la Suisse*, vol. iv. (1906).

SAINT-GAUDENS, AUGUSTUS (1848-1907), American sculptor, was born in Dublin, Ireland, on March 1, 1848, the son of a French father, a shoemaker by trade, and an Irish mother and was taken to America in infancy. He was apprenticed to cameo-cutter, studying in the schools of Cooper Union (1861) and the National Academy of Design, New York (1865-1866). His earliest work in sculpture, made upon the eve of his departure in 1868, for Paris, was a bronze bust of his father, Bernard P. I. Saint-Gaudens. After some delay he was admitted as a pupil of Joutfroy in l'Ecole des Beaux-arts, and two years later, with his fellow-student Mercé, he went to Italy, where he remained three years. While in Rome he executed his statues "Hiawatha" and "Silence." Returning in 1873 to New York he made, the following year, an admirable bust of the statesman, William A. Evans, and was commissioned by John La Farge to execute relief of adoring angels for St. Thomas' Episcopal Church, New York, a work which immediately won the esteem of his brother artists. The church was destroyed by fire a few years later. His statue of Admiral Farragut, Madison Square, New York, was ordered in 1876, exhibited at the Paris salon of 1880 and unveiled in 1881. It was received with enthusiasm and from its first appearance Saint-Gaudens was recognized as a new leader in art. To this period also belong the "Randall" of the "Sailor Snug Harbour," Staten Island, and the beautiful caryatides of the Vanderbilt fireplace, preserved in the Metropolitan Museum.

At all times throughout his life the sculptor found diversions from more serious tasks in modelling portraits of friends in lo relief. Among these we may note the medallions and plaques of Bastien-Lepage and Dr. Henry Schiff (1880); Homer Saint-Gaudens and the children of Prescott Hall Butler (1881); Mrs. Stanford White (1884); Robert Louis Stevenson (1887); William C. Chase and the children of Jacob H. Schiff (1888); Kenyon Cox (1889), etc. Yet another form of sculpture was developed in his high-reliefs of Dr. Henry Bellows (1885) and Dr. McCosh (1889), and the lovely "Amor Caritas," which, with variations, long occupied his mind. His noble statue of Lincoln was unveiled in 1881 in Lincoln park, Chicago, and was at once accepted as the country ideal. In Springfield, Mass., his unique "Deacon Chapman," known as "The Puritan," appeared also in 1887. The Adams memorial (1891) in Rock Creek cemetery, Washington, D.C., is considered by many to be Saint-Gaudens' greatest work; indeed not a few rate it as America's highest artistic achievement. The mysterious draped figure with shadowed face is often called "Grief," but the sculptor had no such intention; "Peace" or "Nirvana" better convey the meaning. The Garfield memorial in Fairmount park Philadelphia, was completed in 1895. The Shaw memorial: Boston, a monument to Robert G. Shaw, colonel of a negro regiment in the Civil War, was begun in 1884 and occupied the master intermittently for more than 12 years, being dedicated in 1891. It is a large relief in bronze, measuring some 15 by 11 ft., and containing many marching soldiers, led by their young officer on horseback. The year 1897 saw likewise the completion of the "Logan" on a fiery steed, in Grant park, Chicago.

Another famous equestrian statue is the "General Sherman" which was begun in 1892 and dedicated in 1905. Standing at the entrance of Central park at 59th Street and Fifth Avenue, New York, this golden group of the mounted commander led by beautiful winged "Victory" is one of the most impressive of all city's monuments. The "Sherman" was shown with other work of Saint-Gaudens at the Paris Exposition of 1900, receiving the highest honours. The sculptor was made an officer of the Legion of Honour and corresponding member of the Institute of

France. A bronze copy of his "Amor Caritas" was purchased by the French Government. Other important works are the Peter Cooper memorial, New York; the "Parnell," in Dublin; the Phillips Brooks monument in Boston and a fine seated figure of Lincoln, recently erected on Chicago's lake front. Saint-Gaudens died at Cornish, N.H., on Aug. 3, 1907. He is rightly regarded as America's greatest sculptor and his work continues to exert a powerful and beneficent influence in the United States. In 1877 he married Augusta F. Homer and left a son, Homer Saint-Gaudens, now director of fine arts of the Carnegie Institute, Pittsburgh, Pa. His brother Louis (1854-1913) also a sculptor, assisted Augustus Saint-Gaudens in some of his creations.

Lewis Hind, *Augustus Saint-Gaudens* (1908); Homer Saint-Gaudens, *The Reminiscences of Augustus Saint-Gaudens* (1913). (L. T.)

ST. GAUDENS, a town of France, capital of an arrondissement in the department of Haute-Garonne, 1 m. from the river Garonne, 57 m. S.W. of Toulouse on the railway to Tarbes. Pop. (1936) 4,684. St. Gaudens derives its name from a martyr of the 5th century, at whose tomb a college of canons was established. It was important as a capital of the Nébezouan, as the residence of the bishops of Comminges and for its cloth industry. The church, once collegiate, dates chiefly from the 11th and 12th centuries, but the main entrance is flamboyant Gothic.

SAINT-GERMAIN, COMTE DE (G. 1710-80) called *der Wundermann*, a celebrated adventurer. Of his parentage and place of birth nothing is definitely known; the common version is that he was a Portuguese Jew. He knew nearly all the European languages, and spoke German, English, Italian, French (with a Piedmontese accent), Portuguese and Spanish. Grimm affirms him to have been the man of the best parts he had ever known. He was a musical composer and a capable violinist. His knowledge of history was comprehensive, and his accomplishments as a chemist, on which he based his reputation, were in many ways real and considerable. He pretended to have a secret for removing flaws from diamonds, and to be able to transmute metals. The most remarkable of his professed discoveries was of a liquid which could prolong life, and by which he asserted he had himself lived 2,000 years.

Saint-Germain is mentioned in a letter of Horace Walpole's as being in London about 1743, and as being arrested as a Jacobite spy and released. Walpole says: "He is called an Italian, a Spaniard, a Pole; a somebody that married a great fortune in Mexico and ran away with her jewels to Constantinople; a priest, a fiddler, a vast nobleman." At the French court, where he appeared about 1748, he exercised for a time extraordinary influence and was employed on secret missions by Louis XV.; but, having interfered in the dispute between Austria and France, he was compelled in June 1760, on account of the hostility of the duke of Choiseul, to remove to England. He appears to have resided in London for one or two years, but was at St. Petersburg in 1762, and is asserted to have played an important part in connexion with the conspiracy against the emperor Peter III. in July of that year, a plot which placed Catherine II. on the Russian throne. He then went to Germany, where, according to the *Mémoires authentiques* of Cagliostro, he was the founder of freemasonry, and initiated Cagliostro into that rite. He was again in Paris from 1770 to 1774, and after frequenting several of the German courts he took up his residence in Schleswig-Holstein, where he and the Landgrave Charles of Hesse pursued together the study of the "secret" sciences. He died at Schleswig in or about 1780-1785, although he is said to have been seen in Paris in 1789.

Andrew Lang in his *Historical Mysteries* (1904) discusses the career of Saint-Germain, and cites the various authorities for it. Saint-Germain figures prominently in the correspondence of Grimm and of Voltaire. See also Oettinger, *Graf Saint-Germain* (1846); F. Bülow, *Geheime Geschichten und räthselhafte Menschen*, Band I. (1850-60); Lascelles Wrexall, *Remarkable Adventures* (1863); and U. Birch in the *Nineteenth Century* (January 1908).

SAINT-GERMAIN, CLAUDE LOUIS, COMTE DE (1707-1778), French general, was born on April 15, 1707, at the

Château of Vertamboz. He entered the army, but left France, apparently on account of a duel, and fought in the armies of the elector palatine and the elector of Bavaria. Then, after a brief service under Frederick the Great of Prussia, he joined Marshal Saxe in the Netherlands, and was created a field-marshal of the French army. On the outbreak of the Seven Years' War (1756) he was appointed lieutenant-general, but he fell a victim to court intrigues and professional jealousy. He resigned his commission in 1760 and accepted an appointment as field-marshal from Frederick V. of Denmark, being charged in 1762 with the reorganization of the Danish army. On the death of Frederick in 1766 he returned to France, bought a small estate in Alsace near Lauterbach, and devoted his time to religion and farming. In October 1775 he was appointed minister of war by Louis XVI., but his efforts to effect economies and to introduce Prussian discipline in the French army brought on such opposition that he resigned in September 1777. He died in his apartment at the arsenal on Jan. 15, 1778.

ST. GERMAIN, TREATY OF (see also VERSAILLES, TRIANON, and NEULLY, TREATIES OF). Austria and Hungary had up to 1918 formed a diplomatic unit, but in Oct. 1918 they were virtually two separate states. The Armistice of Nov. 4 still recognized Austria-Hungary as a diplomatic unit, but Austria was proclaimed a Republic Nov. 12, as was Hungary Nov. 16. The Armistice concluded by the Powers direct with Hungary (Nov. 13) recognized that Power's *de facto* independence of Austria.

All the Powers, except the United States, early asserted that the "Fourteen Points," etc., did not apply to the settlements with Austria and Hungary. In Jan. 1919 it was known that even Wilson favoured including in Italy part of the Slovene population of Istria and Carniola, and would make Italy further concessions. On April 14 he agreed to grant Italy the Tirol south of the Brenner Pass, with about 250,000 Germans, as well as the Trentino, as already agreed by France and Great Britain. It was known also that the Czechoslovak State would include over 3,000,000 Germans. Austria was to be reduced to some two-thirds of her German-speaking territories. In mid-April the French Prime Minister Clemenceau obtained from the Allies the further important decision to prohibit union between Austria and Germany without the unanimous consent of the Council of the League. This was embodied in the draft treaty with Germany of May 6, and formed article 80 of the Treaty of Versailles of June 28, appearing as article 88 of the Treaty of St. Germain, and article 72 of the Treaty of Neuilly.

On May 2 the Austrian delegation was invited to Paris. On June 2 they were presented with a very imperfect draft treaty, followed by a more detailed one on July 20. Austria made great protests, turning mainly on two points. She asserted the applicability of the "Fourteen Points" to her case, and her right therefore to retain all her German subjects. President Wilson alone was willing to extend the application of the "Fourteen Points" to Austria; the treaty assigned 3,500,000 Germans to Czechoslovakia, about 250,000 to Italy. The other main point of dispute was how far Austria must accept the responsibilities of old Austria-Hungary. The Allies finally decided that the Austrian Republic was not a new State but an old one lopped off certain outlying provinces and endowed with a new government. The Allies recognized this government *de facto* by accepting their credentials on May 22 and *de jure* on Sept. 10, by signing the treaty with them at St. Germain-en-Laye. It came into force on July 16 1920.

Part I. The Covenant, and Part XIII. Labour, are as in the Treaty of Versailles.

Part II. of the Austrian Treaty details the borders of the new Austrian State.

Part III. Political Clauses for Europe.—This deals with technical details such as the financial obligations of the former Austrian empire affecting Italy, Yugoslavia, Czechoslovakia and Rumania. Articles 49-50 arranged for a plebiscite in two areas of the Klagenfurt basin. This plebiscite, taken in 1920, went in Austria's favour. West Hungary, with about 333,000

souls, was transferred from Hungary to Austria but ultimately, in 1921, without its chief town (see *BURGENLAND*). Further clauses in Part III dealt with the protection of racial and religious minorities. Article No. 88 prohibits Austria from alienating her independence (*i.e.*, joining Germany) otherwise than with the consent of the Council of the League of Nations.

Part IV. Austrian Interests Outside Europe.—As in the Treaty of Versailles this part provides for a total renunciation of state properties immovable and movable outside Europe, and also of treaties, capitulations, concessions, etc., in the following countries: Morocco, Egypt, Siam and China.

Part V. Military, Naval and Air Clauses followed the general lines of the similar clauses in the Treaty of Versailles but showed somewhat more consideration to Austria. A long-service voluntary force not exceeding 30,000 was allowed. The manufacture of arms, etc., was confined to a single factory (Austria 132). The naval clauses were very drastic; the whole Austro-Hungarian navy was broken up or distributed among the Allies, Austria only retaining four patrol boats on her inland waters. The air clauses were as in the German treaty.

Part VI. Prisoners of War and Graves, **Part XI.** Aerial Navigation, were as in the German Treaty, with a few very small alterations.

Part VII. Penalties provided for the trial before Allied military tribunals of Austrian offenders against the laws and customs of war. This provision was not executed.

Part VIII. Reparations; **Part IX.** Financial Clauses; **Part X.** Economic Clauses.—By article 177 Austria accepted responsibility for herself and her Allies for causing loss and damage to the Allied (Entente) governments by the war. The rest of the "Reparation Chapter" followed the corresponding section in the German treaty. No lump sum was fixed, but discretion was, in effect, given to the Reparation commission to fix it. Austria handed over her whole commercial fleet and much livestock to the Allies. Czechoslovakia, Yugoslavia, Poland and Rumania had, however, to contribute to expenses incurred by the Allies in liberating their territory from Austria. The financial clauses involved many complex questions as to the allocation of pre-war debt and the distribution of war debts. All these provisions were somewhat relaxed by the Supreme council on March 17, 1921, and the process was completed by Austria placing her finances under control of the league in Sept. 1922 (see *AUSTRIA*).

Part XII. Ports, waterways and railways, merely stressed some points in the corresponding section of the German treaty.

See *Treaty Series*, No. II (Cmd. 400 of 1919); also H. W. V. Temperley (ed.), *A History of the Peace Conference of Paris*; vol. IV. and v. (Institute of International Affairs, London, 1921).

ST. GERMAIN-EN-LAYE, a town of northern France, in the department of Seine-et-Oise, 13 mi. W.N.W. of Paris by rail. Pop. (1936) 21,638. Built on a hill on the left bank of the Seine and on the edge of a forest 10,000 to 11,000 ac. in extent, St. Germain has a bracing climate, which makes it a place of summer residence for Parisians.

A monastery in honour of St. Germain, bishop of Paris, was built in the forest of Laye by King Robert. Louis VI built a castle close by. Burned by the English, rebuilt by Louis IX, and again by Charles V, this castle was completed by Francis I. A new castle was begun by Henry II and completed by Henry IV; it was subsequently demolished, except the so-called Henry IV pavilion. The old castle has been restored. James II of England died at St. Germain.

ST. GERMANS, a village and parish of Cornwall, England, situated on the Lynher creek 9½ mi. W. by N. of Plymouth on the G.W.R. Pop. of parish (1931) 1,964. St. Germans has associations with early Christianity in Britain, and is supposed to have been the original seat of the Cornish bishopric. It was the see of Bishop Buryhold, who died in 1027. Under Leofric, who became bishop of Crediton and Cornwall in 1046, the see was removed to Exeter. Bishop Leofric founded a priory at St. Germans and bestowed upon it half the lands which then constituted the bishops' manor of St. Germans. There was then a market on Sundays, but at the time of Domesday it had seriously

declined. The bishop in 1311 obtained a grant of a market on Fridays and a fair at the feast of St. Peter ad Vincula. In 1343 the prior sustained his claim to a prescriptive market and fair at St. Germans. After the suppression the borough belonging to the priory remained with the crown until 1610. Meanwhile Queen Elizabeth created it a parliamentary borough and from 1563 to 1832 it returned two members. The 12th century church of St. Germanus has much Norman work, with Early English, Perpendicular and Decorated additions.

ST. GILLES, a town of southern France, in the department of Gard, on the canal from the Rhone to Certe, 12½ mi. S.S.E. of Nîmes by road. Pop. (1936) 4,399. In the middle ages St. Gilles, the ancient *Valis Flaviana*, was the seat of an abbey founded in the 7th century by St. Aegidius (St. Gilles). It acquired wealth and power under the counts of Toulouse, who added to their title that of counts of St. Gilles. The church was founded 1116. The lower part of the Romanesque front (12th century) has three bays decorated with columns and bas-reliefs. There is a 12th century crypt. St. Gilles was the seat of the first grand priory of the Knights Hospitallers in Europe (12th century) and was their place of embarkation for the east. In 1226 the township of St. Gilles was united to the crown. In 1562 the Protestants ravaged the abbey, which they occupied till 1622, and in 1774 it was suppressed. The town has an important trade in wines.

ST. GOTTHARD PASS, an important motor and railway route from northern Europe to Italy. It takes its name from St. Gotthard, bishop of Hildesheim (d. 1038), but does not seem to be mentioned before the early 13th century perhaps because the access to it lies through two very narrow Alpine valleys much exposed to avalanches. The hospice on the summit is first mentioned in 1331, and from 1683 onward was in charge of two Capuchin friars. But in 1775 the buildings near it were damaged by an avalanche, while in 1799–1800 everything was destroyed by the French soldiery. Rebuilt in 1834, the hospice was burnt in March 1905. The mule path (dating from about 1293) across the pass served for many centuries. The carriage road was only constructed between 1820 and 1830. Beneath the pass is the St. Gotthard tunnel (pierced in 1872–1880, 9½ mi. in length, and attaining a height of 3,786 ft.), through which runs the railway (opened in 1882) from Lucerne to Milan (175½ mi.). The railway runs first along the northern and eastern shores of Lake Lucerne, from Lucerne to Flüelen (32½ mi.), and then up the Reuss valley past Altdorf and Wassen, near which is the first of the famous spiral tunnels, to Göschenen (56 mi. from Lucerne). Here the line enters the tunnel and gains, at Airolo, the valley of

A SECTION OF THE ST. GOTTHARD PASS IN THE FREMOLA VALLEY

the Ticino or the Val Leventina, which it descends, through several spiral tunnels, till at Biasca (38 mi. from Göschenen) it reaches more level ground. Thence it runs past Bollinzona to Lugano (30½ mi. from Biasca) and reaches Italian territory at Chiasso, 35 mi. from Milan. The railway is now the property of the Swiss Government.

ST. HELENA (*hél-én'g*), an island and British possession in the S. Atlantic, 15° 55' 26" S., 5° 43' 30" W. (Ladder Hill observatory). Area 47 sq.mi., extreme length, southwest to northeast 10½ mi., extreme breadth 6½. The island is wholly of volcanic

origin, the activity being long extinct, while subaerial denudation has greatly modified it and marine erosion has formed perpendicular cliffs 450-2,000 ft. high on the east, north and west sides. Its principal feature, a semicircular ridge of mountains, with the culminating summit of Diana's peak (2,704 ft.), is the northern rim of a great crater; the southern rim having been breached hypothetically forms the centre of the ring. From the crater wall outwards water-cut gorges stretch in all directions, widening as they approach the sea into valleys, some of which are 1,000 ft. deep. These valleys contain small streams. Springs of pure water are abundant. Along the enclosing hillsides caves have been formed by the washing out of the softer rocks. The lavas are basalts, andesites, trachytes and phonolites; there is much volcanic ash, tuff, scoriae, etc., and conspicuous features are formed by rocks, representing a late period of activity. Such features are Ass's Ears, Lot's Wife and the Chimney. There are several subsidiary craters. The only practicable landing-place is on the leeward side at St. James's bay. From the head of the bay a narrow valley extends for $\frac{1}{2}$ mi. The greatest extent of level ground is in the northeast of the island, where are the Deadwood and Longwood plains, over 1,700 ft. above the sea.

Although the island is within the tropics its climate is healthful and temperate. This is due to the southeast tradewind, and to the effect of the cold waters of the South Atlantic current. The temperature varies on the sea level from 68° to 84° in summer and 57° to 90° in winter. The higher regions are about 10° cooler. The rainfall varies considerably.

Flora and Fauna.—St. Helena has three vegetation zones: (1) the coast zone, extending inland for 1 mi. to $\frac{1}{2}$ mi., now "dry, barren, soilless, lichen-coated, and rocky," with little save prickly pears, wire grass and *Mesembryanthemum*; (2) the middle zone (400-1,800 ft.), extending about three-quarters of a mile inland, with shallower valleys and grassier slopes—the English broom and gorse, brambles, willows, poplars and Scotch pines being the prevailing forms; and (3) the central zone, about 3 mi. long and 2 mi. wide, the home, for the most part, of the indigenous flora. Of 38 flowering plants all save *Scirpus nodosus* are peculiar to the island; several indigenous plants are dying out. The indigenous flora shows affinities with African flora, but in recent years many species have become extinct. The exotic flora gives the island almost the aspect of a botanic garden. The oak, thoroughly naturalized, grows alongside of the bamboo and banana. Among other trees and plants are the common English gorse; *Rubus pinnatus*, *Hypochaeris radicata*, the *Buddleia Madagascariensis*; *Physalis peruviana*; the common castor-oil plant; and the pride of India. The flax (*Phormium tenax*) was introduced from New Zealand with great commercial success. The government gave encouragement to the cultivation of lily bulbs (*Lilium longiflorum*) for export, and at the agricultural experiment station tested pyrethrum, pelargoniums (for distillation of geranium oil) and carob beans (*Ceratonia siliqua*) with a view to the introduction of new industries.

St. Helena has no indigenous vertebrate land fauna. The only land groups well represented are beetles and land shells. Some two-thirds of the 203 known species of beetles are weevils and a vast majority wood-borers, a fact which bears out the tradition of forests having once covered the island. A South American white ant (*Termes tenuis*, Hagen.), introduced from a slave ship in 1840, soon became a plague at Jamestown. Practically everything had to be rebuilt with teak or cypress. Fortunately it cannot live in the higher parts of the island. Besides domestic animals the only land mammals are rabbits, rats and mice, the rats being especially abundant. Probably the only endemic land bird is the wire bird, *Aegialitis sanctas Helena*; the averdevat, Java sparrow, cardinal, ground-dove, partridge (possibly the Indian *chukar*), pheasant and guinea fowl are all common. There are no freshwater fish, beetles or shells. Of 65 species of sea-fish caught 17 are peculiar to St. Helena; economically the more important kinds are gurnard, eel, cod, mackerel, tunny, bullseye, cavalley, flounder, hog-fish, mullet and skulpin.

Population.—When discovered the island was uninhabited. The majority of the population are of mixed European (British,

Dutch, Portuguese), East Indian and African descent. The original European settlement was made by John Dutton with a few soldiers and followers sent in 1659 by the (British) East India company to annex the island. Subsequently more soldiers and settlers were sent from England, and their numbers were augmented by members of the crews of ships returning to Europe from the east. From 1840 onward for a considerable period there was an influx of freed slaves of West African origin. The estimated population in 1940 was 4,710, of whom nearly half lived in Jamestown, the port and seat of government. Longwood, where Napoleon died in 1821, is $\frac{3}{4}$ mi. E. of Jamestown.

Industries.—Less than a third of the area of the island is suitable for farming. The principal crop is potatoes. Cattle and sheep are raised but there is no outside market, and fish curing and lace making are carried on. Local trade received a severe blow when, with completion of the Suez canal, ships en route from Europe to the orient ceased to call at the island. The principal exports are fibre, tow, rope and twine, and small quantities of wool are also sold. The only banking institution is the government savings bank. The coins of both the United Kingdom and the Union of South Africa are legal tender in the colony. There is a regular monthly mail steamship service to England and to South Africa, and cable communication with all parts of the world.

The governor (who also acts as chief justice) is aided by an executive council comprising the officer commanding the troops and the government secretary, *ex officio*, and nominated residents of St. Helena, generally three in number. The revenue in 1940 was £33,720, and the expenditure £33,365. Under the provisions of the Colonial Development and Welfare act, 1940, the British government assigned to St. Helena £12,200 to develop the water supplies and agricultural and educational facilities. Elementary education is provided (1940) in 9 schools, 3 maintained by the government and the others state-aided. St. Helena is the seat of an Anglican bishopric established in 1859. Ascension and Tristan da Cunha are included in the diocese. (J. I. P.; X.)

History.—The island was discovered on May 21, 1502, by the Portuguese João da Nova, on his voyage home from India, and by him named St. Helena. The Portuguese found it uninhabited, imported livestock, fruit trees and vegetables, built a chapel and one or two houses, and left their sick there to be taken home, if recovered, by the next ship, but they formed no permanent settlement. Its first known permanent resident was Fernando Lopez, a Portuguese in India, who had turned traitor, and had been mutilated by order of Albuquerque. He preferred being marooned to returning to Portugal in his maimed condition, and was landed at St. Helena in 1513, with three or four Negro slaves. By royal command he visited Portugal some time later, but returned to St. Helena, where he died in 1546. In 1584 two Japanese ambassadors to Rome landed at the island. The first Englishman known to have visited it was Thomas Cavendish, who touched there in June 1588 during his voyage round the world. Another English seaman, Captain Kendall, visited St. Helena in 1591, and in 1593 Sir James Lancaster stopped at the island on his way home from the east. In 1603 the same commander again visited St. Helena on his return from the first voyage equipped by the East India company. The Portuguese had by this time given up calling at the island, which appears to have been occupied by the Dutch about 1645. The Dutch occupation was temporary and ceased in 1657, the year before they founded Cape Town. The (British) East India company appropriated the island immediately after the departure of the Dutch, and in 1659 they despatched a small force of troops and others under John Dutton to form a settlement. The company were confirmed in possession by a clause in their charter of 1661. The fort built by the company was named after the duke of York (James II). On New Year's Day, 1673, the Dutch succeeded in capturing St. Helena, but they were ejected the following May 5 by Sir Richard Munden. By a new charter granted in Dec. 1673 the East India company were declared "the true and absolute lords and proprietors of the island." Since that date St. Helena has been in the undisturbed possession of Great Britain, though in 1706 two ships anchored off Jamestown were carried off by the French. In 1673 the inhabitants had num-

bered about 1,000, of whom nearly half were Negro slaves. In 1810 the company began the importation of Chinese from their factory at Canton. During the company's rule the island prospered: homeward-bound vessels, numbering hundreds in a year, anchored in the roadstead, and stayed for considerable periods refitting and revictualling. Large sums of money were thus expended in the island, where wealthy merchants and officials had their residence. The plantations were worked by slaves, who were subjected to very barbarous laws until 1792, when a new code of regulations ensured their humane treatment and prohibited the importation of any new slaves. Later it was enacted that all children of slaves born on or after Christmas day 1818 should be free, and between 1826 and 1836 all slaves were set at liberty.

Among the governors appointed by the company to rule at St. Helena was one of the Huguenot refugees, Capt. Stephen Poirier (1697-1707), who attempted unsuccessfully to introduce the cultivation of the vine. A later governor (1747-42) was Robert Jenkins (q.v.) of "Jenkins' ear" fame. Dampier visited the island twice in 1691 and 1701; Halley's mount commemorates the visit paid by the astronomer Edmund Halley in 1676-78—the first of a number of scientific men who have studied on the island.

In 1815 the British government selected St. Helena as the place of detention of Napoleon Bonaparte. He was brought to the island in October of that year and lodged at Longwood, where he died in May 1821. During this period the island was strongly garrisoned by regular troops, and the governor, Sir Hudson Lowe, was nominated by the crown. After Napoleon's death the East India company resumed full control of St. Helena until April 22, 1834, on which date it was, in virtue of an act passed in 1833, vested in the crown. As a part of call the island continued to enjoy a fair measure of prosperity until about 1870. Since that date the great decrease in the number of vessels visiting James-town has deprived the islanders of their principal means of subsistence. When steamers began to be substituted for sailing vessels and when the Suez canal was opened (1869) fewer ships passed the island; of those that still pass the greater number are so well found that it is unnecessary for them to call. The withdrawal in 1906 of the small garrison, hitherto maintained by the imperial government, was another cause of depression, but during World War I (1914-18) a garrison was again sent to the island. During the South African War (1899-1902) some thousands of prisoners were detained at St. Helena, which has also served as the place of exile of several Zulu chiefs, an ex-sultan of Zanzibar and others. In 1922 Ascension Island (q.v.), up to that time under the care of the British admiralty, was made a dependency of St. Helena. Similarly, Tristan da Cunha (q.v.) and the associated islands of Nightingale, Inaccessible and Gough, became dependencies of St. Helena in 1938. The island was of strategic importance in the naval operations of World War II.

ST. HELENS, a municipal, county and parliamentary borough, Lancashire, England, 12 mi. N.E. of Liverpool, on the L.M.S. and L.N.E. railways. Pop. (1951) 170,276. Area 12.4 sq.mi. A canal communicates with the Mersey. The town is wholly of modern development. Among buildings and institutions are the town hall, the Gamble institute, a technical school and library. This is the principal seat in England for the manufacture of crown, plate and sheet glass; there are also art glass works, copper smelting and refining works, chemical works, iron and brass foundries, potteries and patent medicine works. There are collieries in the neighbourhood. To the north are ruins of Windeshaw abbey and St. Thomas' well. The town was incorporated in 1868, became a parliamentary borough in 1885 (returning one member) and a county borough in 1888.

ST. HELIER, the chief town of Jersey, the largest of the Channel Islands. Pop. (1931) 24,686. Area 3.3 sq.mi. It lies on the eastern side of St. Aubin's bay. The harbour is flanked on the W. by a rocky ridge on which stands Elizabeth castle,

and on the east by a promontory on which stands Fort Regent. The parish church is a cruciform building with embattled tower, partly 14th century. It contains a monument to Major Peirson, who lost his life in opposing the French attack on Jersey in 1781. The French leader, Baron de Rullecourt, is buried in the churchyard. A large canvas by John Singleton Copley depicting the scene is in the National gallery, London, and a copy is in the court house of St. Helier. This building (*la Colonne*), in Royal square, is the meeting place of the royal court and deliberative states of Jersey. Victoria college was opened in 1852 and commemorates a visit of Queen Victoria and the prince consort to the island in 1846. A house in Marine terrace is distinguished as the residence of Victor Hugo (1802-1885). Elizabeth castle dates from 1551-1560; and in 1646 and 1649 Prince Charles resided here. In 1649 he was proclaimed king, as Charles II, in Jersey by the royalist governor George Carteret. On coming to the throne he gave the island the mace which is still used in the meetings of the court and states. Close to the castle are remnants of a hermitage-chapel (9th or 10th century) traditionally connected with St. Helierus, which has given the name of the Hermitage to the rock on which it stands.

ST. HUBERT, a small town of Belgium in the province of Luxembourg and in the heart of the Ardennes. Pop. (1939) 3,025. Its abbey church contains the shrine of St. Hubert, and has an annual pilgrimage. According to tradition the church and a monastery attached to it were founded in the 7th century by Plectrude, wife of Pippin of Herstal. The second church was built in the 12th century, but burned in the 16th century. The present building has been restored in modern times and presents no special feature. The spot where St. Hubert is supposed to have met the stag with the crucifix between its antlers is about 5 mi. from the town. St. Hubert is the patron saint of huntsmen.

ST. HYACINTHE, a city and port of entry of Quebec, Canada, and capital of St. Hyacinthe county, 50 mi. E.N.E. of Montreal, on the left bank of the river Yamaska and on the Canadian National railway. Pop. (1951) 20,236. It is the seat of a Roman Catholic bishop, and contains a classical college, a technical school, a dairy school, two monasteries and several other educational and charitable institutions. Manufactures include organs, leather, shoes, silks, furniture, woollens and mill machinery. The city is an important distributing centre for the surrounding district.

ST. IMIER, a town in the west of the canton of Berne, Switz., on the railway from Biel to La-Chaux-de-Fonds. It lies at the foot of Mont Soleil (4,240 ft.), which is ascended by a funicular railway. It is the centre of the watchmaking industry, a health resort, and a place for winter sports. The inhabitants, (1950) 5,972, are French-speaking and generally Protestant.

SAINTINE, JOSEPH XAVIER (1798-1865), French novelist and dramatist, whose real surname was BONIFACE, was born in Paris on July 10, 1798. In 1823 he produced a volume of poetry in the manner of the Romanticists, entitled *Poèmes, odes, épiques*. In 1836 appeared *Picciola*, the story of the comte de Charney, a political prisoner in Piedmont, whose reason was saved by his cult of a tiny flower growing between the paving stones of his prison yard. This story is a masterpiece of the sentimental kind, and has been translated into many European languages. He produced many novels and dramas, and died on Jan. 21, 1865.

ST. IVES, a market town, municipal borough and seaport of Cornwall, England, 10 mi. N.N.E. of Penzance, on the G.W.R. Pop. (1951) 9,037. Area 6.8 sq.mi. It lies near the west horn of St. Ives bay on the north coast. The site has associations with Celtic Christianity and is supposed to take its name from St. Ilya, or Ia, an Irish martyr, accompanying St. Piran on his missionary journey to Cornwall in the 5th century. St. Ives was a mere chapel of Lelant, an unimportant member of the distant marquis of Ludgvan Leaze (which in Domesday appears as Luduam), and did not grow in the middle ages. In order to augment the influence of the Tudors in parliament, Philip and Mary in 1558 invested it with the privilege of returning 2 members. Its affairs were at that time administered by a headwarden, who after 1598 appears under the name of portreeve. In 1639 a charter

of incorporation was granted under which the portreeve became mayor with aldermen and burgesses. Provision was made for four fairs and for markets on Wednesdays and Saturdays, also for a grammar school. A new charter was granted in 1685. In 1832 St. Ives lost one of its members, and since 1885 has formed the St. Ives division. The older streets near the harbour are narrow and irregular, but on the upper slopes a residential area has developed. The small harbour, built in 1767, has silted up and at the lowest tides is dry. The fisheries for pilchard, herring and mackerel are important. St. Ives is a thriving holiday resort (summer pop. 13,000), and has a town planning scheme.

ST. IVES, a market town and municipal borough in Huntingdonshire, England, mainly on the left bank of the Ouse, 5 mi. E. of Huntingdon, by the Eastern Region railway. Pop. (1951) 3,077. Area, 3.3 sq. mi. The river is crossed by an old bridge said to have been built by the abbots of Ramsey early in the 11th century. A building over the centre pier was once used as a chapel. The church of All Saints is Perpendicular, with earlier portions. Oliver Cromwell was a resident in St. Ives in 1634–35. There is a considerable agricultural trade. St. Ives was noted for its eight-day fair beginning on Monday in Easter week, first granted to the abbot of Ramsey by Henry I. In the reign of Henry III merchants from Flanders came to the fair, which had become so important that the king granted it to be continued beyond the eight days if the abbot agreed to pay a fee of £50 yearly for the extra days. The fair, with a market on Monday granted to the abbot in 1286, survives, and was purchased by the town in 1874, the year of incorporation, from the duke of Manchester. The markets are extremely important to St. Ives and were substantially altered to give greater facilities for auction sales. The Norris library and museum, opened in 1933, is mainly devoted to books and collections relating to the county.

ST. JEAN-D'ANGELY, a town of western France, in the department of Charente-Maritime, 33 mi. E. of Rochefort by rail. Pop. (1946) 6,606. St. Jean is named after the neighbouring forest of Angély (*Angeriacum*). Pippin I of Aquitaine in the 9th century established there a Benedictine monastery, afterward reputed to possess the head of John the Baptist. This relic attracted hosts of pilgrims; a town grew up, took the name of St. Jean-d'Angély, afterward d'Angely, was fortified in 1131, and in 1204 received a charter from Philip Augustus. The possession of the place was disputed between French and English in the Hundred Years' War, and between Catholics and Protestants at a later date. Louis XIII took it from the Protestants in 1621 and changed its name to Bourg-Louis. St. Jean lies on the right bank of the Boutonne, which is navigable for small vessels.

ST. JEAN-DE-LUZ, a coast town of southwestern France, in the department of Basses-Pyrenees, at the mouth of the Nivelle, 14 mi. S.W. of Bayonne on a branch of the Southern railway. Pop. (1946) 10,234. From the 14th to the 17th century St. Jean-de-Luz enjoyed a prosperity due to its mariners and fishermen. Its vessels were the first to set out for Newfoundland in 1520. In 1558, the Spaniards attacked and burned the town. In 1627, however, it was able to equip 80 vessels, which succeeded in saving the island of Ré from the duke of Buckingham. In 1660 the treaty of the Pyrenees was signed at St. Jean-de-Luz. At that time the population numbered 15,000. The cession of Newfoundland to England in 1713, the loss of Canada, and the silting-up of the harbour contributed to the decline of the town's maritime trade. St. Jean-de-Luz is situated in the Basque country on the bay of St. Jean-de-Luz, the entrance to which is protected by breakwaters and moles. It has a 13th-century church, the chief features of which are the galleries in the nave, which, by the Basque custom, are reserved for men.

ST. JOHN, OLIVER (c. 1598–1673), English statesman and judge, was the son of Oliver St. John of Cayshoe, Bedfordshire, and great-grandson of the first Lord St. John of Bletso in 1559, and a distant cousin of the 4th baron who was created earl of Bolingbroke in 1624. Oliver was educated at Queens' college, Cambridge, and was called to the bar in 1626. He got into trouble with the court in connection with a seditious publication, and associated himself with the future popular leaders John Pym and

Lord Saye. In 1638, in a notable speech, he defended Hampden on his refusal to pay Ship Money. In the same year he married, as his second wife, Elizabeth Cromwell, a cousin of Oliver Cromwell, to whom his first wife also had been distantly related. The marriage led to an intimate friendship with Cromwell. St. John was member for Totnes in both the short and the long parliament, where he acted in close alliance with Hampden and Pym, especially in opposition to the impost of Ship Money (q.v.). In 1641, with a view of securing his support, the king appointed St. John solicitor general. Nonetheless he took an active part in promoting the impeachment of Strafford and in preparing the bills brought forward by the popular party in the commons, and was dismissed from office in 1643. On the outbreak of the Civil War, he became recognized as one of the parliamentary leaders. In the quarrel between the parliament and the army in 1647 he sided with the latter, and throughout enjoyed Cromwell's confidence.

In 1648 St. John was appointed chief justice of the common pleas. He refused to act as one of the commissioners for the trial of Charles. In 1651 he went to The Hague on an unsuccessful mission to negotiate a union between England and Holland, but in the same year he successfully conducted a similar negotiation with Scotland. After the Restoration he published an account of his past conduct (*The Case of Oliver St. John*, 1660), which saved him from any more severe vengeance than exclusion from public office. He retired to his house in Northamptonshire till 1662, when he went to live abroad. He died on Dec. 31, 1673.

See the above-mentioned *Case of Oliver St. John* (1660), and St. John's *Speech to the Lords*, Jan. 7th, 1640, concerning *Ship-money* (1640). See also Mark Noble, *Memoirs of the Protectoral House of Cromwell*, vol. ii (2 vol., 1787) and C. H. Firth's art. in *Dict. of Nat. Biog.*, vol. x (1897).

SAINT JOHN, the capital of St. John county, New Brunswick, Canada, in 45° 14' N., and 66° 3' W., 481 mi. from Montreal. Pop. (1951) 50,779. It is situated at the mouth of the St. John river on a rocky peninsula. With it are incorporated the neighbouring towns of Carleton and Portland.

Saint John was visited in 1604 by the Sieur de Monts (1560–c. 1630) and his lieutenant Champlain, but it was not until 1635 that Charles de la Tour (d. 1666) established a trading post, called Fort St. Jean (see Parkman, *The Old Régime in Canada*), which existed under French rule until 1758, when it passed into the hands of Britain. In 1783 a body of United Empire Loyalists landed at Saint John and established a city, called Parr Town until 1785 when it was incorporated with Conway (Carleton), under royal charter, as the city of Saint John. It soon became and remained the largest town in the province, but for military reasons was not chosen as the capital. (See FREDERICTON.) Its growth was checked by several destructive fires, especially that of June 1877. It was rebuilt of stone and brick.

The river enters the harbour through a rocky gorge, which is passable by ships during each ebb and flow of the tide. Saint John is the Atlantic terminus of the Canadian Pacific railway and one of the termini of the Canadian National railways, and joins with Halifax in being one of the chief winter ports of Canada. The harbour is deep, sheltered, free from ice and always accessible, with 32 ft. of water at low tide and 58 to 60 ft. at high tide. It is the distributing centre for a large district, rich in agricultural produce and lumber. It also has an important fishery trade. There are textile works and engineering shops. Among the exports are timber, pulp, fish, cattle, apples, dairy produce, metal manufactures and motorcars. The industries include a structural steel plant with two dry docks, each 1,150 ft. long. Saint John has a municipal airport for both land and sea planes and air service connecting with Trans-Canada at Moncton.

ST. JOHN, one of the Virgin Islands of the United States, formerly the Danish West Indies. It lies 4 mi. E. of St. Thomas and is 10 mi. long and 2½ mi. wide; area, 19 sq. mi. It is a mass of rugged mountains, the highest of which is Camel mountain (1,270 ft.). Although one of the best watered and most fertile of the Virgin group, it has little commerce. It is a free port, and possesses in Coral bay the best harbour of refuge in the Antilles. The village of Cruz Bay lies on the northern coast. Pop. (1950) 749.

ST. JOHN, a river of New Brunswick, Canada, rising in two branches, one in the state of Maine, U.S., and the other in the province of Quebec. The U.S. branch, known as the Wallowastook, flows northeast to the New Brunswick frontier, where it turns southeast and for 80 mi. forms the international boundary. A little above Grand Falls the St. John enters Canada and flows through New Brunswick into the Bay of Fundy at St. John. Its total length is 399 mi. It is navigable for large steamers as far as Fredericton (86 mi.), and in spring and early summer for smaller vessels to Grand Falls (220 mi.), where a series of falls and rapids form a descent of 70 to 80 ft. Above the falls it is navigable for 65 mi. It drains an area of 26,000 sq. mi., of which half is in New Brunswick, and receives numerous tributaries, of which the chief are the Aroostook, Allagash, Madawaska (draining Lake Temiscouata in Quebec), Tobique and Nashwaak.

ST. JOHN OF JERUSALEM, KNIGHTS OF THE ORDER OF THE HOSPITAL OF, known also later as the **KNIGHTS OF RHODES** and the **SOVEREIGN ORDER OF THE KNIGHTS OF MALTA**. The history of this order divides itself naturally into four periods: (1) from its foundation in Jerusalem during the first crusade to its expulsion from the Holy Land after the fall of the Latin kingdom in 1291; (2) from 1309–1310, when the order was established in Rhodes, to its expulsion from the island in 1522; (3) from 1530 to 1798, during which its headquarters were in Malta, and (4) its modern development, as reconstituted after its virtual destruction in 1798.

Early Development.—Ever since Jerusalem became a centre of Christian pilgrimage, a hospital or hospice for pilgrims had existed there; and early in the 11th century one of these was restored, served by Benedictines and later dedicated to St. John the Baptist. When, in 1099, the crusaders surrounded the Holy City, the head of this hospital was a certain Gerard (*q.v.*) who is said to have assisted them during the siege. After the capture of the city he used his popularity to enlarge and reconstitute the hospital and adopted for his order the Augustinian rule. Donations and privileges were thereafter showered upon the new establishment in both Syria and Europe. In 1113 Pope Paschal II took the order and its possessions under his immediate protection (bull of Feb. 15 to Gerard), his act being confirmed in 1119 by Calixtus II and subsequently by other popes. Gerard was indeed, as Pope Paschal called him, the institutor of the order, if not its founder. It retained, however, during his lifetime its purely eleemosynary character. The armed defense of pilgrims may have been part of its functions, but its organization as an aggressive military force was the work of Raymond du Puy who succeeded as grand master on the death of Gerard (Sept. 3, 1120). The statesmanlike qualities of Raymond rendered his long mastership epoch-making for the order; and from 1137, when the knights accepted custody of the newly fortified castle of Bait Jibrin, they took a regular part in the wars of the Cross. During the second crusade Raymond was present at the council of the leaders held at Acre in 1148, which resulted in the ill-fated expedition against Damascus. The failure at Damascus was repaired five years later by the capture of Ascalon (Aug. 1153), in which the grand master and his knights had a conspicuous share.

Meanwhile, in addition to its ever-growing wealth, the order had received from successive popes privileges which rendered it, like the companion order of the Temple, increasingly independent of and obnoxious to the secular clergy. During the 30 years of Raymond's rule the hospital, which Gerard had instituted to meet a local need, had become universal, and establishments were formed east and west. After Oct. 1158, when his presence is attested at Verona, this master builder of the order disappears from history; he died some time between this date and 1160 when the name of another grand master, Gilbert d'Assailly, appears.

Organization of the Order.—The rule of the hospital, as formulated by Raymond du Puy, was based upon that of the Augustinian canons (*q.v.*). Its further developments, of which only the salient characteristics can be mentioned here, were closely analogous to those of the Templars (*q.v.*), whose statutes regulating the life of the brethren, the terms of admission to the order, the maintenance of discipline and the scale of punishments, cul-

minating in expulsion are, *mutatis mutandis*, closely paralleled by those of the Hospitallers.

Within the order were the three classes of knights, chaplains and serving brothers. The dominant class was that of the knights, in whose hands lay all power within the order. At its head was the master who held office for life. His powers were limited only by the statutes and customs and by the chapter general which, however, was only an occasional body summoned by himself. He was assisted in the exercise of his authority by the great officers of the order—prior, preceptor, marshal, hospitaller, drapier and treasurer—to whom were added, shortly after 1300, the turcopoler and admiral. The unit of provincial administration was the priory (England constituted one, while in Italy there were seven), and within each of these there were a number of commanderies (there were 36 in England at the end of the middle ages). As the order increased in size, the brethren came to be grouped in nations or tongues, and in the 14th century the division of the order into its seven tongues (Provence, Auvergne, France, Italy, Spain, England, Germany) was a recognized feature of its constitution. One of the great officers was placed at the head of each tongue; priories and commanderies were reserved for the brethren of the tongue concerned, and disputes were settled within the assembly of the tongue. From the later middle ages the Hospitallers were rather a federation of national societies than a united cosmopolitan order.

In two important respects the knights of St. John differed from the Templars. The latter were a purely military organization; the Hospitallers, on the other hand, were at the outset preponderantly a nursing brotherhood, and though this character was subordinated during their later period of military importance, it never disappeared. It continued to be a rule of the order that in its establishments it was for the sick to give orders, for the brethren to obey. The chapters were largely occupied with the building, furnishing and improvement of hospitals, to which were attached learned physicians and surgeons who had the privilege of eating with the knights. The revenues of particular properties were charged with providing luxuries (*e.g.*, white bread) for the patients, and the various provinces of the order with the duty of forwarding blankets, clothes, wine and food for their use. The Hospitallers, moreover, encouraged the affiliation of women to their order, which the monastic and purely military rule of the Templars sternly forbade.

The Knights in Syria.—As the wealth and military resources of the orders grew, so did their influence in the affairs of the Latin states. The military feudal class among the Syrian Franks had never been sufficiently numerous to ensure effective settlement, and it was continuously impoverished by a variety of causes. As a result the orders acquired castles which lay magnates could no longer afford to maintain, and with the buildings the knights secured the appurtenances—lands and rights over tenants. The Hospitallers acquired Bait Jibrin in 1137, Krak (Crac) des Chevaliers and an extensive border area to the north and east in 1142, Arca and Jebel Akkar in 1170, Chastel Ruge in 1177 and Margat, which later became the headquarters of the order, in 1186. To this extent the military orders were replacing the feudal aristocracy as landlords. It was a change in the balance of power which weakened the monarchy of Jerusalem, for the orders were not bound to the king by the same ties of allegiance as were the feudatories.

The role which the orders were enabled to play in the affairs of the kingdom was reflected in events. The Templars refused to take part in invasions of Egypt led by King Amalric I, but the Hospitallers encouraged the project, supplied the king with an important contingent of his army and bargained with him for the price of that support almost as an independent power. In the problems of regency and succession which followed the death of Amalric in 1174, the masters of the military orders emerged as figures of the first importance, and when Baldwin V died in 1185 all the castles of the kingdom were given into their custody.

These problems weakened the kingdom at a time when Saladin's power was advancing and prepared the way for the disasters of 1187: the annihilation of the Christian army at Hattin and the loss of Jerusalem (*see* **CRUSADES**). The Hospitallers played a full

part in the vain military effort to avert these defeats. After Hattin, Saladin spared the lives of nearly all his prisoners except the Templars and Hospitallers whom he massacred in cold blood. This uncharacteristic act is a measure of the respect in which the knights were held by the Moslems. The Hospitallers were again prominent in the ensuing third crusade and especially distinguished themselves in King Richard of England's victory at Arsuf (1191). During the following decade there was a steady development of the property and privileges of the order.

During the 13th century the Latin states in Syria were less securely established than they had been during the 12th century: the settlement grew progressively weaker until, with the loss of Acre in 1291, it was finally extinguished. The authority of the monarchy was compromised by the succession of women and by the civil war provoked by the conduct of the emperor Frederick II in Syria and Cyprus, and was never subsequently resurrected. The way was left clear for certain groups, such as baronial families, Italian merchant communities and the military orders, to follow their particular interests unchecked by higher authority.

In this way the Hospitallers played a part in weakening Latin Syria. They were engaged in frequent disputes with dioceses and with the Templars. From 1199, in opposition to the Templars, they supported an Armenian claimant to the principality of Antioch and were not reconciled to its prince Bohemund IV until 1203. They held aloof from the efforts of Frederick II to recover Jerusalem. In 1240-41 they and the Templars gave differing advice to the crusaders Thibaut IV of Champagne and Richard of Cornwall in their efforts to negotiate a truce with the Moslems. The two orders again took different sides in the war between the Venetians and Genoese which devastated Acre between 1256 and 1258. In 1236 it had come to the attention of Pope Gregory IX that, in pursuance of their own private quarrels, the knights were contemplating alliance with the sect of the Assassins, and he sternly rebuked them both on this account and because of their backsliding from the ideals of their order (*see his letters translated in E. J. King's The Knights Hospitallers in the Holy Land*, pp. 234-236).

It must be emphasized that in these respects the knights were no worse than their contemporaries in Syria and that there is another side to the picture. The order was to the fore in all the major attacks made on the Moslems during the 13th century. It played a distinguished part in the invasions of Egypt by the forces of the fifth crusade in 1218-21 and by those of St. Louis in 1249-50. It joined the expeditions led by Andrew II of Hungary (1217) and by Thibaut of Champagne (1239). It maintained the great strongholds of Krak and Margat, which up to their loss (1271 and 1285 respectively) continued to serve as bulwarks against Moslem attack and as bases from which Christian raids were organized. The order accepted the custody of the exposed city of Ascalon in 1243 and that of the fortified monastery on Mount Thabor in 1257. At all times it spared neither men nor resources to hold the Moslems at bay.

In the years 1258-60 there were signs of the military orders composing their differences, but it was already too late. In 1260 Bibars, the Mameluke sultan of Egypt, was already free from the Tatar threat, and in 1265 he began the series of conquests which culminated in the fall of Acre in 1291 and in the expulsion of the Franks from Syria. The headquarters of the order were moved to Cyprus. Under a great master Guillaume de Villaret, the order was drastically reformed by a series of statutes between 1301 and 1304. In 1308 a new chapter in its history began when the knights conquered Rhodes from the Byzantines: the order was to rule that island as a sovereign power for more than two centuries.

The Knights in Rhodes.—The character and aims of the order were profoundly affected by their newly acquired sovereignty. The Hospitallers ruled an island too narrow to monopolize their energies but occupying a position of vast commercial and strategic importance. Close to the Anatolian mainland, commanding the outlet of the archipelago and lying in the direct trade route between Europe and the east, Rhodes had become the chief distributing point in the lively commerce which, in spite of papal objections, Christian traders maintained with the Moslem states; the

Hospitallers were thus divided between their duty as sovereign, which was to watch over the interests of their subjects, and their duty as Christian warriors, which was to combat the infidel. In view of the fact that the crusading spirit was everywhere declining, it is not surprising that their policy was henceforth directed less by religious than by political and commercial considerations. Not that they altogether neglected their duty as protectors of the Cross: they became a naval power and maintained a fleet of galleys until the loss of Malta; their consuls in Egypt and Jerusalem watched over the interests of pilgrims; their hospitals were still maintained for the service of the sick and the destitute. But, side by side with this, secularization proceeded apace; even toward the infidel the attitude of the knights was necessarily influenced by the fact that their supplies of provisions were mainly drawn from the Moslem mainland. By the 15th century their crusading spirit had grown so weak that they even attempted to negotiate a commercial treaty with the Ottoman sultan; the project broke down on the refusal of the knights to accept the sultan's suzerainty.

Throughout its occupation of Rhodes, the hospital was always ready to give all possible support to any major attack on the Moslems. In 1344 its galleys took part in the conquest of Smyrna, a town which the knights continued to hold until 1402. They contributed to the force that Peter I of Cyprus led to the temporary capture of Alexandria in 1365. A contingent was at the disaster of Nicopolis in 1396. They showed courage and great military skill in defending Rhodes. In 1440 and 1444 they repelled attacks launched from Egypt. In 1480 the garrison, commanded by the grand master Pierre d'Aubusson, held at bay an Ottoman fleet and army. A still greater attack was mounted in 1522 by Suleiman the Magnificent. Reinforcements failed, the Christian powers sent no assistance, and in the next year the knights capitulated, withdrawing with all the honours of war to Crete. Their occupation of Rhodes had postponed for about two centuries the appearance of the Ottomans as a first-rate naval power in the Mediterranean, a debt which Europe never sufficiently acknowledged. When the emperor Charles V received news of the final siege he exclaimed: "Nothing in the world has been so well lost as Rhodes!" But he would give no help in the plans for its recovery, but instead he gave to the hospital the island of Malta and the fortress of Tripoli.

The Knights in Malta.—The settlement of the Hospitallers in Malta was contemporaneous with the Reformation, which profoundly affected the order. In England the refusal of the grand prior and knights to acknowledge the royal supremacy led to the confiscation of their estates by Henry VIII, and though not formally suppressed, the English organization practically ceased to exist. The knights of Malta, as they came to be known, nonetheless continued their vigorous warfare. In 1550 they defeated the redoubtable corsair Dragut, but in 1551 their position in Tripoli, always precarious, became untenable and they capitulated to the Turks and concentrated their forces in Malta. On May 18, 1565, the Ottoman fleet appeared off the island and one of the most famous sieges in history began. It was ultimately raised in September on the appearance of a large relieving force dispatched by the Spanish viceroy of Sicily, after 2,000 of the enemy had fallen. The memory of the grand master Jean Parisot de la Valette, the hero of the siege, who died in 1568, is preserved in the city of Valette which was built on the site of the struggle.

In 1571 the knights shared in the victory of Lepanto. This crowning success, however, was followed during the 17th century by a long period of depression due to internal dissensions and culminating during the Thirty Years' War, the position of the order being seriously affected by the terms of the peace of Westphalia (1648). The character of the order at this date became more exclusively aristocratic, and its wealth, partly acquired by commerce and partly derived from the contributions of the commanderies scattered throughout Europe, was enormous. The wonderful fortifications, planned by French architects and improved by every grand master in turn, the magnificent churches, chapels, *auberges* and the great library founded in 1650 were the outward and visible signs of the growth of a corresponding luxury in the private life of the order. Nevertheless, under Ramon Perellos

(1697-1720) and Antonio Manoel de Vilhena (1722-36), the knights restored their prestige in the Mediterranean by victories over the Turks. In 1741 Emmanuele Pinto, a man of strong character, became grand master. He expelled the Jesuits, resisted papal encroachments on his authority and, refusing to summon the general chapter, ruled as a despot. Emanuel, prince de Rohan (d. 1797), who was elected grand master in succession to Francisco Jimenes de Texada in 1775, made serious efforts to revive the old spirit of the order. The last great expedition of the Maltese galleys was worthy of its noblest traditions. They were sent to carry supplies for the sufferers from the great earthquake that destroyed Messina in 1783. They had long ceased to be effective fighting ships and survived mainly as gorgeous state barges in which the knights sailed on ceremonial pleasure trips.

The French Revolution was fatal to the order. Rohan made no secret of his sympathy with the losing cause in France, and Malta became a refuge-place for the *émigrés*. In 1792 the vast possessions of the order in France were confiscated; six years later the Directory resolved on the forcible seizure of Malta itself. When Napoleon occupied the island on his way to Egypt in 1798 the grand master Ferdinand von Hompesch organized no resistance, and the knights' long rule of the island came to an end. With this the history of the order of St. John practically ends.

The Order in Modern Times.—After their expulsion from Malta, the knights ceased to be a territorial power and lost their *raison d'être* as a military order. After 1814 Malta was retained by the British, and subsequent French expansion into North Africa extinguished the Barbary corsairs. But the order continued to exist, although much reduced in size, and to fulfil the original purpose of its founder. Since its first beginnings it had never ceased to serve the poor and sick, and from the early 19th century the order, in all its forms, has continued to discharge this Christian work in accordance with its own splendid tradition.

After establishing itself temporarily, first at Catania and then at Ferrara, the order moved to Rome in 1834, where its headquarters remained. The pope, as first superior of the order, appointed a grand master in 1801, but between 1805 and 1879 appointed only lieutenant masters. But the renown gained by the order in the relief of suffering was such that in 1879 the pope re-established the mastership. The third of the restored line, Prince Ludovico Chigi della Rovere Albani, died in 1951. The order, organized into the Italian and German tongues, still retained certain diplomatic privileges and at mid-20th century had accredited representatives with five governments, including that of Spain.

In addition, there remained two orders of St. John of Jerusalem of Protestant origin. During the Reformation in Germany the master of the knights of Brandenburg adopted the new religion. They remained divided from the main order, but joined with it again in 1763. This bailiwick of Brandenburg was suppressed in 1870, but it was restored by the king of Prussia 43 years later. It was not recognized by the order in Rome, but continued as an independent Protestant body. It supports a number of hospitals in Germany and in many respects provided a model for the second Protestant order, that in England.

The grand priory of England, like other religious orders in that country, came to an end as a result of the religious settlement of Henry VIII and Elizabeth I. The grand masters in Malta continued to appoint titular grand priors of England, but the order had neither roots nor property there. Its restoration in the 19th century was due to the initiative taken by the French knights, whose organization was temporarily revived between 1814 and 1818. The Greek War of Independence raised hopes that the order might regain Rhodes; English support was needed, and as a means to this end the French worked for the revival of the English priory, so that in 1837 Sir Robert Peat became prior of the Venerable Tongue of England. The English knights hoped to become a Protestant branch of the main order, but the lieutenant masters in Rome ruled that Protestants could not be admitted, and in 1858 the English knights proclaimed themselves an independent order. By its constitution of 1871 (which subsequently was little amended) it became the Order of St. John of Jerusalem in Eng-

land under the headship of its own prior. Between 1861 and 1888 that office was held by William Drogo Montagu, seventh duke of Manchester, and during that period the philanthropic work of the order assumed the modern forms: the life saving medal was instituted in 1874; the ophthalmic hospital was founded in Jerusalem in 1882; and the St. John's Ambulance brigade followed in 1888, growing from an association which the order had founded ten years earlier. Also in 1874, the order acquired the site and remains of the priory at Clerkenwell which had been the headquarters of the Hospitaliers in England from the 1400s until 1559. It became an imperial order, incorporated by royal charter as the Order of the Hospital of St. John of Jerusalem in the British realm. The reigning monarch is its sovereign head, and it has subordinate commanderies in certain of the dominions. From 1888 the prince of Wales (after 1901 King Edward VII) was its grand prior, until in 1910 that office was assumed by Arthur duke of Connaught.

The British order added to its lustre by outstanding work in the medical field in World Wars I and II.

BIBLIOGRAPHY.—For further study the work of J. Delaville le Roux is essential; his great edition of the *Cartulaire général des Hospitaliers de Saint-Jean de Jérusalem, 1100-1310*, 4 vol. (Paris, 1894-1904) is of fundamental importance, and his *Les Hospitaliers en Terre Sainte et à Chypre, 1100-1310* (Paris, 1904) is based on his own study of the cartulary. See also his *Les Hospitaliers à Rhodes jusqu'à la mort de Philibert de Naillac, 1310-1321* (Paris, 1913). Among the best works in English are J. M. Kemble's introduction to *The Knights Hospitaliers in England*, Camden Soc. (London, 1857); W. Porter, *History of the Knights of Malta*, 2 vol. (London, 1855; 2nd ed., 1885); and E. J. King, *The Knights Hospitaliers in the Holy Land* (London, 1931) and *The Knights of St. John in the British Empire* (London, 1934). (R. C. SMA.; X.)

ST. JOHNS (ST. JEAN), a city and port of entry of Quebec, Canada, and capital of St. Johns county, 27 mi. S.E. of Montreal by rail, on the Richelieu river and at the head of the Chambly canal. Pop. (1951), 19,305. A large export trade in lumber, grain and farm produce is carried on, and its mills and factories produce flour, silk, pottery, hats, etc. Three railways, the Canadian National, Canadian Pacific and Central Vermont, enter St. Johns. On the opposite bank of the river is the flourishing town of St. Jean d'Iberville (usually known simply as Iberville), connected with St. Johns by several bridges.

ST. JOHN'S, the capital of Newfoundland, a province of Canada, on the east coast of the island, in the peninsula of Avalon, in 47° 33' 54" N. and 52° 40' 18" W. It is the most easterly city of the American continent. Pop. (1951) 52,873, mostly of Irish descent and Roman Catholics. It stands on rising ground on the north side of a landlocked harbour, which opens suddenly in the lofty coast. The entrance, known as The Narrows, guarded by Signal hill (520 ft.) and South Side hill (620 ft.), is about 1,400 ft. wide, narrowing to 600 ft. between Pancake and Chain rocks. At the termination of the Narrows the harbour trends suddenly to the west, thus completely shutting out the ocean swell. The port has sufficient water for vessels of 30 ft. draught. There is good wharf accommodation, with a graving and a floating dock.

St. John's was first settled by Devonshire fishermen early in the 16th century. It was twice sacked by the French, and captured by them in the Seven Years' War (1762), but recaptured in the same year, and remained in British possession. Both in the American Revolution and the War of 1812 it was the headquarters of the British fleet. The old city, built entirely of wood, was twice destroyed by fire (1816-1817 and 1846). Half of it was again swept away in 1862, but new and more substantial buildings were erected, notably the Anglican and Roman Catholic cathedrals. Education is in the hands of the various religious bodies. St. John's practically monopolizes the commerce of the island, being the centre of the cod, seal and whale fisheries. The chief industries are connected with the outfitting of the fishing vessels, or with the disposal and processing of their catch. Although nearly all the commerce of the island is sea-borne a narrow-gauge railway (operated by the Canadian National system) runs from St. John's to Port aux Basques on the southwest corner of the island, from whence a railway ferry connects with Sydney, N.S. St. John's is also on Trans-Canada Air Lines flights. The city imports iron,

coal, cattle and general produce, and exports fish, oil, wood pulp and paper.

SAINT JOHNSBURY, a town of northeastern Vermont, U.S., the county seat of Caledonia county, and a village of the same name; 37 mi. E.N.E. of Montpelier, on the Passumpsic river and federal highways 2 and 5. It is served by the Canadian Pacific, the Maine Central and the St. Johnsbury and Lamoille County railways. Pop. (1950) 7,370; (1940) 7,437. It is the home of the Fairbanks platform scale, invented there in 1830 by Thaddeus Fairbanks and manufactured there from 1837, and of the largest maple-sugar plant in the country. The town was settled in 1786 by Jonathan Arnold, and was named after Hector St. John de Crèvecoeur, author of *Letters from an American Farmer* (1782). The village was incorporated in 1853. In 1923 the town adopted a city-manager government.

ST. JOHN'S WORT, the general name for species of *Hypericum* (family Hypericaceae), especially *H. perforatum*, small shrubby plants with slender stems, sessile opposite leaves which are often dotted with pellucid glands, and showy yellow flowers. *H. androsaemum* is tutsum (Fr. *tout saine*), so called from its healing properties. *H. calycinum* (Rose of Sharon), a creeping plant with large almost solitary flowers 3 to 4 in. across, is a plant of southeast Europe which has become naturalized in Great Britain in various places in hedges and thickets. The genus comprises about 250 species of herbs or undershrubs, native mostly to temperate and subtropical regions. About 30 species, chiefly herbaceous, are found in North America, widely distributed across the continent but most numerous in the eastern states and adjacent Canada. Many species are cultivated.

ST. JOSEPH, a city of southwestern Michigan, U.S., on Lake Michigan, at the mouth of the St. Joseph river and immediately west of Benton Harbor; a port of entry and the county seat of Berrien county. It is on federal highways 12, 31 and 33, and is served by the New York Central, the Chesapeake and Ohio and the South Shore Electric railways, and by motorbus lines.

The population was 10,223 in 1950 and 8,963 in 1940 by the federal census. St. Joseph and Benton Harbor, connected by a wide thoroughfare and a ship canal, are practically one community, with a combined population estimated at 35,000, which is doubled in summer by visitors. The surrounding country is the famous Michigan fruit belt. The traffic of the harbour in 1949 amounted to 372,747 tons.

St. Joseph has a variety of industries employing more than 6,000 persons. Principal manufactured products are washing machines, castings, industrial rubber goods, paper boxes, pistons and piston pins, printing products and hosiery.

In 1679 La Salle built Ft. Miami on or near the site of St. Joseph. The present city was settled in 1829, incorporated as a village in 1836 and chartered as a city in 1861.

ST. JOSEPH, a city of northwestern Missouri, U.S., on the east bank of the Missouri river, 55 mi. N.W. of Kansas City; a port of entry and the county seat of Buchanan county. It is on federal highways 36, 59, 71, 169 and 275; and is served by the Burlington Route, the Chicago Great Western, the Missouri Pacific, the Rock Island, the Santa Fe and the Union Pacific railways, and by Mid-Continent Airlines. Pop. (1950) 78,588; (1940) 75,711. The city covers 15 sq. mi. on bluffs above the river, graded down considerably in the business and eastern residential section. There are numerous public and parochial schools, churches, hotels with 2,000 guest rooms, and hospitals. Just east of the city is a state hospital for the insane (1874). The leading industries are livestock feeding and meat packing, grain production and milling; the principal products are paper tablets, flour and mixed feeds, cereals, pharmaceuticals, beer, garments, candy, jewellery, mattresses, dairy products, caskets, cabinets, brick, livestock serum, Christmas decorations and artificial trees, structural steel, tile, cinder blocks, tents, chemicals, vinegar, millinery, caps, hats, textiles, canned foods, wire rope, fabricated houses, plastic signs, fluorescent fixtures and battery cables. The daily *St. Joseph News-Press* was established in 1903 by a merger of the *Daily News* and *Evening Press*.

In 1826 Joseph Robidoux, a French Canadian, established an

Indian trading post there, known as Blacksnake Hills. After the "Platte Purchase" in 1836 other settlers came in, and in 1843 Robidoux laid out a town, which he named in honour of his patron saint. It became the county seat in 1846 and in 1851 was chartered as a city. It developed early into an important trading centre, and was a busy outfitting point during the years of heavy travel by prospectors and other emigrants to the Rocky mountains and the Pacific coast. On April 3, 1860, the first rider of the "Pony Express" galloped out of St. Joseph (the eastern terminus of the service during the 18 months of its operation), and a year later Lincoln's inaugural address was carried through to Sacramento (nearly 2,000 mi.) in 7 days and 17 hours. During the Civil War St. Joseph was held continuously by the Unionists, but local sentiment was bitterly divided. After the war a period of rapid development set in, which increased the population from 8,932 in 1860 to 19,565 in 1870, and to 77,403 in 1910.

SAINT-JUST, ANTOINE LOUIS LÉON DE RICHELIEU-BOURG DE (1767-1794), French revolutionary leader, was born at Decize in the Nivernais on Aug. 25, 1767. At the outbreak of the Revolution he was elected an officer in the National Guard of the Aisne. He assumed a stoical demeanour united to a tyrannical policy. He entered into correspondence with Robespierre, who, flattered by his worship, admitted him to his friendship. Thus supported, Saint-Just became deputy to the National Convention, where he made his first speech on the condemnation of Louis XVI—gloomy, fanatical, remorseless in tone—on Nov. 13, 1792. In the convention, in the Jacobin club, and among the populace he was dubbed the "St. John of the Messiah of the People." In the name of the Committee of Public Safety he drew up reports to the convention upon the absorbing themes of the overthrow of the party of the Girondins (report of July 8, 1793), of the Hébertists, and finally, of that denunciation of Danton which consigned him and his followers to the guillotine. Camille Desmoulins said of Saint-Just—"the youth with the beautiful countenance and the long fair locks—"He carries his head like a Holy Sacrament." "And I," savagely replied Saint-Just, "will make him carry his like a Saint Denis." The threat was not vain: Desmoulins accompanied Danton to the scaffold.

Saint-Just proposed that the National Convention should, through its committees, direct all military movements and all branches of the government (report of Oct. 10, 1793). This was agreed to, and Saint-Just was despatched to Strasbourg to superintend the military operations. It was suspected that the enemy without was being aided by treason within. Saint-Just "organized the Terror," and soon the heads of all suspects sent to Paris were falling under the guillotine. But there were no executions at Strasbourg, and Saint-Just repressed the excesses of J. G. Schneider, who, acting as public prosecutor to the revolutionary tribunal of the Lower Rhine, had ruthlessly applied the Terror in Alsace. Schneider was sent to Paris and guillotined. The conspiracy was defeated, the frontier was delivered and Germany invaded. On his return Saint-Just was made president of the convention. Later, with the army of the north, he placed before the generals the dilemma of victory over the enemies of France or trial by the dreaded Revolutionary tribunal; and before the eyes of the army he organized a force charged with the slaughter of those who should seek refuge by flight. He succeeded again, and Belgium was gained for France (May, 1794).

Meanwhile affairs in Paris looked gloomier than ever, and Robespierre recalled Saint-Just to the capital. Saint-Just proposed a dictatorship. At the famous sitting of the 9th Thermidor, he presented as the report of the committees of General Security and Public Safety a document expressing his own views, a sight of which had been refused to the other members of committee the previous evening. Then the storm broke. He was interrupted, and the sitting ended with an order for Robespierre's arrest, which entailed that of Saint-Just. On the following day, July 28, 1794, 22 men, nearly all young, were guillotined. Saint-Just maintained his proud self-possession to the last.

See *Oeuvres de Saint-Just, précédées d'une notice historique sur sa vie* (1833-34); E. Fleury, *Études révolutionnaires* (2 vol., 1851), with which cf. articles by Sainte-Beuve (*Causeries du lundi*, vol. v), Cuvil-

lier-Fleury (*Portraits politiques et révolutionnaires*); E. Hamel, *Histoire de Saint-Just* (1859), which brought a fine to the publishers for outrage on public decency; F. A. Aulard, *Les Origines de la Législative et de la Convention* (2nd ed., 1905); M. Lénier, *Saint-Just* (1922). The *Oeuvres complètes de Saint-Just* were edited with notes by C. Vélajay (1908).

ST. JUST (St. Just in Penwith), a market town of Cornwall, England, 7 mi. W. of Penzance. Pop. of urban district (1951) 4,122. Area 12 sq. mi. The town lies in a wild district 1 mi. inland from Cape Cornwall, which is 4 mi. N. of Land's End.

ST. KILDA (Gaelic *Hìra*, "the western land"), largest of a small group of about sixteen islets of the Outer Hebrides, Inverness-shire, Scotland. It is included in the civil parish of Harris, and is situated 40 mi. W. of North Uist. It measures 3 mi. from E. to W. and 2 mi. from N. to S. Except at the landing place on the southeast, the cliffs rise sheer out of deep water, and on the northeast side the highest eminence in the island, Conagher, forms a precipice 1,220 ft. high. The inhabitants, an industrious Gaelic-speaking community who numbered 36 in 1930, were that year evacuated at their own request and were settled mainly in Morvern parish, Co. Argyll. The island is practically cut off from the world for eight months of the year. It has been in the possession of the Macleods for hundreds of years except for the period 1779-1871.

ST. KITTS or ST. CHRISTOPHER, an island in the British West Indies, forming, with Nevis and Anguilla, one of the presidencies in the colony of the Leeward Islands. It is a long oval with a narrow neck of land projecting from the southeastern end, total length 23 mi., area 68 sq. mi. Mountains traverse the central part from northwest to southeast, the highest being Mount Misery (3,711 ft.). The island is well watered, fertile and healthy, and its climate is cool and dry (temperature between 78° and 85° F.; average annual rainfall 38 in.). The rim of land formed by the skirts of the mountains, and the valley of Basseterre are cultivable. The higher slopes of the hills afford pasturage; the summits are crowned with dense woods. Sugar is the chief product and export, followed by sea-island cotton. Primary education is free and compulsory. In 1950 there were 17 government and 2 subsidized private primary schools and three government-aided secondary schools. Basseterre (pop. 12,194), on the southwest coast, is the island's port as well as capital of the presidency. St. Kitts was discovered in 1493 by Columbus but was not occupied until 1623, when Thomas Warner made the first English settlement in the West Indies there. It was seized by the French three times between 1666 and 1782 and held for short periods, but remained British from 1783.

The island had a population of 29,818 by the 1946 census, mostly Negro.

SAINT-LAMBERT, JEAN FRANÇOIS DE (1716-1803), French poet, was born at Nancy on Dec. 26, 1716. He entered the army and, when Stanislaus Leszczyński was established in 1737 as duke of Lorraine, he became an official at his court at Lunéville. He left the army after the Hanoverian campaign of 1756-57, and devoted himself to literature, producing a volume of descriptive verse, *Les Saisons* (1769), now never read, many articles for the *Encyclopédie*, and some miscellaneous works. He was admitted to the Académie in 1770. His fame, however, comes chiefly from his amours. He was already high in the favour of the marquise de Boufflers, Stanislaus's mistress, whom he addressed in his verses as *Doris* and *Thémire*, when Voltaire in 1748 came to Lunéville with the marquise du Châtelet. Her infatuation for him and its fatal termination are known to all readers of the life of Voltaire. His subsequent liaison with Madame d'Houdetot, Rousseau's Sophie, proved permanent. He published in 1798 the *Principe des moeurs chez toutes les nations ou catéchisme universel*, and published his *Oeuvres philosophiques* two years before his death on Feb. 9, 1803. Madame d'Houdetot survived until Jan. 28, 1813.

See G. Maugras, *La Cour de Lunéville* (1904) and *La Marquise de Boufflers* (1907); also the literature dealing with Rousseau and Voltaire.

ST. LAURENT, LOUIS STEPHEN (1882-), Canadian statesman, born on Feb. 1, 1882, at Compton, Que., studied

at St. Charles college, Sherbrooke, and Laval university, Quebec, Que. Called to the bar at Quebec in 1905, he practised law until Dec. 10, 1941, when he entered federal politics as minister of justice and attorney general. He was later secretary of state for external affairs, and on Nov. 15, 1948, became the 17th prime minister of Canada.

St. Laurent was first elected to parliament as Liberal member for Quebec East on Feb. 9, 1942, and was returned in the 1945 and 1949 elections.

ST. LAWRENCE. The river St. Lawrence, in North America, with the five fresh-water inland seas (see GREAT LAKES), Superior, Michigan, Huron, Erie and Ontario, forms one of the great river systems of the world, having a length of 1,900 mi. from the source of the river St. Louis (which rises near the source of the Mississippi and falls into the head of Lake Superior) to Cape Gaspe, where it empties into the Gulf of St. Lawrence. The river is here considered as rising at the foot of Lake Ontario, where the name St. Lawrence is first applied to it.

The river, to the point where it crosses 45° N. in its north-easterly course, forms the boundary line between the state of New York and the province of Ontario; thence to the sea it is wholly within Canadian territory, running through the province of Quebec. At Point des Monts, 260 mi. below Quebec, it is 26 mi. wide, and where it finally merges into the Gulf of St. Lawrence, 150 mi. farther on, it is 90 mi. wide, this stretch being broken by the large island of Anticosti, lying in the mouth. The character of the river banks varies with the geological formations through which it runs. Passing over the Archaean rocks of the Laurentian from Kingston to Brockville the shores are very irregular, and the river is broken up by protrusions of granite and gneiss into a large number of picturesque islands, "The Thousand Islands," frequented as a summer resort. From Brockville to Montreal the river runs through flat-bedded Cambro-Silurian limestones, with rapids at several points, which are run by light-draught passenger boats. For the up trip the rapids are avoided by canalization. From Montreal to Three Rivers the course is through an alluvial plain overlying the limestones, the river at one point expanding into Lake St. Peter, 20 mi. long by 10 mi. wide, with a practically uniform depth of 10 ft. Below Three Rivers the banks grow gradually higher until, after passing Quebec through a cleft in slate rocks of Cambrian age, the river widens, washing the feet of the Laurentian mountains on its north shore; while a more moderately hilly country, terminating in the Shick-shock mountains of the Gaspé Peninsula, skirts its south shore.

From Kingston, at the head of the river, to Montreal (170 mi.), navigation is limited to vessels of 14 ft. draught. From Montreal to Quebec (160 mi.), a ship channel has been dredged to a depth of 30 ft.; below Quebec the river is navigable by vessels of any draught. The locks of the present canals are 45 ft. wide, with an available depth of 14 ft. and a minimum length of 270 ft.; but plans are under consideration for a new ship canal allowing vessels of 25 or 30 ft. draught to enter Lake Ontario, from which the new Welland canal of the same depth leads to the Upper Lakes.

In the stretch between Montreal and Quebec the ship channel is a national work, and improvements have been undertaken to secure everywhere a minimum depth of 30 ft. and a width of 450 ft. The river from Kingston to the sea is well supplied with aids to navigation. In the dredged portions lights are arranged in pairs of leading lights on foundations sufficiently high and solid to resist the pressure of ice movement, and there is an elaborate system of fog alarms, lighted and other buoys, as well as telegraphic, wireless and telephonic communication, storm signal, weather and ice-reporting stations and a lifesaving service.

Montreal, at the head of ocean navigation, the largest city in Canada, is an important distributing centre for all points in western Canada, and enjoys an extensive shipping trade with the United Kingdom. Quebec is the summer port used by the largest steamers in the Canadian trade. There are numerous flourishing towns on the river, from Kingston, a grain transferring port, to the sea. Large quantities of lumber are handled at mills along the river.

A natural highway between all points west of the Maritime Provinces and Europe, the St. Lawrence permits ocean traffic to penetrate 1,000 m. into the heart of the country. It is, moreover, the shortest freight route from the Great Lakes to Europe. From Buffalo to Liverpool via New York involves rail or barge canal transport of 496 m. and an ocean voyage of 3,034 nautical miles. Via Montreal there is a 14-ft. transport of 348 m. and river and ocean voyage of 2,772 nautical miles. From Quebec to Liverpool by Cape Race is 2,801 nautical miles, while the route by Belle Isle, more nearly a great circle course, usually taken between July and October, is only 2,633 nautical miles. On the other hand the St. Lawrence is not open in winter and the average time between the arrival of the first vessel at Montreal from sea and the departure of the last ocean vessel is seven months. From Kingston to Quebec the river freezes every winter, except at points where the current is rapid. Below Quebec, although there is border ice, the river never freezes. Efforts have been made to lengthen the season of navigation by using specially constructed steamers to break the ice; and it is claimed that the season of navigation could be materially lengthened, and winter floods prevented by keeping the river open to Montreal. Winter ferries are maintained at Quebec, between Prince Edward Island and Nova Scotia, and between Newfoundland and Sydney, Cape Breton.

The river above tide water is not subject to excessive flooding, the maximum rise in the spring and early summer months, chiefly from northern tributaries from the Ottawa eastward, being 10 feet. The Great Lakes serve as impounding reservoirs for the gradual distribution of all overflows in the west. At Montreal, soon after the river freezes, there is a local rise of about 10 ft. in the level in the harbour, caused by restriction of the channel by anchor ice; and in the spring when the volume is augmented, this obstruction leads to a further rise. To prevent flooding of the lower parts of the city a dike was built in 1887 along the river front, which prevented a serious flooding in 1899.

Tides enter the Gulf of St. Lawrence from the Atlantic chiefly through Cabot strait (between Cape Breton and Newfoundland), which is 75 m. wide and 250 fathoms deep. The tide entering through Belle Isle strait, 10 m. wide and 30 fathoms deep, is comparatively little felt. The greatest range is attained in Northumberland strait and in Chaleur bay, where it amounts to 10 feet. At the entrance to the estuary at Anticosti it has again the oceanic range of about 6 ft., and proceeds up the estuary with an ever-increasing range, which attains its maximum of 19 ft. at the lower end of Orleans island, 650 m. from the ocean at Cabot strait. At Quebec, 30 m. farther up, the range is nearly as great; but at 40 m. above Quebec it is largely cut off by the Richelieu Rapids, and finally ceases to be felt at Three Rivers, at the lower end of Lake St. Peter, 760 m. from the ocean.

The St. Lawrence provides ample water-power, which is being increasingly used, and from Lake Superior to the gulf there are numerous points on its tributaries where power has been developed.

Nearly all the rivers flowing into the St. Lawrence below Quebec are stocked with salmon. In the salt water of the gulf and lower river, mackerel, cod, herring, smelt, sea-trout, striped bass and other fish are caught for market.

The St. Lawrence is spanned by the following railway bridges: (1) A tuss bridge near Cornwall. (2) A tuss bridge with a swing at Coteau Landing. (3) A cantilever bridge at Caughnawaga. (4) The Victoria Jubilee bridge, 6,592 ft. long by 67 ft. wide, with 25 spans, double railway and trolley tracks, driveways and sidewalks. (5) A cantilever bridge, having a central span of 1,800 ft., crosses the river at a point 7 m. above Quebec. The southern half of the superstructure, while in course of erection in August 1907, fell, killing 78 men, and necessitating a serious delay in the completion of the work.

Discovery of St. Lawrence.—The St. Lawrence was discovered by Jacques Cartier, commissioned by the king of France to explore and trade on the American coast. Cartier entered the strait of Belle Isle in 1534; but Breton fishermen had previously resorted there in summer and penetrated as far as Brest, 11 leagues west of Blanc Sablon, the dividing line between Quebec

and Labrador. Cartier circled the gulf, but missed the entrance to the river. On his second voyage in 1536 he named a bay on the north shore of the gulf, which he entered on Aug. 10, the feast of St. Lawrence, *Baye Saint Laurents*, and the name gradually extended over the whole river, though Cartier himself always wrote of the River of Canada. Early in September, he reached "Canada," now Quebec, and on Oct. 2 reached Hochelaga, now Montreal. No permanent settlement was then made. The first, Tadousac, at the mouth of the Saguenay, was established by Champlain in 1603, and Quebec was settled by him in 1608. Between that time and 1616 Champlain explored the whole river system as far west as Lake Huron, reaching it by way of the Ottawa river, and taking possession of the country in the name of the king of France. It became British by the treaty of Paris, in 1763.

Anderson, on improvements to navigation on St. Lawrence, 1904). (W. F. A.)

ST. LEGER, SIR ANTHONY (c. 1496-1559), lord deputy of Ireland, eldest son of Ralph St. Leger, a gentleman of Kent, was educated abroad and at Cambridge. He quickly gained the favour of Henry VIII., and was appointed in 1537 president of a commission for inquiring into the condition of Ireland. In 1540 he was appointed lord deputy of Ireland. His first task was to repress disorder, and he at once proceeded with severity against the Kavanaghs, permitting them, however, to retain their lands, on their accepting feudal tenure on the English model. By a similar policy he exacted obedience from the O'Mores, the O'Tooles and the O'Conors in Leix and Offaly; and having conciliated the O'Briens in the west and the earl of Desmond in the south, the lord deputy carried an act in the Irish parliament in Dublin conferring the title of king of Ireland on Henry VIII. and his heirs. Conn O'Neill, who in the north had remained sullenly hostile, was brought to submission by vigorous measures. For the most part, however, St. Leger's policy was one of moderation and conciliation—rather more so, indeed, than Henry VIII. approved. St. Leger's personal influence was proved by an outbreak of disturbance when he visited England in 1544, and the prompt restoration of order on his return some months later. St. Leger retained his office under Edward VI., and again effectually quelled attempts at rebellion by the O'Conors and O'Byrnes. From 1548 to 1550, he was in England. He was recalled from Ireland in 1551. Under Mary he was again lord deputy from 1553 to 1556, when he was recalled on a charge of falsifying accounts. He died (March 16, 1559) before the investigation was completed.

His great-grandson, SIR WILLIAM ST. LEGER, took part in "the flight of the earls" (see O'NEILL) in 1607, and spent several years abroad. Having received a pardon from James I. and large grants of land in Ireland, he was appointed president of Munster by Charles I. in 1627. He supported Strafford, actively assisting in raising and drilling the Irish levies destined for the royalist service. In the great rebellion of 1641 he executed martial law in his province with the greatest severity, hanging large numbers of rebels, often without much proof of guilt. He was still struggling with the insurrection when he died at Cork on July 2, 1642.

A biography of Sir Anthony St. Leger will be found in *Athenae Cantabrigienses*, by C. H. Cooper and T. Cooper (Cambridge, 1838); see also *Calendar of State Papers relating to Ireland, Hen. VIII.—Elizabeth*; *Calendar of Letters and Papers of the Reign of Henry VIII.*; *Calendar of State Papers* (Domestic Series), Edward VI.—James I.; *Calendar of Carew MSS.*; J. O'Donovan's edition of *Annals of Ireland by the Four Masters* (7 vols., Dublin, 1851); Richard Bagwell, *Ireland under the Tudors* (3 vols., London, 1885-90); J. A. Proude, *History of England* (12 vols., London, 1846-70). For Sir William St. Leger, see *Strafford's Letters and Despatches* (3 vols., London, 1739); Thomas Carte, *History of the Life of James, Duke of Ormonde* (6 vols., Oxford, 1851); *History of the Irish Confederation and the War in Ireland*,

edited by Sir J. T. Gilbert (Dublin, 1882-91).

ST. LEONARDS, EDWARD BURTENSHAW SUGDEN, 1st BARON (1781-1835), lord chancellor of Great Britain, was the son of a hairdresser of Duke street, Westminster, and was born on Feb. 12, 1781. After practising for some years as a conveyancer, he was called to the bar at Lincoln's Inn in 1807, having already published his well-known treatise on the *Law of Vendors and Purchasers* (14th ed., 1861). His parliamentary career was noticeable for his opposition to the Reform bill of 1832. He was appointed solicitor general in 1829, was lord chancellor of Ireland in 1834 and again from 1841 to 1846.

Under Lord Derby's first administration in 1852 he became lord chancellor and was raised to the peerage as Lord St. Leonards. In this position he devoted himself with energy and vigour to the reform of the law; in 1855 he was offered the great seal again, but had to refuse. He died at Boyle farm, Thames Ditton, on Jan. 20, 1875.

Lord St. Leonards was the author of various important legal publications, many of which have passed through several editions. See J. R. Atlay, *Lives of the Victorian Chancellors*, vol. II.

ST. LIZIER-DE-COUSERANS, a village of southwestern France in the department of Ariège on the right bank of the Salat, 1 mi. N.N.W. of St. Girons. Pop. (1946) 1,008. St. Lizier, in ancient times one of the 12 cities of Novempopulania under the name of *Lugdunum Consorannorum*, was later capital of the Couserans and seat of a bishopric (suppressed at the Revolution) to the holders of which the town belonged. It has a cathedral of the 12th and 14th centuries with a fine Romanesque cloister, and also remains of Roman ramparts. The old episcopal palace (17th century) and the adjoining church (14th and 17th centuries), once the cathedral with its fine chapter hall (12th century), remain. The Salat is crossed by a bridge of the 12th or 13th century.

ST. LÔ, a town of northwestern France, capital of the department of Manche, 474 mi. W. by S. of Caen by rail. Pop. (1946) 5,659. St. Lô, called *Brievrea* in the Gallo-Roman period, owes its present name to St. Lô (Laudus), bishop of Coutances (d. 568). In the middle ages St. Lô became an important fortress and a centre for the weaving industry. In 1574 the town, which had embraced Calvinism, was stormed by the Catholics and many of its inhabitants massacred. In 1800 it was made capital of its department in place of Coutances.

In the *hôtel de ville* is the "Torigni marble," the pedestal of an ancient statue, the inscriptions on which relate chiefly to the annual assemblies of the Gallic deputies held at Lyons under the Romans.

ST. LOUIS, the chief city of Missouri, U.S., is situated in a central position in the Mississippi drainage system, on the west bank of the river, about 20 mi. below its confluence with the Missouri, 200 mi. above the influx of the Ohio and about 1,270 mi. above the Gulf of Mexico. Area 61.37 sq.mi.; pop. (1950) 856,623; (1940) 816,048; (1930) 821,960; (1920) 772,897; (1910) 687,029; (1900) 575,238; (1890) 451,770 by the federal census. In 1940, 9.8% were foreign-born and 13.4% nonwhite.

Physical Features.—The city spreads along the river front for about 19 mi. and westward about 7 mi. Near the river the land rises rapidly for about one-third of a mile and then gradually, the uplands in the western part of the city being about 300 ft. above high-water mark. The river front and railroad routes have been the principal determining factors in the situation of industrial areas.

History.—In 1763 Gilbert Antoine de St. Maxent and Pierre Laclede Liguest, merchants of New Orleans, organized a firm which obtained from the French director-general of Louisiana the exclusive right to trade with the Missouri river Indians and with those west of the Mississippi above the Missouri. On Feb. 15, 1764, a party of workmen headed by Auguste Chouteau landed at the site previously selected by Laclede for his trading post and on the following day began work.

In addition to Laclede's original party, settlers came from Cahokia; others who desired to escape from English rule in the Illinois country came, and at the end of the first year 40 families

were living at St. Louis. The town was named by Laclede in honour of Louis XV, but for many years it was locally known as Laclede's village, and as Painscourt. Within its borders and in the general neighbourhood were several mounds erected by a prehistoric people.

In 1765, when the British military took possession of the Illinois country east of the Mississippi, Louis St. Ange de Belliverie, the French commandant, retired with his soldiers to St. Louis, and continued to rule over that part which had been ceded to Spain in 1763, but over which Spain had not asserted her authority. St. Ange was left in control by the Spanish until Feb. 7, 1770, when he was superseded by Don Pedro Piarra, the first Spanish lieutenant governor of Upper Louisiana.

In 1772 the village had a population of 399 whites and 198 slaves. During the administration of St. Ange only one street had a name, the Rue Royale, which now bears the prosaic name of Main street. Later the road which ran to the Bonhomme settlement (Walnut street) was known as the Rue Bonhomme; Market street was the Rue de la Tour; Second street, Rue de l'Eglise.

Modern Third street ran along rising ground in the rear of the village; there the barns were located and it was known as the Rue des Granges. West and northwest of the village lay the common fields, a fenced area in which each settler could, by permission, secure a lot for tillage. To the south and southwest the settlers enclosed a large tract for common pasturage and wood supply.

Excepting the Spanish officials, soldiers and a few traders, the inhabitants were French, and all were Roman Catholics. Families intermarried to such an extent that it is said that at the time of the transfer to the United States, two-thirds of the inhabitants were related. The traders carried on an extensive traffic with the Indian tribes along the Mississippi and Missouri rivers, and monopolized the trade with the Osage. Several large fortunes were made in furs and many families of St. Louis trace their ancestry back to the French fur traders of Spanish days.

The great market was New Orleans; thither the inhabitants shipped their surplus flour and packs of furs. Of the early traders the most prominent were the Chouteaus, Auguste and Pierre, who for many years enjoyed a monopoly of the Osage trade and built up a substantial fortune.

In May 1780 a force of British regulars and Indians descended on the city, but the Spanish soldiery and the settlers beat off the invaders. In 1803 about half of the inhabitants of Upper Louisiana were Americans, but few became residents of St. Louis. Under Spanish rule the town grew slowly and at the close of the regime contained only 180 houses, most of which were scattered along two streets which ran parallel with the river.

On March 9, 1804, Carlos Dehault DeLassus, the Spanish lieutenant governor, formally delivered Upper Louisiana to Capt. Amos Stoddard of the United States army, who had been authorized to act as agent and commissioner of the French republic; and on March 10 Stoddard took possession of Upper Louisiana for the United States. In 1804 congress created the district of Louisiana, and placed it under the jurisdiction of the officers of Indiana territory. St. Louis became the governmental headquarters for the district. In 1805 the district of Louisiana was cut off from the jurisdiction of Indiana and made into the territory of Louisiana. St. Louis was again chosen as the seat of government. In 1812 the territory of Missouri was created, with St. Louis still the territorial capital.

In 1808 the town of St. Louis was created as a result of a petition of about 160 inhabitants, but it was not until 1809 that St. Louis was legally incorporated as a town by the court of common pleas. In 1808 the *Louisiana Gazette* was established, this being the first newspaper west of the Mississippi river. The publication of the territorial laws in 1808 marked the appearance of the first book to be printed in what is now the state of Missouri. By 1815 the population probably did not exceed 2,600. Not until 1819 were primitive fire engines supplied by private subscription. In 1821, at the time of the admission of Missouri to the union, there were 621 buildings and a population of 5,600. In 1822 the state legislature incorporated St. Louis as a city.

During the territorial period the composition of the population had undergone a distinct change. The French element, although still socially and financially prominent, was being engulfed by people from Virginia and Kentucky, but there was also a sprinkling of New Englanders and the Irish were numerous enough in 1819 to form a Hibernian Benevolent society.

The fur trade continued to be a principal source of wealth. Up to 1809, with the exception of the original firm of Maxent, Lacledé and Company, and the later Clamorgan company, the trade had been largely a matter of individual enterprise, aided occasionally by special concessions such as the Chouteau monopoly of the Osage trade.

But in 1807 Manuel Lisa ascended the Missouri river and built a post at the mouth of the Big Horn and, in 1809, formed the St. Louis Missouri Fur company. A rival organization headed by William H. Ashley in 1822 founded a company which later became known as the Rocky Mountain Fur company; the American Fur company, of which John Jacob Astor was the principal figure, established an office in St. Louis in 1822 and soon became the dominant factor in the fur trade. Astor retired in 1834 and the western department of the company was sold to Pratte, Chouteau and Company.

This organization continued to control most of the western fur trade until 1860. St. Louis was also the outfitting place for much of the trade with the North Mexican provinces.

After 1812 St. Louis attracted many settlers including a large foreign element, which, in the 1820s and 1830s was predominantly German. The failure of the reform movement of 1848 brought another tide of German migration. In 1840 the population was 16,469; after that the growth was rapid, the population in 1850 being 77,360 and ten years later 160,773. In 1817 steamboats began to operate to St. Louis, in 1832, 80 steamboats arrived; in 1838, 154, and in 1845, 213. In 1854 St. Louis ranked third in enrolled tonnage among U.S. cities. After that the river traffic increased tremendously; in 1860 5,178 vessels arrived at St. Louis and 5,218 departed, the total tonnage for the year being 844,039.

In the 1830s St. Louis, like other towns in the west, became interested in the development of railroads. The Pacific Railroad company, the parent of the Missouri Pacific, was organized in 1850; the line was begun in 1851, and the first 40 mi. were opened to Franklin (Pacific), Mo., two years later. In 1856 it reached Jefferson City, and Sedalia in 1861. A southwestern branch of the Missouri Pacific was opened to Rolla in 1861. The St. Louis and Iron Mountain railway, incorporated in 1851, was opened from St. Louis to Pilot Knob, Mo., in 1858. The St. Louis, Kansas City and Northern railway was completed as far as Macon, Mo., in 1859. Thus before the Civil War St. Louis became the terminal for four western railroads. The Ohio and Mississippi railroad, to Cincinnati, was completed in 1857; it connected with the Baltimore and Ohio railroad, thus giving St. Louis rail access to the Atlantic coast.

By 1860 the city extended for about six and one-half miles along the river front and reached westward between three and four miles. Most of the houses were built of brick, as were many of the sidewalks. Soft coal was used as fuel, frequently creating a pall of smoke. Missouri was a slave state, but only 1,500 slaves were owned in St. Louis and most of these were in domestic service. The Germans and the newcomers from the north were abolitionists. Many of the businessmen, regardless of their views on the slavery question, were opposed to secession. They feared that a break in the union would be injurious to business, and felt that it was vital to St. Louis to have the Mississippi river under the control of the United States.

Soon after Abraham Lincoln's election it became evident that Gov. Claiborne Jackson was a secessionist and intended to take the state out of the union. He was backed by a secessionist legislature. The state government authorized the election of delegates to assemble in convention to consider the question of the secession of Missouri. The delegates concluded that there was no adequate cause for Missouri to dissolve her connection with the union.

The next step of the unionists was to prevent the St. Louis

arsenal from falling into the hands of the secessionists. Capt. Nathaniel Lyon, with the assistance of the "Wide Awakes," who had been transformed into military companies known as "home guards," succeeded in protecting the arsenal and in shipping most of its guns to Illinois. The governor then authorized the assembly of militia near St. Louis. A camp, named after the governor, was laid out on the western outskirts of the city. Lyon and Francis Blair believed that the purpose of the establishment of Camp Jackson was the seizure of the city. On May 10, 1861, Lyon sent three columns of home guards to capture the camp. The force was overwhelming and Frost, the commander, surrendered without a struggle.

An unfortunate outbreak of violence occurred while the prisoners were under guard and about 25 people, several of them civilians, were killed or wounded. For 48 hours the citizens were in a state of panic, but when no other acts of violence occurred, the excitement subsided, and those who had fled returned to their homes.

After the Camp Jackson episode the wavering took a firm stand on one side or the other. But it soon became evident that the city was overwhelmingly unionist in sentiment. Lynch's "slave pen," a place where adult slaves had been sold at auction, was closed, and the slave pen where children were sold was soon transformed into a military prison. Eminent citizens hoped that the warring factions in the state might be brought into agreement by a conference of the leaders. On June 11 Governor Jackson and Gen. Sterling Price met Blair and Lyon in a conference at the Planters' hotel, but no agreement was reached. The governor hastened to Jefferson City, issued a call for 50,000 troops and then evacuated the capital.

Throughout the Civil War St. Louis remained a unionist stronghold. There Gen. John C. Frémont, in command of the western department, established his headquarters, and from there Gen. Henry Halleck directed movements in the Mississippi valley. Thousands of troops were encamped in and about the city. For many months St. Louis was under martial law; thousands of prisoners of war, and about 40,000 refugees were cared for during the war. St. Louis was the headquarters of the Western Sanitary commission which had charge of much of the war relief work.

Cultural Development.—For a quarter of a century after the Civil War the city was the centre of a remarkable philological and cultural movement. Its inspirer was Henry Conrad Brokmeyer (1828-1906), who later became prominent in state politics and was lieutenant governor of Missouri in 1876-80. Brokmeyer, a Prussian from Minden, arrived at St. Louis in 1856. He attracted William T. Harris, a brilliant graduate of Yale university, who taught in the St. Louis schools during 1858-67 and was superintendent of schools during 1867-80.

Brokmeyer and Harris gathered about them a group of idealistic thinkers and formed a philosophical society which became the sponsor of *The Journal of Speculative Philosophy* (1867-93), the first periodical of the sort in English. For many years Harris, its editor, was the foremost exponent of Hegelian philosophy in the United States.

Economic Progress.—After the Civil War St. Louis grew with unusual rapidity; by 1870 the population was 320,864. In ten years it had almost doubled; St. Louis had become the principal distribution point for the Mississippi valley. But it soon found its supremacy challenged by Chicago, when the railroads made Chicago the terminal for lines to the Pacific coast. After 1870 the Mississippi and Ohio rivers gradually lost their importance as highways and the railroads became the great carriers of interstate commerce.

After 1870 the history of St. Louis was mainly economic. It retained its prominence as a wholesale centre and also became one of the great manufacturing cities in the world.

Louisiana Purchase Exposition.—In 1898 a site on the western outskirts of the city was selected for an exposition to celebrate the 100th anniversary of the purchase of Louisiana from France. The grounds covered 1,240 ac., of which 250 were under roof. The total cost, apart from individual exhibitions, was about \$49,500,000, of which the national government con-

tributed \$5,000,000 and the city and citizens of St. Louis \$10,000,000. The exposition was opened to the public in 1904. During the seven months of its existence, 12,804,616 paid admissions were collected, and total admissions were 19,694,855. Two permanent buildings remained from it, the Jefferson memorial, the home of the Missouri Historical society, and the Art building.

Later Developments.—In 1933 the city determined to turn its central river front district into a national park, at a cost of \$30,000,000. The federal government agreed to put up three-fourths of the money and the city one-fourth. By 1947 the 40-block site had been cleared. The normal Republican city was ruled by a Democratic administration (for the first time in 24 years) from 1933 to 1941, when a Republican mayor was heavily victorious again. In the municipal elections of April 1949 the Democrats won control of the city government from the Republicans who had been in control since 1941.

City Zones.—From 1840 to 1880 the river front was the busiest part of the city. Along the central part for 3.7 mi. stretches the levee. When the railroads took the place of the river as the principal means of transportation, the importance of the levee declined. River traffic, however, underwent some revival with the establishment by the government of a line of steel barges between St. Louis and New Orleans.

Beginning at Fourth street and extending west to 14th on high ground between Market street and Delmar boulevard is the skyscraper business district. The largest retail establishments, several of them department stores, are on Olive street and Washington avenue. In this district are commercial hotels, theatres, clubs, office buildings, wholesale houses and factories. The downtown district extends westward. In 1923 a bond issue of \$87,352,500 for public improvements was voted, including \$6,000,000 for a memorial plaza and building, \$5,000,000 for a municipal auditorium and \$4,000,000 for a new courthouse. The plaza extends from Market street to Olive street and from 12th to 15th streets making a remarkable civic center. At the south end are the city hall, municipal courts and auditorium; at the north the public library. Facing 12th between Market and Chestnut streets is the courthouse.

Adjacent to the downtown retail district on every side are wholesale and jobbing houses, warehouses and factories. Here are most of the plants which produce shoes and shoemaking machinery, garments, drugs and medicines. To the west of the downtown district, spreading out like a fan and extending as far as Grand avenue, was the finest residential district in the 1870s. A \$2,600,000 plaza, with a \$60,000 Carl Milles fountain, was built opposite Union station.

Olive, Market, Delmar (once Morgan street) and other thoroughfares were widened. A depressed superhighway, completed in 1937, traverses the city from east to west.

Industrial Development.—St. Louis is a leading U.S. industrial area. Its advantageous position near the sources of supply of raw materials, the proximity of a vast, thickly populated area and of the soft-coal fields of Illinois, railroad and highway facilities and electric power make it a natural centre for large industrial plants, and for jobbing and wholesale houses. There were 2,960 factories employing 244,516 people in 1947 in the St. Louis industrial area. Leading industries are assembling and manufacturing automobiles, shoes, drugs, chemicals, beer, electric goods, tobacco, brick, terra-cotta and other clay products, railway and street cars, stoves, ranges and furnaces, steel and lead, hardware, various kinds of machinery, clothing, boxes and woodenware products. St. Louis is one of the largest centres of shoe manufacture in the United States. It is one of the largest of all markets for furs, hides, wool, horses and mules, grain, dry goods, millinery and men's hats. It is a centre for the manufacture of poultry and livestock feed and of meat packing. The total value of factory products in 1947 in the city's industrial area was \$1,296,471,000.

The metropolitan district in 1950 had a population of 1,673,467, and the outlying regions were growing more rapidly than the city proper. Metropolitan St. Louis is a rapidly expanding industrial unit, but the outlying communities oppose enlarging the

city boundary. The principal industrial areas followed naturally the lines of transportation; hence industry and warehousing gravitated early to the river front where rail as well as water transport was convenient. (The decline of the river steamboat was to cause many old buildings of the levee district to lose value and to bring about the razing of 40 blocks.)

Other manufacturing areas grew up along the railroads branching through the city. St. Louis is strategically located with respect to transportation. Thirteen major railroads converge there, six major air lines use the municipal airport, numerous truck lines provide service and the navigable water system connects with all of the principal mid-continent cities.

St. Louis is also a wholesale center, with its preferential trade territory being 14 states in the middle west. The United States census of distribution credited it with \$3,047,000,000 of wholesale business of all types in 1948. Total retail sales of stores in St. Louis city were estimated at \$978,300,000 in 1949. Adjacent to the industrial sections are densely populated tenement districts where most of the unskilled foreign-born and Negro labourers live. The industrial area includes several cities on the Illinois side, such as East St. Louis, National City, Madison and Granite City.

South of East St. Louis is the Cahokia power plant, which supplies power to many St. Louis industrial plants.

The Eads bridge, the first across the Mississippi at St. Louis, was completed in 1874, but was not successful until 1889, when the Terminal Railroad association was formed. In 1951 it controlled 368 mi. of track, the Eads and Merchant's bridges and the Union station, and had 137 switching locomotives (8 diesel and 55 steam). The McKinley bridge, built by the Illinois Traction company, is independent. In 1918 the St. Louis Municipal (or free) bridge was completed; it was later named the Douglas MacArthur bridge.

Other bridges spanning the Mississippi at or near St. Louis are: East St. Louis Veterans Memorial, Chain of Rocks, Jefferson Barracks and Lewis and Clark.

Education.—The first permanent kindergarten and kindergarten training school in connection with public schools in the United States were established in St. Louis in 1873. The city in 1951 maintained the Harris Teachers and junior college for white students, the Stowe Teachers and junior college for Negro students, 7 high schools for white and 2 for Negro children, 2 technical high schools, 7 evening schools, 106 elementary schools for white and 37 for Negro children, a division of audiovisual education, an FM radio station, and a large stadium for high school athletics. The registration in the high schools for 1949-50 was 18,473; in the technical high schools, 4,060; in the elementary schools, 72,625; and in the evening schools in the adult education program, 3,659 (average nightly attendance). There were 5,008 employees in the public schools, 3,764 of whom were in the department of instruction. The day schools cost the city \$18,974,729 for the year 1949-50. The Roman Catholic Church maintained 22 high schools with an enrolment of 7,654, and 76 elementary schools with an enrolment of 28,838. The Lutheran Church (Missouri synod) maintained in 1950 1 high school and 21 elementary schools. In or near St. Louis there are a number of excellent private schools. The National Council of Christians and Jews instigated a new approach in education in St. Louis, as elsewhere, through its program in intergroup relations carried through the American Council on Education.

Washington university and St. Louis university are the most important institutions of higher learning. The former (1853) is made up of the college of liberal arts, the schools of engineering, architecture, business and public administration, social work, law, medicine, dentistry, nursing and fine arts, the Henry Shaw school of botany, the university college, the summer school, the graduate school of arts and sciences and the Sever institution of technology. Most of the buildings are in the Tudor-Gothic style of architecture. The faculty in 1950-51 numbered 1,411 and the students 12,048. Endowment in 1950-51 was \$30,444,000. The institution is nonsectarian. St. Louis university was founded by a Catholic bishop as St. Louis academy in 1818, renamed St. Louis

PUBLIC BUILDINGS OF ST. LOUIS

1. Civil Courts building. Plaza Commission, architects

2. Federal building (U.S. court and customs house). Mauran, Russell, Crowell, and Mullgardt, architects

3. Federal Reserve Bank building. Mauran, Russell, Crowell, and Mull-

gardt, architects

4. Municipal auditorium, facing the Memorial plaza. The building has an opera house with a seating capacity of 3,500 persons and an arena seating 12,500 persons. The Plaza Commission, consisting of members of seven firms of architects, designed the building

college in 1820 and incorporated as St. Louis university in 1832. A Jesuit institution, it was the first university west of the Mississippi river to receive a charter. The university is composed of the college of arts and sciences, the schools of divinity, medicine, dentistry, law, commerce and finance, and nursing, the graduate school, the college of philosophy and letters, the institute of technology and the Parks college of aeronautical technology. In addition St. Louis university is affiliated with six corporate colleges, some located in St. Louis county. The faculty in 1950-51 numbered 1,285 and the students 8,943, both exclusive of the corporate colleges. The endowment in 1950-51 was \$4,052,066.

Other institutions of higher learning in St. Louis or its suburbs are the St. Louis Roman Catholic Theological seminary (Kenrick seminary) (Roman Catholic, 1818), St. Stanislaus seminary (Roman Catholic, 1823), Lindenwood college, St. Charles (1827), Shurtleff college, Alton, Ill. (1827), McKendree college, Lebanon, Ill. (1828), Monticello college, Godfrey, Ill. (1835), Concordia Theological seminary (Lutheran Church-Missouri synod, 1839), Eden Theological seminary (German Evangelical Synod of North America, 1850), Principia college, Elsah, Ill. (1898), and Jefferson college (1940).

Libraries and Museums.—In addition to the libraries of Washington and St. Louis universities, there are the public library (1,026,529 vol., 929,835 pamphlets and 27,673 maps with a circulation close to 2,000,000, 20 branches in its own or other buildings and 2 bookmobiles; the Mercantile library (191,490 vol. and pamphlets); the Missouri Historical society, housed in the Jefferson memorial in Forest park, with a collection of about 80,000 vol. and pamphlets, and about 1,000,000 manuscripts pertaining primarily to the history of the Mississippi valley. The society also maintains an archaeological and historical museum and houses the Charles Lindbergh trophies and medals.

An association of music lovers maintains a symphony orchestra. In Forest park is the open-air municipal theatre, which seats 10,000. The City Art museum in Forest park houses a valuable collection of paintings, statuary, tapestries and other works of art.

The Artists' guild offers prizes to encourage artists and gives frequent art exhibits.

Hospitals.—The chief hospitals are the Barnard Free Skin and Cancer, Barnes, Jewish, St. Louis Children's, St. Luke's, St. Mary's, the Shriners' (for crippled children), Evangelical Deaconess, De Paul, Missouri Baptist, St. John's, St. Louis City, Homer G. Phillips, Bliss Psychopathic, Robert Koch, McMillan, St. Louis Maternity, Firmin Desloge, Lutheran, Missouri Pacific, Frisco Employee's, Bethesda and Veterans' Administration.

Newspapers; Water Supply.—The chief newspapers are the *Post-Dispatch* and the *Globe-Democrat*. Foreign language newspapers include weeklies in Jewish, Italian, German, Hungarian, Bohemian and Polish.

The waterworks are near Chain of Rocks park in the extreme northern part of the city, where large settling basins and a filtering plant are located. The Mississippi is the source of supply. After 1923 additional waterworks were built at Howard's Bend on the Missouri river about 30 mi. above its mouth, with a reservoir at Olivette.

Parks and Public Buildings.—The most notable park is Forest park (1,320 ac.), portions of which have been left wild. The western part was used for the Louisiana Purchase exposition of 1904. In the park are the City Art museum, Jefferson memorial, field house, municipal theatre, two public golf links, tennis courts, baseball and soccer fields and zoological gardens. Other large parks are Tower Grove (277 ac.), Carondelet (180 ac.), O'Fallon (159 ac.), Fairground (131.46 ac.) and Tilles (58 ac.).

The Missouri Botanical garden (125 ac.), one of the finest in the United States, was a gift to the city from Henry Shaw (1800-89), who also endowed the botanical school of Washington university. The city maintains 69 parks covering about 3,000 ac. and 44 playgrounds for children.

Of historical interest are the Old Cathedral (Catholic) and the old courthouse, the latter being the scene of the Dred Scott trial. The most imposing public buildings are the city hall, courthouse,

public library, municipal auditorium, Union station, federal building, art museum and Jefferson memorial. Churches include the Roman Catholic cathedral, the Westminster Presbyterian, Christ Church cathedral (Episcopalian), Second Baptist, St. John's Methodist Episcopal, First Church of Christ Scientist and Temple Israel.

Government.—In 1840 a police force composed of a captain, three lieutenants and 28 privates was organized. In 1841 the boundaries were enlarged and the city was divided into five wards. In 1842 voting by ballot was introduced, and an engineering department composed of the city engineer, street commissioner and superintendent of the waterworks was established. A health department was created in 1843. The following year the taxpaying qualification for voters was removed. In 1859 an amendment to the charter provided that the city council was to be a one-chamber body called the common council and composed of 20 members, two from each of the wards. In 1861 the legislature established the metropolitan police of St. Louis, and placed it under the control of a board of police commissioners appointed by the governor. The mayor was an ex-officio member of the board. The police department was then made independent of city government. In 1866 the council was again made bicameral. In 1871 the number of wards was increased to at least 12.

Up to 1876 St. Louis and St. Louis county were a judicial unit, and jointly controlled the courthouse, jail, insane asylum and poor farm. By an act of the state legislature in 1875 provision was made for the separation of the city and county, for the city to extend its boundaries and for a new charter. In 1876 the provisions were carried into effect. The courthouse, jail, insane asylum and poor farm became the property of the city and the old county debt became a city obligation. Under the charter of 1876 the city was divided into 28 wards. The mayor was to hold office for four years and was given extensive power of appointment. The municipal assembly was bicameral, being composed of a council of 13 and a house of delegates composed of one member from each ward. The mayor appointed a board of public improvements composed of the street, sewer, water, harbour and wharf and park commissioners. Each commissioner was head of a department. The charter also provided for a health department, for an elective school board of 28 members, one from each ward, for a board of assessors and a board of equalization.

In 1914 a new charter went into force. Under this charter the mayor holds office for four years and is given large powers of appointment and supervision. The board of aldermen is made up of a president and 28 aldermen, who hold office for four years. The board is a legislative body and has large powers, especially over money bills. The mayor appoints the members of the board of public service; this is composed of the president of the board and directors of public utilities, of streets and sewers, of public welfare and of public safety. Each is the head of a department. The department of finance is headed by a comptroller; the law department is headed by the city councillor. The charter provides for two city courts, for a board of standardization, a board of estimate and apportionment and a city plan commission. One of the reasons for the adoption of a new charter was the desire to safeguard the city against the machinations of politicians and political rings. To effect this, provisions were introduced for the recall of officials, for the initiation of legislation by petitions signed by 5% of the voters and for the referendum upon ordinances if called for by 2% of the registered voters.

SAINT LOUIS, administrative seat of the French sub-colonies Senegal (q.v.) and Mauritania, first capital (1895-1902) of French West Africa (q.v.), a considerable regional market, and the onetime French West African port for overseas and Senegal river trade.

Located at the point where the Senegal reaches a dune-covered sand bar, behind which it flows 12 mi. before entering the sea, it is near the climatic division between Sahara and Sudan. Its original site, and present commercial core and locale of the Senegalese government, is a bar-shaped island 1½ mi. long. This is connected by two short bridges with native fishermen's quarters and the Mauritanian government offices on the main sand bar, and by a bridge 2,132 ft. long, with a suburb at the mainland terminal of the railroad to Dakar (q.v.), 168 mi. south. The total population (1936 census) was 33,100; (1938) 35,929 including 1,000 Europeans.

Vessels drawing up to 10 ft. can cross the bar and navigate the river during the rains (July-September inclusive), but water traffic has been supplanted by rails. Founded in 1659 by Dieppe merchants, Saint Louis is the oldest colonial establishment in Africa belonging to France. After 1854 it became the base of military expeditions leading to the formation of French West Africa. Made one of the two original communes in Senegal in 1872, its citizens may vote for a representative in the French chamber of deputies. Institutions include a secondary school on the model of a French *lycée*, a school for sons of Moslem chiefs (specializing in administration, law and accounting), and a hospital.

See R. Rousseau, "Le site et les origines de Saint-Louis," *La Géographie* 44 (1925). (D. Wn.)

ST. LOUIS-SAN FRANCISCO RAILWAY COMPANY, popularly known as "The Frisco," was incorporated on Aug. 28, 1916, as successor to a company formed in 1876, having for its purpose the construction of a railroad from St. Louis, Mo., to the Pacific coast. This original plan, however, did not fully materialize. The present railroad comprises a total of 5,175 mi. of road, extending from St. Louis and Kansas City, Mo., through Missouri, Kansas, Oklahoma, Arkansas into Texas, and crossing the Mississippi river at Memphis, Tenn., it passes through Tennessee, Mississippi, Alabama and Florida to the port of Pensacola on the Gulf of Mexico. The railway serves a rapidly developing section of the United States. The more important industries in the territory are iron and steel and other manufactures in St. Louis and Kansas City, Mo., Memphis, Tenn., and Birmingham, Ala.; the mid-continent oil fields; coal mining; lead and zinc mining; livestock raising; grain and cotton growing; and fruit and dairying in the great Ozark region.

(J. M. Kv.; X.)

ST. LUCIA, the largest of the British Windward Islands, West Indies, in 13° 54' N. and 60° 59' W., 24 mi. S. of Martinique and 21 mi. N.E. of St. Vincent. Area 233 sq.mi., length 27 mi., maximum breadth 14 mi.; circumference 150 mi. It is considered one of the loveliest of the West Indian islands. It is a mass of mountains, rising steeply from the water, their summits bathed in perpetual mist. The highest of these is Morne Gimie (3,143 ft.), but the Pitons (2,619 ft. and 2,461 ft.) are the chief natural feature—two immense pyramids of rock rising abruptly from the sea with their slopes, inclined at a 60° angle, clothed on three sides with dense verdure. Near Petit Piton is Soufrière, a low-lying volcanic crater. The boiling sulphur springs which give Soufrière its name are at Ventine, 2½ mi. S.E. of the town of Soufrière. Rainfall averages 91 in. a year, the temperature averages 80° F.

History.—St. Lucia was discovered by Columbus in 1502 and named after the saint on whose day it was sighted. The Dutch are said to have built a fort there, but the first attempt to settle was made by Englishmen in 1650. Carib resistance compelled its abandonment. From this time until the island became definitely a British possession in 1814 it was the scene of fiercely recurring

struggles between England and France; and 13 British regiments gained the right to inscribe the name St. Lucia on their colours. In the first half of the 17th century it was included in royal grants made by the kings of England and France; but English settlers were long deterred by the unlucky reputation which St. Lucia gained after a second disastrous attempt at colonization in 1638, frustrated by sickness and native hostility. The French were more successful, sending settlers from Martinique in 1650, by whom a treaty was made with the Caribs ten years later. England defeated the French shortly afterward, and regained the island, but it was restored by the peace of Breda in 1667.

Another British settlement under a grant of 1722 was frustrated by France. In 1748 the two nations agreed to regard St. Lucia as neutral. In 1762 it was captured by Rodney and Monckton, only to be given up once more by the treaty of Paris. In 1778 it again surrendered to the British, who used its harbours as a naval base; and it was from Gros Islet bay that Rodney sailed before his famous victory over de Grasse in April 1782. Between 1782 and 1803 the possession of St. Lucia passed six times between England and France, England having to suppress a vigorous revolutionist party, aided by insurgent slaves, before gaining possession in 1803, confirmed by a final cession in 1814. From this time the island was administered as a crown colony—under Barbados from 1838 to 1885.

Representative government was obtained by the constitution of 1924 which introduced an elective element into the legislative council, and the constitution of 1936 provided for an unofficial majority in the council.

French influence on the development of St. Lucia has been very great, and is illustrated by the preponderance of the Roman Catholic Church and the survival of a French patois. In the years following 1763 French planters came from St. Vincent and Grenada and formed cotton and sugar plantations. In 1772 the population was said to number 15,000, mostly slaves. In 1834, when the slaves were emancipated there were in St. Lucia more than 13,000 Negro slaves, 2,600 free Negroes and 2,300 whites. Prosperity was greatly retarded by the frequent wars, by epidemics of cholera and smallpox and by the decline of the sugar-cane industry. Improvement came with the increase of banana and cocoa cultivation, and resuscitation of sugar-cane cultivation.

The excellent landlocked harbour of Castries, one of the best in the West Indies, gives St. Lucia great strategic importance. In 1940, as part of its "destroyer-bases" agreement with Great Britain, the United States acquired on 99-yr. lease a naval and air base on Gros Islet bay, 4 mi. from Castries, along with other facilities. These were all relinquished by 1949, but the United States retained the right to re-establish them in the event of war or grave emergency.

Population and Economic Conditions.—The population of St. Lucia was estimated at 79,500 in 1950. Castries (pop. 7,056), the capital, on the N.W. coast, was almost completely destroyed by fire in June 1948, but rebuilding on a carefully planned basis began shortly thereafter. The bulk of the inhabitants of the island are Negroes and mulattoes; the rest are whites or of East Indian extraction. A French patois is generally spoken by most, gradually being supplanted by English. The government subsidizes primary education through grants-in-aid to the island's denominational primary schools (principally Roman Catholic) and two secondary schools.

Government is under an appointed administrator (subordinate to the governor of the Windward Islands, of which colony St. Lucia forms part). The legislative council is partly appointed, partly elected.

The colony's essentially agricultural economy is dominated by sugar raising. In 1950 St. Lucia produced 10,447 tons of sugar. Although much of the land is held in large estates, there were more than 4,000 individual proprietors in 1949. Fishing is carried on extensively for the local market and provided full-time employment for 1,750 persons in 1949. In addition to sugar and sugar products, copra and coconuts, cacao, bananas and lime products are exported to non-West Indian areas. There is also a flourishing charcoal trade with Barbados. In 1950 exports totalled £309,071

in value; imports, principally flour, rice and other foodstuffs and a wide variety of manufactured goods, were valued at £1,093,372.

External communication is by steamer service which is irregular but fairly frequent, and by air. St. Lucia enjoys better air service than any other of the British West Indian islands except Jamaica and Trinidad.

ST. MAIXENT (L'École), a town of western France, in the department of Deux Sèvres, on the Sèvre Niortaise, 15 mi. N.E. of Niort by rail. Pop. (1946) 5,440. The fine abbey church, built from the 12th to the 15th century, was in great part destroyed by the Protestants in the 16th century and rebuilt from 1670 to 1682 in flamboyant Gothic. There is a Romanesque nave and a lofty 15th century tower over the west front. The crypt contains the tomb of St. Maxentius, second abbot of the monastery, which was founded about 460. The prosperity of the town was at its height after the promulgation of the edict of Nantes, when it numbered 12,000 inhabitants.

ST. MALO, a seaport of western France, capital of an arrondissement in the department of Ille-et-Vilaine, 51 mi. N.N.W. of Rennes by rail. Pop. (1946) 11,311.

In the 6th century the island on which St. Malo stands was the retreat of Abbot Aaron, who gave asylum in his monastery to Malo (Maclovius or Malovius), a Cambrian priest, who afterwards became bishop of Aleth (now St. Servan); the see was transferred to St. Malo only in the 12th century. In the 17th century the maritime power of St. Malo attained some importance. In Nov. 1693 and July 1695 the English vainly bombarded it. The St. Malo shipowners financed the Rio de Janeiro expedition of Duguay-Trouin in 1711 and also lent the king large sums for carrying on the war of the Spanish Succession. In June 1758 the English inflicted great loss on the royal shipping in the harbour of St. Servan, but another expedition in the following September received a complete check. In 1778 and during the wars of the Empire the St. Malo privateers resumed their activity. In 1789 St. Servan was separated from St. Malo, and in 1801 St. Malo lost its bishopric.

St. Malo is situated on the English channel on the right bank of the estuary of the Rance at its mouth. It is a garrison town surrounded by ramparts which include portions dating from the 14th, 15th and 16th centuries but as a whole were rebuilt at the end of the 17th century and restored in the 19th century. The most important of the gates are that of St. Vincent and the Grande Porte, defended by two massive 15th-century towers. The granite island on which St. Malo stands communicates with the mainland on the northeast by a causeway known as the "Sillon" (furrow), commanded by the old 14th and 15th century castle, flanked with four towers, one of which, the great keep, is an older and loftier structure. In the sea round about lie other granite rocks, which have been turned to account in the defenses of the coast. The rocks and beach are continually changing their appearance, owing to the violence of the tides; spring tides sometimes rise 50 ft. above low-water level, and the sea sometimes washes over the ramparts. The harbour of St. Malo lies south of the town in the creek separating it from the neighbouring town of St. Servan. Including the contiguous and connected basins belonging to St. Servan, it comprises an outer basin, a tidal harbour, two wet-docks and an inner reservoir, affording a total length of quays of over 2 mi. The wet-docks have a minimum depth of 13 to 15 ft. on sill, but the tidal harbour is dry at low water. The great bulk of trade is with England, the exports comprising large quantities of fruit, dairy produce, early potatoes and other vegetables and slate. The principal imports consist of coal and timber. The Southern railway maintains a regular service of steamers between Southampton and St. Malo. The port carries on shipbuilding and equips a fleet for the Newfoundland cod-fisheries. The industries also include iron- and copper-founding and the manufacture of portable forges and other iron goods and rope. The town is the seat of a sub-prefect and has a tribunal of commerce.

St. Malo is largely frequented for sea-bathing, but not so much as Dinard, on the opposite side of the Rance. The town presents a tortuous maze of narrow streets and small squares lined with high and sometimes quaint buildings. Above all rises the stone spire (1859) of the cathedral, a building begun in the 12th century but added to and rebuilt at several subsequent periods.

SAINT-MARC GIRARDIN (1801–1873), French politician and man of letters, whose real name was MARC GIRARDIN, was born in Paris on Feb. 22, 1801. After a brilliant university career in Paris he began in 1828 to contribute to the *Journal des Débats*, on the staff of which he remained for nearly half a century. At the accession of Louis Philippe he was appointed professor of history at the Sorbonne and master of requests in the Conseil d'État. Soon afterwards he exchanged his chair of history for one of poetry, continuing to contribute political articles to the *Débats* and sitting as deputy in the chamber from 1835 to 1848. He was charged in 1833 with a mission to study German methods of education and issued a report advocating the necessity of newer methods and of technical instruction. In 1844 he was elected a member of the academy. During the revolution of Feb. 1848 Girardin was for a moment a minister, but after the establishment of the republic he was not re-elected deputy. After the war of 1870–71 he was returned to the Bordeaux assembly by his old department—the Haute Vienne. His Orleanist tendencies and his objections to the republic were strong, and though he at first supported Thiers, he afterwards became a leader of the opposition to the president. He died on April 1, 1873, at Morsang-sur-Seine, before Thiers was actually driven from power.

His chief work is his *Cours de littérature dramatique* (1843–63), a series of lectures better described by its second title, *De l'usage des passions dans le drame*.

See Hatfield and Meunier, *Les Critiques Littéraires du XIX^e siècle* (1894).

SAINT-MARTIN, LOUIS CLAUDE DE (1743–1803), French philosopher, known as "le philosophe inconnu," the name under which his works were published, was born at Amboise on Jan. 18, 1743. While in garrison at Bordeaux he came under the influence of Martinez de Pasquales, who taught a species of mysticism drawn from cabalistic sources and endeavoured to found a secret cult with magical or theurgical rites. In 1771 Saint-Martin left the army to become a preacher of mysticism, first in Paris, and then in England, Italy, Switzerland and the French provinces. At Strasbourg in 1788 he met Charlotte de Boecklin, who introduced him to the writings of Jacob Boehme and inspired in him a semi-romantic attachment. He was brought up a strict Catholic and always remained attached to the church, although his first work, *Of Errors and Truth*, was placed upon the Index. He died at Aunay, near Paris, on Oct. 23, 1803.

His chief works are a translation of the works of Boehme; *Lettre à un ami sur la Révolution Française*; *Eclair sur l'association humaine*; *De l'esprit des choses*; *Ministère de l'homme-esprit*. Other treatises appeared in his *Oeuvres posthumes* (1807). Saint-Martin's ideal society was "a natural and spiritual theocracy," in which God would raise up men of mark, who would regard themselves strictly as "divine commissioners" to guide the people.

See A. J. Matter, *Saint-Martin, le philosophe inconnu* (1862); A. Franck, *La Philosophie mystique en France à la fin du dix-huitième siècle* (1866); A. E. Waite, *The Life of Louis Claude de Saint-Martin* (1901). There are English translations of *The Ministry of Man* (the Spirit) (1864) and of *Select Correspondence* (1863) by E. B. Penny.

ST. MARTIN, an island in the West Indies, about 5 mi. S. of the British island of Anguilla in 18° N. and 63° W. It is 37 sq. mi. in area and nearly triangular in form, composed of conical hills, culminating in Paradise peak (1,024 ft.). It is the only island in the Antilles owned by two European powers; 20 sq. mi. in the N., belonging to France, form a dependency of Guadeloupe, while the rest, belonging to Holland, is a dependency of Curaçao. Sugar, formerly its staple, has been succeeded by salt. The chief town of the French area is Marigot, a free port on the W. coast; of the Dutch, Philipsburg, on the S. St. Martin was first occupied by French freebooters in 1638, but ten years later the division be-

tween France and Holland was peaceably made. The inhabitants, mostly English-speaking Negroes, numbered in 1946, 6,786 in the French part, and in the Dutch (1947) 1,697.

ST. MARYLEBONE; see **MARYLEBONE, ST.**

SAINT MARYS, a city of Auglaize county, Ohio, U.S.A., on the Saint Marys river, 85 mi. W.N.W. of Columbus. It is served by the New York Central and the Nickel Plate railways. Population was 6,211 in 1950, 5,532 in 1940 and 5,433 in 1930 by the federal census. It is in the gas and oil region of the state, and has various manufacturing industries. A mile west is Lake Saint Marys (17,600 ac.), constructed as a reservoir to supply the Miami and Erie canal (abandoned about 1900), and now developed as a pleasure resort.

Saint Marys is on the site of a Shawnee village, where James Girty (captured in Pennsylvania when a boy of 13 by a French and Indian force and adopted by the Shawnees) established a trading post in 1783. For this reason the place was for some years called Girty's Town. Ft. Saint Marys was built in 1784 or 1785 by Gen. Wayne; Ft. Barbeau in 1812 by Col. Joshua Barbee at the instance of Gen. Harrison. The town was laid out in 1823 and became a city in 1903.

SAINT MARYS, a borough of Elk county, Pennsylvania, U.S.A., on Elk creek and federal highway 120, at an altitude of 1,700 ft.; served by the Pennsylvania railway. The population of the borough was 7,852 in 1950, and 7,653 in 1940 by federal census. The borough was incorporated in 1848.

ST. MAWES, village in parish of St. Just-in-Roseland, Cornwall, England, on an arm of Falmouth harbour. Pop. of parish (1931) 970. There is a considerable fishing industry. The harbour is guarded by a large circular castle dating from the time of Henry VIII. St. Mawes was a borough, 1562-1835.

ST. MICHAEL'S (*São Miguel*), the largest island in the Portuguese archipelago of the Azores. Pop. (1940), 148,018; area, 288 sq.mi. See **AZORES**.

ST. MICHAEL'S MOUNT, a lofty pyramidal island, exhibiting a curious combination of slate and granite, rising 400 yd. from the shore of Mount's bay, Cornwall, England. It is united with Marazion by a natural causeway passable only at low tide. If its questionable identity with the Mictis of Timaeus and the Ictis of Diodorus Siculus be allowed, St. Michael's Mount is one of the most historic spots in the west of England. It was possibly held by a religious body in the Confessor's time and given by Robert, count of Mortain, to Mount St. Michael, of which Norman abbey it continued to be a priory until the dissolution of the alien houses by Henry V, when it was given to the abbeys and Convent of Syon. It was a resort of pilgrims, encouraged by Pope Gregory (11th century). The Mount was captured by Henry Pomeroy in the reign of Richard I. John de Vere, earl of Oxford, seized it and held it against the king's troops in 1473. Perkin Warbeck occupied it in 1497. Humphry Arundell, governor of St. Michael's Mount, led the rebellion of 1549. During the reign of Queen Elizabeth it was given to Robert, earl of Salisbury, by whose son it was sold to Sir Francis Basset, whose brother, Sir Arthur Basset, held it against the parliament until July 1646. It was sold in 1659 to Colonel John St. Aubyn and is now the property of his descendant Lord St. Levan, who has a residence in the castle. The chapel is extra-diocesan. Many relics are preserved in the castle. The chapel of St. Michael, a beautiful 15th century building, has an embattled tower. The harbour, widened in 1823 to allow vessels of 500 tons to enter, has a pier dating from the 15th century. Pop. (1931) 71.

ST. MIHIEL, a town of northeastern France, in the department of Meuse, on the right bank of the Meuse and the Canal de l'Est. 23 mi. S. by E. of Verdun by rail. Pop. (1946) 4,335. St. Mihiel is famous for its Benedictine abbey of St. Michael, founded in 709. The abbey buildings (occupied by the municipal offices) date from the end of the 17th century and the beginning of the 18th century, and the church from the 17th century. The church of St. Étienne, chiefly in the flamboyant Gothic style, contains a magnificent Holy Sepulchre by Ligier Richier. St. Mihiel formerly possessed fortifications and two castles, destroyed in 1635.

Battle of St. Mihiel, 1918.—In his first conference with the

commander-in-chief of the French armies, Gen. Pershing visualized the reduction of the St. Mihiel salient as the first U.S. operation in World War I. In accordance with studies made at his headquarters in Sept. 1917, he planned that the decisive U.S. effort would be against the German railroad system north and east of the Meuse river and the ore deposits in the vicinity of Metz and Longwy, with the elimination of the St. Mihiel salient as a necessary preliminary. Though early American control of the Woerwe sector was agreed (May 19, 1918) the demands for American troops to assist the Allies in meeting the Germans elsewhere limited further steps along these lines to the creation of supply installations. At Bombon, on July 24, the commanders-in-chief, having determined to maintain the offensive, accepted Gen. Pershing's proposal that his army should undertake to reduce the St. Mihiel salient before the autumn rains began about the middle of September. This operation harmonized with the Château Thierry offensive and the British and French attacks against the Amiens and Ypres-Lys salients, made in order to free strategic railroads, preparatory to more extended operations. The counter-offensives against the Marne and Amiens salients in July and Aug. had gained such advantages that it was apparent the emergency which justified the dispersion of American divisions had passed. On Aug. 9, final decision was given for the immediate assembly of the American army for an attack against the St. Mihiel salient.

The American troops in France—at this time over 1,200,000—were sufficient for the offensive, but they were dispersed along the front from Switzerland to the Channel. While the I Army Headquarters, two corps and corps troops and seven divisions were operating in the Marne offensive, other American divisions were holding sectors in the Vosges and Lorraine and several were training as reserves behind the British front. To assemble these combat and service troops into an army and undertake a major operation within the short period available and with the staffs so recently organized was an extremely difficult task. Deficiencies in artillery, aviation and special troops, caused by shipment of an undue proportion of infantry and machine guns to assist the Allies, were largely met by the French. While the I American army was given a distinct and independent mission, Gen. Pershing suggested, as expedient, that it should function under the nominal direction of Gen. Pétain, the French commander-in-chief, in order to assure co-ordination on the part of the French armies adjacent to the I army and to provide French units needed at the outset for supply services. To all intents and purposes the I army was entirely independent of French command, as all plans were prepared and all movements and operations ordered by the commander of the I army. The initial battle plan approved by Marshal Foch by Aug. 17, contemplated as an ultimate objective the general line: Marienla (east of the Moselle), the heights south of Gorée, Mars la Tour, Etain and the employment of 25 divisions under Gen. Pershing's personal direction. In furtherance of this plan, the scattered divisions, corps and service troops were first gathered in areas about Chaumont and Neufchâteau and then, beginning Aug. 28, the army advanced to its battle position.

The I American army took command of the front from Port-Sur-Selle (east of the Moselle) to Watronville (north of Les Eparges) from the II and VIII French Armies on Aug. 30. On this day, at I American Army headquarters (Ligny-en-Barrois), Marshal Foch discussed with Gen. Pershing a general plan for future operations and proposed employing American divisions under French command in the Champagne and Meuse-Argonne regions with a material reduction of the St. Mihiel forces in order to make available American troops for these new operations. Gen. Pershing could not accept such plans as they would require the immediate separation of the recently formed I American army into several groups delaying further the formation of a distinct American army. Moreover, an enormous amount of preparations had already been made in supplies and munitions and in construction of roads, railroads, regulating stations and other installations for the supply of the army on a particular front. While willing to accept the employment of the American army as a unit where desired, Gen. Pershing would not entertain proposals for its dis-

ruption. At a later conference on Sept. 2, the employment of the American army as a unit was conceded and a decision reached to the effect that after reducing the St. Mihiel salient, the I American army would attack by Sept. 25 between the Meuse river and Argonne forest (see MEUSE-ARGONNE OPERATION). As a result of the decisions, the depth of the St. Mihiel operation was limited to the line Vigneulles, Thiaucourt, Regneviller. The number of divisions to be used was reduced and the time shortened. There were 15 American divisions (each equal in size to 2 French divisions) and 4 French divisions available, 6 of which would be in reserve. Furthermore, 2 army corps headquarters and corps troops, practically all army artillery and aviation and the 1st, 2nd and 4th divisions, the first 2 destined for a leading part in the St. Mihiel attack, were all due to be withdrawn and started for the Meuse-Argonne by the fourth day of the battle.

The salient had been held by the Germans since Sept. 1914. It covered the most sensitive section of the enemy's position on the western front; i.e., the Mézières-Sedan-Metz railroad and the Briey Iron Basin; it threatened the entire region between Verdun and Nancy and interrupted the main railroad line from Paris to the east. Its primary strength lay in the natural defensive features of the terrain itself. The western face of the salient extended along the rugged, heavily-wooded eastern heights of the Meuse; the southern face followed the heights of the Meuse for 5 mi. to the east and then crossed the plain of the Woëvre, including within the German lines the detached heights of Louvemont and Mont Sec, which dominated the plain and afforded the enemy unusual facilities for observation. The enemy had reinforced the positions by every artificial means during a period of four years. Having concentrated by night movements over 600,000 men on the battlefield, the troops of the I army were deployed in attack positions on the night of Sept. 11. On the south face of the salient was the I corps (4 divisions in line) extending from the Moselle westward. On its left was the IV corps (3 divisions in line) with left facing Mont Sec. These 2 corps were to deliver the main attack, the advance pivoting on the centre of the I corps. The left of the IV corps was to advance toward the heart of the salient where contact would be made with the V corps from the west. On the western face of the salient lay the V corps (3 divisions in line) extended from Mouilly via Les Eparges to Watronville. While the centre division made a deep advance to gain contact with the IV corps on the south, the rest of the corps was to limit its advance while covering the flanks of the centre division. Between the IV and V corps around the apex of the salient, the II French corps (3 divisions in line) covering 24 mi., had the mission of attacking to hold the enemy in the salient. American artillery and aviation were greatly augmented by French artillery and aviation and assisted indirectly by the British independent air force located south of Nancy. The heavy artillery could reach the railroads entering Metz.

Gen. Foch's Army Detachment C held the salient on Sept. 12 with 8 divisions in line and 3 divisions in immediate reserve. While the Germans had an inkling of a possible American attack as early as Sept. 1, the magnitude and imminence were not suspected. An American ruse at Belfort, which comprised extensive preparation for an attack in that region, proved misleading to the enemy. A decision having been made to withdraw in face of a serious attack at St. Mihiel, preparations for a deliberate and methodical withdrawal were under way, some dismounted batteries having been displaced, when the Americans launched their attack at dawn on Sept. 12. After four hours' violent artillery preparation, accompanied by small tanks, the I and IV corps advanced. The infantry of the V corps attacked at 8 A.M. The operation was carried out with precision. Just after daylight of the 13th, elements of the IV and V corps joined at Vigneulles, 11 mi. N.E. of St. Mihiel. The enemy was overwhelmed, and all objectives were reached on the afternoon of Sept. 13. During the 14th and 15th, while the two German counterattacks were repulsed by the I corps, the Americans advanced along the Moselle to the line Jaulny-Pagny-sur-Moselle. On Sept. 14-16, local operations continued, American patrols advancing to Dampvilloux, eastern edge of Etang de Lachaussée, Jonville and Fresnes-en-Woëvre. The swiftness with

which the operation was carried out enabled the Americans to smother the opposition to such an extent that they suffered less than 7,500 casualties during the actual period of the advance. During the battle the Germans engaged four new divisions and drew into local reserve several other divisions.

The Americans captured nearly 16,000 prisoners (over 4,000 in the salient proper), 443 guns and large stores of material and supplies. The moral result of the victory was striking. An American army had suddenly appeared and crushed the enemy in one of his strongest positions. No form of propaganda could overcome the depressing effect on the enemy of this demonstration of ability to organize a large American force in so short a time and drive it successfully through its defenses. The strength of the I American army in the battle totalled over 500,000 Americans and 100,000 French, approximately 2,900 cannons, 400 tanks and 1,000 aeroplanes. (H. A. Dr.; J. J. P.)

ST. MORITZ, loftiest (6,037 ft.) and most populous village of the Upper Engadine in the Swiss canton of the Grisons. Pop. (1941) 2,305; about half were German-speaking, the rest chiefly Romansch and Italian. About half were Protestant and half Roman Catholic. It is built above the north shore of the lake of the same name, and is 56 mi. from Coire by the Albula railway. The village is about 1 mi. north of the baths, an electric tramway connecting the two. Both are ordinarily frequented by foreign visitors. The baths (chalybeate, sparkling with free carbonic acid) were already well-known in the 16th century.

ST. NAZAIRE, a town of France, capital of an arrondissement in the department of Loire-Inférieure, 40 mi. W.N.W. of Nantes by rail and 29 mi. by river. Pop. (1936) 38,627. According to remains discovered, St. Nazaire seems to occupy the site of the ancient *Corbilo*, placed by Strabo among the more important maritime towns of Gaul. At the close of the 4th century the site of Corbilo was occupied by Saxons, and, their conversion to Christianity being effected one or two hundred years later by St. Felix of Nantes, the place took the name of St. Nazaire. Under the Second Empire it was chosen as the site of the new harbour for Nantes, because the ascent of the Loire was becoming difficult. St. Nazaire, on the Loire at its mouth, is a modern town. It possesses a granite dolmen 10 ft. by 5 ft. resting horizontally on two other stones. The harbour, accessible to largest ships, is separated from the estuary by a narrow strip of land and comprises an outer harbour and entrance, two floating docks, three graving docks and the extensive shipbuilding yards of the Loire Co. and of the General Transatlantic Co. whose steamers connect St. Nazaire with Mexico, the Antilles and the Isthmus of Panama. Ships for the navy and the mercantile marine are built, and there are important steelworks, blast furnaces, forges and steam saw-mills.

The town is the seat of a sub-prefect and has a board of trade-arbitrators, a chamber of commerce and a tribunal of commerce.

ST. NEOTS (pronounced St. Neets), a market town in Huntingdonshire, England, on the right bank of the Ouse, 5½ mi. N. of London by the L.N.E.R. Pop. of urban district (1938) 4,087. Area 2.2 sq.mi. A stone bridge, built in 1589 from the ruins of a former priory, here crosses the river and connects the county with Bedfordshire.

St. Mary's church is a fine Perpendicular building of the later 15th century, with original oak roof.

ST. NICOLAS, town, province of East Flanders, Belgium, 12 mi. southwest of Antwerp, a railway junction on the Antwerp-Ghent line, with linen manufactures of its own, and the central market of Waes; formerly barren and bleak downs, it is now highly productive. Pop. (est. 1939) 42,190.

ST. NICOLAS or ST. NICOLAS DU PORT, a town of north-eastern France, in the department of Meurthe-et-Moselle, on the left bank of the Meurthe, 8 mi. S.E. of Nancy by rail. Pop. (1936) 5,078. The town has a fine Gothic church (15th and 16th century), possessing a finger joint of St. Nicolas, formerly the object of pilgrimages which were themselves the origin of well-known fairs. The fairs declined after 1635, when the Swedes sacked the town. Important saltworks are nearby.

ST. OMER, a town and fortress of northern France, capital of an arrondissement in the département of Pas-de-Calais, 42 mi. W.N.W. of Lille on the railway to Calais. Pop. (1946) 18,106.

Omer, bishop of Thérouanne, in the 7th century established the monastery of St. Bertin, from which that of Notre-Dame was an offshoot. In the 9th century the village which grew up round the monasteries was named St. Omer. In 1559 St. Omer became a bishopric and Notre-Dame was raised to the rank of cathedral. The town and monastery were surrounded by walls by 980. Situated on the borders of frequently disputed territories, St. Omer long continued subject to siege and military disaster. In 1071 Philip I and Count Arnulf III of Flanders were defeated at St. Omer by Robert the Frisian. In 1127 the town received a communal charter from William Clito, count of Flanders. In 1493 it came to the Low Countries as part of the Spanish dominion. In 1677, after 17 days' siege, Louis XIV forced the town to capitulate; and the peace of Nijmegen permanently confirmed the conquest. In 1711 St. Omer, on the verge of surrendering to Prince Eugene and the duke of Marlborough owing to famine, was saved by the darning of Jacqueline Robin, who brought provisions into the place. St. Omer ceased to be a bishopric in 1801.

At St. Omer begins the canalized portion of the Aa, which reaches the sea at Gravelines, and under its walls connects with the Neufossé canal, which ends at the Lys. There are two harbours outside and one within the city. The old cathedral belongs almost entirely to the 13th, 14th and 15th centuries. A heavy square tower finished in 1499 surmounts the west portal. The church contains interesting paintings, a colossal statue of Christ seated between the Virgin and St. John (13th century, originally belonging to the cathedral of Thérouanne) and the cenotaph of St. Omer (13th century). The richly decorated chapel in the transept contains a wooden figure of the Virgin (12th century), the object of pilgrimages. Some arches and a lofty tower are all that remain of the abbey church of St. Bertin. St. Sepulchre (14th century) has a beautiful stone spire and stained-glass windows. There is a fine collection of records in the town hall, which was built of the materials of the abbey of St. Bertin. There are several houses of the 16th and 17th centuries; of the latter the finest is the Hôtel Colbert, once the royal lodging. St. Omer is the seat of a sub-prefect, of a court of assizes, of a tribunal of commerce, of a chamber of commerce, and of a board of trade arbitrators. It was the British headquarters during part of World War I. The industries include the manufacture of linen goods, sugar, soap, tobacco pipes and mustard, the distilling of oil and liqueurs, dyeing, salt-refining, malting and brewing.

The suburb of Haut Pont to the north of St. Omer is inhabited by a special stock, which has remained faithful to the Flemish tongue, its original costume and its peculiar customs, and is distinguished by honesty and industry. The ground which these people cultivate has been reclaimed from the marsh, and the *lègres* (i.e., the square blocks of land) communicate with each other only by boats floated on the ditches and canals that divide them. At the end of the marsh, on the borders of the forest of Clairmarais, are the ruins of the abbey founded in 1140 by Thierry d'Alsace, to which Thomas Becket betook himself in 1165.

SAINTONGE, one of the old provinces of France, of which Saintes (q.v.) was the capital, was bounded on the north-west by Aunis, on the north-east by Poitou, on the east by Angoumois, on the south by Guyenne, and on the west by Guyenne and the Atlantic. It now forms a small portion of the département of Charente and the greater part of that of Charente Inférieure. Originally occupied by the Gaulish *Santonnes*, whose name it preserves, the district subsequently formed part of Aquitania Secunda. It formed the bishopric of Saintes and was divided into two pagi: *Santonicus* (whence Saintonge) and *Alienensis* (Aunis). Divided between the kings of England and France in 1259 it was wholly ceded to the king of England in 1360, but reconquered by Du Guesclin in 1371. Up to 1789 it was in the same *gouvernement* with Angoumois, but for judicial purposes Saintonge was under the parlement of Bordeaux and Angoumois under that of Paris.

See D. Massiou, *Histoire politique, civile et religieuse de la Saintonge*

et de l'Aunis (6 vols. 1836-39; 2nd ed., 1846); P. D. Raignet, *Biographie saintongaise* (1852). See also the publications of the Société des archives hist. de la Saintonge et de l'Aunis (1874 seq.).

ST. PANCRAS, a metropolitan borough of London, England, bounded east by Islington, southeast by Finsbury, south by Holborn and west by St. Marylebone and Hampstead, and extending north to the boundary of the county of London. Pop. (1938) 179,400. Area, 4.2 sq.mi. In the centre of the borough are Camden Town and Kenish Town and the three great railway termini of Euston, St. Pancras and King's Cross, with their extensive goods depôts and adjacent hotels. To the south of this lies the residential district of Bloomsbury, one mainly of boarding houses and private hotels, and with several fine squares. Still further south is a shopping district adjoining the main shopping thoroughfares. North of the railway stations are the residential districts adjoining Hampstead Heath and Regent's Park, including Gospel Gate, part of Highgate and the Holly Lodge Estate (the property of the late Baroness Burdett-Coutts), which was bought in 1923 for a garden suburb. In the northern part also are considerable open spaces, the largest of which are Waterlow Park, part of Regent's Park, Parliament Hill and Fields (bought for the public in 1886) and Ken Wood, purchased in 1919. The last contains Ken Wood House, with a noted collection of pictures.

A thoroughfare, called successively Tottenham Court Road, Hampstead Road, High Street Camden Town, Kenish Town Road, and Highgate Road, runs from south to north; Euston Road crosses it in the south, and Camden Road and Chalk Farm Road branch from it at Camden Town. The parish church of St. Pancras in the Fields, near Pancras Road, has lost its ancient character owing to reconstruction, though retaining several early monuments. Among institutions, University College, Gower Street, was founded in 1826, and provides education in all branches common to universities excepting theology. It was partly burned in World War II. With the department of medicine is connected the University College hospital (1833) opposite the college. There are several other hospitals; among them the Royal Free hospital (Gray's Inn road); the British (Forbes Winslow memorial) hospital for functional mental disorders; the London Skin hospital; and the Elizabeth Garrett Anderson Hospital for Women. The site of the Foundling Hospital (in the old Lamb's Conduit Fields) has been transformed into a permanent open-air study and play centre for children through a fund initiated for the purpose by Lord Rothermere. The hospital moved in 1926 to Redhill, Surrey, and in 1935 to Berkhamstead, Herts. Other institutions are the British Medical association in Tavistock square (1925), the Royal Veterinary college and the North Western Polytechnic (1929). The Mary Ward (formerly Passmore Edwards) Settlement, first named for its principal benefactor, was founded largely through the instrumentality of Mrs. Humphry Ward. In Euston road are the headquarters of the Society of Friends of Great Britain. The new buildings were completed in 1926. St. Pancras has three parliamentary divisions, each returning one member. Many of the inhabitants are employed in work connected with the railways. There are also extensive furniture and piano-making industries.

St. Pancras is mentioned in Domesday as belonging to the chapter of St. Paul's Cathedral, in which body the lordship of the manors of Cantelows (Kenish Town) and Totenball (Tottenham Court) was invested. Camden Town takes its name from Baron Camden (d. 1794), lord chancellor under George III. King's Cross was so called from a statue of George IV., erected in 1830, greatly ridiculed and removed in 1845, but an earlier name, Battle Bridge, is traditionally derived from the stand of Queen Boadicea against the Romans, or from one of Alfred's contests with the Danes.

SAINT PAUL, the capital city of Minnesota, U.S.A., a port of entry, the judicial seat of Ramsey county, and federal headquarters for the state; 2 mi. below the head of navigation on the Mississippi river and 1,836 mi. from its mouth. It is on federal highways 10, 12, 52 and 61; and is served by the Burlington Route, the Chicago Great Western, the Chicago, Milwaukee, St. Paul and Pacific, the Chicago, St. Paul, Minneapolis and Omaha, the Great Northern, the Minneapolis and St. Louis, the Northern Pacific, the Rock Island, the Soo Line and electric interurban rail-

ways, a terminal switching and belt line, motor coach and truck lines. Air service is supplied by Capital, Mid-Continent, Northwest and Western air lines.

The population was 271,606 in 1930, of whom 44,743 were foreign-born white (largely from the Scandinavian countries, Germany and Canada); 1950 federal census 309,474. The Twin

WEATHER GRAPH OF SAINT PAUL. THE THERMOMETER INDICATES THE ANNUAL MEAN TEMPERATURE. THE MIDDLE CURVE SHOWS THE MONTHLY MEAN TEMPERATURE. THE CURVES ABOVE AND BELOW, THE HIGHEST AND LOWEST EVER RECORDED. THE COLUMNS INDICATE THE NORMAL MONTHLY PRECIPITATION: (BLACK) TOTAL PRECIPITATION (INCLUDING MELTED SNOW); (WHITE) SNOWFALL.

Cities (Saint Paul and Minneapolis) and their immediate suburbs constitute a great urban community of about 1,107,000.

Transportation Facilities.—Saint Paul is picturesquely located on a series of benches or terraces of irregular breadth and height, reaching a maximum of 266 ft. above the level of the river and merging in an elevated rolling plateau. It occupies 55.44 sq.mi., mostly on the north (or "east") bank of the Mississippi, but including an area in a bend of the river on the south side, opposite the heart of the business district. Six highway bridges and several used by railways cross the river within the city limits, connecting the main part of the city with the "west" side, and connecting Saint Paul with Minneapolis. Because of the irregular nature of the terrain and the numerous railways entering the city, there are 67 other bridges spanning railroad tracks and valleys. Saint Paul is indeed "the port of entry to the great northwest." The nine railway systems have an aggregate mileage of 59,250 mi., one-fourth of the total railway mileage of the United States. They enter the city along the foot of the bluffs, or through a narrow valley giving access to the highlands back of the city. All use the Union depot, completed in 1926 at a cost of \$15,000,000. A switching and interchange railway, serving all the lines, handles 775,000 cars in a year.

After a long period during which the river, originally the principal artery of commerce, had scarcely been used, regular barge service on the upper Mississippi was again inaugurated (by the Inland Waterways corporation) in the summer of 1927. Shipments in and out of the port of Saint Paul in 1949 totalled 1,300,821 tons. There are three municipal terminals for handling general cargo, grain, coal and ore and passenger service. Many motor truck lines and numerous bus lines operate in and out of the city in all directions.

On the south bank of the river, opposite the river terminal and little more than a mile from the courthouse, the principal rail-

way freight terminals and the bus depot, is the municipal airport (375.6 ac.).

The city is the northwestern headquarters for the U.S. railway mail service and U.S. district engineer.

Buildings and Parks.—Dominating the view as the city is approached from the south and the east is the sky line of the loop section with the state capitol in the background. Prominent in this sky line is the new city hall and courthouse. Costing \$4,000,000, this structure departs from the typical monumental public building and places full emphasis upon the utilization of space, and it depends for beauty upon its simplicity of lines, mass and shadows, rather than upon columns and ornaments; and secondly, on the works of art contained in it and the excellence of the interior finish.

The state capitol stands on high ground north of the business district, where it commands a view of the entire city. Designed by Cass Gilbert, Saint Paul architect, this structure of Minnesota granite and white Georgia marble, with massive central dome, was completed in 1905 at a cost of \$4,500,000. Included in the state building group are the state office building and the State Historical society building. Other prominent buildings are the federal building and the municipal auditorium, which seats more than 12,000 in the main arena and in addition has a theatre section, numerous smaller halls, conference rooms and exhibit areas. The residential sections of the city, mostly on high ground, are beautiful with trees, shrubbery and wide lawns. The most noted street, Summit avenue, 200 ft. wide, winds for part of its length along the edge of the bluff, commanding fine views of the river gorge and the lower terraces of the city. Adjoining the city on the southwest is the Fort Snelling military reservation of 2,000 ac. The picturesque original fort, built in 1822, still stands high on the bluff. The city's park system covers 2,207 ac. including nine large parks (up to 600 ac.) connected by drives and river boulevards and 80 smaller triangles and monument sites. Harriet Island, opposite the business section of the city, has been made a pleasure ground. Three of the parks contain large lakes and golf courses, and there are 53 lakes in the county. Indian Mounds park (named from the Sioux burial mounds which it encloses) on Dayton's bluff commands a magnificent view of the Mississippi. Next to it are the grounds of the state fish hatchery, one of the best equipped in the country.

On the northern edge of the city, bounded by it on three sides, are the 260-ac. grounds and beautiful buildings (owned by the state) of the Minnesota Agricultural society, the scene of the annual state fair, the largest one in the United States, with an attendance in 1950 of 905,563.

Schools and Churches.—In the northwestern corner of the city, adjoining the fair grounds, is the farm campus (419 ac.) of the state university, where the schools of agriculture and the main agricultural experiment station are located. Saint Paul is the seat also of Macalester college (Presbyterian, founded in 1885); Hamline university (Methodist, chartered 1854); the College of St. Thomas (Roman Catholic, 1885); the College of St. Catherine (Roman Catholic, 1905); Bethel college and seminary (Baptist); Luther Theological seminary; and St. Paul theological seminary (Roman Catholic); the St. Paul College of Law; and a number of secondary and special training schools under various auspices, including one for the training of laboratory technicians. The public schools are housed in 73 buildings, most of them modern in construction. The system includes eight athletic fields and 52 playgrounds. The public library occupies an entire block. In one wing is the valuable Hill reference library, maintained by the heirs of James J. Hill, and part of his famous gallery of paintings, which included the best collection of the Barbizon school in America. The law library of the state is housed in the capitol, and the collection of the Minnesota Historical society has a fine building of its own. Two daily newspapers are published. The *Pioneer-Press*, established in 1853, is one of the oldest newspapers in the northwest.

Saint Paul is the see of a Roman Catholic archdiocese. The Cathedral of Saint Paul is one of the notable ecclesiastical structures of the country.

There are 287 churches, representing all the principal faiths and denominations. The charitable agencies which depend for support on voluntary contributions are financed through a joint annual campaign, which raises about \$1,500,000. The community chest and several of the larger philanthropic agencies are housed in a central administration building provided by the Amherst H. Wilder charity, a trust fund of about \$3,800,000, established in 1910 for the benefit of the poor of the city.

Government.—Saint Paul operates under a charter adopted in 1912 and effective Jan. 1, 1914, establishing a commission form of government. Elections are held biennially. The voters elect a mayor, a comptroller and six councilmen or commissioners; three justices of the peace, two municipal judges and four constables. The mayor assigns each commissioner to one of the six departments of government (public safety, public works, public utilities, parks and public buildings, finance, and libraries, auditorium and museums) as its administrative head. Saint Paul's public schools are administered by a school board of seven members, authorized by city charter amendment in 1950. Fiscal powers relating to tax levy and budget control are retained by city council and comptroller under basic charter provisions. The mayor is ex-officio president of the council and has the veto power over its acts, but they may be passed over his veto by four votes. The comptroller is also the civil service commissioner. A city planning board was created in 1918. In 1922 it submitted a general city plan, and in 1924 a zoning ordinance was adopted. Saint Paul has a low death rate, a low infant mortality, high level literacy, a high percentage in school attendance, high percentage of home ownership and an index figure for cost of living below the average. The valuation of taxable property for 1950 was \$533,034,198.

Trade and Manufactures.—Saint Paul, near the head of navigation on the Mississippi river, became the railroad centre of the northwest in the days when the river was the principal artery of transportation. Because of these transportation advantages, it also became the distributing centre of the northwest. Today the wholesalers and jobbers distribute food, dry goods, clothing, general merchandise, hardware, petroleum products, printing specialties and farm implements nationally and internationally. The South Saint Paul (adjacent to Saint Paul) livestock market has grown so that it is second only to Chicago in the receipt and slaughter of livestock.

Poultry, dairy and food products from the surrounding agricultural area are also processed in large quantities. Printing and publishing is one of the major industries of Saint Paul. Among the firms in this field are the world's largest publishers of law books and the largest producers of calendars and advertising specialties in the United States. Automobiles and accessories, wearing apparel and furs, foundries and machine shops are also important in the industrial life of the city. Saint Paul supplies the world with the familiar cellulose tapes and produces abrasives and other products. More than 800 manufacturers in the Saint Paul industrial area make about \$600,000,000 worth of products annually. The city has an important agricultural industry in the production of mushrooms, which are raised in large quantities in the caves in the sandstone bluffs on the west side of the river. The caves are also used to age cheese, most of which is a Roquefort type developed at the University of Minnesota farm school and called "Minnesota blue." Saint Paul has 18 banks, with total resources of \$541,819,228 in 1950. Debts to individual accounts in that year amounted to \$5,601,766,572. The federal land bank and the federal intermediate credit bank for the northwest are both located in Saint Paul.

History.—The site of Saint Paul was known to the Indians as *Imijiska*, the White Rock. It was occasionally used as a camping place, but it was not until about 1800 that an Indian village was established there. The first white visitor of record was the Jesuit missionary, Father Louis Hennepin, in 1680, but probably the traders Pierre Radisson and Médart, sieur de Groselliers, were there in 1658. Robert, sieur de la Salle, mentions the locality in a letter written in 1682. In 1766 Jonathan Carver (*q.v.*) of Massachusetts made an adventurous journey by way of Mackinac across Wisconsin and into Minnesota, and his heirs claimed the

entire site of Saint Paul and much adjacent territory on the ground of an alleged grant made to him by the Indians. In 1805 Lieut. Zebulon M. Pike, sent by Thomas Jefferson to take possession of the region, bought most of the ground now occupied by the city, as well as the Fort Snelling reservation, from the Sioux for 60 gal. of whiskey and a few presents, to which congress later added \$2,000 in cash. In 1823 the first steamboat made its way up the river. In 1837 the site was opened to settlement. By 1840 there were about 200 settlers, mainly French, living by hunting, fishing and trading. To them came Father Lucien Gaultier, and under his guidance they built a church of logs in 1841 on the crest of the bluff and dedicated it to Saint Paul. The place came to be known as Saint Paul's Landing, later shortened to Saint Paul. On the organization of the territory of Minnesota in 1849, the village of 32 houses was designated as the capital. It was incorporated as a city in 1854.

ST. PAUL, a volcanic island in the southern Indian ocean, in 38° 42' 50" S., 77° 32' 29" E., 60 m. S. of Amsterdam island, belonging to France. The island was attached to the general government of Madagascar by decree (1924) at the same time as other islands of the southern seas. The two islands belong to two separate eruptive areas characterized by quite different products; and the comparative bareness of St. Paul contrasts with the dense vegetation of Amsterdam. On the north-east of St. Paul, which has an area of 24 sq.m., is a land-locked bay, representing the old crater, with its rim broken down on one side by an explosion, forming a natural harbour. The highest point is 862 ft. above the sea. Inaccessible cliffs occur on the south-west side. The oldest rocks are a trachyte which occurs at Nine Pin rock; this was followed by an extrusion of basalts, then by basic lavas, scoriae, palagonite tuffs, and basaltic ashes and finally basalt flows proceeded from the crater. The only remaining indications of volcanic activity are the warm springs and emanations of carbon dioxide. The island is uninhabited but the waters are well stocked with fish (see C. Vélain, "St. Paul et Amsterdam," *Annales de Géographie*, t. ii, p. 329).

ST. PAUL'S ROCKS, a number of islets in the Atlantic, nearly 1° N. of the equator and 540 m. from South America, in 29° 15' W. The whole space occupied does not exceed 1,400 ft. in length by about half as much in breadth. Besides sea-fowl the only land creatures are insects and spiders. Fish are abundant, seven species being collected by the "Challenger." Darwin considered the rocks not of volcanic origin; later investigators maintain that they probably are eruptive.

ST. PETER, a city of Minnesota, U.S.A., on the west bank of the Minnesota river, 75 mi. S.W. of Minneapolis; county seat of Nicollet county. It is served by the Chicago and North Western and the Chicago, St. Paul, Minneapolis and Omaha railways, and by bus lines. Pop. (1950) 7,766. St. Peter is an important grain, livestock, dairying, limestone and lumber market, and is the seat of a state hospital for the insane and of Gustavus Adolphus college (Swedish Evangelical Lutheran, 1862). The city was founded about 1852, incorporated as a village in 1865, and chartered as a city in 1891. In 1857 a bill making it the state capital passed the legislature, but was not signed by the governor.

ST. PETER PORT, the chief town of Guernsey, one of the Channel Islands. Pop. (1931) 16,318. It lies on a steep slope above its harbour, on the east coast of the island. The harbour is enclosed by breakwaters, the southernmost of which connects with the shore and continues beyond an islet on which stands Castle Cornet (12th century). A sea wall extends more than a mile towards the port of St. Sampson. To the south of the town is Fort George. The old boundaries of the town are marked by five stones. St. Peter's, the town church, standing low by the side of the quay, dates from various periods, with possible remnants of Norman walls, and has fine details of the 14th and 15th centuries. The Elizabeth college for boys was founded by Queen Elizabeth. Hauteville house, the residence of Victor Hugo from 1856 to 1870, is preserved as he left it, and the authorities of the city of Paris are now its trustees. Among other works which he produced in this island fastness was *Les Travailliers de la Mer* (1863), unsurpassed even among the works of its author for

splendour of imagination and for pathos. The church of St. Sampson, consecrated 1111, is the oldest in the island.

The original harbour was built under King Edward I., if not earlier; it was added to under Queen Elizabeth, and outside this harbour lay a roadstead, landward of the islet of Castle Cornet. Most of this roadstead was enclosed by breakwaters in the mid 19th century, and the large harbour thus formed has had its quayside increased by the completion in 1930 of a jetty projecting out into the pool. A large export trade in fruit, vegetables and flowers is carried on.

ST. PETERSBURG: 566 LENINGRAD.

SAINT PETERSBURG, a city of Pinellas county, Fla., U.S., on the west coast, 20 mi. S.W. of Tampa; served by the Atlantic Coast Line and the Seaboard Air Line railways, by National, Delta and Eastern airlines and by Cuban and South American air freight lines. The city covers 581 sq. mi. on the southern tip of Pinellas peninsula; it is bordered on the west and south by the Gulf of Mexico and on the east and northeast by Tampa bay. The 7-mi. Gandy bridge connects St. Petersburg with Tampa, 20 mi. across the bay. Three causeways across Boca Ciega bay on the west connect the city with the Gulf Beach keys along the Gulf of Mexico; a 13-mi. lower bay bridge to Bradenton and Key West was under construction in 1951. The city has 33 mi. of water front, a municipal airport, solarium, swimming pools and 6 mi. of water-front park with piers and marina. Assessed valuation in 1950 was \$164,082,627; the form of government is commission-managers. Apartments and numerous guest homes care for a tourist industry of 500,000 annually. The setting is subtropical, the climate mild and equable. Beginning in 1910, a local newspaper has given away its entire edition on any day in which the sun has not shown at press time (2 p.m.), an average of four times a year. St. Petersburg is a spring training baseball centre. The commerce of its international airport (Pinellas county) in 1949 amounted to 7,080,546 lb. of air freight, third largest in poundage in the U.S., and included fish, fruit, winter vegetables, flowers and bulbs, cattle, furniture, drugs, jewellery and automobiles transhipped to foreign countries. St. Petersburg was platted in 1883, became a town in 1887 and was incorporated as a city in 1907. In 1950 it had 402 manufacturing firms employing 4,000 persons with an industrial pay roll in excess of \$7,000,000.

SAINT-PIERRE, BERNARDIN DE (1737-1814), French man of letters, was born at Havre on Jan. 19, 1737. He was educated at Caen and at Rouen, and became an engineer. According to his own account he served in the army, taking part in the Hesse campaign of 1760, but was dismissed for insubordination, and, after quarrelling with his family, was in some difficulty. He appeared at Malta, St Petersburg, Warsaw, Dresden, Berlin, holding brief commissions as an engineer and rejoicing in romantic adventures. He came back to Paris in 1765 poorer than he set out. He came into possession of a small sum at his father's death, and in 1768 he set out for the Isle of France (Mauritius) with a government commission, and remained there three years, returning home in 1771. On his return from Mauritius he was introduced to D'Alembert and his friends, but he was most attracted to J. J. Rousseau, of whom in his last years he saw much, and on whom he formed both his character and his style. His *Voyage à l'île de France* (2 vols., 1773) gained him a reputation as a champion of English religion, and his *Œuvres complètes* (1789) brought him the bishopric of Aix, with 1,000 livres a year. The *Études de la nature* (3 vols., 1784) was an attempt to prove the existence of God from the wonders of nature.

His masterpiece, *Paul et Virginie*, appeared in 1789 in a supplementary volume of the *Études*, and his second great success, much less sentimental and showing not a little humour, the *Chauvrière indienne*, not till 1790. In 1792 he married a very young girl, Félicité Didot, who brought him a considerable dowry. For a short time in 1792 he was superintendent of the Jardin des Plantes, and on the suppression of the office received a pension of 3,000 livres. In 1795 he became a member of the Institute. After his first wife's death he married in 1800, when he was 50, a second and another young girl, Désirée Pellport, and is said to have been very happy with her. On Jan. 21, 1814 he died at his house at Eragny, near Poissy.

Paul et Virginie has been pronounced gaudy in style and unhealthy in tone. Bernardin's merit lies in his breaking away from the arid vocabulary which more than a century of classical writing had brought upon France, in his genuine preference for the beauties of nature, and in his attempt to describe them faithfully. After Rousseau, and even

more than Rousseau, Bernardin was in French literature the apostle of the return to nature, though both in him and his immediate follower Chateaubriand there is still much mannerism and unreality.

Almé Martin, disciple of Bernardin and the second husband of his second wife, published a complete edition of his works in 18 volumes (1818-20), afterwards increased by seven volumes of correspondence and memoirs (1826). *Paul et Virginie*, the *Chaumière indienne* etc. have often been separately reprinted. See also Arvéde Barin's *Bernardin de Saint Pierre* (1891).

SAINT-PIERRE, CHARLES IRÉNÉE CASTEL, *Abbé* (1658-1743), French writer, was born at the Château de Saint-Pierre l'Eglise near Cherbourg on Feb 18, 1658. His father was *bailli* of the Cotentin, and Saint-Pierre was educated by the Jesuits. In Paris he frequented the salons of Madame de la Fayette and of the Marquise de Lambert. He was appointed to the library of the Académie in 1691. He was elected to the Académie in 1695. In the same year he gained a footing at court as almoner to Madame. But in 1718, in consequence of the political offence given by his *Discours sur la polygamie*, he was expelled from the Académie. He died in Paris on April 29, 1743.

Saint-Pierre's works are almost entirely occupied with an acute criticism of politics, law and social institutions. They had a great influence on Rousseau, who left elaborate examinations of some of them, and reproduced not a few of their ideas in his own work. His *Projet de paix perpétuelle*, which was destined to exercise considerable influence on Kant, was published in 1713. It was followed by a universal peace, which culminated in the Holy Alliance, was published in 1713 at Utrecht, where he was acting as secretary to the French plenipotentiary, the Abbé de Polignac. His works were published at Amsterdam in 1738-40 and his *Annales politiques* in London in 1757. A discussion of his principles, with a view to securing a just estimation of the high value of his work, was published in 1760, and given by St. Sijgts in *Un Contemporain égaré au XVIII^e siècle. Les Projets de l'abbé de Saint-Pierre, 1658-1743* (Paris, 1900).

ST. PIERRE and MIQUELON, the largest islands of two small groups 10 mi. off the south coast of Newfoundland; united area about 93 sq.mi. Both islands are rugged masses of granite, with a few small streams and lakes, a thin covering of soil and scanty vegetation. Area of St. Pierre group, 70 sq.mi.; Miquelon group, 83 sq.mi. The population of the two islands in 1950 was 4,605, the capital city of St. Pierre having 3,997 people.

The islands were occupied by the French in 1604 and fortified in 1606. In 1702 they were captured by the British and held till 1763, when they were given back to France as a fishing station. They are thus the sole remnant of the French colonies in North America. Taken by the English in 1778, restored to France in 1781, again captured and depopulated by the English in 1793, recovered by France in 1802 and lost in 1803, the islands have remained in undisputed French possession since 1814 (treaty of Paris). Their importance is due to their proximity to the Grand Banks. There are two schools for the training of fishermen on the islands.

The islands are administered by the Government of St. Pierre and Miquelon. The islands have no direct representation in the French Parliament. The national assembly and the Senate of France elect representatives from the islands. The islands are represented in the French Parliament by two members of the National Assembly and one member of the Senate. The islands are also represented in the Council of Ministers of the Republic. The islands are also represented in the Council of State. The islands are also represented in the Council of Economic Advisors. The islands are also represented in the Council of the Republic. The islands are also represented in the Council of the Republic. The islands are also represented in the Council of the Republic.

See Henriquez, *Les Colonies françaises*, t. II (Paris, 1889); Levasseur, *La France*, t. II (Paris, 1893); *L'Année coloniale*, yearly from 1899.

ST. POL, COUNTS OF. The countship of St. Pol-sur-Ternoise owed its importance to its position between the countship of Flanders and the lands of the Capetian kings of France. It appears at the beginning of the 11th century bounded by the Aa, the Lys and the Canche. The *castrum* of St. Pol, built c. 1023 near Ternoise, commanded the crossroads to Théroutanne, Bèthune and Arras. Formerly vassals of the count of Flanders through the count of Boulogne, the Candavènes, who formed the first dynasty of St. Pol (1025-1205), were able to resist Flemish

domination, particularly in the time of Hugh II (1081-1126), relying instead on the Capetians. The same policy prevailed under the two following dynasties, to which the county, now owing allegiance to the counts of Artois, successively fell in female succession; viz., the house of Châtillon (1205-1371), particularly devoted to Philip the Fair in his struggle against Guy of Dampiere (see also Blois, *COUNTSHIP OF*), and the house of Luxembourg-Ligny (1371-1482), one of the last members of which, Louis XI. The French kingdom thus became possessed of the county, which passed to the house of Bourbon-Vendôme, then to that of Orléans-Longueville.

See P. Feuchère, "Les Origines du Comté de St. Pol," *Revue du Nord* (Lille, 1951). (Mt. M.)

ST. POL-DE-LÉON, a town of N.W. France, in the department of Finistère, about 1 mi. from the shore of the English channel, and 131 mi. N. of Morlaix by the railway to Roscoff. Pop. (1946) 5,812. In the 6th century a Welsh monk, Paul, became bishop of the small town of Léon, and lord of the domain in its vicinity, which passed to his successors and was increased by them. St. Pol-de-Léon is a quaint town with several old houses. The cathedral (13th and 14th centuries) is largely in the Gothic style. The west front has a projecting portico and two towers with granite spires. Within the church there are beautifully carved stalls of the 16th century, a wooden shrine containing the bell of St. Pol-de-Léon, said to cure headache and diseases of the ear, and a huge baptismal font, popularly regarded as the stone coffin of Conan Meriadec, king of the Bretons. Notre Dame du Kreiz-ker is mainly late 14th century. Fishing is carried on.

ST. PÖLTEN, an old town and bishopric in Lower Austria, annexed by Germany in 1938, on the left bank of the Traisen.

Inhabited since the Roman period, the modern town grew up around an abbey founded there in the 9th century and dedicated to St. Hippolytus, whose name in corrupted form was adopted for the town. St. Pölten is an important railway junction and has a considerable development of industries, notably cotton-spinning and the manufacture of iron and hardware. In addition, several religious institutions have grown up around the old abbey church. Pop. (1934), 36,619; (1939) 45,037.

SAINT PRIEST, EMMANUEL LOUIS MARIE GUIGNARD, VICOMTE DE (1780-1881), French politician, third son of the following, took part in the invasion of France in 1814. At the Restoration he was in the service of the duke of Angoulême, and during the Hundred Days tried to raise Dauphiné in the royal cause. He served in Spain in 1823, and after two years at Berlin became French ambassador at Madrid, where he negotiated in 1828 the settlement of the Spanish debt. After the July revolution Frederick VII. made him a grandee of Spain with the title of duke of Almazan. He arranged the escape of the duchess of Berry in Provence in 1832, and was imprisoned for 10 months. He arranged an asylum in Austria for the duchess, and returned to Paris, where he was a leader of legitimist society until his death at Saint Priest, near Lyon on Feb. 26, 1881.

SAINT PRIEST, FRANÇOIS EMMANUEL GUIGNARD, CHEVALIER, then COMTE DE (1735-1821), French statesman, was born at Grenoble on March 12, 1735. He entered the army at the age of fifteen, leaving it in 1763 with the grade of colonel. After four years as representative of the court of France at Lisbon, he went to Constantinople, where he remained, with a short interval, until 1785, and married Wilhelmina von Ludolf, daughter of the Neapolitan ambassador. After a few months at the Hague, he joined Necker's ministry as minister without portfolio, and in Necker's second cabinet held office as minister of the interior until Dec. 1790. In 1795 he joined the comte de Provence at Verona as minister of the household. He followed the exiled court to Blankenburg and Mittau, retiring in 1808 to Switzerland.

He wrote *Mémoires sur l'ambassade de France en Turquie et le commerce des français dans le Levant* (ed. C. Schefer, 1877); and *Examen des assemblées provinciales* (1787).

ST. PRIVAT, a village of Lorraine, 7 mi. N.W. of Metz. The village and the slopes to the west played a great part in the battle

of Gravelotte (Aug. 18, 1870). (See METZ and FRANCO-GERMAN WAR.)

At St. Privat occurred the famous repulse of the Prussian Guard by Marshal Canrobert's corps.

ST. QUENTIN, a manufacturing town of northern France, capital of an arrondissement in the department of Aisne, 32 mi. N.N.W. of Laon by rail. Pop. (1946) 48,556. St. Quentin (anc. *Augusta Veromandunorum*) stood at the meeting-place of five military roads. In the 3rd century it was the scene of the martyrdom of Gaius Quintinus. The date of the foundation of the bishopric is uncertain, but about 532 it was transferred to Noyon. Towards the middle of the 7th century St. Eloi (Eliugis), bishop of Noyon, established a collegiate chapter at St. Quentin's tomb, which became a famous place of pilgrimage. The importance of the town was increased during the middle ages by the rise of its cloth manufacture. The town was surrounded by walls in 883. It became under Pippin, grandson of Charlemagne, one of the principal domains of the counts of Vermandois, and in 1080 received from Count Herbert IV a charter which was extended in 1103. From 1420 to 1471 St. Quentin was occupied by the Burgundians. In 1557 it was taken by the Spaniards (see below). Two years later the town was restored to the French, and in 1560 it was assigned as the dowry of Mary Stuart. During the Franco-Prussian War St. Quentin repulsed the German attacks of Oct. 8, 1870; and in January 1871 it was the centre of the great battle fought by General Faidherbe. In World War I St. Quentin was held by the Germans from the end of Aug. 1914 to Oct. 1, 1918.

The town stands on the right bank of the Somme, at its junction with the St. Quentin canal (which unites the Somme with the Scheldt) and the Crozat canal (which unites it with the Oise). The collegiate church of St. Quentin, a fine Gothic building of the 12th, 13th, 14th and 15th centuries, damaged during World War I, was reopened in 1920. It has no west façade but terminates at that end in a tower and portal of Romanesque architecture; it has double transepts. The choir (13th century) has remains of a choir screen of the 14th century. Under the choir is a crypt of the 11th century, containing the tombs of St. Quentin (Quintin) and his fellow-martyrs Victorinus and Gentianus. The hôtel-de-ville of St. Quentin (only slightly damaged) is a Gothic building of the 14th, 15th and 16th centuries, with a flamboyant façade, adorned with curious sculptures. St. Quentin is the seat of a sub-prefect, of a tribunal of commerce, of a board of trade-arbitrators, and a chamber of commerce. The town has recovered its industrial activity and is the centre of a district which manufactures cotton and woollen fabrics. St. Quentin produces chiefly window-curtains and carries on the spinning and preliminary processes and the bleaching and finishing. Other industries are the making of embroideries by machinery and by hand, and the manufacture of iron goods, machinery and chemical products. Trade is in grain, flax, cotton and wool.

1. **Battle of 1557**.—An army of Spaniards under Emmanuel Philibert of Savoy, invading France from the Meuse, joined an allied contingent of English troops under the walls of St. Quentin, which was then closely besieged. Admiral Coligny threw himself into the town, and the old Constable Montmorency prepared to relieve it. On St. Lawrence's Day, Aug. 10, the relieving column reached the town without difficulty, but time was wasted in drawing off the garrison, for the pontoons intended to bridge the canal had marched at the tail of the column, and when brought up were mismanaged. The besiegers, recovering from their surprise, formed the plan of cutting off the retreat of the relieving army. Montmorency had thrown out the necessary protective posts, but at the point which the besiegers chose for their passage the post was composed of poor troops, who fled at the first shot. Thus, while the constable was busy with his boats, the Spanish army filed across the Bridge of Rouvroy, some distance above the town, with impunity, and Montmorency, in the hope of executing his mission without fighting, refused to allow the cavalry under the duc de Nevers to charge them, and miscalculated his time of freedom. The Spaniards, enormously superior in force, cut off and destroyed the French gendarmes who formed the vanguard of the column, and then headed off the slow-moving infantry south of Essigny-le-

Grand. Around the 10,000 French gathered some 40,000 assailants with forty-two guns. The cannon thinned their ranks, and at last the cavalry broke in and slaughtered them. Yet Coligny gallantly held St. Quentin for seventeen days longer. Nevers rallied the remnant of the army and, garrisoning Péronne, Ham and other strong places, entrenched himself in front of Compiègne, and the allies, disheartened by a war of sieges and skirmishes, came to a standstill. Soon afterwards Philip, jealous of the renown of his generals and unwilling to waste his highly trained soldiers in ineffective fighting, ordered the army to retreat (Oct. 17), disbanded the temporary regiments and dispersed the permanent corps in winter quarters.

2. **The Battle of 1871.**—This was fought between the German I. Army under General von Goeben and the French commanded by General Faidherbe. The latter concentrated at St. Quentin on Jan. 18, and took up a defensive position on both sides of the Somme Canal. The Germans, though inferior in numbers, were greatly superior in discipline and training, and Goeben boldly decided to attack both wings of the French together on the 19th. The attack took the customary enveloping form. After several hours' fighting it was brought to a standstill, but Goeben, using his reserves in masterly fashion, drove a wedge into the centre of the French line between the canal and the railway, and followed this up with another blow on the other bank of the canal, along the Ham road. This was the signal for a decisive attack by the whole of the left wing of the Germans, but the French offered strenuous resistance, and it was not until four o'clock that Faidherbe made up his mind to retreat. By skilful dispositions and orderly movement most of his infantry and all but six of his guns were brought off safely, but a portion of the army was cut off by the victorious left wing of the Germans, and the defeat, the last act in a long-drawn-out struggle, was sufficiently decisive to deny to the defenders any hope of taking the field again without an interval of rest and reorganization. Ten days later the general armistice was signed. (See further FRANCO-GERMAN WAR.)

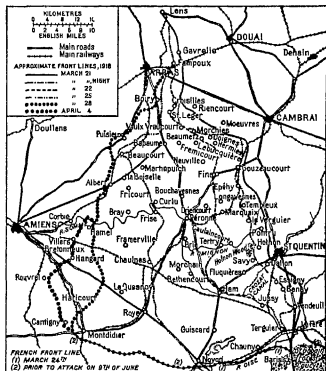

ST. QUENTIN, BATTLE OF, 1918. This is the name commonly given to the first phase of the great offensive of the Germans in 1918, by which they hoped to gain a military decision before the inflow of American reinforcements, the exhaustion of their food supplies under the stranglehold of the British Navy, and the obvious weakening of their allies could definitely turn the scales against them. The strategic conditions under which the offensive of March 21, 1918, was launched on the front north and south of St. Quentin are recounted under WORLD WAR I, and succeeding phases in LVS, BATTLE OF THE; CHEMIN DES DAMES, BATTLE OF THE, 1918; and MARNE, SECOND BATTLE OF THE.

At 4.30 A.M. on March 21, 1918, the sudden crash of some 6,000 German guns heralded the breaking of a storm which, in grandeur of scale, of awe and of destruction, surpassed any other in World War I. By nightfall a German flood had inundated forty miles of the British front; a week later it had reached a depth of nearly forty miles, and was almost lapping the outskirts of Amiens, and in the ensuing weeks the Allied cause itself was almost submerged. These weeks rank with that of the Marne in 1914 as the two gravest crises of World War I. In them Germany came desperately near to regaining that lost chance, and best chance, of victory, which she had forfeited in early September, 1914. Why, when the Allies had made so little visible impression on the German front in two years of constant offensive, were the Germans able to tear a huge hole in the Allied front within a few days? Why, as this breach so far exceeded in size the dream-aims of its Allied forerunners, did it fail to obtain any decisive results? In seeking the answer to these "whys" lies the prime historical interest of the battle of St. Quentin, 1918.

The Opposing Forces.—Between Nov. 1, 1917 and March 21, 1918, the German divisions on the western front were increased from 146 to 192, troops being withdrawn from Russia, Galicia, Italy and the East. By these means the German armies in the West were reinforced by no less than 18,492 officers and 553,794 other ranks. Finally it was decided to make available 62 divisions for the main attack. These troops were systematically trained in new tactics of mobile warfare behind the front, while

every effort was made to conceal the actual area of attack, which extended from near Lens in the north to a little south of La Fère.

The opposing line on this front was held, except for a few miles in the north, by the III. (Byng) and V. (Gough) British Armies respectively. The front of the III. Army extended from just south of the village of Gavrelle to half a mile north of Gouzeaucourt (26½ m.), and on March 21 was held by 10 divi-

PLAN OF THE BATTLE OF ST. QUENTIN

sions in line and seven in reserve. The V. Army front (42 m.), extended on a recent relief of the French (see WORLD WAR I), ran from the right of the III. Army to the village of Barisis, a little south of the river Oise, between the forests of Coucy and St. Gobain. On this extended front there were 11 divisions in line and three in reserve.

German Plan.—The attack was to be carried out by four armies:—(a) XVII. Army (Below), comprising 17 divisions, was to attack on the frontage Gavrelle-Moeuvres. (b) II. Army (Marwitz), comprising 18 divisions, was to attack from Moeuvres to Pontru (north of St. Quentin). (c) XVIII. Army (Hutier), comprising 24 divisions was to attack from Pontru to Vendeuil (south of St. Quentin). (d) VII. Army (Gayl) was to demonstrate with three divisions against La Fère.

The motive of this plan, devised by Ludendorff, now the directing brain of the German war-machine, was that the main strength of the German effort should be exerted north of the Somme—with the aim of driving the British Army back towards the coast and of cutting it off from the French—while the Somme and the XVIII. Army guarded the Germans' southern flank. This plan was radically changed in execution because Ludendorff gained rapid success where he desired it little and failed to gain success where he wanted it most.

To mystify the enemy as to the frontage selected for the main attack, subsidiary operations were prepared all along the Allied front, in Flanders, Champagne and the Argonne. From March 14 onwards the crown prince's army group was to bombard the enemy's headquarters on his front and make a show of bringing up reinforcements, and Gallwitz's army group was to carry out an attack on Verdun up to the point of engaging his infantry. The forming up for deployment of the attacking armies was begun on March 10, the divisions being organized in groups normally in a depth of three lines. The first or assault line was made the strongest, and was moved close up to the

front on March 20. The second line of divisions was some three to five km. in rear, and the third seven to ten km. behind the second line; the third line was to be held in reserve under the higher command, and was only to be used as the operations developed.

The Prelude.—On the British side, while the seriousness of the menace was appreciated, there was an apparently well-grounded belief in the power of the defence to stop a German attack. But these defensive calculations, like so many offensive actions throughout the previous three years, underrated the infinite value of surprise, which for three thousand years of recorded warfare has proved the master-key to victory. The real significance of the Cambrai attack on Nov. 20 previous had been that the British had revived the use of such a key, forging it from an amalgam of armour and the caterpillar tank. Unhappily, the effect of this tank key was largely lost because when inserted in the lock they had not the power to turn it fully, through exhausting their strength in the Passchendaele mud. (*See* YPRES, BATTLES OF, 1917.)

In the German counter-attack of Nov. 30 Ludendorff had used a key similar in principle if different in design—a short, sharp bombardment with gas and smoke shell, followed up by an influx of infantry, specially trained in the new infiltration tactics. It would seem that by the following March the British had not sufficiently taken this lesson to heart. For, just as were the V. Army's subsequent excuses of weak numbers and a long line, the command had expressed ample confidence beforehand in its power to resist the onslaught. As a result, when the original front was forced, an inadequate preparation and co-ordination of the measures to block the enemy's path further back was revealed. The Army Command had failed to arrange for the blowing up of certain causeways and G.H.Q. had not given it a definite order. Worse still was the confusion caused by the fact that in the case of the more important railway bridges, this duty was entrusted to the railway authorities instead of the local commanders, and in this way the vital railway bridge at Peronne was allowed to fall undestroyed into German hands.

If this was good luck for the Germans, their thorough and skilful preparations for the initial assault had earned them success—although here again fortune favoured them. Ludendorff's solution for breaking the deadlock was a compound of wider frontages of attack, new infantry tactics, and, above all, for surprise, a lavish use of gas in a brief but intense artillery bombardment. For it, masses of artillery were brought up close to the front line in concealment, and against the V. Army front opened fire without preliminary ranging. This was to be followed by the infiltration of many dispersed little groups of automatic rifles and machine-guns. But the effect of the gas-gained surprise was immensely increased by nature, which in the early hours of March 21 provided a thick mist, which cloaked the infiltrating assailants as much as it masked the defending machine-guns. Without this aid it is questionable how far the German tactical surprise would have succeeded, and in this lay the essential inferiority of the German method of surprise, which still depended on unarmoured infantry, compared with the British surprise at Cambrai, and later, on Aug. 8, 1918, which was achieved by armoured machines.

The Attack, March 21.—While the bombardment, with a lavish mixture of gas and smoke shell, opened at 4.30 A.M., the German infantry attack did not begin until 9.40 A.M., when a general move forward was made under the cover of a creeping barrage, supplemented by low-flying aircraft. The British outpost zone was overrun almost everywhere by midday, but this was inevitable, and had been foreseen. But the northern attack met such stubborn resistance against the right of Byng's III. Army that it had not seriously penetrated the main battle zone even by the night of the 22nd, and, despite putting in successive reinforcements, the capture of Vaulx-Vraucourt was then the high-water mark of its progress. On most parts of Gough's V. Army front the battle-zone resistance was just as firm, but the flood found a way through on the 21st near La Fère, on the extreme right, at Essigny and Ronsoy. The resistance of the

21st Division at Epéhy for a time checked this last breach from spreading northward, but it began to crumble so deeply that the neighbouring sectors were affected. Southward, near St. Quentin, the line sagged still more deeply, and on the night of the 22nd Gough felt compelled to order a general retirement to the line of the Somme.

On the 23rd Ludendorff gave the XVIII. Army, his left or southern wing, a limited permission to exploit this opportunity along the line of least resistance. But for several days he still pinned his faith and reserve strength to his right wing, despite the relatively small progress of his XVII. Army in the north and by the enforced postponement of its intended supplementary attack towards Arras, where Byng had anticipated the blow by a partial withdrawal. When the postponed blow was attempted on the 28th it collapsed under a storm of fire from the expectant defence. No fog came to the German aid. At last Ludendorff threw his weight into the push along the Somme westward, although he still held his left wing in a tight rein. But by that time the new surge towards Amiens was almost as stagnant, its impetus slackening far less because of the resistance than because of the exhaustion of the German troops and the difficulty of supply in so rapid and deep an advance. This was accentuated because their route had taken them across the desert formed by the old battlefields of 1916. On March 30 and April 4 they made fresh attempts, but the effect was and could only be local. For the resistance in the south had been given time, and relief from pressure, to harden into a crust which the belated intervention of fresh German reserves could not break.

On April 4 the great battle to all intents and purposes came to an end. The initial success had been great; since March 21 from a base of 74 m. a penetration of no less than 38 m. had been effected; the ground lost in 1916 and abandoned in 1917 had been more than made good, and vast quantities of stores as well as 90,000 prisoners and 1,200 guns had been captured. The British Armies had been seriously defeated, and 20 French divisions had been drawn into the battle; yet, in spite of the fact that 90 German divisions had been engaged, neither the transition to a war of movement nor the separation of the British and French forces had been achieved.

Conclusion.—The supreme features of this great offensive are, first, the immensity of its outward results compared with any previous offensive in the west; second, its ineffectiveness to attain decisive results. For the first it would be both unjust and untrue to blame the defending troops. They achieved miracles of heroic endurance, and the prolonged resistance in most of the battle zone is the proof. The real cause of the subsequently rapid flow-back lay in the frequent breakdown of control and communication. During three years of trench warfare the British had built up an elaborate and complex system, largely dependent on the telephone, and when the static suddenly became fluid they paid the inevitable penalty of violating those fundamental axioms of war—simplicity and flexibility.

On the German side, Arras was the actual rock on which their plan broke, and by which their advance was diverted into less profitable channels. It is possible that military conservatism cost them dear. For Colonel Bruchmüller, the famous artillery battle-piece "producer," brought from the eastern front for this offensive, has revealed that while Hitler's army carried out his surprise bombardment designs, Below's in the north clung to their old-fashioned methods, refusing to dispense with preliminary ranging. But if Hitler scored at the outset, his onrush slackened as his supplies and reinforcements failed with the distance covered, and when due tribute has been paid to the sturdy resistance, the German advance is seen really to have beaten itself.

(B. H. L. H.)

ST. RÉMY (-DE-PROVENCE), a town of southeastern France in the department of Bouches-du-Rhône, 15 mi. N.E. of Arles by road. Pop. (1936) 3,625. It lies to the north of the range of hills named the Alpes or Alpilles in a valley of olive trees. The church has a 14th-century spire. About a mile to the south are Gallo-Roman relics of the ancient Glanum, destroyed about 480, including a triumphal arch and a fine three-storied

mausoleum. Near by is the old priory of St. Paul-de-Mausole with a Romanesque church and cloister.

ST. RIQUIER, a town of northern France, in the department of Somme, 8 mi. N.E. of Abbeville by rail. Pop. (1936) 1,313. St. Riquier (originally *Centula*) was famous for its abbey, founded about 625 by Riquier (*Richarius*), son of the governor of the town. It was enriched by King Dagobert and prospered under the abbacy of Angilbert, son-in-law of Charlemagne. The fine Flamboyant church of the 15th and 16th centuries has a richly sculptured west front. The treasury, among other valuable relics, possesses a copper cross said to be the work of St. Eloi (*Eligius*). In 1544 the town was burned by the English, an event which marks the beginning of its decline.

SAINTS, BATTLE OF THE. This battle was fought between the fleets of England and France in the channel between the islands of Dominica and Guadeloupe on April 12, 1782. It takes its name from the Saints Is. in the channel. The French had 35 battleships under the Comte de Grasse based on Martinique, and their object was to give the British fleet the slip, and capture Jamaica. The British fleet of 36 ships was based on St. Lucia and was under Rodney.

The British Admiral kept close watch on the French movements. When, therefore, on April 8, the signal came that the French were out, the British were immediately after them on a northerly course. At dawn on April 9 the British van, under Hood, was close to de Grasse, who was forced to order his store-ships to make for Guadeloupe, sending two of his battleships to protect them. Hood was soon in action with the French rear, and his position was awkward in that he only, of the English, had made the Saints passage, the centre and rear being becalmed under the lee of Dominica. De Grasse was thus in a position to attack him with all his force, but he merely cannonaded his enemy from a distance. The British van suffered enough to make it necessary subsequently for it to change places with the rear, under Drake, but the arrival of Rodney caused de Grasse to withdraw, and the French battleship *Cato* was put out of action.

During the ensuing night and day the French gained somewhat and seemed likely to get clear away, but on the night of the 10th two battleships, the *Jason* and the *Zélé*, collided and the former was so seriously injured that de Grasse had to part with her. It would have been better for him had he dispensed with the *Zélé* also, for on the 11th she fell far behind the rest of the fleet, and it became clear that she would fall a victim to the British unless de Grasse turned to help her. This he did; and thus a general action was joined on April 12, the French by then having only 30 effective ships. The two fleets approached one another on opposite courses with the wind from the east; the British were sailing roughly north and the French south, the latter being the nearer to the wind. The fight began early, and by 10 o'clock the moment for the British to get on the same course as the French had arrived.

Rodney, however, never issued orders to this effect for, at this juncture, the wind shifted four points to the south. This meant that gaps appeared in the French line, and, more important, the English could turn to starboard and sail through them. Rodney and his flag-captain, Sir Charles Douglas, both grasped the possibilities of the situation, and the former decided to risk it. There were no signals for the movement so, relying on the force of example, Rodney took his flagship, the *Formidable*, stationed in the centre, through a convenient gap in the rear of the French centre. He was followed by the five ships immediately astern, all raking the French as they passed. A similar movement took place in the rear. Captain Affleck, in the *Bedford*, passing through the head of the same French squadron, was followed by Hood with the entire British rear. The French were thus broken into three bodies, de Grasse, in the *Ville de Paris*, with other ships of the centre being isolated between the two points of intersection, and, after a gallant defence, captured.

Rodney's officers blamed him for not putting up a more energetic pursuit, but he preferred to make sure of cutting the enemy off from their base. Actually the bad morale of the French, and the complete scattering of their fleet, rendered either alternative

nugatory.

SAINT-SAËNS, CHARLES CAMILLE (1835-1921), French composer, was born in Paris on Oct. 3, 1835. For a short time he studied composition under Halévy, and in 1852, and again in 1864, competed without success for the Grand Prix de Rome. In 1853, when only eighteen, he was appointed organist at the Church of St. Merry, and from 1861 to 1877 was organist at the Madeleine, in succession to Lefebvre-Wély. In 1867 his cantata "Les Noces de Prométhée" won a prize at the International Exhibition of that year but his first operas *La Princesse jaune* (1872) and *Le Timbre d'argent* (1877) had no great success. It was with his brilliantly effective "symphonic poems" *Le Rouet d'Omphale*, *La Danse Macabre*, *Phaéton* and *La Jeunesse d'Hercule* that he first attracted general attention as a composer, though his powers as a pianist had been recognised from the first. His success as a dramatic composer was however not long delayed.

Through the influence of Liszt, his Biblical opera *Samson et Dalila* was brought out at Weimar in 1877 when its merits were immediately recognised, though it was not until 1890 that it was first heard in France, namely at Rouen. This work, generally accepted as his operatic masterpiece, had been begun as far back as 1869, and an act had been heard at one of Colonne's concerts in 1875. The following year it was given in Paris at the Eden Theatre, and finally in 1892 it was produced at the Grand Opera, where it has remained ever since, one of the most attractive works of the *répertoire*. Its Biblical subject prevented its performance in London until 1909, when it was given at Covent Garden with great success. None of his works is better calculated to exemplify the dual tendencies of his style. The first act, with its somewhat formal choruses, suggests the influence of Bach and Handel, and is treated rather in the manner of an oratorio. The more dramatic portions of the opera are not uninfluenced by Meyerbeer, while in the *Dalila* music there are occasional suggestions of Gounod. But though Saint-Saëns was an eclectic he put the stamp of his own individuality on every scene of the opera.

After the production of *Samson et Dalila* Saint-Saëns stood at the parting of the ways and compromised to some extent between the traditional style of the French school and the newer Wagnerian methods. As the result none of his later operas—*Etiennette Marcol* (Lyons, 1879), *Henry VIII.* (Grand Opéra, 1883), *Proserpine* (Opéra-Comique, 1887), *Ascanio* (Grand Opéra, 1890), *Phryné* (Opéra-Comique, 1893), *Las Barbares* (Grand Opéra, 1901) achieved anything like the success of *Samson et Dalila*. But Saint-Saëns by no means confined his attentions to the stage, his compositions including examples in almost every department of the art. Among these may be mentioned the oratorios and cantatas *Oratorio de Noël*, *Les Noces de Prométhée*, *Le Déluge*, *La Lyre et la Harpe*; three symphonies; the four symphonic poems previously named; five pianoforte concertos; three violin concertos; the ballet *Zavotta*; many chamber works; a Mass and a Requiem, besides a quantity of piano and organ music, and many songs. His literary works in turn include *Harmonie et mélodie*, *Portraits et souvenirs*, and *Problèmes et mystères*, besides a volume of poems, *Rimes familières*. He died in Algiers on Dec. 16, 1921.

SAINTSBURY, GEORGE EDWARD BATEMAN (1845-1933), English man of letters, was born at Southampton on Oct. 23, 1845. He was educated at King's college school, London, and at Merton college, Oxford (B.A. 1868), and spent six years in Guernsey as senior classical master of Elizabeth college (1868-74). From 1874 to 1876 he was headmaster of the Elgin educational institute. He began his literary career in 1875 as a critic for the *Academy*, and for ten years was actively engaged in journalism, becoming an important member of the staff of the *Saturday Review*. From 1895 to 1915 he was professor of rhetoric and English literature at Edinburgh university. Saintsbury's work bears the mark of his vast range of reading. Among the most important of his many works are his *Short History of French Literature* (1882; 6th ed., Oxford, 1901); *A Short History of*

English Literature (1898; 3rd ed., 1903); an edition of the *Minor Caroline Poets* (3 vols., 1905-21); *A History of Criticism* (3 vols., 1900-04); *A History of English Prosody* (3 vols., 1906-21); *The History of English Criticism* (1911); and *A History of the French Novel* (1917-19).

ST. SERVAN, a town of western France, in the department of Ille-et-Vilaine, on right bank of the Rance, south of St. Malo, from which it is separated by the Anse des Sablons, a creek 1 mi. wide. Pop. (1936) 10,866. The "Cité" occupies the site of the city of Aleth, which at the close of the Roman empire supplanted Corseul as the capital of the Curiosolites. Aleth was not Christianized till the 6th century, when St. Malo became its first bishop. At the Revolution St. Servan became a separate commune from St. Malo. North of the town is a wet dock, forming part of the harbour of St. Malo. The dock is used chiefly by coasting and fishing vessels, a fleet starting annually for the Newfoundland codfisheries.

SAINT-SIMON, CLAUDE HENRI DE ROUVROY, COMTE DE (1760-1825), French socialist, was born in Paris on Oct. 27, 1760. He fought in the War of American Independence, was imprisoned in the Luxembourg during the Terror, and, on his release, amassed a small fortune by land speculation. He was also the originator of schemes to unite the Atlantic and Pacific by a canal, and to construct a waterway from Madrid to the sea. He continued his experiments throughout his life with the result that he was completely impoverished, and for some years before his death he was obliged to work nine hours a day to earn £40 a year. In 1823 he attempted suicide. He died two years later, on May 19, at Paris. Although a prolific writer his work attracted little attention while he lived and it was only after his death that his influence became considerable.

As a thinker Saint-Simon was deficient in system, clearness and consecutive strength; but his influence on modern thought is undeniable, both as the historic founder of French socialism and as suggesting much of what was afterwards elaborated into Comtism. Apart from the details of his socialistic teaching, his main ideas are simple, and are at once a reaction against the French Revolution and the militarism of Napoleon. So far was he from advocating fresh social revolt that he appealed to Louis XVIII. to inaugurate the new order of things. In opposition, however, to the feudal and military system, he advocated an arrangement by which the industrial chiefs should control society. In place of the mediaeval church the spiritual direction of society should fall to the men of science. What Saint-Simon desired, therefore, was an industrialist state directed by modern science in which universal association should suppress war, and society should be organized for productive labour by the most capable men. The social aim is to produce things useful to life.

Although the contrast between labour and capital is not emphasized by Saint-Simon, the cause of the poor is discussed, and in his greatest work, *The New Christianity*, it takes the form of a religion. It was this development of his teaching that occasioned his final quarrel with Comte. Previous to the publication of the *Nouveau Christianisme*, Saint-Simon had not concerned himself with theology; but here, beginning with a belief in God he endeavours to resolve Christianity into its essential elements and finally propounds this precept—"The whole of society ought to strive towards the amelioration of the moral and physical existence of the poorest class; society ought to organize itself in the way best adapted for attaining this end." This principle became the watchword of the entire school of Saint-Simon.

Of the disciples who propagated his doctrines the most important were Olinde Rodrigues, and Barthélemy Prosper Enfantin (*q.v.*), who together had received Saint-Simon's last instructions. Their first step was to establish a journal, *Le Producteur*, but it was discontinued in 1826. The sect, however, had begun to grow, and before the end of 1828, had meetings not only in Paris but in many provincial towns. An important departure was made in 1828 by Amand Bazard, who gave a "complete exposition of the Saint-Simonian faith" in a long course of lectures at Paris, which were well attended. His *Exposition de la doctrine de St. Simon* (2 vols., 1828-1830), which is by far the best account of it, won

more adherents. The second volume was chiefly by Enfantin, who along with Bazard stood at the head of the society, but who was superior in metaphysical power, and was prone to push his deductions to extremities. The revolution of July (1830) brought a new freedom to the socialist reformers. A proclamation was issued demanding the community of goods, the abolition of the right of inheritance, and the enfranchisement of women. Early next year the school obtained possession of the *Globe* through Pierre Leroux (*q.v.*), who had joined the school, which now numbered some of the ablest and most promising young men of France.

The members formed themselves into an association arranged in three grades, and constituting a society or family, which lived out of a common purse in the Rue Monsigny. Before long, however, the sect was split by dissensions between Bazard, a man of logical and solid temperament, and Enfantin, who desired to establish a fantastic sacerdotalism with lax notions as to the relation of the sexes. After a time Bazard seceded, together with many of the strongest supporters of the school. A series of extravagant entertainments given by the society during the winter of 1832 reduced its financial resources and discredited it in character. They finally removed to Ménilmontant, to a property of Enfantin, where they lived in a communistic society, distinguished by a peculiar dress. Shortly after the chiefs were tried and condemned for proceedings prejudicial to the social order; and the sect was broken up (1832).

Saint-Simonism.—In the doctrine of the followers of Saint-Simon we find a great advance on the confused views of the master. In the philosophy of history they recognize epochs of two kinds, the critical or negative and the organic or constructive. The former, in which philosophy is the dominating force, is characterized by war, egotism and anarchy; the latter, which is controlled by religion, is marked by the spirit of obedience, devotion and association. The two spirits of antagonism and association are the social principles whose prevalence determines the character of an epoch. The spirit of association, which tends more and more to prevail over its opponent, is to be the keynote of the social development of the future. Under the present system the industrial chief exploits the proletariat, the members of which, though nominally free, must accept his terms under pain of starvation. The only remedy for this is the abolition of the law of inheritance, and the union of all the instruments of labour in a social fund, which shall be exploited by association. Society thus becomes sole proprietor, intrusting to social groups and social functionaries the management of the various properties. The right of succession is transferred from the family to the state.

The school of Saint-Simon insists strongly on the claims of merit; they advocate a social hierarchy in which each man shall be placed according to his capacity and rewarded according to his works. This is, indeed, a most special and pronounced feature of the Saint-Simon socialism, whose theory of government is a kind of spiritual or scientific autocracy, degenerating into the fantastic sacerdotalism of Enfantin. With regard to the family and the relation of the sexes the school of Saint-Simon advocated the complete emancipation of woman and her entire equality with man. The "social individual" is man and woman, who are associated in the exercise of the triple function of religion, the state and the family. In its official declarations the school maintained the sanctity of the Christian law of marriage. Connected with these doctrines was their famous theory of the "rehabilitation of the flesh," deduced from the philosophic theory of the school, which was a species of Pantheism, though they repudiated the name. On this theory they rejected the dualism so much emphasized by Catholic Christianity in its penances and mortifications, and held that the body should be restored to its due place of honour.

An excellent edition of the works of Saint-Simon and Enfantin was published by the survivors of the sect (47 vols., Paris, 1865-78). Of his other works the most important are, *Lettres d'un habitant de Genève* (1802); *Du Système Industriel* (1821); *Catéchisme des Industriels* (1823-24); *Nouveau Christianisme* (1825). See also Georges Weill, *Un Précurseur du socialisme, Saint-Simon et son oeuvre* (Paris, 1894), and a history of the *École Saint-Simonienne*, by the same author

(1896); G. Dumas, *Psychologie de deux messies positivistes St. Simon et Comte* (1905); G. Brunet, *Mysticisme social de Saint-Simon* (1925); E. N. Butler, *The St-Simonian Religion in Germany* (1926); and M. Leroy, *Vie véritable de Saint-Simon* (1925).

SAINT-SIMON, LOUIS DE ROUVROY, DUC DE (1675-1755), French soldier, diplomatist and writer of memoirs, was born at Versailles on Jan. 16, 1675. The peerage granted to his father, Claude de St. Simon, is the central fact in his history. The boy had for godfather and godmother Louis XIV. and the queen. After some tuition by the Jesuits (especially by Sanadon, the editor of Horace), he joined the *mousquetaires gris* in 1692. He was present at the siege of Namur, and the battle of Neerwinden. At this time he chose to begin the crusade of his life by instigating, if not bringing, an action on the part of the peers of France against Luxembourg, his victorious general, on a point of precedence. He fought, however, another campaign or two (not under Luxembourg), and in 1695 married Gabrielle de Durfort, daughter of the maréchal de Lorges, under whom he latterly served. He seems to have regarded her with respect and affection; and she sometimes succeeded in modifying his aristocratic ideas. But as he did not receive the promotion he desired he flung up his commission in 1702. Louis took a dislike to him, and it was with difficulty that he was able to keep a footing at court. He was, however, intensely interested in all the transactions of Versailles, and by dint of a most heterogeneous collection of instruments, ranging from dukes to servants, he managed to obtain the extraordinary secret information which he has handed down.

His own part appears to have been entirely subordinate. He was appointed ambassador to Rome in 1705, but the appointment was cancelled before he started. At last he attached himself to the duke of Orleans and, though this was hardly likely to conciliate Louis's goodwill to him, it gave him at least the status of belonging to a definite party, and it eventually placed him in the position of tried friend to the acting chief of the state. He was able, moreover, to combine attachment to the duke of Burgundy with that to the duke of Orleans. Both attachments were no doubt all the more sincere because of his undying hatred to "the bastards," that is to say, the illegitimate sons of Louis XIV. It does not appear that this hatred was founded on moral reasons or on any real fear that these bastards would be intruded into the succession. The true cause of his wrath was that they had precedence of the peers.

The death of Louis seemed to give Saint-Simon a chance of realizing his hopes. The duke of Orleans was at once acknowledged regent, and Saint-Simon was of the council of regency. But he had little real influence with the regent. In 1721 he was appointed ambassador to Spain to arrange for the marriage (not destined to take place) of Louis XV. and the infanta. His own account of the cessation of his intimacy with Orleans and Dubois, the latter of whom had never been his friend, is, like his own account of some other events of his life, obscure. But there can be little doubt that he was practically ousted by the favourite. He survived for more than thirty years; but little is known of his life. His wife died in 1743, his eldest son a little later; he had other family troubles, and he was loaded with debt. When he died, at Paris on March 2, 1755, he had almost entirely outlived his own generation, and the prosperity of his house.

Saint-Simon was an indefatigable writer, and he began very early to set down in black and white all the gossip he collected, all his interminable legal disputes of precedence, and a vast mass of unclassified and almost unclassifiable matter. Most of his manuscripts came into the possession of the government, and it was long before their contents were published in anything like fullness. Saint-Simon, though careless and sometimes even ungrammatical, ranks among the most striking memoir-writers of France, the country richest in memoirs of any in the world. He has been compared to Tacitus, and for once the comparison is just. In the midst of his enormous mass of writing, phrases scarcely inferior to the Roman's occur frequently, and here and there are passages of sustained description equal, for intense concentration of light and life, to those of Tacitus or of any other historian. As may be expected from the vast extent of his

work, it is in the highest degree unequal. But he is at the same time not a writer who can be "sampled" easily, inasmuch as his most characteristic phrases sometimes occur in the midst of long stretches of quite uninteresting matter. The interest of the *Memoirs*, independent of the large addition of positive knowledge which they make, is one of constant surprise at the novel and adroit use of word and phrase. Some of Macaulay's most brilliant portraits and sketches of incident are adapted and sometimes almost literally translated from Saint-Simon.

The first edition of Saint-Simon (some scattered pieces may have been printed before) appeared in 1788. It was a mere selection in three volumes and was much cut down before it was allowed to appear. Next year four more volumes made their appearance, and in 1791 a new edition, still further increased. The whole, or rather not the whole, was printed in 1829-1830 and reprinted some ten years later. The real creator of Saint-Simon, as far as a full and exact text is concerned, was M. Chéruel, whose edition in 20 volumes dates from 1856, and was reissued again revised in 1872. The standard edition is that edited by A. de Boissière for the *Grands Ecrivains de la France* Series. For criticism on Saint-Simon there is nothing better than Sainte-Beuve's two sketches in the 3rd and 15th volumes of the *Causeries du lundi*. The latter was written to accompany M. Chéruel's first edition. In English by far the most accurate treatment is in a Lothian prize essay by E. Cannan (Oxford and London, 1885).

ST. THOMAS, a city and port of entry of Ontario, Can., capital of Elgin county, on Kettle creek, 18 mi. S. of London and 8 mi. N. of Lake Erie. Pop. (1951) 17,942. It is an important station on the Canadian National, New York Central, London & Port Stanley, Chesapeake and Ohio, Washburn, and Canadian Pacific railways. A collegiate institute and Alma Ladies' college are located there. The New York Central railway shops and car-wheel foundry, flour, flax and planing mills, shoe and knitted-goods factories are among the chief industries.

ST. THOMAS (São Tomé), a volcanic island in the Gulf of Guinea immediately north of the equator (0° 23' N.) and in 6° 40' E. With the island of Príncipe (Prince's island, see below), and the small territory of Sarame around the fortress of São João Batista de Ajuda, on the coast of Dahomey, it forms the Portuguese province of S. Tomé and Príncipe. From the Gabon, the nearest point of the mainland of Africa, St. Thomas is distant 166 m., and from Cameroon 297 m. The length of the island is 32 m., the breadth W. to E. 21 m.; the area 40 sq. m.

From the coast the land rises towards lofty mountains (St. Thomas over 7,000 ft.). Malaria is common in the lower regions, but the unhealthiness of the island is largely due to the absence of hygienic precautions and to alcoholism. Conditions are now being improved. Manufacture of brandy ceased at the end of 1929. During the dry season (June to September) the temperature ranges in the lower parts between 66-2° and 80-6° F., and in the higher parts between 57-2° and 68°; in the rainy season it ranges between 69-8° and 89-6° in the lower parts, and between 64-4° and 80-6° in the higher parts. On Coffee mount (2,265 ft.) the mean of ten years was 68-9°, the maximum 90-5° and the minimum 47-3°. The heat is tempered by the equatorial ocean current. The rainfall is very heavy save on the north coast, but has steadily decreased of recent years, simultaneously with deforestation.

Communications.—There are 200 kilometres of good motor roads, and 500 km. of Decauville line are in use. A State railway of 19 km. runs from St. Tomé to Vila da Trindade and the Milagrosa plantation; 45 km. more are being laid. S. Tomé and Príncipe are connected with Europe by cable. S. Tomé has a wireless station communicating directly with Cape Verde, Angola, etc. Telephone lines link the capital with the principal settlements and plantations. Two Portuguese and one German steamship line maintain a monthly service, and other ships call frequently.

Agriculture and Trade.—The soil is extremely fertile, and three-fifths of the island is covered with forest. Among the products are oranges, lemons, figs, mangroves, and, in the lower districts, the vine, pineapple, guava and banana. The first object of cultivation was sugar, and to this the island owed its prosperity in the 16th century. Sugar has been displaced by coffee, and, principally, cocoa, introduced in 1795 and 1822 respectively. The cocoa zone lies between 650 and 2,000 ft. above the sea. Four-fifths of the total production of the island is cocoa. In 1907 the export of cocoa (including that from Príncipe) was over 24,000

Production of Helium.—In 1902 Rutherford and Soddy suggested that the helium which is invariably found in radioactive minerals was derived from the disintegration of radioactive matter. In 1903 W. Ramsay and Soddy definitely showed that helium was produced by radium and also by its emanation. From the observed mass of the α -particle, it seemed probable from the first that the α -particle was an atom of helium. This conclusion was confirmed by the work of Rutherford and Geiger, who showed that the α -particle was an atom of helium carrying two unit charges of electricity. In order to prove definitely this relation, it was necessary to show that the α -particles, quite independently of the active matter from which they were expelled, gave rise to helium. This was done by Rutherford and J. T. Royds, who allowed the α -particles from a large quantity of emanation to be fired through the thin glass walls of the containing tube. The collected particles gave the spectrum of helium, showing, without doubt, that the α -particle must be a helium atom.

Since the particle is an atom of helium, all radioactive matter which emits α -particles must produce helium. This has been found to be the case for every α -ray product that has been examined. The rate of production of helium by radium in equilibrium was measured with accuracy by J. Dewar, Boltwood and Rutherford. In terms of the international radium standard, the rate of production of helium by one gram of radium in equilibrium with its three α -ray products has been found to be 172 cu mm per year. This value is in excellent accord with that calculated from the rate of emission of α -particles. The rate of production of helium by radon, ionium and polonium has been found by Boltwood to be in fair agreement with calculation. Soddy has observed the production of helium by purified uranium, while R. J. Strutt showed that the rate of production of helium in uranium and thorium minerals was in good accord with calculation.

Strutt has made a systematic examination of the amount of helium present in many minerals and rocks which contain minute quantities of radium, and has utilized the results to estimate the age of the geological deposits. On account of the tendency of the helium to escape from minerals in the course of geologic ages, this method gives only a minimum estimate of the age of the mineral, except in the case of dense and compact specimens. The measurement of the lead content has proved a more reliable method of estimating the age.

Heat Emission of Radioactive Matter.—In 1903 it was shown by P. Curie and A. Laborde that a radium compound is always hotter than the surrounding medium, and radiates heat at a constant rate of about 100 g.-calories per hr per g. of radium. The rate of evolution of heat by radium has been measured subsequently by a number of observers. These observations have made it clear that the evolution of heat by radium and by other radioactive substances is caused by the energy of the absorbed radiations, and not by any additional interatomic processes. Since the α -particles have a large kinetic energy and are easily absorbed by matter, all of these particles are stopped by the radium itself or by the envelope surrounding it, and their energy of motion is transformed into heat. The transformation of the kinetic energy of the α -particles accounts for the greater part of the heat. To this must be added the energy supplied by the recoil of the radioactive atom after the expulsion of the α -particle, together with some of the energy of the β - and γ -rays absorbed in the envelope.

This view has been fully confirmed by the measurements of Rutherford and H. R. Robinson, and others, who found that each of the α -ray products of radium gave a heating effect equal to that calculated from the energy of the α -particles and the absorbed β - and γ -rays. Radon and its products when removed from radium were responsible for three-quarters of the heating effect of radium in equilibrium. The heating effect of radon, radium A and radium C decayed at the same rate as their activity. Accurate measurements give for the total heating effect of radium in equilibrium (with the short-lived products) surrounded by sufficient material to absorb all the radiations a value of 140 i calories per hr per g. Of this, 124.4 calories are caused by the α -particles and recoiling atoms, 6.3 by the β -particles and 9.4 by

the γ -rays. The energy of the β - and γ -rays comes from radium B and radium C. On account of its great penetrating power, it is difficult to measure the energy of the γ -radiation accurately but the results show clearly that the energy of the γ -rays is greater than that of the β -rays, and that the two together contribute rather more than 11% of the total heating effect of radium in equilibrium.

Measurements have been made of the heating effect of several other radioactive substances, such as uranium, thorium, thorium C, polonium, etc., and also of uranium and thorium minerals. In every case, the evolution of heat is of the magnitude to be expected from the energy of the radiations.

Experiments on the evolution of heat from radium have brought to light the astonishing amount of energy accompanying the transformation of active matter, especially where α -particles are emitted. For example, 1 curie of radon in equilibrium with its products emits heat initially at the rate of about 114 calories per hour. The total heat emitted during its transformation is about 15,000 calories. The volume of 1 curie is 0.65 cu mm and its weight 6.5×10^{-6} g. Thus 1 g. of radon emits during its life about 2.3×10^6 calories of heat. Contrasting this with the 8,000 calories obtained from the combustion of 1 g. of carbon, we see that the evolution of heat is enormous compared with that emitted in chemical reactions. It is evident that the atoms of matter must contain a great reservoir of energy which becomes available, even partially, only by the disintegration of the atoms. This energy is released in the re-arrangement of the particles in the atomic nucleus which takes place in the disintegration process and is accompanied by a change of mass. Albert Einstein showed in 1905 that, according to the theory of relativity, there is no essential difference between mass and energy, but that energy has mass and mass represents energy. The relation deduced by Einstein that the energy $E = m(\text{mass}) \times C^2$, where C is the velocity of light, has in fact been confirmed by experiments on the artificial transmutation of atoms. It appears that in the transformation processes, both natural and artificial, matter is partially converted into energy, and that a very small change in mass corresponds to a very large release of energy. The most striking example of the enormous energy which can be obtained in this way is the case of nuclear fission and its application in the atomic bomb and in nuclear fission reactors (see NUCLEUS).

Nature and Properties of the α -Rays.—Although the α -rays from active substances are of small penetrating power compared with the β - or γ -rays, they are responsible for most of the energy evolved by radioactive substances and contribute most of the ionization. Rutherford showed in 1903 that the α -rays are deflected in a powerful magnetic and electric field and consist of positively charged atoms of matter projected with high velocity. From the first it seemed probable that the α -particle was an atom of helium carrying two positive charges, and this was subsequently confirmed in a number of ways. The value of e/m —the ratio of the charge on the particle to its mass—and the velocity can be determined from observations on the deflection of the pencil of rays by a magnetic field and electric field. In this way Rutherford and Robinson in 1914 showed that the α -particle, whether from radon, radium A or C, gives a value of $e/m = 4,820$ em units, agreeing within the limit of error with the electrochemical value of $e/m = 4,822$, assuming that the mass of the helium atom is 4.004 and that it carries two unit positive charges. The magnitude of the charge carried by each particle was measured by Regener and Rutherford and Geiger, and found to be twice that carried by the electron. The velocity of the α -particles expelled from radium C' (of range 7.06 cm.) was found to be 1.92×10^9 cm. per sec., or about $\frac{1}{15}$ the velocity of light. From this result the velocity of expulsion of all α -particles can be calculated approximately from the relation found by Geiger, that $V^3 = KR$, where V is the velocity of the particle and R its range in air. The evidence indicates that the α -particles from active products are in all cases atoms of helium.

In general, the α -emission from a given product consists of a single group of α -particles emitted with a definite velocity, which is characteristic of that product. In some cases, however, several

groups of α -particles, each group having a definite velocity, are emitted, the implications of this phenomenon will be discussed later. The velocity of emission of the α -particles is connected with the period of transformation of the element (*see below*).

The laws of absorption of the α -particle in matter were first worked out by W. H. Bragg and R. D. Kleeman. On account of its great energy of motion, the α -particle travels in nearly a straight line through matter, producing intense ionization along its path. The effects produced by the α -particle, whether measured by ionization, phosphorescence or photographic action, vanish suddenly after the α -particle has traversed a definite amount of matter. This means that particles of the same initial velocity have a well-defined length of path, or *range*. It is found that the ionization per centimetre of path caused by a narrow pencil of α -rays increases with the distance from the active matter, at first slowly, then more rapidly, near the end of the range. After passing through a maximum value the ionization falls off rapidly to zero, corresponding to the end of the range. If a uniform screen of matter is placed in the path of the pencil of rays the range is reduced by a definite amount proportional to the thickness of the screen. All the α -particles have their velocity reduced by the same amount in their passage through the screen. The ranges in air of the α -rays from the various radioelements have been measured and are usually expressed in terms of cm. of air traversed at 15° C and 760 mm. pressure. The ranges for the different products vary between 2.6 cm. and 11.5 cm.

Bragg and Kleeman made observations of the stopping powers of gases and solids and these led to the empirical rule that the stopping power of an atom is proportional to the square root of its atomic weight. This simple rule has proved very useful in estimating the reduction in range of α -particles in traversing different kinds of matter. It was later supported on theoretical considerations.

The absorption of α -particles in matter results essentially from elastic collisions with the electrons. As the mass of the α -particle is about 7,000 times the mass of the electron, the energy lost in a single collision is an extremely small fraction of its total energy. Therefore a large number of collisions is necessary to stop the α -particle completely, and the range of all α -particles of the same initial velocity will be the same, except for small fluctuations. Moreover, since an impact with an electron can not deflect the α -particle appreciably, the particle will follow a straight path. In this way the remarkable definiteness of the range of the α -particle is explained. The collisions with an atomic nucleus, which may cause a large loss of energy and an abrupt change of direction, are too infrequent to affect the general picture. This description needs some qualification. The loss of energy of the α -particle is caused by a large but finite number of electron collisions or ionization processes, and these are subject to statistical fluctuations. The energy loss is therefore not quite the same for all the particles, and in consequence the range is not quite exactly defined but has an average value about which the ranges of the individual particles fluctuate. This effect is known as the straggling of the range. The mean fluctuation of the ranges around the average value is between one and two per cent. The average value of the range, known as the *mean range*, is now generally used to characterize a given emission of α -particles.

On account of its great energy of motion the effect caused by a single α -particle can be detected in a variety of ways. Sir William Crookes first noted that the α -rays produce scintillations when they fall on a screen of phosphorescent zinc sulphide. It is now known that each of these scintillations results from the impact of a single α -particle. The number of scintillations can be counted with the aid of a suitable microscope, and this method has proved of great utility in many investigations. Scintillations caused by α -rays are observed in certain diamonds, but they are usually not so bright as in zinc sulphide. S. Kinoshita has shown that a single α -particle produces a detectable effect on a photographic plate. When the α -rays fall on a plate nearly horizontally the track of the α -particle is clearly visible under a high-power microscope. This method has recently been developed to a useful means of investigation under appropriate conditions. By the expansion

method developed by C. T. R. Wilson, the track of the α -particle through the gas is made visible by the condensation of the water on each of the ions produced. In a similar way the track of a β -particle can be easily shown. The photographs of these trails bring out in a striking and concrete way not only the individual existence of α - and β -particles, but the main effects produced in their passage through matter.

Rutherford and Geiger in 1908 devised an electrical method of detecting a single α -particle. The α -particle entered, through a small window, a metal tube containing a gas at a reduced pressure, and a strong electric field was applied between the wall of the tube and a central wire electrode. The ionization produced by the α -particle in its passage through the gas was magnified several thousand times by the movement of the ions in the electric field, so that the charge communicated to the central wire was large enough to be detected by means of an electrometer. A simple counter was devised by Geiger which responded to single β -particles as well as to single α -particles. This consisted of a fine needle point, or a small sphere at the end of a wire, placed axially in a metal cylinder. A strong electric field is maintained between the cylinder and the point, the gas in the cylinder may be at atmospheric or at reduced pressure. The point electrode is connected to a short-period electrometer and also grounded through a high resistance. When an α -particle enters the cylinder through a hole or window opposite the point a discharge occurs which causes a sudden variation in potential of the point, sufficient to be easily detected by the electrometer. The tube counter of Geiger and W. Muller differs from the point counter mainly in the shape of the electrodes. The cathode is cylindrical and the anode is a thin wire along the axis of the cylinder. The sensitive region extends over the whole space between the electrodes. This counter is more usually employed for the detection of β -particles or of γ -radiation. For this purpose, the conditions are generally chosen so that the multiplication is very high and the magnitude of the impulses produced becomes independent of the original ionization. It can however be used so that the magnitude of the impulse is proportional to the original ionization, when it is then possible to distinguish between the impulses caused by α -particles and those caused by β -particles. The most practical method of counting the impulses is to couple the counter circuit, by means of a small capacity, to a valve amplifier which operates a mechanical recorder such as a telephone callmeter.

In the counters just described the primary ionization of the particle is magnified by producing ionization by collision by means of a strong electric field. The most generally useful method for α -particles (and protons, etc.) is to use a valve amplifier in order to magnify the potential variation of the electrode of a simple ionization chamber. This method was first successfully applied by H. Greinacher, and developed to a high degree by C. E. Wynn-Williams. From four to six amplification stages may be used and the voltage amplification is of the order of 10^4 or more. The amplification is linear and therefore gives a measurement of the primary ionization. The α -particles can be counted in the presence of β - and γ -radiation, which however produce a disturbance resulting from the fluctuations in their ionization (*see RADIOACTIVITY, ARTIFICIAL*).

When the α -rays fall on a sheet of matter, a cloud of slow-speed electrons is emitted. These were first studied by J. J. Thomson and were called by him the delta (δ) rays. Most of the δ -rays have an energy corresponding to only a few volts but a few particles are present which have much higher speeds, some reaching to twice the velocity of the α -particle. These δ -rays are a secondary phenomenon and are liberated from the atoms of matter by the action of the α -particle. The δ -rays can be best studied by photographing the tracks of the α -particles in a Wilson chamber containing a gas at low pressure. The swifter δ -particles are able themselves to ionize the gas and their tracks are easily visible. J. Chadwick and K. G. Emeleus and also P. Auger have shown that the number and velocity of the swifter δ -rays agree excellently with the view that they are produced by the collision of the α -particles with the electrons in the atom. The primary process of ionization by the α -particle is the removal of the electron and the second-

ary ionization is produced by the δ -particles. In general the primary ionization is about one-half of the total ionization observed.

The α -particle at the moment of its explosion from a radioactive atom carries two charges and it was at first supposed that it retained this charge until very near the end of its range where the charge was neutralized by capture of two electrons. Later work, however, by G. H. Henderson and Rutherford showed that the α -particle changes its charge several thousand times in its passage through matter. When the α -rays pass through a sheet of matter in a good vacuum, the issuing rays consist of doubly-charged, singly-charged and neutral helium atoms. For high speeds, the doubly-charged particles predominate, at low speeds most of the particles are singly charged or neutral. It seems clear that the α -particle in its passage through matter occasionally captures an electron and that this may be removed in a subsequent collision. This process of capture and loss of electrons is repeated many thousand times before the α -particle is brought to rest.

Although most of the α -particles travel in nearly a rectilinear path through absorbing material there is in general a small scattering or deflection of the α -particles in passing through matter, amounting on the average to a few degrees. This scattering increases with the atomic weight of the absorber and with reduction of velocity of the α -particle. In addition to this small angle scattering, a small fraction of the α -particles is deflected by collisions with heavy atoms through angles greater than a right angle. This large angle scattering is in general caused by a close collision of an α -particle with a single atom of matter. A close study of the laws of single scattering of α -particles has been made by Geiger and E. Marsden. The observations on this large angle scattering first disclosed the nuclear structure of the atom and has given us most definite information on the laws of force inside the atom close to the nucleus and on the dimensions of atomic nuclei. (See NUCLEUS.) P. M. S. Blackett has obtained a number of expansion photographs showing close collisions of α -particles with the nuclei of light atoms like hydrogen, helium, nitrogen and oxygen. In general a forked track is obtained, one branch caused by the scattered α -particle and the other by the recoiling nucleus.

The Relation between Range of α -Rays and Period of Transformation.—It was early observed that there appeared to be a connection between the period of transformation of a product and the velocity of the α -particles emitted by it. The shorter the period of transformation, the swifter is the velocity of expulsion of the α -particle. This relation was clearly shown by the measurements of Geiger and J. M. Nuttall, which show that if the logarithm of the range is plotted against the logarithm of λ , the constant of transformation, all the points for each radioactive series lie approximately on a straight line. The relation can be written

$$\log R = A \log \lambda + B$$

where A and B are constants, and the constant A is nearly the same for all three radioactive series. A similar relation exists between the logarithm of the transformation constant and the logarithm of the energy of the α -particle.

This relation, although only approximately fulfilled, was rightly regarded as of fundamental importance. One of the most striking successes of the theory of α -disintegration, advanced by G. Gamow and by R. W. Gurney and E. U. Condon in 1928, was to explain the meaning of this relation.

Theory of α -Disintegration.—The difficulty encountered in forming a theory of α -disintegration can be illustrated by the use of uranium. Scattering experiments, using the fast α -particles of thorium C' (energy nearly 9 Mev) show that there is no appreciable departure from the Coulomb potential up to a distance of 3×10^{-12} cm from the centre of the uranium nucleus. At smaller distances, to which the α -particle can not penetrate, there must be large deviations from the Coulomb potential, to account for the nearly stable binding of α -particles in the nucleus. The general shape of the potential field between the nucleus and an α -particle is therefore as shown in fig. 5, where the dotted line represents the Coulomb potential $V(r) = \frac{Ze^2}{r}$. On the

other hand, the α -particles emitted spontaneously by uranium have an energy of about 4 Mev. As these particles must come from inside the nucleus, it is impossible to explain on classical mechanics how they can surmount a potential barrier which is at least twice as high as their energy. On quantum mechanics, however, there is the possibility of leakage through the barrier. An adequate description of the tunnelling can only be given in terms of the Schrödinger equation for the wave function of the α -particle, which enables a calculation to be made for the probability of the particle being found outside the nucleus after a certain time. A semiclassical description can be given by supposing that the α -particle inside the nucleus has a degree of excitation indicated by the height of the line AB , along which it vibrates, making collisions with the walls of the barrier. At each collision, the particle has a small but finite chance of penetrating the barrier and escaping. The greater the chance of escape, the fewer the oscillations will be necessary for the α -particle to reach the edge of the barrier. The chance depends markedly on the degree of excitation of the particle. Thus we see in a general way that a body which emits fast α -particles will have a short period and one

Fig. 5

which emits slow α -particles will have a long period. Detailed calculation leads in fact to a relation between the period of transformation and the energy of the α -particle which is similar to the Geiger-Nuttall law. Further, the calculation leads to values for the nuclear radii (R) of the radioactive atoms which are, for the same series, close to one another and in agreement with the order of magnitude of the nuclear radius as deduced in other ways.

Long Range α -Particles and Fine Structure Groups.—For many years all the α -particles emitted by a given radioactive element were believed to have exactly the same velocity. The first departures from this rule were found in the cases of thorium C' and radium C'. In the former case, two weak groups of α -particles were found which have ranges of 9.7 cm and 11.5 cm, considerably longer than the normal group of 8.6 cm range. The "long-range" emission of radium C' is more complicated, consisting of several groups of ranges between 7.7 cm and 11.5 cm. In both cases, the intensities of the long-range groups are very weak, being about 10^{-7} to 10^{-8} or less of the main group. These long-range groups are believed to arise in the β -transformation of the C nucleus leaves the C nucleus in an excited state. There are then two possibilities, the nucleus may go to the normal state by emitting a γ -radiation, followed by the normal α -disintegration, or an α -particle only may be emitted, taking away the excess energy of the excited nucleus. The relative intensities of the two processes depend on the relative probability of γ -emission and of an α -particle of high energy. As the probability of γ -emission is large, the second process will seldom occur, and will be observed at all only when the α -particle has a short period. This explains why the long-range particles have been found only with radium C' and thorium C'. On this explanation, the measurement of the energies of the long-range groups gives part of the excited-level system of these nuclei and the energy differences should correspond to γ -rays emitted in α -transitions RaC-RaC' and ThC-ThC'. This has been borne out by examination of the γ -ray spectra emitted in these transitions.

A more common complexity in the α -emission is known as "fine structure." This was first observed by S. Rosenblum who analyzed the α -groups by means of a magnetic spectrograph. Many products are now known, e.g., ThC, Am, AC, ACX, RdAc, Ra, RaC, RaF, which emit a complex α -spectrum, consisting of a number of homogeneous groups of about the same order of intensity. Thus thorium C has 5 groups, actinium 3 groups, radioactinium 21 groups. In these cases, the complexity of the α -emission arises from excitation of the product nucleus. If, e.g., thorium C emits an α -particle of energy lower than the α -particle of the highest energy group, the thorium C' nucleus, the result of the change, will be formed in an excited state. The energy difference between the groups measures the excitation energy of the thorium C' nucleus. The various α -groups thus correspond to various energy levels of thorium C'. The thorium C' nuclei will thus be formed in varying degrees of excitation, and they will follow transitions, with the emission of γ -radiation, to the ground state of thorium C'. Thus there must be a correspondence between the energy differences of the α -groups and the energies of the γ -rays emitted by thorium C'. This has been confirmed very satisfactorily.

The Properties of the β -Rays.—We have seen that the β -particles, which are emitted by a number of radioactive elements, consist of swift negative electrons spontaneously liberated in the transformation process. The energy of expulsions varies widely for different products, from values of some thousands electron volts up to a few million electron volts. The penetrating power of the rays varies correspondingly. e.g., the β -rays of radium D are so easily absorbed by matter that they are difficult to detect, while those of radium C can pass through a few millimetres of aluminum before they are totally stopped. At first sight, the laws of absorption of β -particles by matter appear different from those observed with α -particles, although the process of energy loss is essentially the same. This is caused by the small value of the electron mass, about 1/1836 times less than the mass of the α -particle, as a result of which the β -particles are easily scattered. While an α -particle can be deflected from its straight path only by collision with a nucleus a β -particle can transfer a large fraction of its energy and momentum to the electrons contained in the matter in its path. Consequently, the β -particles are frequently deflected from their course and pursue in general a tortuous path in their passage through

matter. Although we can still speak of a "range" in matter, this range is far from being so well-defined as that of the α -particle. Thus the study of the passage of β -particles through matter is much more complicated, both in theory and in experiment, than the same problem for α -particles. Although the energy of the β -particles is in general considerably less than the energy of the α -particles, the rate of loss of energy by ionization is much less, for the β -particle carries only one unit charge as against two for the α -particle and its velocity is much higher. An α -particle of 3,000,000 electron volts has a velocity of about $0.04c$ (c being the velocity of light) and produces about 4,000 ion pairs per millimetre of its path in air, whereas a β -particle of the same energy has a velocity of about $0.99c$ and produces only about 4 ion pairs per millimetre of path in air. Because of this small rate of energy loss the β -particle has a much greater range than an α -particle of the same energy. Thus, in our example, the α -particle would have a range in air of about 1.7 cm while the β -particle would have a range of about 13 metres. The difference in behaviour between α -particles and β -particles is strikingly shown in experiments with the expansion chamber. In contrast to the short, straight and densely ionized tracks of the α -particles the tracks of the β -particles are long, show many gradual deflections and occasional "forks" resulting from a close collision with an electron, and are sparsely populated with ions. In addition to the loss of energy by ionization, there is a loss of energy by radiation caused by sudden deceleration of the β -particle on impact, an effect which is responsible for the emission of the continuous X-ray spectrum when cathode rays are stopped by a target. The production of γ -rays by β -rays in passing through matter was first observed by J. A. Gray.

A great difficulty in the study of the detailed properties of the β -particles is that the rays emitted by a radioactive product are not homogeneous but differ widely in velocity. This fact was not fully appreciated for some time. In the early days, it was found that the absorption of β -rays appeared to follow an exponential law and different pieces of *Becquerel* were characterized by a definite absorption

statistical fluctuations in the number of impacts and in the energy lost in the electron collisions. The β -particles which emerge after traversing a layer of matter have had different lengths of path and suffered different energy losses. It is nevertheless possible to define and measure the range of the β -particle as a function of its energy. The results of experiments show that for the lower energies, up to about 200,000 electron volts, the range of the β -particle is proportional to the fourth power of the velocity, while for much higher energies the range is proportional to the energy.

The scattering of β -rays has been examined experimentally by many observers but the results are not concordant. This is partly because of the difficulty of realizing well-defined conditions and to the susceptibility to scattering of these particles. The scattering is indeed so marked that when a beam of β -rays falls on a thick sheet of material a large fraction, as much as one-half in the case of heavy elements, may be irregularly reflected, i.e., scattered through more than 90° .

The β -Ray Spectrum and the Disintegration Process.—It has already been stated that the β -particles arising from the disintegration of a single product are expelled over a wide range of velocity. When the β -rays from a product such as radium B or radium C are bent in a uniform magnetic field and fall on a photographic plate, a kind of magnetic spectrum is obtained. Superimposed on a continuous background resulting from particles of all velocities from zero up to a certain limit, a number of sharp lines are observed, each of which represents a definite group of β -rays which are emitted with the same velocity. These lines are generally referred to as the β -ray line spectrum and are characteristic of the radioactive product. Many careful measurements of the β -ray line spectra have been made, and they are now known accurately for most of the important radioactive substances. In some cases, the line spectrum is relatively simple while in others it is complex. The appearance of these lines in the spectrum is connected with the emission of γ -rays, they arise from the process known as *internal conversion*, the conversion by the photoelectric effect of a γ -ray emitted by the radioactive nucleus in the electron or positron structure of the atom (see below). These lines are thus secondary in origin and do not represent the primary emission of β -particles from the nucleus. The β -ray line spectra have been of great importance in the study of the γ -ray spectra of radioactive products.

Since most β -ray products also emit a strong γ -radiation the magnetic spectra in general show pronounced line spectra and for some time these were thought to be the disintegration particles. The fact

that the number of particles in the lines was only a fraction of the total number of β -particles and that the primary β -emission had a continuous distribution of velocity was first recognized by Chadwick in the case of radium (B+C). Later experiments have shown that in all cases the disintegration electrons are ejected from the radioactive nucleus with a continuous distribution of velocities, and that the number of particles in this continuous spectrum corresponds, within the accuracy of experiment, to one particle for each disintegration. The form of the distribution has been measured for a number of products. The general result is that the distribution curves are similar, showing a definite maximum and then decreasing to zero at a well-defined upper limit of energy. The form of the curves in the region of very low energies is difficult to measure accurately, so that it is uncertain whether there is a definite lower limit of energy or whether the distribution extends to zero energy. On the other hand, the upper limit of the energy is well-defined and is characteristic of the radioactive product. Thus the upper limit of energy of the continuous spectrum of radium B is 0.65 Mev, of radium E, 1.17 Mev, and of radium C, 3.15 Mev. The value of this end point is an important constant, for on present theory it gives the total energy released in the β -disintegration. There is a relation between the maximum energy of the β -rays emitted by a product and its rate of disintegration, first pointed out by B. W. Sargent, but the relation is not so simple as the Geiger-Nuttall relation in the case of α -disintegration.

The distribution curve of the β -ray spectrum should be simplest in the case of a radioactive substance in which the final product of the nucleus is formed in its ground state, as is shown by the absence of γ -radiation. In most cases, however, the β -transformation is more complex and the new nucleus can be formed in any one of a number of excited states; the transitions between these excited states to the ground state account for the γ -radiation which accompanies such β -transformations. In these cases, therefore, the energy distribution curve of the β -ray spectrum will be complex, consisting of a superposition of a number of continuous spectra, each one of which has a definite upper limit and corresponds to a β -transformation to a certain quantum level of the resulting nucleus. The successful analysis of a complex β -ray distribution into the simple or "partial" spectra would give information on the quantum states of the new nucleus, as in the case of the "fine-structure" of the α -emission. This is, owing to the broad distribution in the spectra, difficult to carry out in practice and in general little accurate information about quantum states has been derived from the primary β -ray spectrum.

The process of β -decay, in which the transformation from one nucleus to another appears to take place with a release of energy varying between wide limits, is in such strong contrast to the process of α -decay, and indeed of all other nuclear phenomena, that for some time the facts were not generally accepted. It was suggested, e.g., that the β -particles are all liberated initially with identical energy and that the continuous spectrum results from varied losses of energy suffered by the different particles in escaping from the atom. This supposition was disproved by direct experiment, in which the average energy released per disintegration of radium E was measured by means of a calorimeter. The experiments gave an average energy of 0.34 Mev, in close agreement with the average value deduced from the observed distribution curve, and far from the upper limit of 1.17 Mev. There can therefore be no doubt that the β -particles are emitted from the nucleus with varied energies. On the other hand, all phenomena connected with α - and γ -ray spectra show that the radioactive nuclei have well-defined quantum levels and that the energy of the initial nucleus and the energy of the product nucleus have well-defined values. In order to retain the conservation of energy in the process of β -decay—and to abandon it is a counsel of despair—it is necessary to assume that part of the energy of disintegration is emitted in the form of a new and undetected type of radiation. Pauli suggested that this radiation may consist of particles bearing no electric charge and of small, possibly zero, mass. Such particles, called *neutrinos*, would have no interaction with matter and would thus not be detected directly. The β -decay process would then consist of the simultaneous emission of an electron and a neutrino, which share the constant total energy of the disintegration, distributed between them in a continuous way. The maximum energy of the β -particle would occur when the neutrino is emitted with zero velocity, the total energy in the disintegration process is thus equal to the maximum energy of the β -rays. Since the self-energy of a spin of one-half particle and the neutrino mass is zero. In all cases where a test can be made, this assumption leads to consistent results.

In addition to helping to conserve energy in the β -decay process, the assumption of a neutrino removes other difficulties, for experimental evidence shows that the nucleus produced in a β -decay process has the same spin and the same statistics as the initial nucleus, in spite of the emission of an electron of a spin of one-half and a Fermi-Dirac statistics. The correct relations regarding spin and statistics are restored if a spin of one-half and Fermi-Dirac statistics is ascribed to the neutrino. All attempts to observe effects resulting from the interaction of the neutrino with matter have failed, but such a result is only to be expected from the properties which the neutrino must be assumed to possess. Some experimenters have suggested that in which the energy and momentum of the emitted β -particle and of the associated recoil-

ing nucleus have been measured have, however, given some indications that momentum is not conserved if only these two particles are involved in the disintegration. These experiments thus give some support to the hypothesis of the neutrino.

A theory of the β -disintegration process was constructed by Fermi on the basis of the neutrino hypothesis. Fermi proposed that β -disintegration corresponds to the transformation, inside the nucleus, of a neutron to a proton, with the simultaneous emission of an electron and a neutrino. In this way he was able to explain the general shape of the continuous spectrum of primary β -rays, and also to deduce a relation between the mean life of a substance and the maximum momentum of its β -particles, analogous to the rules found empirically by Sargent. It is not surprising that the deductions from the theory show some discrepancies with experimental results, for the theoretical basis of some of the arguments is incomplete, depending as it does on an intimate understanding of the nature of the relation between the proton and the neutron. The theory is rather to be regarded as the first, although an important, step toward the description and explanation of β -disintegration on the basis of quantum mechanics.

The Properties of the γ -rays.—The γ -rays from radioactive substances are electromagnetic radiations. A γ -radiation may be characterized by its wave length, generally expressed in X -units (X -unit = 10^{-8} cm.), by its frequency ν , or momentum by the energy of the quantum $h\nu$, generally stated in electron volts. The γ -radiation from any one product consists of one or more spectrum lines which may differ widely in wave length and in intensity. The spectral region occupied by the γ -radiations extends from the soft X -ray region of some thousands of electron volts in quantum energy to the high-frequency region of a few millions of electron volts.

The absorption of γ -rays by matter is analogous to the absorption of X -rays, but owing to the higher frequencies of the γ -rays some effects assume a greater importance than in the case of X -rays. The absorption follows an exponential law with thickness of matter traversed, thus the ionization in an electroscope falls off according to the equation $I/I_0 = e^{-\mu d}$, where d is the thickness of matter traversed and μ the coefficient of absorption. The absorption coefficient for different kinds of matter is approximately proportional to the density, indicating that absorption depends on the mass of matter traversed. The absorption curve, more especially in the case of high energy γ -rays, depends to some extent on the geometrical conditions, the results being more nearly characteristic of the radiation and the absorbing matter the more the effects of scattered radiation are excluded from the measurements.

The absorption of γ -rays by matter is mainly caused by interaction with the electrons. There are three different processes—scattering, photoelectric absorption and creation of positive and negative electron pairs, the relative importance of these three processes depends upon the frequency of the radiation and the atomic number of the absorbing element. The experimental investigation of these types of interaction of γ -rays with matter is thus complicated by the difficulty of separating their effects.

In the classical theory of scattering a free electron is set in vibration by the electric field of the incident radiation, emitting spherical waves of the same frequency as the incident waves. Thus on the classical theory the scattered radiation has the same frequency as the incident radiation. It was early noted by J. A. Gray that scattered γ -radiation was more easily absorbed than the incident γ -radiation, indicating a change in frequency, but these experiments did not attract much attention. The explanation of the change of frequency on scattering, and the calculation of its magnitude, was given by A. H. Compton, together with experimental proof. Compton's argument was that the process of scattering must be regarded, on the quantum theory, as a collision between a photon, a quantum of radiation, of energy $h\nu$ and an electron. In general, the electron will be ejected from the atom and the photon will be deflected from its original direction. Since the photon transfers momentum and energy to the electron, the scattered quantum will have a smaller energy than the incident quantum. Scattering will therefore be accompanied by a change of frequency (the Compton effect). However, if the electron is very tightly bound in the atom, the process may be similar to the classical process of scattering, and there will be scattered radiation of unmodified frequency. Such scattering is responsible for the interference of X -rays and γ -rays in crystals, which could not occur if the scattered radiation were not coherent. This unmodified scattering becomes less important with increasing energy of the photon, with high energy γ -rays it can only be detected with difficulty.

The Compton effect is of great importance in the case of high-frequency radiations, such as compose in general the γ -rays emitted by radioactive substances, for it means that the radiation becomes degraded as it passes through matter, acquiring in a single scattering process a wave length of perhaps several X -units. The scattering theory has been verified experimentally by observation of the change of frequency and also of the simultaneous production of the scattered quantum and the recoil electron. A detailed quantum theory of scattering has been given by O. Klein and Y. Nishina on the basis of P. A. M. Dirac's relativistic theory of the electron.

Absorption of γ -rays by the photoelectric effect occurs when the whole energy $h\nu$ of the quantum is transferred to an electron in one

or other of the K, L, M , etc. levels of an atom. The photoelectron will be ejected with a kinetic energy $E = h\nu - W$, where W is the energy required to ionize the atom in the corresponding quantum level. In this case, the quantum of radiation is completely absorbed, and the residual atom takes up the momentum necessary for the conservation of momentum and energy.

For light elements and for γ -rays of energy of the order of 1 Mev the absorption results almost entirely from Compton scattering. For heavy elements and radiation of low energy, the absorption is mainly caused by the photoelectric effect. In the intermediate region, the two processes are comparable in their effects. The experiments of J. A. Gray and G. T. P. Tarratt, C. Y. Chao and others showed that in heavy elements the absorption of γ -rays of high energy is not entirely accounted for by Compton scattering, coherent scattering by bound electrons, and by the photoelectric effect, but that a further absorption process must take place. This was later explained to be caused by the creation of positron-electron pairs, a quantum-mechanical process which has no classical analogy.

The explanation of this process is derived from Dirac's relativistic theory of the electron and its consequence of negative energy states as well as of positive energy states. A quantum of energy greater than $2mc^2$, where mc^2 is the rest energy of an electron, can raise an electron from a state of negative energy, or the state of positive energy, from a quantum corresponding to the creation of a pair of particles, a negative electron corresponding to the "hole" in the negative energy state. This process is analogous to the photoelectric effect. It can not occur in empty space, for, as the quantum is wholly absorbed, energy and momentum can not be conserved, it occurs in the electron field near the nucleus and the nucleus takes up the extra momentum. The probability of pair production increases with increasing quantum energy of the radiation and is proportional to the square of the nuclear charge, Z , of the absorbing element. As the Compton scattering is proportional to the number of electrons, Z , and decreases with increasing energy, the total absorption coefficient should show a minimum for a certain quantum energy, which will be higher for the lighter elements than for the heavier, and then increase again with increasing quantum energy. For lead, the minimum absorption coefficient should occur for γ -rays of about 3 Mev, for aluminum, for γ -rays of about 20 Mev.

The γ -Ray Spectra.—The spectral distribution of the γ -rays has been examined in a few cases by means of diffraction in crystals. The first work of this kind was done by Rutherford and E. N. da C. Andrade in 1914, who studied the spectrum from a thin crystal of alkali of the γ -radiations emitted from a fine glass tube filled with radon. A complicated spectrum of sharp lines was observed corresponding to some of the γ -rays emitted by radium B and radium C. Later, similar experiments were carried out by M. Finley and by J. Thibaud.

The crystal diffraction method has the advantage of easy and direct interpretation but it has difficulties which seriously limit its use. The spectra of the spectra of high-frequency radiation are only a few minutes of arc, so that the precision obtained is not great, very active sources are required, and even with these only the strongest γ -ray lines have been photographed.

Nearly all our information on γ -ray spectra has been derived by an entirely different method depending on the photoelectric effect. A γ -ray in escaping from the radioactive atom occasionally interacts, with one of the electrons in the shells of the atom in which it originates, giving rise to a secondary β -ray. This process is known as *internal conversion*. Considering a large number of disintegrating atoms there will be a certain probability that a particular γ -ray will be converted in the K, L, M , etc. levels, and consequently the secondary β -ray emission will consist of a number of groups of energy $h\nu - W_K, h\nu - W_L, h\nu - W_M$, etc. Since the energies of the γ -rays can be deduced from its deflection in a magnetic field, and W_K, W_L, W_M , etc. are known from X -ray data the frequency ν of the radiation can be directly determined. In general, the γ -ray spectrum of a radioactive substance consists of a number of lines, each of which may give rise to one or more groups of β -rays. If the γ -ray is intense enough to give several β -ray lines caused by conversion in the various electron shells, the interpretation is clear, but when the γ -ray is weak it may not be possible to observe more than one β -ray line, and interpretation becomes more difficult.

This method has been extensively developed by C. D. Ellis, L. Meitner, Thibaud and others, and the γ -ray spectra of many of the radioactive elements have been studied. In general, the frequencies of the γ -rays, the intensities of the strong lines, are now known with fair accuracy, the intensities, on the other hand, are in most cases known only roughly. The β -rays resulting from internal conversion appear always to consist of homogeneous groups, indicating that the γ -ray spectra consist of highly monochromatic lines. No experiment has yet revealed a measurable width of the γ -ray lines, and their width is at present estimated purely on theoretical reasoning.

In measuring the energy of the γ -rays by this method it was a question of some importance to decide whether the binding energies W_K, W_L , etc. of the electron levels of the initial nucleus or those of the product nucleus should be substituted in the photoelectric equation, i.e., whether the γ -rays are emitted *before* or *after* the expulsion of the disintegration particle from the nucleus. This question

was investigated by a number of observers by different methods, leading to a clear proof that in all cases, whether of α - or β -disintegration, the γ -ray always follows the emission of the disintegration particle. For example, the γ -rays which are ascribed to the disintegration of radium B of nuclear charge 82 actually arise from the nucleus of charge 83 resulting from the expansion of a β -particle from radium B and are converted in the electronic levels of an atom of charge 83. This conclusion accords with the modern conception of the emission of γ -radiation, which is supposed to be caused by the excitation of the product nucleus and the subsequent transitions to the ground state. The general evidence indicates that the γ -ray spectra can be interpreted by assuming a system of energy levels in the nucleus, analogous to the well-known system of levels in the electronic system of an atom which have been postulated for the explanation of optical and X-ray spectra. In contrast to the case of the atom, where emission of radiation is caused by electronic transitions, there is every reason to believe that the emission of radiation from the nucleus is caused by the motion of heavy particles—protons, neutrons, α -particles. First, electrons are believed not to exist in the nucleus, and second, if the γ -emission were caused by an electron, the γ -ray lines would not possess the high degree of homogeneity which is actually observed.

In principle it is possible to devise a system of energy levels which will describe the γ -ray emission and so to arrive at the quantum levels of the radioactive nucleus. In most cases the experimental data are on the energies and especially on the intensities of the γ -ray lines are still too meagre and too inaccurate to give an unambiguous solution of the problem. Generally, the level system can only be partially and somewhat tentatively established. In some cases, however, notably those in which additional information about the level system is available from α -ray groups, the solution is more satisfactory.

The disintegration process of a nucleus X which emits long-range α -particles and changes to a nucleus Y can be represented diagrammatically by fig. 6. In the potential "well" of X, A is the ground state from which the normal α -particles are emitted, with an energy corresponding to the difference between A and the ground state B of the nucleus Y. Levels A_1, A_2 , etc., are the excited levels from which the various groups of long-range α -particles are emitted, with energies corresponding to the transitions (1), (2), etc., to the ground state B. The spectrum of the radiation emitted by the nucleus X should be accounted for by transitions in the level system A, A_1, A_2 , etc. An appropriate example of this case is that of radium C, for which the long-range α -groups have been closely examined. It has been found possible to account for many of the γ -ray lines by transitions between the levels deduced from the study of the long-range α -particles.

If the nucleus X emits α -particles with a "fine-structure" the emission of the most energetic group of α -particles will correspond to the transition (1) in fig. 7, from the ground state A to the ground state B of the product nucleus, and the other groups will correspond to transitions (2), (3), etc., to the excited states B_1, B_2 , etc. A good example of this process is the case of thorium C—thorium C'. The fine-structure groups of thorium C have been measured accurately, so that the level system of thorium C' should be well established, and the γ -ray spectrum of thorium C' is also well known. Comparison shows that all the lines of the γ -ray spectrum can be explained, both in energy and in intensity, by transitions in the level system deduced from the fine-structure.

If the nucleus X decays by emission of a β -particle there will in general occur transitions (1), (2), (3), etc., to excited states of the nucleus Y. In this case, it is difficult to separate the different partial spectra, owing to the continuous energy distribution of the β -rays in each, and the consequent overlapping. Only in rather simple cases can any accurate information be obtained about the energy levels B_1, B_2 , etc. In β -ray disintegrations, one has to rely mainly, if not entirely, on the information from the γ -ray spectrum to convert the level system of the product nucleus. It may be noted that the emission of a β -particle to an excited state B_1 , etc., should be associated with the emission of a γ -ray in the γ -emission of nucleus Y. Since the γ -ray is, as a rule, emitted almost instantaneously these two processes are practically simultaneous. The observation of "coincidences" between the emission of a β -particle and of a γ -ray can thus give considerable help in the elucidation of the level system.

Radioactivity of Ordinary Matter.—All matter shows a very

weak radioactivity, which in most cases is caused by the presence of extremely small amounts of the well-known radioactive elements. Thus, in general, one gram of a common metal will contain an impurity of the radioactive elements equivalent in activity to about 10^{-14} or 10^{-15} gram of radium. Four cases had, however, been definitely established in which the activity is not caused by a contamination of the known radioactive elements but had been proved to be characteristic of the element itself. These four are the following elements—potassium, rubidium, samarium and lutecium (cassiopeium).

The activities of potassium and rubidium were discovered in the early days of radioactivity, while those of samarium and lutecium were found only in recent years. The activity of all these elements is very weak.

Potassium emits a β -radiation of average penetrating power, and a small amount of penetrating γ -radiation. By a separation of the isotopes of potassium it has been shown that the β -activity is caused by the isotope of mass 40, present in ordinary potassium to the extent of about 1 part in 8,000. The half-value period of the transformation is 1.9×10^9 years and the resulting product is calcium of mass 40. Some evidence has been obtained which suggests that potassium 40 undergoes decay by another process also, that of electron capture. In this case, the result of the transformation would be argon of mass 40, and the transformation period will be less than the figure just quoted.

Rubidium emits a rather soft β -radiation, but its amount is, weight for weight, greater than that of potassium. The active isotope is that of mass 87, which has an abundance of 27% in ordinary rubidium. The period of transformation is 5×10^{10} years, the resulting product is strontium of mass 87. Strontium has been extracted from a quantity of lithium mica which contained about 4% to 5% of rubidium. A mass-spectrographic examination of this strontium showed that it consisted almost wholly (99%) of strontium 87, whereas ordinary strontium contains only 7% of this isotope.

Samarium is the only element outside the three radioactive series which has been found to emit α -particles. These have a mean range of 1.3 cm in air at 15°C and 760 mm pressure, and are thus shorter than any emitted in the known series. It has been shown by separation of the isotopes, depositing them directly onto a photographic plate, that the isotope of mass 148 emits the α -rays. Its period is 1.4×10^{11} years.

Lutecium (cassiopeium) emits a very soft β -radiation. It is probable that this is the isotope of mass 176 which is responsible, and on this assumption the half-value period of transformation is 7.3×10^{10} years. These results are summarized in the following table.

Element	Atomic No. Z	Mass No. of Iso., A	T	Type of Change
Potassium	19	40	1.9×10^9 years	β
Rubidium	37	87	5×10^{10} years	β
Samarium	62	148	1.4×10^{11} years	α (2.13 cm)
Lutecium	71	176(?)	7.3×10^{10} years	β

In addition to these well-established cases, there is some indication that certain other elements may be unstable. According to theory of the stability of atomic nuclei, current in 1947, two neighbouring isotopes, 146 and 148 , two nuclei with the same mass number and with nuclear charges different by one unit, should not both be stable, but the nucleus of higher energy should undergo radioactive change and transform into the other. Such pairs are A^{40} and K^{40} , K^{40} and Ca^{40} , Rb^{87} and Sr^{87} , Lu^{176} and Hf^{176} , and as we have seen one element of each of these pairs has been shown definitely to be radioactive. There are other pairs of neighbouring isotopes, however, in which both members of the pair are apparently stable, viz. Cd^{114} and In^{115} , and Sb^{123} , Sn^{123} and Te^{123} , Re^{187} and Os^{187} . Although these elements have been examined carefully, only in one case has evidence of transformation been obtained. This is the case of osmium, where it appears that osmium probably transforms by K-electron capture, followed by the emission of K-radiation from the resulting rhenium atom. The period of transformation suggested by the experiment is about 5×10^6 years but this value may be in error by a large factor.

RADIO COMPASS, a radio receiving set which permits determination of the line of travel of waves as received from transmitting stations. See WIRELESS TELEGRAPHY; AERIAL NAVIGATION; NAVIGATION.

RADIOLOGY, Radiology is that branch of medicine which deals with the employment of X-rays as an aid in the diagnosis of

disease and the use of X-rays, gamma-rays and other forms of ionizing radiation in the treatment of disease. (For details of the physical nature, method of production and technical and industrial applications of the various components of the electromagnetic spectrum, see RADIATION, RAYS, RADIOACTIVITY, ARTIFICIAL; RADIOACTIVITY, NATURAL, and X-RAYS, NATURE OF.)

DIAGNOSTIC RADIOLOGY

Quality and Intensity of Radiation Employed.—In some of the work for which X-rays are used, the quality or penetrating ability of the radiation is expressed in wave length, in frequency or in terms of its absorptivity in filters of standard composition and thickness, and its intensity is designated in ionization units, such as the roentgen. In X-ray diagnosis, however, it is the practice to indicate radiation quality and intensity by stating the voltage and current applied to the tube, the current being expressed in milliamperes, abbreviated ma ($1 \text{ ma} = 0.001 \text{ amp}$), and the voltage in peak kilovolts, abbreviated kv. Current is measured by means of a milliammeter inserted between the two halves of the secondary winding of the X-ray transformer at a point where the potential is close to zero, and tube voltage by means of a kilovoltmeter wired across the primary of the X-ray transformer.

Certain aspects of alternating currents and of pulsating unidirectional currents will be reviewed at this point. When one plots on a time scale the instantaneous voltage of the current produced by a single-phase, 60-cycle, alternating-current generator, he obtains a sine curve. Rising from zero, the voltage reaches full potential during the first $\frac{1}{120}$ sec., returns to zero by $\frac{1}{60}$ sec., falls to full negative value by $\frac{1}{40}$ sec. and returns to zero by $\frac{1}{20}$ sec., repeating the pattern indefinitely. That portion of the curve lying between the first and third zero points is called 1 cycle, and it is the repetition of this cycle 60 times in each second that gives 60-cycle current its name. Obviously the designation of the voltage of such a current requires reference to the factor of time, and for such applications as heating, lighting and power the "root mean square" value is employed. This is abbreviated RMS and means the square root of the mean of the instantaneous voltages throughout the entire cycle.

A time-voltage plot of the potential applied to the tube of a self-rectified X-ray machine consists of a distorted sine curve in which the peak of the half-cycle that is used is lower than that of the half-cycle that is suppressed, and in the case of full-wave rectification the plot becomes a series of more or less distorted half-cycles, all having the same electrical sign.

In pure sine wave alternating current, RMS voltage may be computed from maximum instantaneous voltage or vice versa by substitution in the equation

$$R.M.S.V. = \frac{M.I.V.}{\sqrt{2}},$$

but in pulsating unidirectional currents this simple relationship breaks down. The RMS values for such nonsinusoidal currents could be determined by suitably designed meters or by complete analysis of the instantaneous voltages throughout the curve, but this is not commonly done because in the production of X-rays it is the maximum instantaneous voltage of the current passing through the tube that is of particular importance. This voltage is termed the peak voltage and since in practice it amounts to several thousands of volts it is commonly expressed in kilovolts ($1,000 \text{ v} = 1 \text{ kv}$). In most X-ray generators the so-called kilovoltmeter is merely an ordinary A C voltmeter wired across the primary winding of the high-tension transformer but calibrated in peak kilovolts by means of direct sphere gap measurements of tube voltage made by the manufacturer during the factory calibration of the machine.

For fluoroscopy and the making of X-ray films, tube current may be as low as 3 ma. or as high as 500 ma. or even higher, and voltage usually ranges from 45 kv. to 90 kv. or even up to 130 kv. The magnitude of the voltage applied to an X-ray tube has two important effects on the radiation that is produced. It determines the wave-length composition of the beam and therefore its penetrating ability, and in addition affects the intensity of all beam components exponentially. For example, a tube volt-

age of 45 kv. will produce a certain amount of rather soft radiation having a maximum shortness of approximately 0.274 angstroms (\AA) ($0.274 \times 10^{-8} \text{ cm}$), a type of radiation so feebly penetrating that it is unsuitable for the fluoroscopy or filming of heavy body parts. Doubling the voltage (to 90 kv.) brings the maximum shortness of the beam down to 0.137 \AA , thus providing penetration adequate for the thickest anatomical parts, and in addition this voltage change quadruples the intensity of all the components of the beam.

Contrary to a widely held misconception, there is no specific relationship between the part to be examined and the voltage, current and exposure time that should be employed. As far as the photographic effect is concerned, these factors—voltage, current and exposure time—may be juggled almost at will, provided only that the time intensity product of the radiation reaching the film approaches a constant that has been determined empirically as adequate for recording the tissue densities of the body part that is being examined. The experienced radiologist or X-ray technician uses voltages of approximately 60 kv. and currents of something like 25 ma. for thin body parts that can be well immobilized thus keeping the exposure time within the range where minor time switch errors are of negligible importance and allowing the use of fine-focus tubes, but when the work to be done requires that the exposure time be as short as possible, he sets the time switch for $\frac{1}{100}$ sec. or sometimes even $\frac{1}{200}$ sec., sets the current at the maximum allowable for the tube (for example, 500 ma.) and then adapts to variation in the thickness and density of body parts by varying kv.

X-Ray Generators.—In their simplest form the X-ray generators used in diagnosis consist of a hot cathode X-ray tube, a controllable means of heating the cathode, a source of alternating current and a means of regulating the voltage of that current. Circuits of this sort are known as self-rectified because in them the X-ray tube itself acts as a rectifier, passing one half-cycle and suppressing the other half-cycle of the raw alternating current that is supplied by the transformer. Thousands of sets of this design are in daily use throughout the world, functioning as dental X-ray machines, portable and bedside X-ray machines and in small fluoroscopes. They are adequate where the service is intermittent and the loads range from 3 ma. to 10 ma. at potentials from 40 kv. to 75 kv., but for heavy work full-wave rectification is preferable.

In theory, full-wave rectified generators differ from the self-rectified sets described above merely by the insertion of four kenotrons between the high-voltage terminals of the transformer and the terminals of the X-ray tube. In practice, however, they are much more complex, including voltage stabilizers for the filaments of valve tubes and X-ray tube, voltage regulators for the primary windings of the high-voltage transformer and the X-ray filament transformer, devices for the automatic selection and limitation of tube voltage and current, circuits for energizing the rotors of rotating anode tubes, meters, fuses, circuit breakers and some means for the precise timing of both short and long exposures. In addition, they allow employment of higher voltages and larger tube currents. All modern generators are completely insulated or "shockproof," regardless of whether they are of the self-rectified or the valve-tube-rectified type.

X-Ray Tubes.—The tubes used in X-ray diagnosis consist of a well-exhausted glass-enveloped diode surrounded by a metallic housing that is lined with lead, except at a small port through which the useful beam of X-rays emerges. The space between glass insert and housing is filled with insulating oil. In the simplest and smallest sets the tube housing is integral with the transformer housing, but in larger machines the two usually are separate, tube and transformer being connected by means of flexible, shielded, insulating cables. In these modern descendants of William David Coolidge's hot cathode tube, the cathode stream is focused as a ribbon on a steeply inclined target so that the heat of impact will be distributed as widely as possible and yet the optically effective source of the rays will approach a point. Frequently two filaments are provided—one focusing the electrons sharply for use when great detail is required and small currents

are allowable, the other distributing the electrons over a larger target area for use when heavier currents must be employed. Targets are of two general types—those that are stationary and those that rotate or spin during operation. In the stationary anode tube, the target is of swaged tungsten embedded in a massive copper anode which extends out through the glass envelope to conduct the heat of electron bombardment into the insulating oil that surrounds the tube. Sometimes there is a pump or impeller to circulate the oil and usually there is a blower to expedite removal of heat from the housing.

Rotating anodes turn on precision bearings that are mounted within the exhausted glass envelope and therefore must be devoid of ordinary lubricants which would ruin the vacuum. The stator lies outside the envelope, its lines of force passing through the glass to operate the rotor which is attached to the anode stem. Sometimes the anode disk is of massive copper with an embedded belt of tungsten to receive the electron bombardment, but more commonly it is of solid tungsten capable of withstanding a cherry-red heat during heavy loading. For many applications rotating anode tubes are extremely satisfactory, but they have the serious limitations of dissipating target heat almost exclusively by radiation through the glass envelope and lacking the direct conduction through copper that is so effective in the case of stationary anode tubes.

Fluoroscopy.—A fluoroscope is an apparatus for the direct observation of body tissues by means of X-rays. It consists of a fluoroscopic screen supported in front of the port of an X-ray tube so that a patient may be interposed between the screen and the source of the radiation. A shutter usually is provided to control the area of the beam of radiation emitted by the tube, and a sheet of plywood or other strong but radiolucent material is interposed between tube and patient to provide a surface on which he lies when the instrument is tilted from the vertical into the horizontal position.

Many crystalline substances will glow when exposed to X-rays. Among the best for clinical fluoroscopy is zinc cadmium sulphide mixed with traces of other materials. A fluoroscopic screen consists of a piece of cardboard coated with a layer of such fluorescent salts and faced with a sheet of thick lead-bearing plate glass that is highly opaque to X-rays but almost perfectly transparent to the greenish light given off by the fluorescing crystals.

Fluoroscopy has a great advantage over filming in that it is able to record motion, but there are many offsetting disadvantages, the most important of which is the inevitable radiation hazard to operator and patient. In addition, fluoroscopy lacks objectivity because it leaves no permanent record and the image on the screen is so faint that to see it the room must be well darkened and the eyes of the fluoroscopist fully dark-adapted. The dark-adapted eye employs largely the rod type of vision which is suitable only for rather coarse "seeing." Thus, many of the finer anatomical details that would be seen well by the cone vision used in examining brightly transilluminated X-ray films cannot be seen at all on the fluoroscope. Formerly fluoroscopy was widely employed to detect fractures of the extremities and to aid in their reduction, but it was recognized that this practice is dangerous to patient and physician, as well as being diagnostically inferior to filming. The most important remaining clinical use of fluoroscopy is in the examination of the alimentary tract and the spinal cord, where it is used in conjunction with filming.

Films, Screens and Cassettes.—X-ray films consist of an acetate cellulose base coated on both sides with an emulsion of silver halide and gelatin. It is possible to prepare emulsions that are particularly sensitive to X-rays, but since most X-ray films are used in conjunction with calcium tungstate intensifying screens, the emulsions are given maximum sensitivity to the fluorescence of calcium tungstate rather than to X-rays themselves.

For the examination of certain parts—such as the teeth, fingers and toes—plain film without screens is ordinarily used, and in such applications it suffices to wrap the film or otherwise enclose it in a covering such as black paper or cardboard which is opaque to visible light but not to X-rays. For the filming of heavier parts, however, the exposure time can be reduced and the contrast in the

image enhanced if films pressed between two intensifying screens are used instead of plain films. These screens must be in intimate contact with the emulsions if sharp detail is to be recorded. Such contact is provided by rigid lightproof containers known as cassettes. The fronts of cassettes are made of bakelite or magnesium to exclude light but admit X-rays, and when phototiming is employed the backs must also be reasonably radiotranslucent. The screen attached to the inside of the cassette front is purposely thin because it must transmit most of the radiation, but the rear screen is thick, absorbs more radiation and fluoresces more actively. In the making of a film—for example, of the chest—the patient stands facing a 14-in. \times 17-in. duplified X-ray film (double emulsion) contained in a double-screen cassette of the sort described above, the X-ray tube being arranged so that its beam of radiation passes through the patient's back in a direction perpendicular to the surface of the film. The X-rays induce a moderately brilliant fluorescent image of the lungs, ribs, heart, etc., on the front screen, produce a slight photographic effect directly on the front and rear layers of film emulsion, and finally induce a brilliant fluorescent image on the rear screen. The light from the two fluorescent images photographs itself onto the emulsion along with the two direct X-ray images, and in the completed film all four images, being superimposed, appear as one.

Primary and Scattered Radiation.—X-rays arise on the target of an X-ray tube at the point where it is bombarded by electrons emitted by the cathode. In fine-focus tubes the effective X-ray source may have a diameter as small as 1.0 mm. and in coarse-focus tubes as large as 4.5 mm. All else being equal, X-ray images are sharpest in detail when the radiation source approaches a point and become blurred when the source is large. In the discussion that follows, we shall assume, for convenience, a point source of radiation.

From their point of origin X-rays are propagated in straight lines in all directions over a solid angle of 4π , but most of them are absorbed in the lead lining of the housing and the cone of useful radiation that emerges through the port has an apex angle of only approximately 15° . Within the ordinary meaning of the terms, X-rays cannot be reflected or refracted by the substances they encounter on their straight-line course to the X-ray film, but some of them do become scattered. For small, thin parts, scattering is practically negligible, but for heavy parts, such as the skull and trunk of an adult, the radiation that is scattered in the patient's body fogs the image formed by the straight-line or primary radiation to such a degree that finer details become indistinguishable.

Prior to 1917 good X-ray plates of the skull, spine, hip, etc., required that the primary beam be narrowed to a very small diameter to reduce scattering, and 14-in. \times 17-in. plates of the entire pelvis of a heavy subject were so badly fogged by scattered radiation as to be of little clinical usefulness (they were glass plates in those days rather than films). However, as early as 1912 Gustav Bucky in Germany laid the groundwork for overcoming this difficulty, and by the early 1920s there became commercially available, first in the U.S. and later in Europe, moving grids designed by the U.S. radiologist Hollis Potter. These instruments, known as Potter-Bucky grids or, less properly, as Potter-Bucky diaphragms, became an indispensable part of the equipment of all diagnostic radiologists. Such grids, consisting of an assembly of lead strips interspaced with strips of wood, plastic or other radio-transparent material, are interposed between patient and film and are kept in motion while the exposure is being made. The lead strips are aligned as radii of a segment of a theoretical cylinder that has a diameter equal to twice the target-film distance. A small portion of the primary or unscattered radiation that emerges from the patient's body impinges squarely on the edges of the lead strips where it is absorbed, but most of it passes through the interstices between the strips and thus to the film. The scattered radiation, on the other hand, being no longer aligned with the translucent interstices, impinges for the most part on the sides of the lead strips, where it is absorbed.

In Bucky's original stationary grids, the metallic members were thick and widely spaced, thereby causing disturbing patterns on the film, and Potter's contribution was to conceive and build grids

that could be moved during exposure, thus obliterating the pattern of their grid members but not interfering with their ability to absorb scattered radiation. Modern moving grids are flat rather than curved, they are built to extremely precise dimensional tolerances, have greatly improved ability to absorb scattered radiation and reciprocate throughout the exposure instead of starting before the exposure begins and continuing to move in the same direction until the exposure has been completed. Stationary grids were improved even more. In their original form they were virtually useless except as precursors to a great idea, but the work of the Swedish radiologist, Eric Lysholm revived interest in them. Excellent European and U.S. units became available, some composed of parallel strips, others having two systems of parallel strips aligned at right angles to one another to form crisscross or honeycomb grids. Grids of this latter type came to be used widely for bedside roving, raying in the operating room, for angiography and for spot filming of the stomach and intestines.

Unlike the moving grids, the stationary ones inevitably leave their own images on films along with the images of the body parts that are being examined. In modern stationary grids, however, these superimposed patterns are regular and faint, detracting little from appearance and nothing from clinical usefulness.

Timing the Exposure.—When the intensity of the X-ray beam is low and the exposure time of the order of 10 sec., errors of plus or minus a few tenths of a second are negligible and the simplest of spring-driven time switches are adequate to time the exposure, but for tube currents of from 100 ma. to 500 ma. and exposure times of the order of $\frac{1}{10}$ sec., precise timing becomes important and difficult, much of the difficulty being inherent in the pulsating nature of the current applied to the X-ray tube. When 60-cycle current is employed, X-rays are emitted by the target not continuously but in brief bursts starting from zero, rising to full intensity and then returning to zero every $\frac{1}{120}$ sec. (each half-cycle). Brief exposures therefore must be measured out in half-cycles and it is important that the exposures be initiated and terminated approximately at zero points on the voltage wave. In other words, the timing device and the contactor must be phased with the generator. Such phasing formerly was accomplished reasonably well even with heavy conventional magnetic contactors, but it was rendered vastly easier and more precise by the substitution of the electron discharge in heavy-duty thyristors for mechanically operated metal-to-metal contacts.

Phototiming.—In the early 1940s it became possible to time X-ray exposures automatically by means of multiplier phototubes. Phototiming, as it is called, gradually was made available in commercial X-ray machines. In general radiography the phototube and a fluorescent screen are mounted in a box that is impervious to light but has a top that is transparent to X-rays. This box, known as a detector, is located beneath the Potter-Bucky grid where it receives radiation that has passed through the patient's body, the film and the cassette. The detector is calibrated empirically so that when the film has received an amount of exposure that will assure an optimum image, the phototube will have received sufficient fluorescent light to cause it to trigger an electronic switch and thus terminate the X-ray exposure. In fluorography (described below) the phototube is mounted in the camera head and, like the lens, "observes" the fluorescent screen. In the case of the filming fluoroscope, which is so important in the examination of the gastrointestinal tract, the phototube scans an image produced on the fluoroscopic screen by radiation that has passed through the patient's body and through the back of the film cassette.

Processing X-Ray Films.—When the technician who exposes an X-ray film also develops it, the composition and temperature of the developer and the length of development need not be regulated precisely because modern films have wide latitude and the experienced worker learns to shorten or prolong development until inspection before a safelight indicates that an acceptable image has been obtained. Where the volume of work requires division of labour, however, the situation is different. One set of workers exposes the films to carefully measured amounts of radiation and another group working in darkrooms develops them in solutions

of standard strength and temperature for standard periods of time. After World War II, larger hospitals and clinics turned to automatic film-processing machines, and even in smaller laboratories the simpler hand-operated processing tanks usually included constant-temperature baths. The common practice is to standardize exposures so that development for from four to five minutes at temperatures of from 65° F. to 67° F. in standard-strength developer will yield films of optimum density. For special examinations, such as those conducted in the operating room in conjunction with surgery, the solutions may be made rather warm in order that developing time may be shortened, the saving in time being considered more important than the inevitable reduction in the quality of the image.

The Land method of rapid film processing was adapted for certain phases of military radiography. The "film" is enclosed in a special envelope that contains capsules or "pods" of processing chemicals. After exposure to X-rays the film-chemical assembly is passed through a special wringer box and a few seconds later is developed, fixed, dried and ready for inspection by the radiologist.

Photofluorography.—From the earliest days of radiology, attempts were made to make permanent records of fluoroscopic images by photographing them, but until the late 1930s the manoeuvre saw little practical application. The advantage of photofluorography lay in its ability to employ small, inexpensive and easily processed photographic roll film instead of large, costly, individual sheets of X-ray film, its disadvantage in the fact that fluoroscopic images were faint and the camera lenses available for recording them slow. As far as the chest is concerned, the disadvantages finally were overcome by developing faster film emulsions, faster screens and refractor lenses large enough to cover a 64-mm by 70-mm area on roll film and yet having a speed of F/1.5. Millions of members of military and civilian populations were subjected to small-film chest surveys, but though such photofluorography of the chest is of genuine importance as a public health measure it is not a rival of the older methods as a means for the detailed study of pulmonary diseases.

The substitution of large-aperture refractor lens systems for the F/1.5 refractors made it possible to extend microfilm surveys to the alimentary tract where the fluoroscopic image is much fainter than in the case of the chest, but the importance of such surveys to the individual and to the public health was still doubtful in the early 1950s.

X-Ray Motion Pictures.—Within a year following Wilhelm Konrad Röntgen's announcement of the discovery of X-rays, attempts were made to produce X-ray motion pictures. Scores of publications on the subject appeared thereafter in the public and scientific press. More than half a century later, however, no really practical method had been developed. In the so-called direct method a motion-picture positive is made from a sequence of individual X-ray negatives, and in the indirect method the positive is printed from a motion-picture negative of the fluoroscopic screen. Both methods have limited applications in experimental medicine but both have the fault of requiring too much X-ray exposure to the tissues that are being examined.

Electronic Amplification of the Fluoroscopic Image.—The conventional fluoroscopic image of the abdominal organs of an average adult has a brightness only about $\frac{1}{10000}$ as great as that of a page of newspaper viewed by the light of an ordinary reading lamp. Even this amount of fluoroscopic brilliance assumes the use of the most sensitive of modern fluoroscopic screens, a tube voltage of 90 kv and a tube current of 3 ma. Even small increases in the amount of the X-rays employed would involve health hazards that would be out of keeping with the resulting gain in brilliance.

W. Edward Chamberlain and George C. Henny in 1947 discussed the theory of enhancing image brightness by electron acceleration. John W. Coltman produced an image tube with some clinical applications. R. H. Morgan had promising results using television techniques and R. J. Moon worked on a method of amplifying the fluoroscopic image by means of a scanning X-ray tube.

Dental Radiography.—Intraoral films were early employed

for detecting abscesses in the bone about the apices of the teeth, for locating unerupted or impacted teeth and for discovering retained broken tooth roots. Their field of usefulness was enlarged until they came to play an important part even in the periodic examination and cleaning of the teeth. Small cavities at abutting surfaces, poorly fitting fillings and inlays, recession of the bone from the necks of the teeth and, most important of all, subgingival deposits of salivary calculus—such lesions as these are easily detectable in X-ray films though they may escape all but the most skillful and searching direct inspection.

Radiography of Bones.—For the first few years following Röntgen's discovery, it seemed that X-rays might be used in medicine chiefly as an aid in the diagnosis and reduction of fractures, but subsequently almost all the tissues of the body came within the scope of radiography. In the case of bones, X-ray films are used not only for the detection of injuries but also for demonstrating the presence of tumours, infections and almost every other form of skeletal disease. In normal bone the cortex shows in X-ray films as a dense amorphous shell and the spongy portion as a honeycombed structure made up of the shadows of the coarse primary trabeculae, on which are superimposed the shadows of the fine secondary trabeculae. The disease of living bone causes a generalized loss of density known as osteoporosis, but when portions of bone are killed by disease or injury before osteoporosis has occurred, they retain their original density for long periods of time. Some tumours and infections cause localized destruction of bone and others cause the bone to become denser than normal (sclerosis). Certain parts of normal living bone, such as marrow, periosteum and articular cartilage, though not themselves discernible by X-rays, may when diseased produce subtle changes in visible bone adjacent to them, thus leading to their own detection. Rickets, scurvy, syphilis, tuberculosis, Paget's disease, benign and malignant tumours and many other skeletal diseases produce changes in the X-ray appearance of bones that are almost always easy to see and frequently so characteristic as to warrant a specific diagnosis.

Stereoscopic X-Ray Films.—Three-dimensional vision is helpful in the radiography of any part of the body and almost essential in X-ray examinations of the skull and trunk. Two films that are required are made with the film and body part in identical spatial relationship for each but with the X-ray tube shifted slightly between the two exposures. The amount of the shift is determined by the relationship between the distance from the film to the target of the X-ray tube at the time the exposure is made and the optical distance from the film to the eyes of the observer at the time the two films are examined. If these two distances are identical the tube shift should be 66 mm, which is the average interpupillary distance, but if the more common situation obtains and target-film distance is greater than film-eye distance, then the tube shift must be increased proportionally.

Even without the aid of instruments some workers become able to view one of the films with one eye, the other with the other eye and then fuse these two slightly dissimilar, real, flat images into a single, virtual, three-dimensional image. It is more convenient, however, and for some persons actually essential to employ a special viewing apparatus known as an X-ray stereoscope.

Chest and Heart.—Although internists and surgeons must lean heavily on the findings of the radiologist for the detection and managing of such pulmonary diseases as tuberculosis, pneumonia and cancer, they must weigh all the evidence in making the final diagnosis and not depend on X-rays alone. Active fibrocystic tuberculosis usually produces rather characteristic dense spotches in one or both of the lung apices, but at certain stages in their course some of the pneumonias show almost identical X-ray patterns. Malignant tumours arising in the bronchi usually reveal themselves promptly by causing bronchial obstruction with resulting rather typical areas of atelectasis. Foreign bodies accidentally introduced into the trachea or bronchi frequently are dense enough to show directly in X-ray films but when radio-transparent may be detectable with the aid of opaque mediums or by virtue of changes they produce in the air patterns of the lung. When the diagnosis of pulmonary tuberculosis has been estab-

lished, repetition of the X-ray examination is important for observing the results of treatment, but here too it is only by combining information obtained by numerous means that the physician can be sure a particular lesion is healed or that another is still active.

Radiology plays only a minor role in the diagnosis and management of heart disease, but it plays that role well. It is the best means of determining the size and shape of the heart and provides dramatic proof of the presence or absence of aortic aneurysm. Cardiologists faced with the seemingly hopeless task of predicting the likelihood or unlikelihood of coronary disease in subjects who have not yet had an attack would welcome radiologic information as to the presence or absence of calcification in the coronary vessels. In the cadaver it is an easy matter to make stereoscopic films that will show such calcified vessels in great detail, and even in the vigorously moving living heart the radiologist can by employing heavy currents and very brief exposures make acceptable single films. Three-dimensional portrayal is needed, however, to distinguish calcification in the coronary vessels from that in hilum glands, ribs, costal cartilages and other structures, and at mid-20th century methods for obtaining it were still lacking.

Contrast Mediums.—The lungs show in X-ray films and in fluoroscopic images by virtue of the sharp difference between the X-ray absorbing power of the air that distends them and that of the pulmonary tissue itself. This difference in absorbing power is called "contrast." The heart, being composed largely of muscle and blood, contrasts strongly with the air-filled lungs adjacent to it but scarcely at all with the liver beneath. The uterus, also composed of muscle, normally does not contrast with the structures surrounding it because usually they too have about the same density of muscle. Bones are distinguished from surrounding muscle and the various parts of bone from one another by virtue of the calcium phosphate they contain. The deposition of radiopaque salts makes it possible to see most of the stones that may be formed in the kidney and urinary bladder and some of those that occur in the gall-bladder.

To a great extent, however, the clinical usefulness of the X-ray examination depends on the employment of artificial contrast mediums. The most extensively used opaque medium is barium sulphate. Stirred into water and flavoured with a little chocolate syrup, this insoluble heavy metal salt is employed for examination of the oesophagus and stomach, and mixed with powdered scacia and water it becomes a barium enema for the examination of the rectum, colon and terminal ileum. For the examination of the gall-bladder the halogenated phthalen introduced by Evans A. Graham gave way to β -(4-hydroxy-3,5-diiodophenyl)- α -phenylpropionic acid (Priodax) or another similar but more highly iodized organic compound, Telepaque.

X-ray visualization of the bronchi better than that obtained merely by the contrast of contained air is made possible by the introduction into the bronchial tree of unsaturated vegetable oil partially saturated with iodine (Lipiodol). An emulsion of ethyl iodophenylundecylate (Pantopaque) was offered as a substitute for Lipiodol in bronchography and largely supplanted it in the examination of the spinal canal (myelography).

Among several iodized organic compounds available as contrast mediums for the urinary tract and blood vessels, iodopyracet compound (Diodrast) was in widest use in the United States during the early 1950s. The colloidal suspension of thorium dioxide (Thorotrast) had fallen into disrepute. Thorotrast may be injected into the blood stream with little or no immediately unfavourable reaction, is extremely opaque to X-rays and is perhaps the only medium that can be expected to accomplish X-ray visualization of the spleen and liver, but these important advantages are negated by potential long-range dangers inherent in the particulate nature of the material and the fact that it is slightly radioactive.

Skull, Brain and Spinal Cord.—The X-ray criteria employed for diagnosing injuries and diseases of bone are most dependable in regions where cortex is thick and well differentiated from spongiosa, as in the long bones of the extremities. Cortex is well developed in the vault of the skull, and fractures, neoplasm, in-

fection, etc., there are usually reasonably evident. In the face bones where the cortex may be as thin as paper, however, such lesions may be almost invisible.

Because of the air that they contain, the normal mastoids and the sinuses (frontal, ethmoid, maxillary, sphenoid) show as black shadows sharply silhouetted against bone, and if fluid or benign or malignant tumours are present they too will stand out in contrast with the air. Certain tumours of the pituitary gland cause the sella turcica to enlarge in a characteristic fashion, and in young children a long-continued increase in the intracranial pressure may be inferred from a resulting "bursting of the seams" of the skull, or distasia of the sutures as it is called.

The brain itself is radiotranslucent except for several normal and occasional pathological patches of calcification, and so it is necessary to employ contrast mediums when the brain is to be examined. The medium of choice being oxygen or air. When such gases are introduced into the subarachnoid space, the procedure is termed *encephalography*, and when they are injected directly into the hollow chambers or ventricles at the centre of the brain it is called *ventriculography*. In either case, the X-ray examination is done with stereoscopic films rather than fluoroscopy, and the object is to study the internal and external contours of the brain by virtue of the gas that is in contact with them.

Opaque mediums are much more effective than gas for examining the spinal cord and the canal in which it lies, a procedure known as *myelography*. In the United States, Pantopaque is the medium most commonly employed for myelography, but water-soluble organic compounds such as Diodrast are sometimes used, particularly in Europe. Under fluoroscopic control, the contrast material in the subarachnoid space is manoeuvred into all parts of the spinal canal from the tip of the caudal sac in the lumbosacral region up to (but not into) the cisterna at the base of the brain. The films that are made at all levels and in several positions show the cord itself as a translucent or negative shadow and the surrounding subdural space as a dense shadow by virtue of the Pantopaque it contains.

Protruding knobs of intervertebral cartilage, spikes or ridges of arthritic osteophytes, tumours of bone, cord or meninges are among the abnormalities that may be detected by myelography, but normal variation is great and differentiation difficult even when the examination is conducted by teams of specially trained neurosurgeons and radiologists.

Gall-Bladder and Bile Ducts.—In 1923 E. A. Graham introduced a method for the X-ray examination of the gall-bladder which came into universal use, known as *cholecystography*. An iodized organic compound (Priodax or Telepaque at mid-20th century), after being given by mouth in tablet form, is absorbed from the alimentary tract into the blood and then removed from the blood stream by the liver and combined with the bile. A normal gall-bladder, receiving through its cystic duct watery, weakly iodized bile, concentrates it until eventually it becomes thick and its iodine content high. In X-ray films made 10 to 15 hours following administration of Telepaque, the normal gall-bladder casts a dense shadow and any cholesterol stones present stand out as negative shadows against the iodized bile. If the gall-bladder is seriously diseased or its cystic duct is occluded, bile will fail to reach the gall-bladder or, reaching there, will fail of concentration, either of these events resulting in nonvisualization.

Cholangiography, which is the examination of the bile ducts, usually is conducted in conjunction with surgery to assure that stones or a tumour obstructing the ducts have not been overlooked. Diodrast is the contrast medium usually employed, the injection being either through a T tube tied into one of the bile ducts or by means of a hypodermic needle introduced through the wall of a duct or of the gall-bladder itself.

Urinary Tract.—Pyelograms are X-ray films of the urinary tract made following the introduction of an opaque medium, usually Diodrast. In the retrograde method, Diodrast is injected through ureteral catheters introduced with the aid of a cystoscope. In the excretion or intravenous method, Diodrast is injected intravenously followed by filming at intervals of from 5 to 15 minutes.

Most tumours lying in the fleshy part of the kidney outside its collecting system compress, stretch and otherwise distort the calyces and pelvis. Tuberculous abscesses are prone to break through into the calyces, allowing the opaque medium to extravasate into disease tissue, and the infrequent kidney stones that are radiotranslucent may be rendered visible by Diodrast in the same way that Telepaque visualizes cholesterol gallstones. Cystograms are films of the urinary bladder made after the direct or excretory filling of that organ with Diodrast. Bladder tumours, diverticula and urethral obstruction by chronic prostatic enlargement produce rather characteristic alterations in the appearance of the cystogram.

Use of Radiology in Gynaecology and Obstetrics.—Sterility of the human female may result from various causes, one of which is occlusion of the fallopian tubes. The best means of demonstrating such occlusion is to make X-ray films following the injection of iodized oil into the uterus. In the normal subject, the oil passes out through both fallopian tubes to spill into the peritoneal cavities where, 24 hours later, it becomes smeared over the serous surfaces of loops of bowel and appears by X-ray as a slightly opaque, crumpled veil. When no connection exists between the uterine cavity and the peritoneal cavity, the peritoneal spread of the oil does not occur, and when occlusion is due to saclike adhesions about the outer ends of the fallopian tubes, the oil breaks up into droplets and is retained in the watery fluid that fills the sacs (hydrosalpinx). While the purpose of the injection is diagnostic, it is believed that it may sometimes be therapeutic as well, breaking up adhesions if they are not too tough and developing communication where none existed before.

When a pregnant woman is known to have an obstetrically adequate pelvis and a presumably normal foetus, pelvic X-ray examination seldom is called for, but if circumstances require quantitative knowledge as to the dimensions of the birth passages, the X-ray examination is by far the best means of measuring them.

Since X-rays diverge from their point of origin, the X-ray images of anatomical parts that are parallel with the plane of the film are always somewhat larger than the parts themselves, and if the parts are oblique to the film, that too causes distortion of the image. With the aid of a little special equipment and the application of a little simple geometry it is possible to compensate for distortion and translate measurements of film images into the actual dimensions of the maternal or foetal parts they portray, the procedure being known as *pelvimetry* or *foetometry*.

Blood Vessels.—For many decades opaque injections of heavy metal salts were used for making X-ray films of the blood vessels of anatomical specimens, and later angiography of the living subject became of serious clinical importance. Diodrast is the medium commonly employed. When the vessels to be injected are those of the brain, most workers prefer to use the material in 30% concentration, but for the chambers of the heart and the great vessels leading from them concentrations as great as 70% are necessary. Several films must be made in rapid succession, each exposure being brief, the first in the series phased carefully with the beginning of the injection. For angiography most radiologists employ wide rolls of X-ray film motor-driven past a radiolucent window in a device patterned after aeroplane mapping cameras but, of course, having no lens. Other workers prefer series of cut film in either standard or special cassettes, and photofluorography has been employed experimentally. Motion pictures of the electronically amplified fluoroscopic screen constitute the ideal but at mid-century still unattainable medium for angiography.

Angiograms are used for the investigation of certain brain tumours, to identify obstructions and abnormal communications involving vessels of the extremities and, above all else, for the study of the abnormal anatomy of the great vessels in patients with congenital heart disease for whom cardiac or vascular surgery is contemplated.

Stomach and Intestine.—X-ray examination has become an important, almost indispensable, agent in the diagnosing of peptic ulcer, benign and malignant tumours of the oesophagus, stomach and bowel, diverticulosis, and diverticulitis, ulcerative colitis, regional ileitis and several other diseases. Barium sulphate is the

medium almost invariably employed. Formerly it was the fluoroscopic examination that made the diagnosis, with films occupying a position of secondary importance, but many modern radiologists came to look upon fluoroscopy largely as a means of obtaining small, so-called "spot" films of various parts of the tract. In spot filming, the fluoroscopist manipulates a small segment of the alimentary tract into position beneath the fluoroscopic screen and adjusts the amount of barium that it contains and the pressure applied to it until he has an optimum view. A film is now brought into position between the patient and the fluoroscopic screen and, when the X-ray machine setting has been changed from the continuous small current adequate for fluoroscopy to the high voltage and large currents needed for rapid filming, the exposure is initiated with a foot switch and terminated automatically with a phototube. Peptic ulcers usually deform the outline of the stomach or duodenal bulb and, in addition, frequently excavate craters which, when filled with barium, are highly diagnostic. Cancers appear as soft tissue masses protruding into the lumen of the stomach or bowel and distorting the appearance of the gastric or intestinal mucosa.

THERAPEUTIC RADIOLOGY

One of the most remarkable attributes of the X-rays that Röntgen discovered in 1895 was the seemingly innocuous way in which they penetrated human tissue without causing pain, a feeling of heat or any other immediate sensation, but it did not take long to learn that in spite of the absence of immediate effect, large doses led presently to redness of the skin, blistering and ulceration. Even small doses, it was found, if repeated often enough were followed by serious skin lesions that showed up only after a considerable lapse of time. Of course, an agent so capable of damaging normal tissue was bound to be employed therapeutically on the theory that some means might be found to direct its damaging effects specifically against diseased parts.

By the early 1905 a little had been learned about the fundamental nature of the biological action of radiation, and research on this subject had been accelerated, but usefulness had not waited on a complete understanding. Radiation therapy became one of medicine's few means of restraining and in some cases curing cancer.

Those who practise it must be able to measure the dose and map its distribution in the body with great precision, but they must accept the fact that frequently the cancers at which it is aimed can be delimited only approximately. It is a professional requirement that they keep always in mind quantitative information as to the optimum dosage and technique for each of scores of types of neoplasms without forgetting that such information is empirical and that individual response may be at sharp variance with the rule. They must be optimists without becoming complacent, strive for major victories but be content sometimes with small gains, advance their specialty as a science but apply it as an art.

The radiations they employ include X-rays ranging in voltage from about 5 kv to more than 4,000 kv, radium, artificial radioisotopes, electrons, neutrons and other high-speed particles. Important differences in the physical distribution of the dose determine which of these should be used for a particular application, but biologically speaking it is the similarities rather than the differences that are most obvious throughout the entire range from the low-voltage X-rays used in contact therapy to the high-speed particles of the largest cyclotrons.

Historically and for several other reasons a discussion of radium and low- and medium-voltage X-ray therapy lends itself particularly well to an exposition of principles that apply throughout the entire radiation range. It is for this reason alone that radium and X-rays of low and medium voltage are emphasized below. This distribution of emphasis should not be misinterpreted as indicating that multimillion-volt X-rays, radioisotopes and high-speed particles are clinically unimportant.

Progress after Röntgen.—The ideas of Heinrich Geissler, J. W. Hittorf, Sir William Crookes and P. E. A. Lenard were important immediate antecedents to those of Röntgen, and in the

years after 1895 the stream of those ideas was swelled by innumerable tributaries. Italians such as Enrico Fermi supplied key ideas in nuclear physics. Frenchmen such as the Curies, H. Courtyard, A. Lacassagne and C. Regaud discovered radium and established the importance of the time factor as a modifier of the reaction of tissue to radiation.

German physicists made important contributions, and German physicians such as H. Holthausen studied large masses of clinical material to establish much empirical knowledge. Scandinavians typified by G. Forsell and R. Sievert refined and advanced dosimetry and made large-scale clinical application of facts established in the laboratory.

British contributions were of two sorts. In the closing decades of the 19th century and the opening decades of the 20th such physicists as J. J. Thompson, C. T. R. Wilson, H. G. J. Moseley and the two Braggs led in the development of X-ray physics, and later such physicists as Ralston Paterson and David Smithers and such radiation physicists as W. V. Mayneord, W. J. Meredith and H. M. Parker increased the precision with which radiation beams may be regulated and directed and advanced knowledge as to the response of normal and diseased tissues to such beams.

In the U.S., W. D. Coolidge conceived and produced X-ray tubes superior to anything available before, and Arthur Compton and his students, employing X-rays to study the nature of matter, discovered in the process new and important facts about the X-rays themselves.

Ernest Lawrence's pioneering cyclotron typified a whole group of instruments developed for accelerating particles of various sorts, and the large-scale biological experiments on ionizing radiation that were carried on during World War II under John Lawrence in California and under Robert Stone in Chicago served as patterns for many later similar activities.

During the war years it was necessary to direct most of such effort at the military aspects of radiation, but with the lifting of restrictions on materials and information the clinical aspects received the attention of increasing numbers of U.S. physicists, biologists and physicians.

MEASURING THE DOSE

The dose employed in X-ray therapy cannot be defined merely by stating the voltage and current at which the X-ray tube is operated. Numerous other factors are involved, including diameter and filtration of the X-ray beam, target-skin distance and the size and location of the lesion being irradiated. The need of dependable dosage guides was recognized more or less clearly from the outset but their development proved difficult. Tried and found wanting were the measurement of the heat produced by the absorption of X-rays, the intensity of fluorescence, colour changes in several different combinations of chemicals, the blackening of silver bromide paper, the liberation of iodine from a solution of iodoform in chloroform and an increase in the electrical conductivity of selenium under the action of X-rays.

Ionization Methods.—Röntgen's original papers described the ability of X-rays to ionize air and in 1896 J. J. Thompson independently discovered the effect and suggested its use by physicists as a means of measuring X-ray intensity. P. Villard in 1908 advocated ionization for measuring the clinical dose but his idea was not practical at that time because the large, delicate ionization chambers that were serving physicists so well were not suitable for clinical work and no others were available. Gradually, however, small, rugged chambers were developed, and in 1928 at the second International Congress of Radiology in Stockholm, Sweden, there was adopted the "r" or roentgen unit, which became the standard throughout the world.

The Roentgen Unit.—The roentgen unit was defined in Stockholm as follows:

The unit of dose is that quantity of roentgen radiation which, when the secondary electrons are fully utilized and the wall effect of the chamber is avoided, produces in 1 cc. of atmosphere air at 0° C. and 760 mm. mercury pressure such a degree of conductivity that one electrostatic unit of charge is measured under saturation conditions.

This definition sufficed as long as the X-rays to be measured were produced at voltages up to 200 kv, but as r meters began

to be employed in the 1,000-kv range and for the gamma-rays of low voltage, the following definition was substituted

The roentgen shall be the quantity of X or gamma radiation such that the associated corpuscular emission per 0.001293 grams of air produces, in air, ions carrying 1 esu of quantity of electricity of either sign (The mass of 1 cu cm of dry atmospheric air at 0° C and 760 mm of mercury pressure is 0.001293 gm)

Roentgen (r) Meters.—The condenser-type r meters in general use in the United States consist of two parts, a chamber-condenser unit and a charging-measuring unit. Three sizes of chamber usually are supplied—a large one that measures up to 25 r, an intermediate size measuring up to 100 r and a small chamber for measurements up to 250 r. The electrometer that measures the charge has three corresponding scales calibrated from 0 on the left to 25 r, 100 r or 250 r, respectively, on the right.

Chamber-Condenser Unit.—In the 100-r unit the chamber itself is a small plastic thimble that contains one cubic centimetre of air at room temperature and pressure. The inside of the wall of the chamber, which has been rendered conducting by a thin coating of carbon, constitutes one electrode and is connected to the metal sheathing that forms one of the plates of a 60-micro-microfarad condenser. The second electrode is a carbon-coated plastic rod mounted in a block of high-impedance material with its tip protruding into the air in the chamber, its base in electrical contact with the insulated plate of the condenser. Care is taken to exclude air from all parts of the system except the space inside the chamber itself.

Charging and Measuring Unit.—The charging and measuring unit consists of a hand-driven plastic disk that generates a static charge by rubbing against a leather pad, plus a quartz fibre electroscrope that is calibrated in roentgen units. In using the instrument, the condenser is plugged into the charging unit and the charging wheel is rotated until the fibre stands at 0. The charged condenser is then disconnected from the electrometer and placed for a measured period of time with its chamber in the beam of the X-ray that is to be measured. The X-rays ionize the air in the chamber, causing it to become an electrical conductor, and this in turn allows the charge on the central plate of the condenser to leak to the wall of the chamber and thence to the outer plate of the condenser. When the partially discharged condenser is reconnected to the electrometer, the fibre has moved from the fully charged position on the left toward the discharged 100-r position on the right, the precise amount of loss of charge being read directly in roentgens without computations of any sort.

Roentgen meters of this sort are secondary standards requiring initial checking against large standard chambers and occasional subsequent rechecking, but when they are carefully built and properly calibrated their accuracy is well within the limits necessary for radiation therapy. The required dose varies widely from as little as 1,200 r in some lymphomas to as much as 5,000 r in most laryngeal carcinomas.

LOW-VOLTAGE X-RAYS—5 KV TO 100 KV.

Until the close of World War I most clinical X-ray apparatus could not be operated at voltages in excess of 100 kv, and while this was more than enough for diagnosis, it limited therapeutic applications to lesions lying at or close to the surface of the body. Regardless of the exciting voltage, the raw beam as it leaves the X-ray tube contains amounts of long wave-length radiation that are enormously greater than the amounts of short wave-length rays. Because the long-wave rays are easily absorbed, they are said to be "soft," while the short penetrating rays are said to be "hard."

If raw radiation from a tube operated at 100 kv, is allowed to fall on a patient's skin, the soft radiation will be strongly absorbed in the superficial layers, so that an exposure time long enough to result in serious skin damage delivers only small amounts of relatively hard radiation to tissues lying a few centimetres beneath the surface.

Filtration through three millimetres of aluminum will harden such a beam so that it may be possible to deliver 20% of the surface dose to tissues five centimetres beneath the surface, but it is

impractical to deliver doses of therapeutic magnitude to tissues ten centimetres deep unless the voltage at the X-ray tube is raised well above 100 kv.

Formerly the degree of reddening of the skin was used as an indication of the dose, but this so-called erythema dose had serious limitations and was abandoned in favour of actual tissue doses expressed in roentgens. Along with the conception of erythema dose went also an indiscriminating attitude toward the employment of radiation for almost any of the cutaneous diseases. Radiation has its place in dermatology but it is dangerous as well as useful and its employment must be restricted to physicians who are specially trained in its use. Under competent supervision, low-voltage X-rays are indicated in the treatment of such conditions as small- to moderate-size skin carcinomas, large keratoses, obstinate circumscribed neurodermatitis, plantar warts, superficial hemangiomas, scalp ringworm, cutaneous lymphomas and Kaposi's sarcomas, but in skin lesions where drugs and other agents will suffice they should be employed rather than X-rays.

Contact Therapy.—Much of the very soft radiation produced at any operating voltage is absorbed in the glass wall of the X-ray tube and when voltages are reduced below 30 kv almost none of the rays are hard enough to pass through the glass. For some of the vascular birthmarks, keloids, skin cancers and certain other skin lesions, it is desirable to be able to irradiate superficial tissues heavily with only a minimum dose to deeper structures. This is made possible by special X-ray tubes in which the port for the emergence of the radiation is a thin sheet of beryllium rather than glass. Such tubes are operated at voltages of the order of five peak kilovolts and the circuits are arranged so that it is safe to press the port against the skin of the patient. These three factors—closeness of the target to the skin, low operating voltage and minimum beam filtration—operate to minimize the depth dose and maximize the dose at the surface.

RADIUM

Opinion as to the clinical importance of radium fluctuated widely after the discovery of this element was announced by the Curies in 1898. Administered internally, it is a slow but lethal poison devoid of any therapeutic value, but confined in airtight needles or capsules, sheathed with a filtering layer of one-half millimetre or more of platinum, it constitutes a gamma-ray emitter of established clinical importance. Radium needles or capsules having only thin layers of brass or Monel metal as filters emit large quantities of electrons or beta-rays and are of only limited clinical value.

The hardest gamma rays of radium have a hardness or penetrating power approximately equivalent to the hardest of the X-rays produced at 3,000 kv, but paradoxically the important medical role of radium is to deliver large ionizing doses to superficial tissues while minimizing the effect at a depth. The explanation lies in the geometry of the situation. Gamma-rays like X-rays diverge from their point source of origin in a solid angle of 4π , so their intensity falls off as the square of the distance from that point of origin. Radium usually is employed in rods of appreciable diameter and length which act as multitudes of point sources re-enforcing one another, but to simplify the explanation that follows, it will be assumed that the radium has been concentrated in a single minute sphere. Since it is possible to bring the source of the gamma-rays into almost full contact with surface tissue it follows that tissues one centimetre distant from that source will receive only about 1% of the dose that is delivered at the surface, and tissues five centimetres distant only about 4% of the dose delivered at one centimetre. (These values ignore losses by absorption and gains by scattering, though both must be taken into consideration in actual practice.)

In a few instances several grams of radium have been concentrated in heavily shielded containers that can be backed off five to ten centimetres from the surface of the patient's body. Such gamma-ray beams filtered through one millimetre of platinum deliver depth doses distinctly better than those obtained with radium at the surface or inserted into the body but are inferior in this respect to well-filtered 250-kv. X-rays from tubes stationed 80 cm, 60 cm or even 50 cm away from the surface of the body.

These so-called telecurie radium applicators would lose all justification with the availability of megacurie radiocobalt applicators, but heavily filtered interstitial and intracavitary radium employed sometimes alone and sometimes in conjunction with X-rays meanwhile continued to be important

ARTIFICIAL RADIOISOTOPES

In addition to the series of naturally occurring radioisotopes of uranium known collectively as radium which emit gamma-radiation and have an aggregate half life of 1,590 years, there are available as products of cyclotrons and nuclear reacting piles a great number of artificial radioisotopes of many different elements. In some of these the radiation intensity decays to half its initial value in fractions of microseconds while others have half lives longer than that of radium. A few of these isotopes had been investigated clinically by the early 1950s but most of such work remained to be done. ^{228}Ra administered intravenously as a sodium phosphate in doses of one to two millicuries a week for four to eight weeks is employed for the treatment of chronic leukemia. ^{131}I administered orally as a solution of sodium iodide in doses of six to eight millicuries, repeated if necessary at trimonthly intervals, is used to reduce excessive activity of the thyroid gland, and occasionally cancer of the thyroid responds favourably to much larger doses. By mid-century there was great interest in the clinical possibilities of ^{60}Co . Megacurie cobalt applicators under construction were expected to possess many of the virtues that were lacking and to avoid most of the faults that were inescapable in telecurie radium applicators. The charge of radioactive ^{60}Co , though weighing only 12 g and comprising a rod only 0.7 cm in diameter and 3 cm in length, will produce gamma-rays of 1.13 and 1.32 Mev with a source intensity more than 200 times that of the same weight of pure radium or 260 times that of radium chloride. It is true that the decay of intensity by one-half within five and three-tenths years will require occasional substitution of new cobalt and the consideration of decay time in computing the output of the applicator, but at most these should prove to be only minor inconveniences.

To shield against unwanted gamma-radiation and to regulate the dimensions of the port, the container itself and the port diaphragms will be constructed of uranium 13 cm thick, but the removal of all beta-radiation from the beam will require merely a thin aluminum filter. With such a cobalt source stationed 80 cm distant from the skin, it is expected that the surface dose to a 5 cm by 5 cm area will be approximately 35 r per minute and the dose 10 cm beneath the surface 18.2 r per minute.

MEDIUM-VOLTAGE X-RAYS—100 TO 400 KV.

By 1915, German scientists had added three concepts and a group of associated techniques which became basic to the radiation therapy of deep-lying lesions. These concepts were the role of voltage, filtration and the geometry of patient and X-ray beam in determining the dose delivered to deep-lying tissues. The techniques were Walter Friedrich's thimble chamber for measuring the dose in air, body cavities, wax, water, etc., and Friedrich Dessauer's 200-kv X-ray generators, isodose charts, and the employment of wax, water bags and similar material to reduce the patient's body to a straight-sided geometric form to which his isodose charts could be applied. In the next three decades, knowledge and experience advanced enormously, but Dessauer's paper, presented in 1921 to the American Roentgen Ray Society, lacked little that is really fundamental to an understanding of medium-voltage X-ray therapy as it was practised 30 or more years later.

Increasing the voltage to 200 kv made it possible to treat deep-seated lesions, most of which had been inaccessible before, but raising it another 50 kv, though desirable, did not prove to be essential. Increasing the voltage still further to 400 kv brings additional advantages, but most workers agree that they are more than offset by decreased flexibility and considerably greater cost. Experimental work during the early 1950s was designed to show that generators in the 2,000- to 4,000-kv. range would yield clinical advantages commensurate with their great cost. Meanwhile, the most important tool of the X-ray therapist continued to be the generator in the 200- to 250-kv. range.

RADIATION PHYSICS

The work of calibrating X-ray machines, mapping the doses of the radiation that is purposely delivered to the tissues of a patient's body and protecting patients and radiation workers from unwanted radiation became a subspecialty within the specialty of radiation therapy. Modern treatment centres require the full-time services of considerable numbers of graduate physicists specially trained in this branch of physics. Much oversimplified, dose mapping may be summarized as follows.

The intensity and hardness of the X-ray beam are adjusted by varying the operating voltage and current and the nature and amount of interposed filter. For example, one combination will be found which yields a beam that will have its intensity reduced to one-half by the addition of a testing filter of one millimetre of copper. Such a beam is designated as having a hardness of 1 millimetre of copper half value layer (mm cu hvl). Another combination will yield a hardness of 1.5 mm cu hvl, and a third a hardness of, for example, 3.0 mm cu hvl.

These calibrations depend on r meter measurements of the beam with and without the added test filter, and from time to time the physicist checks them with his meter, but for the day-to-day work beam hardness is adjusted merely by selecting the interposed filter, voltage and current indicated on the calibration charts.

Other tables are prepared showing the dose in r per minute measured at points located, for example, 50 cm and 80 cm from the target of the tube.

From r measurements made with the thimble chamber at the surface and inserted into phantoms of wax, water or similar absorbing and scattering material, tables and isodose charts are prepared to show the doses that will be delivered at various points beneath the surface for given beam hardness, tube-skin distance, beam diameter and minute surface intensity.

It is the responsibility of the clinical radiologist to judge as closely as possible the size and location of the lesion, the amount and delivery rate of radiation most likely to be effective, and the tolerance of neighbouring uninvolved tissues. When this has been done his physicist determines the hardness intensity, geometry and aiming of the single or multiple beams best suited to place the radiation in the amounts and at the points stipulated, following which the technician administers the treatment as directed.

The usefulness of the physician-radiologist is enlarged greatly by such assistance from his physicists and technicians, but his own contribution to the work of the treatment is that he is competent in their fields as well as his own, and legally as well as morally he must be responsible for the whole.

CLINICAL ASPECTS

The tissues of the body are unaffected by radiation that merely passes through them, it is only absorbed radiation that produces an effect. When there is an effect it is invariably cell injury, and the direct agency in this injury appears to be the ionization invariably associated with absorption.

The relationship between the degree of ionization and the nature and magnitude of the biological response is constant throughout the low- and medium-voltage range. In the multimillion-volt range, direct comparison is difficult because measuring instruments regularly employed for lower-voltage radiation are no longer fully dependable and the type of ionization itself changes slightly. It seems probable, however, that with the change in type of ionization there is an advantageous alteration in the ratio between the intensity of ionization and the magnitude of cell response.

Opinions differ as to whether radiation should be used to treat non-malignant conditions such as arthritis, infections, etc., but its value in cancer is established beyond all argument (see CANCER, CANCER RESEARCH). In the radiation therapy of cancer both the effect on the host and the effect on the diseased tissue are important. The body is not totally without natural defenses against cancer but those defenses usually are not quite adequate and new cancer cells develop faster than old ones are destroyed. The aim of the radiation therapist is to deliver major damage to cancer cells with minimum damage to the adjacent normal tissue, hoping to tip the scales to such an extent that the natural defense of the body will regain the upper hand. When too large a dose is given, cancer growth may be increased rather than diminished because the restraining action of a healthy tissue bed has been lost. Such excessive doses were called "supralethal" by R. Paterson.

The radiosensitivity of tumours is influenced by numerous factors including cell type, tumour size and location and the age and general health of the host. Small tumours located rather superficially in young and otherwise healthy patients respond better than do large deep-seated tumours in debilitated old patients. Grouped in order of

decreasing sensitivity the response by cell type is as follows:

- Lymphocytes
- Granulocytes
- Epithelial cells
 - 1 Basal cells of secretory glands
 - 2 Basal cells of testes and ovaries
 - 3 Basal cells of skin and intestinal tract
 - 4 Alveolar cells of lungs, bile ducts
 - 5 Tubules of kidneys
- Endothelial cells
- Connective tissue cells
- Muscle cells
- Bone cells
- Nerve cells

The probability of clinical cure is not proportional to the degree of cell sensitivity, however. For example, the cells of Hodgkin's disease are extremely sensitive to ionizing radiations but, though patients skillfully treated respond strikingly at first, this favourable response seldom is permanent.

On the other hand, cancer of the cervix of the uterus with cells much less sensitive than Hodgkin's tissue can be cured. Skin cancer is curable unless it has been neglected until it has extensively invaded bone or cartilage. Cancer of the larynx, nasopharynx and tongue are particularly suited to radiation therapy because the mutilation incident to surgical extirpation is so disabling. Cancer of the cervix of the uterus responds well to radiation and cancer of the body of the uterus to surgery combined with radiation. Cancers of the stomach and bowel are best treated surgically. In many cases where there can be no expectation of cure, radiation may provide relief from pain and frequently considerable prolongation of the period of usefulness and relative comfort.

RADIOMETER, an instrument of a certain type for measuring the intensity of radiant energy.

It was noticed by A. J. Fresnel that a body delicately suspended *in vacuo* is apparently repelled by radiation. Using this principle, Sir William Crookes constructed an instrument, which he called a radiometer, by pivoting a vertical axle carrying vertical vanes inside an exhausted bulb, one side of each vane was blackened and the other side bright, the black sides all facing the same way round the axle. When rays from the sun or other light source or dark radiation from a warm body fall on the vane, the black sides are repelled more than the bright sides, and the vanes are set into rotation. The more intense the radiation the more rapidly do the vanes rotate. It was Crookes's idea that the instrument might be used to measure the intensity of radiation.

Instead of allowing free rotation of the vane system on a pivot, it may be suspended by a quartz fibre. Radiation falling on the black face of the vane will then cause the system to turn round until the restoring couple, because of the torsion of the suspension, balances the deflecting couple due to the radiometer action. A small mirror, attached to the vane system and reflecting a beam of light on to a scale, enables very small deflections to be observed. Ernst Pringsheim constructed such an instrument in 1883 and used it for spectrographic investigations in the infra-red. In 1893 E. F. Nichols improved the radiometer by using mica vanes, one at each end of a horizontal arm suspended on a quartz fibre and each blackened on its front surface. Radiation falling on both vanes would tend to turn them in opposite directions, and if they were correctly adjusted the system would not move under the influence of general stray radiation. The radiation to be measured was allowed to fall on one only of the vanes, and the resulting deflection of a spot of light was observed. With such a radiometer Nichols was able to measure the radiation from individual stars. The radiometer has been applied to measurements of ultra-violet radiation and to that of short Hertzian waves (wave length one to two millimetres).

The explanation of the radiometer action has presented a problem of considerable interest. The question arises whether the rotation of the vanes may be caused by the direct impact of the radiation, somewhat as the rotation of a cup anemometer is caused by the wind. This

explanation has been disproved in several ways. If, for example, the vanes are made of transparent material and blackened on the back face, they move toward the direction from which the light comes. The ordinary radiometer effect must be caused, therefore, by stresses set up in the gas. As the pressure of the gas is reduced, the rotation increases to a maximum and then decreases. Even in a very high vacuum, however, a small effect persists, directed away from the light. The magnitude of this residual effect agrees with the value as calculated from the electromagnetic theory of light, which predicts a small pressure because of incident radiation.

The ordinary radiometer action in the presence of gas has been rather definitely shown to be a consequence of the creep of the gas over the unequally heated surface of the vanes near their edges, as was suggested by J. C. Maxwell in 1879. The gas creeps toward the more heated part of the vane surface and produces there a slight condensation of the gas and an increase in its pressure, the inequalities of pressure thus created give rise to a reverse flow in the surrounding gas, but this flow is hindered by viscosity, so that some inequality of pressure persists and forces the vane back. The existence in the gas of streaming motions such as are required by this explanation has been demonstrated by hanging tiny vanes in the path of the streams and observing their deflections.

RADIO RECEIVER, The two principal parts of a radio system are the transmitter and receiver. The waves radiated from transmitting antennas set up voltages in a receiving antenna, so that the first function of a receiving set is to select the signal desired. This must then be amplified and further modified so that a faithful reproduction of a program can be produced by the loud-speaker. Although a modern broadcast transmitter may have an output of 50 kw, only a few microwatts from distant stations are often available at the receiving antenna, principally because of the spreading out of the radio waves as they are propagated through space. A large amount of amplification is thus required in order to obtain a sound output of one watt, for example.

Receivers are provided also with automatic gain and manually operated volume and tone control. Other features often found include multiband reception, automatic selectivity and frequency control, push-button or remote tuning indicators, squelching circuits, etc. Some sets also include facilities for microphone pickup or for sound recording and reproduction.

History—The first demonstration of the production and reception of radio waves was made by Heinrich Hertz in Germany in 1887. His receiver consisted of an open wire loop with spheres attached to the ends to form a gap. The presence of the waves was "detected" by observing a spark set up in the sphere gap. Hertz was interested only in studying the properties of the waves and expressed no thought of practical application. It remained for Oliver Lodge to develop a system of wireless communication in England in 1894.

The receivers included an antenna, tuned circuit, a detector consisting of a glass tube filled with metal filings called a "coherer" and a relay-controlled ink for recording Morse code. Lodge

FIG 1—SINGLE-CIRCUIT REGENERATIVE RECEIVER (1921)

FIG 2—BLOCK DIAGRAM FOR SUPERHETERODYNE RECEIVER (1951)

subsequently received several patents on radio apparatus—two of the better-known covering tuned circuits and loop antennas.

There was much activity in wireless telegraphy following Lodge's initial disclosures. Many new and improved types of detectors or "cynoscopes" (from *κῡμα*, a wave) were invented,

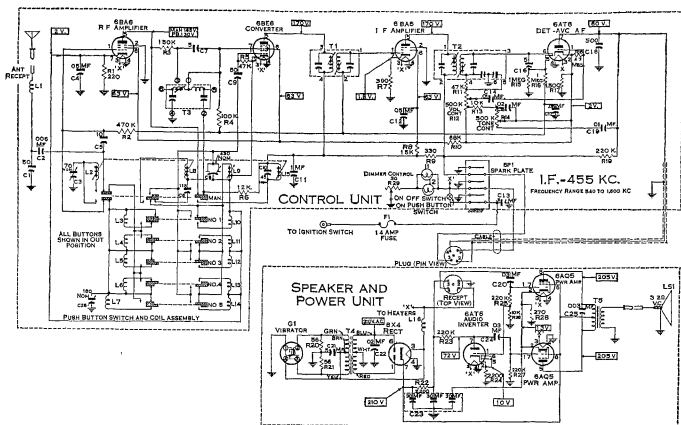

FIG 3 —CIRCUIT DIAGRAM FOR AUTOMOBILE RECEIVER (1951)

These included magnetic types by Guglielmo Marconi, Ernest Rutherford and others, electrolytic by F K Vreeland, R A Fessenden and Lee De Forest, and a wide variety of crystal detectors using carborundum, galena and iron pyrites. Much progress was made also in radio measurements through the use of thermocouple and other types of hot wire instruments, the bolometer, etc.

The first electronic device to appear in radio receivers was the "Zehnder trigger tube cymoscope" in Germany. This was a glow tube in which the potential difference between anode and cathode was set to a value of several hundred volts. A discharge could then be initiated by impressing a radio signal between the pair of trigger electrodes with which the tube was provided.

The first thermionic electron tube for radio use was patented by J. A. Fleming in England in 1904. This was a vacuum diode detector tube, known as the "Fleming oscillation valve." Its apparent advantage over other types of detectors was the ability to undergo mechanical shocks and static surges without "jarring out." Its inherent insensitivity to weak signals, together with the primitive status of manufacturing, limited its application

The three-element vacuum tube was invented by De Forest in 1906. A receiver using an "audion," as it was called, could deliver more power to an output device than was received from the antenna, so that it was operating in the dual capacity of detector and amplifier. Subsequent work showed that it could be used simply as a radio-frequency (R.F.) or audio-frequency (A.F.) amplifier, or even as a modulator. De Forest manufactured radio sets equipped with audions for several years. The audion, like the Fleming valve, was inconsistent in initial characteristics and unreliable over long periods of time, because of the inadequacy of the manufacturing techniques.

One of the most remarkable applications of the audion was to the feed-back, or regenerative, circuit. In this, coupling was introduced between the plate and grid circuits such as to produce an appreciable increase in both the selectivity and sensitivity of the circuit. By providing adequate coupling, such a circuit could be made to oscillate continuously without benefit

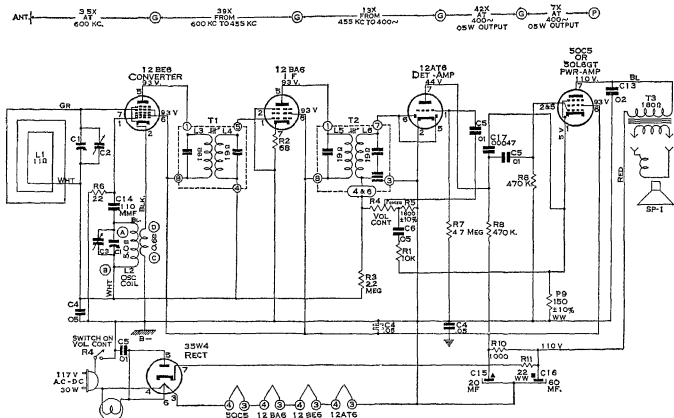

of external grid signal

It is difficult to place proper priority for the invention of the feed-back circuit. In 1913 Alexander Meissner was granted a patent on an oscillator in Germany and E. A. Armstrong presented a paper describing regenerative circuits. Other names associated with contemporary work were C. S. Franklin and H. J. Round in England and De Forest and Irving Langmuir in the United States. A four-way litigation initiated by Meissner, Armstrong, De Forest and Langmuir was decided finally in favour of De Forest by the supreme court of the United States in 1928, and it reaffirmed its action in 1934.

Considerable progress was made in the theory, construction and applications of vacuum tubes and their circuits between 1910 and 1920, much of it in connection with the World War I efforts and long-line carrier-current telephony. The greatest single impetus to be noted in radio history, however, was the introduction of radio broadcasting in 1921. This created a tremendous demand for receivers as transmitters were established throughout the world. The vacuum tube receiving circuits were battery operated for the first few years, but rectifier-type power packs soon appeared for plate and grid supplies. These were followed almost immediately by the self-contained alternating-current sets, which were made possible by the development of tubes whose cathodes could be operated on alternating current without introducing excessive hum in the output.

The first broadcast signals were amplitude modulated (AM) exclusively, and many types of receiving sets were in use. Some of the more common were: regenerative, superregenerative, reflex, tuned radio frequency, neutrodyne and superheterodyne. The superheterodyne came to be used almost exclusively for broadcast reception, although a few portable models are tuned radio frequency.

The difficulties of static elimination inherent in AM operation led Armstrong to develop frequency modulation (FM). Although he began work on the problem in 1914, his system was not perfected until 1933 and several more years elapsed before much use was made of it. By Jan 1940, however, there were 20 li-

BY COURTESY OF ZENITH RADIO CORP.

FIG. 4—CIRCUIT DIAGRAM FOR PORTABLE AC DC RECEIVER (1951)

censed transmitting stations with applications for 150 more on file. By Dec 1951 there were 639 FM stations operating in the 88- to 108-mc band. The superheterodyne circuit with adaptations is universally used for FM broadcast reception.

TYPES OF RADIO RECEIVERS

Regenerative Receivers.—One of the first circuits in common usage is shown in fig. 1. In this the single tube acted as both radio-frequency amplifier and detector. The input circuit was tuned by means of the variable air condenser and taps on the "variocoupler" tuning coil, and the amount of feedback was controlled by rotating the "tickler coil." This circuit was especially common in home-built sets, principally because of its simplicity and the phenomenal results sometimes obtained with it, such as coast-to-coast reception during unusually favourable conditions, for example. Other types of regenerative receivers were the two- and three-circuit, tuned plate, Cockaday, etc. Most of them had a tendency to oscillate and to act as a radio transmitter while being tuned. The radiated output would combine with other signals present to produce obnoxious squeals and whistles in neighbouring sets. This, together with a demand for more selective receivers as the number of broadcast transmitters with closer frequency allocations increased, eventually limited applications to long-wave and marine use.

Superregenerative Receiver.—The selectivity and sensitivity of a regenerative receiver increases rapidly with the coupling and resulting approach to the condition for sustained oscillation. Armstrong first described a circuit in 1923 for taking advantage of this by superimposing a supersonic signal upon the received signal, in a manner such as to prevent the circuit from oscillating at a high frequency. This principle is used in the superregenerative receiver, which is characterized by extremely high sensitivity. Because of poor quality of output, its use is limited principally to short-wave reception in police and radio amateur sets.

Reflex Receiver.—Reflex action consists of feed-back action between the plate circuit of one tube and the grid circuit of the

preceding tube. In the reflex receiver, the antenna signal was first amplified by one stage of tuned radio frequency (T.R.F.) and then applied to the grid of the detector tube. The audio-frequency output of the latter was then fed back to the grid of the first tube by means of an audio-frequency transformer, the headset or loud-speaker being connected in the plate circuit of that tube. Thus, the first tube acted simultaneously as a radio-frequency and audio-frequency amplifier, to give sufficient output to operate a small loud-speaker upon occasion. This was an important consideration in the days of high-priced tubes, parts and batteries. Poor selectivity was the principle factor which brought about an early obsolescence.

Tuned Radio-Frequency (T.R.F.) Receiver.—It was found that an increase in both sensitivity and selectivity could be obtained by introducing one or more stages of the tuned radio-frequency amplification preceding detection. However, the plate-grid capacitances in triodes created a tendency for the circuit to oscillate. Although a limited amount of feed-back action was desirable, it was necessary to control it carefully in order to prevent oscillations. Bridge circuits for accomplishing this were developed by C. W. Rice and L. A. Hazeltine. A set utilizing the last was known as the neutrodyne receiver, considered to be the last word in receivers until superseded by the superheterodyne.

Some of the weaknesses inherent in early types of tuned radio-frequency receivers were separate tuning for each stage and non-uniform neutralization, sensitivity and selectivity over the broadcast band. The first was removed by gang tuning and the need for neutralization by use of screen-grid tubes, but the problem of varying sensitivity and selectivity remained in tuned radio-frequency receivers. As a result, this type is used in only a few portable broadcast receivers and certain isolated applications where the selectivity requirements are not too stringent.

Superheterodyne Receiver.—A circuit which gave uniform performance over a wide range of station frequencies was developed by Armstrong while working in France during World War I. This made use of the heterodyne principle, which consists of combining together two frequencies to give a different

frequency. It had been introduced by Fessenden of the University of Pittsburgh in 1913, to convert radiotelegraph signals into interrupted audio-frequency code signals.

In the Armstrong superheterodyne receiver, or superonic heterodyne receiver as it was called first in England, the incoming signal is combined with the output of an oscillator to produce a given superonic frequency, called the intermediate frequency (IF). The latter is then amplified by means of one or more tuned stages, demodulated to give the required audio-frequency signal, amplified and finally fed into a loud-speaker. The selection of the particular station to be received is accomplished by adjusting the oscillator frequency so that the difference between it and the carrier frequency of the received station is equal to the intermediate frequency. Since the major part of the amplification is in the intermediate-frequency amplifier, both the selectivity and sensitivity of the set are essentially independent of the original station frequency. The advantages of the superheterodyne receiver were quickly recognized, but since the early sets required eight or ten expensive battery-operated tubes its use was limited to the more expensive models. By mid-century, however, more than 98% of the broadcast receivers in use in the United States were superheterodynes.

The accompanying block and schematic circuit diagrams show the principal features of typical modern receivers. Starting at the input terminals, the signal is first amplified with one stage of tuned radio frequency in order to provide initial selectivity and thus to reduce so-called image and cross-modulation effects and mixer tube noise. The tuned radio-frequency amplifier and local oscillator circuits are gang tuned with a single dial.

The mixer, converter or first detector tube, as it is called, changes the carrier frequency of the signal to the intermediate-frequency value. This was originally taken as 50 kc, but was later increased to 130-175 kc. Later it was further increased to 450-480 kc, with a tendency to standardize at 455 kc. in order to accommodate multiband receivers.

Although separate oscillator and mixer tubes have been used, a single tube known as a "pentagrid converter" is preferable. Referring to figs 3 and 4, it will be noticed that grid number 1 and grid number 2 serve as grid and anode, respectively, of an oscillator. The radio-frequency signal from the tuned radio-frequency stage is applied to grid number 4 so that the electron stream will acquire a frequency component equal to the difference between the oscillator and signal frequencies (equal to the intermediate frequency) by heterodyne action before reaching the anode. Grids number 3 and number 5 are connected together to act as a shield around grid number 4 in order to prevent reactions between the radio-frequency and oscillator circuits.

The intermediate-frequency amplifier usually consists of one or two transformer-coupled stages. The primaries and secondaries are permanently tuned, aside from small "trimmers" which are used for alignment purposes. The major portion of the high-frequency gain occurs in the intermediate-frequency amplifier. Remote cutoff pentodes are used to permit automatic gain control, to be discussed below.

The function of the second detector is to convert the modulated intermediate-frequency signal into audio-frequency. Square-law detection by means of a triode was used originally. This is preferable for weak signals, but since the percentage of second harmonic distortion increases rapidly with signal strength and percentage modulation, linear detection came to be used. Among the advantages of high-level linear detection are the elimination of one stage of audio-frequency amplification, low harmonic distortion, reduction in tube noise and a lowering in cost of power pack filter.

The process of linear detection is essentially one of rectification and can be accomplished with either diodes or suitably biased grid-control tubes. Duplex tubes are often used, one part feeding into the audio-frequency amplifier, the other into the automatic volume-control system.

The audio-frequency amplifier may consist of one stage of voltage amplification and a power stage which utilizes two pentodes in push-pull, when considerable output is demanded. Figs 3 and 4 show audio-frequency circuits for automobile and

portable sets where less output is required.

Automatic volume, or gain, control (AVC) was one of the most important developments in radio receivers. Its principal purpose is to maintain constant detector input. In this way the output of the receiver is unaffected by the strength of in-

FIG 5—BLOCK DIAGRAM FOR FM BROADCAST RECEIVER (1951)

coming signals. In brief, automatic volume control is accomplished by introducing an extra bias in the variable mu tubes in the tuned radio-frequency and intermediate-frequency stages, which increases with the carrier input to the second detector. This automatically adjusts the gain of those stages so as to maintain nearly constant detector input as long as the incoming antenna signal exceeds a minimum threshold value.

The output of a receiving set is adjusted to suit the listener by means of a volume control, consisting of a potentiometer in the audio-frequency amplifier. Since the sensitivity of the ear varies with frequency, some volume controls also include fixed coils or condensers such that the quality of the loud-speaker output will appear to be independent of intensity.

The purpose of the tone control is to allow the listener to vary the relative intensity of the high and low tones. The circuit for doing this consists of a variable resistance connected in series with a fixed capacitor, its effect being to enunciate the bass notes by decreasing the high ones.

Receivers for FM Reception.—The block diagram in fig 5 is for a typical receiver designed for use in the 88- to 108-mc. broadcast band. In this, the intermediate-frequency amplifier operates in the region of four to eight megacycles and has a pass band 200 kc wide. After leaving the intermediate-frequency amplifier, the signal passes through a one- or two-stage "limiter" which levels off the signal at about four volts, so that it is essentially devoid of amplitude modulation. This is very effective in eliminating interference as well as noise caused by static, ignition systems, etc., since the major portion of these can be considered AM. The remaining FM component can be reduced by using a large frequency swing, ± 75 kc. for 100% frequency modulation being standard in broadcast.

The first step in the process of detection is to convert the FM signal into AM. This is done with a frequency-sensitive circuit called the discriminator. This consists of a transformer with primary and secondary tuned to the same frequency and with the coupling slightly less than critical in order to obtain the desired shape of the frequency-response curve. The output of this is fed into a duplex diode detector such as to produce the required audio-frequency output which is further amplified as in AM receivers. (See also BROADCASTING, ELECTRIC WAVES, ELECTROMAGNETIC WAVES, ELECTRON TUBE, LOUD-SPEAKER; RADIO; TELEVISION, WIRELESS TELEGRAPHY.)

RADIOSONDE, an instrument sent aloft, attached to a freely rising balloon, for the purpose of obtaining information on the temperature, humidity and other properties of the upper atmosphere. It includes a radio transmitter which sends down signals representing the numerical values of these properties. (See UPPER AIR SOUNDINGS.) (W. E. K. M.)

RADIOTHERAPY; see RADIOLOGY

RADISH, *Raphanus sativus* (family Cruciferae), an annual or biennial grown for its large, succulent root. The edible part of the root, together with some hypocotyl, forms a structure

varying in shape, among varieties, from spherical, through oblong, to long cylindrical or tapered. Outside colour of the root varies from white, through pink to red, purple and black. Size of edible part varies among varieties from a few grams in the most popular early American and European varieties to a kilogram or more in the late Japanese field type of radish, or daikon. As generally grown, flower stalks form the first season, bearing white or lilac-veined flowers. The seeds are borne in a spongy, non-dehiscent, beaked pod called a silicle. The small, quick-growing spring varieties have a mild crisp, moderately firm flesh, and are quite perishable. The large, slow-growing summer and winter types have pungent, firm flesh. Winter varieties can be stored through the winter. The common radish is probably of oriental origin. *R. sativum* is a wild radish found along the Mediterranean. The rat-tailed radish (*R. caudatus*) has no enlarged root, but bears enormous seed pods 8-12 in long which are eaten fresh or pickled. *R. sativum* (var. *longipinnatus*) produces deeply pinnate leaves up to 2 ft long, the roots are large, firm and are grown as a winter radish. This type is much grown in the orient and is generally known as Chinese radish. (V R B)

RADIUM (Symbol Ra, atomic number 88, atomic weight 226.05) is the heaviest element of the alkaline earth group and the most familiar of the natural radioelements. The name originally applied only to the first discovered and most important isotope of the element, that of mass number 226, but is now used as a general name for the element. It was discovered in 1898 by Pierre Curie, Marie Curie and G. Bémont at the Sorbonne in Paris. Mme Curie had observed that the radioactivity of pitchblende, an ore of uranium, was several times that of the uranium it contained, and by chemical separation of the constituents of the mineral two highly radioactive elements were discovered and named polonium and radium. The latter was found associated with the barium of the mineral and followed it throughout the procedure. In 1902, as a result of working up several tons of pitchblende residues and carrying out tedious chemical fractionations to separate the radioactive substance from the barium, the first pure salt of radium was isolated by Mme Curie, and in 1910 the metal was prepared by Mme Curie and A. Debierne.

Isotopes and Radioactive Properties.—Several isotopes of radium, all radioactive, are known. Only Ra^{226} is stable enough to permit its isolation in visible and weighable amounts, and the name "radium" often refers simply to this isotope. Its half-life is approximately 1,600 years, and it disintegrates with the emission of alpha-particles. It is a member of the uranium, or radium, family of natural radioelements, following ionium in the series. Its immediate transformation product is radon, a noble gas of 3.825 days' half-life, which in turn changes into a series of short-lived radioelements, radium A, B, C, C' and C''. It is rarely encountered in a radioactively pure form, for immediately after purification from its disintegration products they rapidly grow in again. Radium C emits very penetrating gamma-rays, so that, although radium itself emits only small numbers of gamma-rays of low penetrability, a sample which has been sealed up to prevent loss of the gaseous radon is a source of strong gamma-radiation. About a month is required for the gamma activity to reach its maximum, or equilibrium, intensity. The end product of the short-lived descendants of radium is radium D, which is also radioactive, and from this grow radium E and polonium, or radium F. Since the half-life of radium D is 22 years it comes to equilibrium only very slowly in radium preparations.

The half-life of radium is so great that it cannot be determined by directly observing the decay, and recourse must be had to indirect methods. Most of these involve the determination of the specific activity, or the number of disintegrations per unit weight in unit time. This can be done by counting the alpha-particles emitted in a measured interval by a sample of known weight. The first measurements were done by visual counting of the scintillations produced by the impact of the particles on a zinc-sulphide screen, while later experimenters have used electrical instruments to amplify and record the bursts of ions produced by the particles in a gas. Since alpha-particles are helium nuclei, measurement of the rate of helium generation by radium provides

another means of determining the specific activity. The half-life can also be calculated from the rate of growth of radium in a sample of purified ionium relative to the amount in equilibrium with the same quantity of ionium in ancient and intact uranium minerals. Finally, from the equilibrium ratio of radium and uranium in such minerals the half-life of radium can be calculated if that of uranium is known independently. Although there is some disagreement as to the exact values, the specific activity is approximately 3.7×10^{10} alpha-disintegrations per second per gram and the half-life 1,600 years. The disintegration rate of radium is the basis of a standard unit of radioactivity, the curie, originally a rate of disintegration equal to that of a gram of radium. Now, a curie of any radioelement is by definition that amount undergoing 3.7×10^{10} disintegrations per second.

In the thorium series of radioelements occur two radium isotopes, mesothorium I (Ra^{228}) and thorium X (Ra^{228}), the former a beta-emitter of 6.7 years' half-life and the latter an alpha-emitter of 3.64 days' half-life. One of their descendants, ThC' , emits gamma-radiation even more penetrating than that of RaC, and as a result of the complex sequence of half-lives the gamma activity of freshly purified mesothorium increases for about four years and then decays steadily. A fourth isotope, actinium X (Ra^{228}) occurs in the actinium series and is an alpha-emitter of 11.2 days' half-life. (See RADIOACTIVITY, NATURAL.)

Several artificial radioactive isotopes of radium are also known (See NUCLEUS.)

Natural Occurrence.—Although the half-life of radium, 1,600 years, is long with respect to human experience, it is infinitesimal in the geological time scale, and any radium present at the time of the formation of the earth has by now completely disappeared. It is only because a new supply of the element is continually being generated by the disintegration of uranium that any is found at the present time, and its distribution in nature is practically identical with that of uranium. There is a constant ratio between radium and uranium, 0.00000034, in all sufficiently old minerals in which radioactive equilibrium has not been disturbed by weathering or leaching. In altered minerals the radium is generally relatively lower because of the greater solubility of its oxide as compared with that of uranium and its resulting greater tendency to leach out. Springs, rivers and sea water contain small amounts of radium as do the various layers of the ocean sediments. Uranium, and consequently radium, are widely distributed in minute traces in nearly all common rocks, both igneous and sedimentary, the average concentration of radium in the earth's crust being about one part per million million. The bulk of the earth's radium is so accounted for, but in this form it is, of course, commercially unavailable. Only in uranium minerals is radium present in high enough concentrations to make its extraction feasible, and even the richest ores contain only about a quarter of a gram of radium per ton. Most deposits contain smaller amounts, and some which contain as low as 1% of uranium, or 1 g of radium in 300 tons, have been exploited for the latter.

Radium was discovered in the mineral pitchblende, an oxide of uranium, which had been mined for centuries at Joachimsthal, Czechoslovakia, for its uranium content. More extensive pitchblende deposits have been found at Katanga in the Belgian Congo and at Great Bear lake in Canada. Second in importance as a radium source is carnotite, a double vanadate of uranium and potassium found principally as a yellowish impregnation of sandstone in the western United States. Altogether several dozen different radium-containing minerals are known, and deposits of varying extent are found in many other places including England, Portugal, Germany, Russia, Madagascar, South Africa and Australia. Many of these have been worked from time to time for radium. The increased importance of uranium, as a source of atomic energy, has resulted in intensive prospecting and the discovery of many more radium-bearing deposits.

Mesothorium is obtained principally from monazite, a mixed phosphate of thorium and rare earths occurring chiefly in alluvial sands in Travancore, Ceylon, Brazil and North Carolina. Thorium X and actinium X occur naturally in thorium and uranium minerals, respectively, but are usually obtained from their parents

rather than from natural sources (See URANIUM, THORIUM)

Industrial Production.—For a number of years following its discovery the only important source of radium was the Joachimsthal mines, operated by the Czechoslovakian government. Later some radium was produced in other European countries. The United States became the first major producer and from 1911 to 1923 was the chief world supplier, with carnotite from the western states being extracted principally at Denver, Colo., and Pittsburgh, Pa. The rich Belgian Congo pitchblende deposits were discovered in 1913, and the refinery at Oleno, Belgium, began production in 1922, immediately dominating the world market. The extensive Canadian deposits were discovered in 1930, and the refinery at Port Hope, Ont., started producing radium in 1933. For a number of years the world market was divided between the Belgian and Canadian producers on a 60-40 basis by a cartel agreement. After Belgium fell to the German army in 1940, the African ores were shipped to the United States and Canada for refining.

It is a tribute to the genius of Mme. Curie that the general method she devised to isolate radium is still used for its commercial extraction, in spite of much subsequent research. The following is a typical treatment of pitchblende. The ground ore is digested with a mixture of nitric and sulphuric acids to which a little barium is added to act as a carrier for the radium. The uranium dissolves, and an insoluble residue of radium, barium and lead sulphates and siliceous gangue remains. This is separated by filtration and boiled with sodium-hydroxide solution to leach out the lead sulphate and some of the silica. The residue is then autoclaved with sodium-carbonate solution to convert the barium and radium sulphates to carbonates, which are dissolved in hydrochloric acid. After filtering off the remaining silica, the barium and radium are again precipitated as sulphates and converted to carbonates to effect a purification. The carbonates are now dissolved in hydrobromic acid and the bromides subjected to an involved fractional crystallization process. Since radium bromide is somewhat less soluble than barium bromide, the crystals are enriched in radium. After ten recrystallizations the ratio of radium to barium in the head crystals is changed from a few parts per million to a few parts per thousand. At this stage, the bromides from several batches are accumulated, purified again and subjected to further crystallizations until radium of the desired purity, usually 95% or 99%, is obtained. This is sealed into small glass tubes to be measured and sold.

Variations in this process are dictated by differences in the nature and quality of the ores found in different locations. Canadian pitchblende contains considerable native silver, which is recovered by roasting the ore with sodium chloride to convert the silver to its chloride and subsequently leaching the latter out of the sulphate residue with sodium-thiosulphate solution. With carnotite, the treatment can be altered by leaching the ground ore with hydrochloric acid to dissolve the radium, uranium and vanadium away from the siliceous matter before adding sulphuric acid. The sulphate precipitate can alternatively be heated with charcoal to reduce the sulphates to sulphides, which dissolve readily in hydrochloric acid. In the fractional crystallization the chlorides are often used instead of the bromides.

A recently developed separation method for radium and barium employs synthetic organic cation exchange resins.

Radium was originally interchanged freely among scientific and medical investigators, but when it became an item of commerce it became extremely expensive. However, as new and richer sources have become available, the price has steadily fallen. Typical market prices per gram were \$10,000 in 1904, \$80,000 in 1912, \$120,000 in 1915, \$135,000 in 1918, \$90,000 in 1920, \$70,000 in 1923, \$50,000 in 1929, \$25,000 in 1936, \$20,000 in 1941 and \$25,000 in 1946. The total world production in grams was approximately 50 by 1916, 300 by 1925 and 1,000 by 1940. Production was greatly accelerated during World War II.

Chemical Properties.—Of the 88 electrons of the radium atom, the first 86 are very strongly bound, whereas the outer two are readily lost leaving a divalent cation of noble-gas structure. This property classifies it among the alkaline-earth elements, which include, in order, magnesium, calcium, strontium, barium

and radium. There is a general gradation of properties in going from the lighter to the heavier members of the group, and radium continues this trend. It is very similar to barium, all of its known compounds being isomorphous with the corresponding barium compounds and differing so little in properties as to make the separation of the two elements a matter of great difficulty. The chemistry of radium is, therefore, well understood even though its scarcity has caused it to be studied comparatively little.

Radium is divalent in all of its compounds. The sulphate, RaSO_4 , is the most insoluble sulphate known and for this reason is important in the separation of the element from its ores. However, it is only because lead sulphate is also precipitated from the solution of the ore that quantitative precipitation of radium is obtained, for the amount of radium sulphate present is far too low to precipitate by itself. This principle, whereby an element present in quantity too small to permit manipulation by itself is caused to undergo certain chemical reactions by the presence of a larger quantity of a similarly behaving element, is called "carrying" and is important both in the isolation and in the chemical study of radium. The nitrate, $\text{Ra}(\text{NO}_3)_2$, chloride, RaCl_2 , and bromide, RaBr_2 , are soluble in water but highly insoluble in concentrated solutions of the corresponding acids, and are consequently of use in the purification of radium, including its separation from the last traces of barium. The chloride and bromide crystallize as hydrates, $\text{RaCl}_2 \cdot 2\text{H}_2\text{O}$ and $\text{RaBr}_2 \cdot 2\text{H}_2\text{O}$, but form the anhydrous salts on heating. The hydroxide, $\text{Ra}(\text{OH})_2$, is the most soluble of the alkaline-earth hydroxides. The carbonate, RaCO_3 , is insoluble in water but soluble in acids, and the sulphide, RaS , is soluble in water.

In the elementary state radium is a shiny white metal of high reactivity, melting at approximately 700°C . It dissolves in water with vigorous evolution of hydrogen and darkens in air with the formation of the nitride. It is prepared by electrolysis from an aqueous solution of the chloride into a cathode of mercury, followed by volatilization of the mercury in a stream of hydrogen.

The optical spectrum of radium is similar to that of the other alkaline-earth elements, consisting of comparatively few relatively strong lines. The ordinary compounds of radium are all colourless but become coloured upon standing as a result of the continual bombardment by radioactive particles. Glass containers of considerable quantities of radium also become coloured, and suitable preparations can be seen to glow in the dark. These properties are not peculiar to radium but are common to all strongly radioactive substances.

Analytical Methods.—The assay of radium is generally made not by the usual chemical procedures, such as weighing, but by methods based on its radioactivity. Strong samples, such as those for medical and radiographical use, are assayed by their gamma-radiation by means of an ionization chamber and electrometer. The sample must be sealed for at least a month before the measurement so that the equilibrium quantity of radium C is present. For calibration of the measuring apparatus, standard preparations of radium have been made. The primary international standard was prepared by Mme. Curie by precise weighing and has been preserved at Sèvres, France. Secondary standards, carefully checked against the international standard, are kept in the capitals of the principal nations. In using these standards allowance must be made for their decay, which amounts to 0.043% per year. Another assay method is the emanation technique, in which the gaseous radon generated by the radium sample in a measured time is collected in an ionization chamber and the intensity of its radiations measured. This method can be made extremely sensitive by electrically counting the individual alpha-particles, and as little as 10^{-14} gram of radium can be so detected.

Uses.—The uses of radium all result from its radiations. The most important of these have been in medicine, principally for the treatment of cancer. For this purpose the element may be used directly, sealed in a tube, or the accumulated radon may be drawn off and compressed into a small capsule which may be used until it has decayed to a low intensity (See RADIOLOGY). An increasingly large amount of radium is being employed for industrial radiography, particularly for the inspection of metal

castings. Radium is mixed, in very small concentrations, with a paste of zinc sulphide to make a luminescent paint for watch, clock and meter dials and signs which must be read in the dark. An intimate mixture of radium with beryllium is a moderately intense source of neutrons. Such neutron sources have been used extensively in scientific work and have found practical applications in searching for oil deposits.

Mention should be made of the hazards of handling radium, which result from the physiological effects of the radiations and which are enhanced by the gaseous nature of its decay product, radon. Before the dangers were recognized and adequate precautions taken a number of radium workers suffered serious injury or death. For physiological effects of radioactive substances see RADIOLOGY.

Mesothorium can be used in a manner similar to radium for all the purposes mentioned, but its greater expense and shorter lifetime limit its applications. It is superior to radium as a luminous paint activator because the intensity of its radiations increases for several years and thus compensates for the fatigue of the zinc sulphide. Except for scientific purposes, the other radium isotopes have no practical value.

For all the uses of radium, substitutes have become available. Artificial radioelements and high-voltage X-ray generators are supplanting radium in radiotherapy and radiography. Fluorescent paints activated by ultra-violet radiation are replacing radium paints in aeroplane panel meters. Cyclotrons and nuclear chain reactors provide much more intense neutron sources. Nevertheless, the use of radium is expected to increase because of greater availability as a by-product of uranium.

RADIUM THERAPY; see RADIOLOGY

RADNORSHIRE, an inland county of Wales, bounded north by Montgomery, north-east by Shropshire, east by Hereford, south and south-west by Breconshire and north-west by Cardigan. Its area is 470.6 sq. mi., and it is consequently the smallest of the six south Wales counties. Pop. (1951) 19,998. The county is a highland region grading eastwards to the plain of the Severn. The western section is formed of Ordovician rocks which are succeeded eastwards by the Llandovery, Wenlock and Ludlow beds of the Silurian. This region forms part of the central Wales plateau with a general level of about 1,000 feet. To the east of the L.M.S. mid-Wales line that cuts the county diagonally from south-west to north-east the grits and shales of the lower Palaeozoic rocks are overlain by the Old Red Sandstone which culminates in the rugged mass of Radnor forest (2,166 feet). The railway follows the lower Ithon valley (a tributary of the Wye) from near Bulth Road to Llanbadarn Fawr. The Wye forms the south-west boundary of the county between Newbridge and Three Cocks, and divides Radnor forest from the Epynt mountains of Breconshire. Between Llandrindod and Bulth is a disturbed area of Ordovician strata with masses of andesitic and diabasic igneous rocks. The region has also saline, sulphurous and chalybeate springs. East of New Radnor in the eastern section of the county an inlier of Wenlock rocks is surrounded by Ludlow beds, while at Old Radnor a ridge of very ancient rocks appears. The eastern half of the county is characterized by the number of river valleys that open out to the English plain and consequently offer important ways into the county from the East. In the north the Teme opens out to Knighton and Ludlow and forms the northern boundary of the county for a part of its course. The Lugg flows eastward past Presteign, and the Arrow past Kington, while the vale of Wye leads down to Hereford.

History and Early Settlement.—The heavily forested nature of the county in early times made it unsuited for settlement. Indeed, the region does not seem to have been densely peopled at any time. There are remains on the open higher ground especially in the north of the county of tumuli of uncertain date. Evidence of Bronze age and Megalithic cultures are almost entirely absent. There are, however, a few good examples of hill-top camps, especially at Burfa, and Castle Ring in the parish of Evenjobb. The Roman interests in the region seem to have centred on Castell Colleen a focus of ways among the hills and on the road running due north from Brecon to Caersws. The post-

Roman centuries were naturally times of difficulty in this region and the outstanding memorial of the time is the remains of Offa's Dyke that traversed the county. The best preserved sections are in the hilly districts west of Knighton and Presteign. Church dedications show the influence of the Celtic Saint movements of these centuries. Towards the close of the 9th century Maesyfed was absorbed into the middle kingdom of Powys, and in the 10th century it was included in the realm of Elystan Glodrudd, prince of Fferyllys, or Feryllyng, who ruled over all land lying between the Wye and Severn. In the reign of William I, the Normans began to penetrate into Maesyfed, where, according to Domesday, the king already laid claim to Radenour, or Radnor, in the lordship of Melenthy (Moelynnardd), which was subsequently bestowed on the Mortimer family. The Domesday records are of interest in that they show evidences of cultural penetrations along the valley ways from the east (English place-names west of Offa's Dyke, etc.). Influences from the plain have long been a feature of the social, religious and political life of the county. Later, the Norman invaders forced their way up the Wye valley, the de Braose family, lords of Elvel (Elfael), building fortresses at Painscastle and at Colwyn or Maud's Castle. The Wye valley long formed one of the debatable districts between Welsh and Normans. After the annexation of Wales by Edward I, the district of Maesyfed remained under the jurisdiction of the Lords-Marchers, represented by the families of Mortimer and Todeney.

The weakness of the Norman hold on many parts of the county is illustrated by the absence of large numbers of stone castles and the great number of those of the motte and bailey type. The valley ways show evidences of compact settlements in marked contrast to the single farms of the upland west. The difficult nature of much of the county throughout mediaeval times, together with the weak Norman hold, meant that the manorial system was very late in establishing itself. The ravages of the Black Death which were particularly severe in this region brought manorial conditions to an early end and the county became almost entirely dependent on sheep rearing. The increase in the number of sheep and the development of the wool trade and the great wool-markets of the Welsh Border—Shrewsbury, Ludlow, Hereford and Gloucester—were features of 14th and 15th century England. There was only one monastic house of consequence in this pastoral county, the Cistercian abbey of St. Mary, founded by Cadwallon ap Madoc in 1143 in "the long valley" of the Clywedog, 6 m. E. of Rhayader, and from its site commonly called Abbey Cwm Hwr. Its existing ruins are insignificant, but the proportions of the church, which was 238 ft. long, are still traceable. The churches of Radnorshire are mostly poor and small.

The political instability of the county continued throughout the 15th century and in 1402 Owen Glendower entered the Marches and raided the lands of the young Edward Mortimer, earl of March.

Radnorshire (Maesyfed) was created a county on the English model by the Act of Union (1536). It was parcelled out of the suppressed marches lordships. The new county was represented in parliament by two members, one for the county and one for the group of united boroughs. Together with the rest of north-east Wales the county was conservative and royalist during the 17th century, the local clergy during the commonwealth coming in for severe criticism under the administration of the Puritan Vavasor Powell (1617-70). The developments in the wool trade and local weaving attracted in the 16th and 17th centuries numbers of continental weavers, mostly religious refugees and the county is well known for the strong points of view it took later in religious matters. It was an old stronghold of the Quakers and later of the Baptists.

During the 20th century the rise of Llandrindod as a watering-place and the construction of the Birmingham reservoirs in the Eilan valley have tended to increase interest in the county.

Occupations.—Good hay and cereals are raised in the valleys, oats being by far the chief crop. The extensive upland tracts, which cover over one-third of the total area of the county, afford pasturage for large flocks of sheep. The quality of the wool of Radnorshire has long been celebrated, and also the delicacy of the

Welsh mutton of the small sheep that are bred in this county. Important sheep fairs are held at Rhayader.

The Central Wales branch of the LMS enters the county at Knighton, traverses it by way of Llandrindod and passes into Brecknock at Bulth Road Junction on the Wye. The GWR railway follows the course of the Wye, by way of Bulth and Hay. Two small branch lines connect New Radnor and Presteign with the GWR.

There is no existing municipal borough, although New Radnor, now a mere village, was incorporated in 1561, and its municipal privileges were not formally abolished till 1883. The chief centres are Presteign, Llandrindod Wells, Knighton and Rhayader, all, except Rhayader, being urban districts. Radnorshire is included in the South Wales circuit, and Presteign ranks as the county town. The whole county together with that of Brecknock returns one member to parliament. Ecclesiastically, Radnorshire is divided into 46 parishes, the majority of which lay after 1923 in the diocese of Swansea and Brecon, but, before that, had been for centuries included in the diocese of St David's. Wartime population movements caused an increase of 10% in the Radnorshire population between Sept. 1939 and Feb. 1941.

RADOM, a town of Poland in Kielce province, 100 mi by rail south of Warszawa. Pop. (1931) 77,400, half of whom were Jews, (1946) 69,455. St. Wladaw church, contemporary with the foundation of the town, was transformed by the Austrians into a storehouse and subsequently by the Russian government into a military prison. The old castle is in ruins. Radom has several iron and agricultural machinery works and tanneries. In 1216 it occupied the site of what is now Old Radom. New Radom was founded in 1340 by Casimir the Great, king of Poland. There Jadwiga was elected queen of Poland in 1382, the first act relating to the union of Poland with Lithuania was signed in 1401, the *sejm* or diet of 1505, where the organic law of Poland was sworn by the king, was also held there. Several great fires, and the Swedish war of 1701-07, ruined the old city. After the third partition of Poland in 1795 Radom fell under Austrian rule, it was in 1815 annexed to Russia and was returned to Poland in 1918. Germany conquered Radom after bitter fighting in Sept. 1939. It was again returned to Poland in 1945.

RADON (symbol Rn , atomic number 86, atomic weight 222) is the heaviest element of the noble gas group and an important radioelement. The name is used either for the most important isotope, that of mass 222, or for the element as a whole, although for the latter purpose the name emanation (symbol Em) is sometimes preferred. Other isotopes are thoron (Th , mass number 220) and actinon (Ac , 219). Thoron was discovered in 1899 by R. B. Owens and E. Rutherford, who observed that some of the radioactivity of thorium preparations can be swept away by a current of gas. Radon was similarly discovered in radium samples by F. E. Dorn in 1900, and actinon was found associated with actinium in 1904 by F. O. Giesel and A. Debiere.

Radon is the immediate product of the decay of radium and

decays to too low a value. "Dead" radon tubes are often saved for the extraction of radium D and polonium.

Radon possesses a particularly stable electronic configuration which gives it a chemical inertness characteristic of the noble gas elements. Thus it is always found in the elementary state, and no true compounds are known. Its properties are similar to those expected by extrapolation from the other noble gas elements, helium, neon, argon, krypton and xenon. It is the most easily condensed and solidified of the group, the boiling point being $-62^{\circ}C$. and the freezing point $-71^{\circ}C$. It dissolves more readily in water than the other noble gases and is very soluble in a number of organic liquids.

For bibliography, see **RADIUM**.

(T P K)

RADOWITZ, JOSEPH MARIA VON (1797-1853), Prussian general and statesman, was born at Blankenburg in the Harz mountains, his family being of Hungarian origin. As a lieutenant in the Westphalian artillery he was wounded and taken prisoner at Leipzig (1813), subsequently entered the Hanoverian service, and in 1823 that of Prussia, becoming chief of the general staff of the artillery in 1830. In 1836 he went as Prussian military plenipotentiary to the federal diet at Frankfurt, and in 1842 was appointed envoy to the courts of Carlsruhe, Darmstadt and Nassau. He was an intimate friend of the crown prince (afterward King Frederick William IV), and the Prussian constitution of Feb. 1847 owed much to his *Gespräche aus der Gegenwart über Staat und Kirche*, published under the pseudonym "Waldheim" in 1846. In the Frankfurt parliament he was leader of the extreme right; and after its break-up he worked for the Unionist policy of Prussia in the Prussian diet and the Erfurt parliament. On Sept. 27, 1850, he was appointed minister of foreign affairs, but resigned on Nov. 2. In Aug. 1852 he was appointed director of military education. He died on Dec. 25, 1853. Radowitz published, in addition to several political treatises, *Iconographie der Heiligen, ein Beitrag zur Kunstgeschichte* (1834) and *Deussen und Mottos des spätem Mittelalters* (ib., 1850). His *Gesammelte Schriften* were published in 5 vol. at Berlin, 1852-53.

See *Hassel, Joseph Maria von Radowitz* (1905, etc.).
RAE, JOHN (1813-1893), Scottish Arctic explorer, was born on Sept. 30, 1813, in the Orkney Islands. He studied medicine at Edinburgh university. He made a voyage as surgeon in one of the ships of the Hudson's Bay company, and was resident surgeon for ten years at the company's station at Moose Factory, at the head of James bay. In 1846 he made a boat voyage to Repulse bay, and next spring surveyed 700 mi. of new coast line connecting the earlier surveys of Koss and Parry. He then joined the expedition under Sir John Richardson in search of Franklin, and in 1851, at the request of the government he travelled some 5,300 mi., much of it on foot, and explored and mapped 700 mi. of new coast on the south side of Wollaston and Victoria lands. For this achievement he received the Founder's gold medal of the Royal Geographical society. In 1853 he commanded another boat expedition fitted out by the Hudson's Bay company, which connected the surveys of Ross with that of Deane and Simpson, and proved King William's Land to be an island. He subsequently travelled across Iceland, and in Greenland and the northern parts of America, surveying routes for telegraph lines. He died at his house in London in 1893 and was buried in the Orkney Islands. He wrote *A Narrative of an Expedition to the Shores of the Arctic Sea in 1846 and 1847* (1850).

RAE BARELI, a town and district of the Union of India, in the Lucknow division of the United Provinces. The town is on the river Sai, 48 mi. S.E. of Lucknow. Pop. (1941) 20,945. It possesses many architectural features, chief of which is a strong and spacious fort of solid brick. Among other ancient buildings are the magnificent palace and tomb of nawab Jahan Khan, governor in the time of Shah Jahan, and four fine mosques. It is an important centre of trade, and muslins and cotton cloth are woven.

The **DISTRICT OF RAE BARELI** has an area of 1,765 sq. mi. The general aspect of the district is slightly undulating, and the country is beautifully wooded. The soil is remarkably fertile, and the cultivation of a high class. The principal rivers of the district are the Ganges and the Sai. In 1941 the population was 1,064,804. The principal crops are rice, pulse, wheat, barley, millet and poppy.

all of which contain minute quantities of radium. For preparing intense samples a supply of radium is kept in a glass vessel in aqueous solution or in the form of a porous solid from which the radon can readily effuse. At intervals of a few days the accumulated radon is pumped off, purified, and compressed into a small tube which is then sealed and removed.

Radium C rapidly grows into equilibrium with the radon and, since the former is the source of the intense penetrating gamma-rays, the gamma activity is in effect transferred from the radium sample to the tube by this process. The radon can then be used for radiotherapy, radiography, or other purposes, until its strength

RAEBURN, SIR HENRY (1756-1823), Scottish portrait-painter, was born at Stockbridge, Edinburgh, on March 4, 1756, the son of a manufacturer of the city. He was educated at Heriot's hospital, and at 15 was apprenticed to a goldsmith in Edinburgh. He began to paint miniatures, and, meeting with success and patronage, he extended his practice to oil-painting, being all the while quite self-taught. The goldsmith his master watched his pupil with interest, and introduced him to David Martin, the leading portrait-painter in Edinburgh. From him Raeburn received considerable assistance, and was given portraits to copy. When he was in his 22nd year he was asked to paint the daughter of Peter Edgar of Bridgeland and widow of Count Leslie. A month later she became his wife, bringing him an ample fortune, but the acquisition of wealth affected neither his enthusiasm nor his industry. He decided to visit Italy with his wife, and, in London, called upon and was kindly received by Sir Joshua Reynolds, who gave him excellent advice as to his study in Rome, commending to him in particular the works of Michelangelo. He also offered him more substantial pecuniary aid, which was declined as unneeded, but Raeburn carried with him to Italy many valuable introductions from the president of the Academy in Rome he made the acquaintance of Gavin Hamilton, of Batoni, and of Byers, who advised him "never to copy an object from memory, but, from the principal figure to the minutest accessory, have it placed before him." After two years of study in Italy he returned to Edinburgh in 1787, where he began a most successful career as a portrait-painter. In that year he executed an admirable seated portrait of the second Lord President Dundas.

Interesting examples of his earlier portraits are those of Mrs Johnstone of Baldovie and the three-quarter-length of Dr James Hutton. The portraits of John Clerk, Lord Eldon, and of Principal Hall of St Andrews belong to a somewhat later period. Raeburn was fortunate in the time in which he practised portraiture. Sir Walter Scott, Blair, Mackenzie, Woodhouselee, Robertson, Home, Ferguson and Dugald Stewart were resident in Edinburgh, and they all, along with a host of others less celebrated, honoured the painter's canvases. Of his fully matured manner the finest examples are his own portrait and that of the Rev Sir Henry Moncreiff Wellwood, the bust of Dr Wardrop of Torbane Hill, the two full-lengths of Adam Rolland of Gask, the remarkable paintings of Lord Newton and Dr Alexander Adam in the National gallery of Scotland, and that of William Macdonald of St Martin's. Raeburn was considered less successful in his female than in his male portraits, but the exquisite full-length of his wife, the smaller likeness of Mrs R. Scott Moncreiff in the Scottish National Gallery, and that of Mrs Robert Bell, prove that he could portray all the grace and beauty of the gentler sex.

Raeburn spent his life in Edinburgh, rarely visiting the metropolis, and then only for brief periods, thus preserving his own sturdy individuality. But though he, personally, may have lost some of the advantages which might have resulted from closer association with the leaders of English art, and from contact with a wider public, Scottish art certainly gained much from his disinclination to leave his native land. He became the acknowledged chief of the school which was growing up in Scotland during the earlier years of the 19th century, and to his example and influence at a critical period is undoubtedly due much of the virility of his followers and immediate successors. Professional honours fell thick upon him. In 1812 he was elected president of the Society of Artists in Edinburgh, in 1814 associate, and in the following year full member of the Royal Academy. In 1822 he was knighted by George IV and appointed His Majesty's limner for Scotland. He died at Edinburgh on the 8th of July 1823.

In his own day the portraits of Raeburn were excellently engraved by the last members of the great school of English mezzotint. In 1876 a collection of over 300 of his works was brought together in the Royal Scottish Academy galleries, in the following year a series of twelve of his finest portraits was included in the winter exhibition of the Royal Academy, London, and a volume of photographs from his paintings was edited by Dr John Brown.

Raeburn Andrew (2nd ed., 1894), with complete catalogue of the exhibition of 1876, *Works of Sir Henry Raeburn, R.A.*, with tributes by Dr John Brown and others (Andrew Elliot, Edinburgh), *Tribute to the Memory of Raeburn* by Dr Andrew Duncan, the *Catalogues* of the loan exhibitions in Edinburgh of 1884 and 1901, and the Essay by W. E. Henley—*Sir Henry Raeburn* (1890) with a finely produced series of plates, printed by T. & A. (Constable), *Sir Henry Raeburn* by Sir Walter Armstrong, with an introduction by R. A. M. Stevenson and a biographical and descriptive catalogue by J. L. Caw (1901).

RAEDWALD (d. c. 620), king of the East Angles, was the son of King Tythil. He became a Christian during a stay in Kent, but on his return to East Anglia he sanctioned the worship both of the Christian and the heathen religions. Very little is known about his reign, which probably began soon after 600. For a time he recognized the overlordship of Aethelberht, king of Kent, but he seems to have shaken off the Kentish yoke. He gained some superiority over the land south of the Humber with the exception of Kent and is counted among the Bretwaldas. Raedwald protected the fugitive Edwin, afterwards king of Northumbria, and in his interests he fought a sanguinary battle with the reigning Northumbrian king, Aethelfrith, near Retford in Nottinghamshire, where Aethelfrith was defeated and killed in April 617. He was followed as king of the East Angles by his son Eorpwald.

See Bede, *Historia ecclesiastica*, edited by C. Plummer (Oxford, 1896), and J. R. Green, *The Making of England* (1897-99).

RAEMAËKERS, LOUIS (1869-), Dutch cartoonist, was born at Roermond, Holland, on April 6, 1869. He was educated in Amsterdam and Brussels, and began his career by painting landscapes, portraits and posters. In 1908 he produced his first political cartoons, and subsequently gained international fame by his violent anti-German cartoons in the Amsterdam *Telegraaf* and other papers during and after the World War.

His cartoons have been published in *The Great War in 1916*, *The Great War in 1917*, *Devant l'Histoire* (1918), and *Cartoon History of the War* (1919).

RAETIA (so always in inscriptions, in classical mss usually *RHAETIA*), in ancient geography, a province of the Roman empire, bounded on the west by the country of the Helvetii, on the east by Noricum, on the north by Vindelicia and on the south by Cisalpine Gaul. It thus comprised the districts occupied in modern times by the Grisons, the greater part of Tirol, and part of Lombardy. The land was very mountainous, and the inhabitants chiefly supported themselves by cattle-breeding and cutting timber, little attention being paid to agriculture. Some of the valleys, however, were rich and fertile, and produced corn and wine. Trade was also carried on in pitch, honey, wax and cheese. Little is known of the origin or history of the Raetians, who are described as one of the most powerful and warlike of the Alpine tribes. It is stated by Livy (v. 33) that they were of Etruscan origin. At the time when the land became known to the Romans, Celtic tribes were already in possession of it and had amalgamated so completely with the original inhabitants that, generally speaking, the Raetians may be regarded as a Celtic people, although non-Celtic tribes (Leponiti, Euganei) were settled among them. They retained their independence until their subjugation in 15 B.C. by Tiberius and Drusus. At first Raetia formed a distinct province, but towards the end of the 1st century A.D. Vindelicia was added to it, hence Tacitus (*Germania*, 41) could speak of Augusta Vindelicorum (Augsburg) as "a colony of the province of Raetia." The whole province (including Vindelicia) was at first under a military prefect, then under a procurator, it had no standing army quartered in it, but relied on its own native troops and militia for protection. In the reign of Marcus Aurelius it was governed by the commander of the *Legio III Italica*. Under Diocletian (q.v.) it formed part of the diocese of the *vicarius Italiae*. During the last years of the Western empire, the land was in a desolate condition, but its occupation by the Ostrogoths in the time of Theodoric, to some extent revived its prosperity. The chief towns of Raetia were Tridentum (Trent) and Curia (Coire or Chur). It was traversed by two great lines of Roman roads—one leading from Verona and Tridentum across the Brenner to Oenipons (Innsbruck) and

thence to Augusta Vindelicorum, the other from Brigantium (Bregenz) on Lake Constance, by Core and Chiavenna to Como and Milan

RAFF, JOSEPH JOACHIM (1822–1882), German composer and orchestral conductor, was born near Zurich, Switzerland, on May 27, 1822, and educated chiefly at Schwyz. He was encouraged and assisted by Liszt and von Bulow, his opera, *König Alfred*, being produced at Weimar under Liszt's direction.

Raff lived at Weimar until 1856. In 1859 he married Doris Genast, an actress of high repute, and thenceforward devoted himself with renewed energy to the work of composition, displaying an inexhaustible fertility of invention and great technical skill. He resided chiefly at Wiesbaden till 1877, when he was appointed director of the Hoch-Conservatorium at Frankfurt, an office which he retained until his death on June 25, 1882.

Raff's compositions included symphonies, quartets, concertos, sonatas and songs.

RAFFIA. A fibrous product consisting of the epidermal strips of the leaves of *Raphia rufia* (from Madagascar) and *R. taedigera* (from Japan) largely employed as a binder twine in horticulture and in various kinds of handwork.

RAFFLE, a special kind of lottery, in which a particular article is put up as the prize, the winner being drawn for by lot out of the number of those who have paid a fixed sum for admission to the drawing, the total amount realized by the sale of tickets is supposed to approximate to the value of the object raffled for. The word appears in English as early as Chaucer (*The Parson's Tale*), where it is used in its original sense of a game of dice, the winner being that one who threw three dice all alike, or, next, the highest pair. The Fr. *raffle*, Mod. Lat. *raffia*, was also used in the sense of a "sweeping-off" of the stakes in a game, it has been connected with Ger. *raffen*, to carry off.

RAFFLES, SIR THOMAS STAMFORD (1781–1826), English administrator, founder of Singapore, was born on July 5, 1781, on board a merchantman commanded by his father, Benjamin Raffles, when off Port Morant, Jamaica. He became a clerk in the office of the East India Company, and in 1805 was sent out to Penang as assistant secretary to the first governor. In addition to his duties as secretary he acted as Malay interpreter, and in 1807 he became secretary.

In 1808 his health gave way, and he was ordered for a change to Malacca. The East India Company had decided to abandon Malacca, and orders had been issued to dismantle it. Raffles drew up a report explaining the great importance of Malacca, and urging in the strongest manner its retention. Lord Minto was so impressed by the report that he at once gave orders for suspending the evacuation of Malacca and in 1809 the company decided to reverse its own decision. In June 1810 Raffles, of his own accord, proceeded to Calcutta, where Lord Minto gave him the kindest reception. Raffles remained four months in Calcutta, and gained the complete confidence of the governor-general. He brought Lord Minto round to his opinion that the conquest of the island of Java, then in the hands of the French, was an imperative necessity. To prepare the way for the expedition, Raffles was sent to Malacca as "agent to the Governor-General with the Malay States." He did his work well and thoroughly—even to the extent of discovering that the short and direct route to Batavia by the Caramata passage would be a safe one for the fleet to take.

In August 1811 the expedition, accompanied by Lord Minto, and with Sir Samuel Auchmuty in command of the troops (11,000 in number, half English and half Indian), occupied Batavia without fighting. On the 25th a battle was fought at Cornehs, a few miles south of Batavia, and resulted in a complete English victory. On Sept. 18 the French commander, General Janssens, formally capitulated at Samarang, and the conquest of the island was completed. Lord Minto's first act was to appoint Raffles lieutenant-governor of Java. From September 1811 until his departure for

England in March 1816, Raffles ruled this large island with conspicuous success. He increased the revenue eightfold at the same time that he abolished transit dues, reduced port dues to one-third and removed the fetters imposed on trade and intercourse with the Javanese by Dutch officialdom. In his own words, his administration aimed at being "not only without fear, but without reproach." He had a still greater ambition, which was, in his own words, "to make Java the centre of an Eastern insular Empire," and to establish the closest relations of friendship and alliance with the Javanese, whom he described as "a highly polished people, considerably advanced in science, highly inquisitive and full of penetration." It is interesting to note that when another great Englishman, Rajah Brooke, began his career in Sarawak in 1838, he announced "I go to carry Sir Stamford Raffles's views in Java over the whole Archipelago."

In November 1817 Raffles quitted England on his return to the East, where the lieutenant-governorship of Fort Marlborough (Sumatra) had been kept in reserve for him. His administration of Sumatra (1818–23) was characterized by the same breadth of view, consistency of purpose and energy in action that had made his government of Java remarkable. He had not, however, done with the Dutch, who, on their recovery of Java, endeavoured to establish a complete control over the Eastern archipelago, and to oust British trade. This design Sir Stamford set himself to baffle, and by a stroke of genius and unvalued statecraft he stopped for all time the Dutch project of a *mare clausum* by the acquisition and founding of Singapore on Jan. 29, 1819.

In 1824 Raffles returned to England to vindicate his acts to the East India Company. The court exonerated him from the charges made against him, but censured him for "his precipitate and unauthorized emancipation of the Company's slaves," and after his death charged his widow to pay £10,000 for various items, which included the expense of his mission to found Singapore. Harassed by these personal affairs, he still found time to help in the foundation of the zoological society in London. His fine Sumatra collection formed its endowment. He died July 5, 1826.

See Lady Raffles, *Memoir of Sir Thomas Stamford Raffles* (1830), D. C. Boulger, *Life of Sir Stamford Raffles* (1897), Hueston Egerton, *Sir Stamford Raffles* (1899), J. Buckley, *Records of Singapore* (1903).

RAFFLESIA, a genus of plants of the family Rafflesiaceae with six species confined to Malaya. They are all parasitic on the roots of vines (*Vitis*). *R. Arnoldi* has the largest flower known, measuring 18 in. across and weighing 15 lb. with a small like decaying flesh. It is pollinated by carrion-flies, and is the only part of the plant visible above ground, the remainder being reduced to a fungus-like mycelium.

RAFTER. A beam in a sloping roof to which is attached the framework for the slating, tiling or other external covering (see ROOFS).

O E *rafter*, a beam, in the special sense of a floating collection of timbers, gives the English "raft."

The ultimate base of this word is the root *raf-*, to cover, seen in Gr. *ῥαφος*, roof.

RAGAZ or **RAGATZ**, a famous watering-place in the Swiss canton of St. Gall, situated on the left bank of the Rhine, and by rail 6½ m. S.E. of Zurich. It stands at a height of 1,696 ft., at the entrance to the magnificent gorge of the Tamina, about 3 m. up which by road are the extraordinarily placed Baths of Pfäfers. Since 1840 the hot mineral waters of Pfäfers have been conducted to Ragaz, which has much increased in importance as a result. In 1930 its native population was 2,162, mainly German-speaking, while there were 1,500 Roman Catholics and 500 Protestants. About 2 m. by road above Ragaz are the 17th-century buildings (now the cantonal lunatic asylum) of the great Benedictine abbey of Pfäfers (720–1838), to which all this region belonged till 1798; while between them and Ragaz are the ruins of the 14th-century castle of Wartenstein.

RAGGED ROBIN (*Lychnis Flos-cuculi*), a perennial plant with pink, divided petals, belonging to the pink family, Caryophyllaceae (*g v*), native to Europe and Asia, common in Great Britain and naturalized in the eastern United States. It is a slender herb, about 1½ ft. high, and is much parasitized by a fungus

Ustilago antherarum, which forms its spores in the stamens, whence they are transported from plant to plant by insects.

RAGLAN, FITZROY JAMES HENRY SOMERSET, 1ST BARON (1788-1855), British field marshal, was the eighth and youngest son of Henry, 5th duke of Beaufort, by Elizabeth Boscaen, and was born on Sept. 30, 1788. Lord Fitzroy Somerset was educated at Westminster school, and entered the army in 1804. He served on the staff of Sir Arthur Wellesley in the expedition to Copenhagen (1807), and went with him to Portugal in 1808. During the whole of the Peninsular War he was at his right hand, first as aide-de-camp and then as military secretary. He was the first to mount the breach at Badajoz, and afterwards showed great resolution and promptitude in securing one of the gates before the French could organize a fresh defense. During the short period of the Bourbon rule in 1814 and 1815 he was secretary to the English embassy at Paris. On the renewal of the war he again became aide-de-camp and military secretary to the duke of Wellington. About this time he married Emily Harriet, daughter of the 3rd earl of Mornington, and Wellington's niece. At Waterloo he was wounded in the right arm and had to undergo amputation, but on the conclusion of the war resumed his duties as secretary to the embassy at Paris. From 1818 to 1820, and again in 1826-29, he sat in the house of commons as member for Truro. In 1819 he was appointed secretary to the duke of Wellington as master-general of the ordnance, and from 1827 till the death of the duke in 1852 was military secretary to him as commander-in-chief. He was then appointed master-general of the ordnance, and was created Baron Raglan.

In 1854 he was promoted general and appointed to the command of the British troops sent to the Crimea (see CRIMEAN WAR) in co-operation with a strong French army under Marshal St. Arnaud and afterwards, up to May 1855, under Marshal Canrobert. Here the advantage of his training under the duke of Wellington was seen in the soundness of his generalship, and his diplomatic experience stood him in good stead in dealing with the generals and admirals, British, French and Turkish, who were associated with him.

For the hardships and sufferings of the British soldiers in the terrible Crimean winter before Sevastopol, owing to failure in the commissariat, both as regards food and clothing, Lord Raglan and his staff were at the time severely censured by the press and the government, but it afterwards appeared that the chief neglect rested with the home authorities. He was made a field marshal after Inkermann. During the trying winter of 1854-55 his health was undermined. Disappointment at the failure of the assault of June 18, 1855, finally broke his spirit, and on June 28, 1855, he died.

See *Kingslake, Invasion of the Crimea (1853-87)*; Hamley, *War in the Crimea (1891)*.

RAGMAN ROLLS, the name given to the collection of instruments by which the nobility and gentry of Scotland were compelled to subscribe allegiance to Edward I of England between the conference of Norham in May 1291 and the final award in favour of Edward in Nov. 1292, and again in 1296. Of the former of these records two copies were preserved in the chapterhouse at Westminster (now in the Record office, London), and it has been printed by Rymer (*Foedera*, ii. 542). Another copy, preserved originally in the Tower of London, is now also in the Record office.

The derivation of the word "ragman" has never been satisfactorily explained, but various guesses have been made. One is that the Scots spoke of such an instrument as "ragman" because of the numerous seals attached to it. The name "ragman roll" survives in the colloquial word "riggerole," a rambling, incoherent statement.

RAGNAR LODBROK, Scandinavian ruler of the 8th or 9th century, supposed to have invaded England and France. It is nearly certain that such a person existed, but he has become a Scandinavian hero and the myths surrounding him are so extensive that it is difficult to separate the true from the fictional and to determine precisely what took place during his reign. One theory is that there were two men around whom the stories are

woven a prince named Ragnar Lodbrok, who died in 794; and another prince named Ragnfrid or Regnier, who actually led the invasions of France and England, which did not take place until the 9th century, but who is known in Scandinavian history and legend as Ragnar Lodbrok also. In any case, the myths about the two men of the same name have become inextricably intertwined.

The story is that Ragnar Lodbrok sailed up the Seine river to Paris, which he captured and which was only redeemed by a ransom of 7,000 lbs of silver. Later, the story runs, jealous of the reported achievements of his two sons, he planned to outdo them by invading England. He constructed two ships, the largest that had ever been built in Scandinavia, and sailed for Northumberland. He was captured by Aella, the Saxon king of Northumberland, after a valiant fight, and thrown alive into a pit of snakes, which stung him to death. His death song, the *Lodbrokar-quada*, has become a Scandinavian epic. His sons revenged him by killing Aella, and Northumberland ceased to be a Saxon kingdom and was looted and plundered by the Norsemen.

RAGNAROK, a Scandinavian myth telling of the death of the gods and the destruction of the world. The name is probably derived from the Old Norse words *ragin* or *rogn*, god, and *rok*, reason, origin or history, although it is sometimes thought that the word comes from the Icelandic *ragna*, gods, and *rokr*, twilight. The story is contained in the Icelandic saga *Voluspá*. It tells of the war between the gods, led by Odin, and their evil opponents, led by Loki. The Ragnarok combines three common stories of the destruction of the world: the sinking of the earth into the sea and the devouring of the sun by a monster; a devastating winter, and the destruction of the earth by fire. In addition to the annihilation of the earth, the chief protagonists on each side are killed and there is a period of darkness and chaos. Afterwards, however, some of the gods who were not destroyed return to the earth, which has risen from the sea, and with them return a human couple, Lif and Lifthrasir (Life and Vitality), who are the progenitors of a new race. This is the story used by Richard Wagner, the German composer, in his opera *Götterdämmerung*, the German word for "twilight of the gods."

RAGS. With the growth of the textile industries throughout the world, the consumption of rags of various sorts became enormous. The aggregate cannot be computed, but some conception of the dimensions of the trade may be gathered from the fact that the United Kingdom, in addition to consuming the greater part of her own production of rags, has a substantial import trade in linen, cotton and woollen rags. The linen and cotton rags are used in paper manufacture, and the woollen rags are employed in the textile industries. (See PAPER MATERIALS; SHODDY.)

RAG-STONE, a name given sometimes to work done with stones which are quarried in thin pieces, such as the Horsham sandstone, Yorkshire stone, the slate stones, etc., but this is more properly flag or slab work. Technically, rag-stone is an excellent material from the neighbourhood of Maidstone, near London; a very hard limestone of bluish-grey colour, peculiarly suited for mediaeval work. It is often laid as uncoursed work, or random work, sometimes as random coursed work and sometimes as regular ashlar. (See MASONRY.)

RAG-TIME: see JAZZ

RAGUSA, a town and provincial capital of Sicily in the province of Ragusa, 70 mi. S.W. of Syracuse by rail and 32 mi. direct. It consists of an upper and a lower town united into one commune in 1926. Pop. (1936) 40,480 (town); 49,530 (commune). The city has an entirely new quarter, called Littorio. It has some churches with fine Gothic architecture, and is commercially important, a stone impregnated with bitumen being quarried and prepared for use for paving slabs by being exposed to the action of fire. Oil suited to Diesel motors is extracted. On the hill occupied by the castle of the lower town (Ragusa Ibla) stood the ancient Hybla Heraclea, a Sicel town, under the walls of which Hippocrates of Gela fell in 491 B.C. During World War II Ragusa was severely bombed by the U.S. and British air forces prior to its occupation.

RAGUSA, Yugoslavia · see DUBROVNIK.

RAGWEED, the name given in North America to native plants of the genus *Ambrosia* (family Compositae). They are chiefly coarse annuals, with rough hairy stems, mostly lobed or divided leaves, and greenish flowers borne in small heads, the male in terminal spikes and the female in the upper axils of the leaves. The common ragweed (*A. artemisiifolia*), called also Roman wormwood, hogweed and bitterweed, found across the continent, grows from 1 to 7 ft high, with thin, alternate or opposite, much-divided leaves. The great ragweed (*A. trifida*), called also butterweed and horse cane, native from Quebec to Saskatchewan and southward to Florida, Arkansas and Colorado, grows from 3 to 17 ft tall, with opposite, entire or palmately three- to five-lobed leaves. Both the foregoing are annuals and often become pernicious weeds, their pollen, which is shed in great abundance in late summer, is a prolific source of hay fever. The western ragweed (*A. psilostachya*), found from Illinois to Alberta and southward to California, Texas and Mexico, is similar to the common ragweed, but is a perennial and has thicker leaves.

FROM NEW YORK STATE COLLEGE OF AGRICULTURE AT CORNELL UNIVERSITY

COMMON RAGWEED (AM-BROSIA ARTEMISIIFOLIA), WITH SPIKES OF POLLEN-BEARING FLOWERS, READY TO SHED THE POLLEN WHICH CAUSES HAY FEVER

RAGWORT (*Senecio jacobaea*), a common plant in European pastures and wasteland, growing to a height of over 2 ft., with heads of bright yellow flowers. It is allied to the groundsel (*q v*) and is one of the five noxious weeds whose removal in Great Britain is enforced by law. This weed, known also as staggerwort, is sparingly naturalized in North America from Newfoundland to Ontario and southward to Pennsylvania. In the United States and Canada various other species of *Senecio* are called ragwort, e.g., the golden ragwort or swamp squawweed (*S. aureus*), a conspicuous wild flower of early summer, inhabiting swamps and wet meadows.

RAHAB, a Biblical character, who sheltered the spies sent by Joshua to investigate Jericho before the Jews crossed into Canaan. Rahab, whom Joshua speaks of as a harlot, admitted the spies to her house and concealed them from the messengers of the king of Jericho by hiding them under sheaves of flax on the roof. She sent the king's messengers away and then let Joshua's spies out of her window by a cord; and, since her house was built on the town wall, they escaped. In return, she asked that she and her family be spared from injury if the Israelites should take Jericho. This request the spies granted, telling Rahab that when the Israelites came, she should hang a red cord from the window through which the spies had escaped. This she did, and she and her family were saved. Later, when the Israelites had taken Jericho, Rahab was admitted to the community. Jewish tradition is that Rahab married Joshua and that eight prophets were descended from them. Another story is that she married Salmon, one of the spies, and that they were the parents of Boaz and thus she is an ancestor of David and of Jesus Christ. The Roman Catholic Church has made her a saint, whose day is celebrated Sept. 1. The Targum and the majority of older Jewish commentators translate the Biblical word *sōnāl*, used to describe Rahab as "innkeeper," deriving it from the root, *zān*, "to feed," instead of from the root, *sōnāl*, "to be a harlot," but most versions translate "harlot."

RAHWAY, a city of Union county, N. J., U. S., on the Rahway river, 20 mi. S. W. of New York city. It is served by the Pennsylvania railroad and motorbus lines. Population in 1950 was 21,290, it was 17,498 in 1940 and 16,011 in 1930 by federal census. The city has attractive parks and many houses dating from colonial times. At the Old Peace tavern (still standing) the marquis de La Fayette was entertained in 1824.

The city's manufactures include vacuum cleaners, office equipment, furniture, automobile bodies and accessories, books, oil, bleaches, chemicals, cotton and wool waste and cereals. In the

outskirts of the city is the New Jersey reformatory (1903) for men from 16 to 30 years of age. Rahway was settled in 1720, named after the Indian chief Rahwack of the tribe which owned the site, and was chartered as a city in 1853. A skirmish of the Revolution (called the battle of Spanktown, from the name by which the town was popularly known at the time) took place there in Jan. 1777.

RAICHUR, a town and district of India, in the state of Hyderabad, at the junction of the Madras and Southern Mahratta and Great Indian Peninsula railways, 351 mi. N. E. from Madras. Pop. (1941) 34,972. It gives its name to the *daab*, or tract between the rivers Kistna and Tungabhadra, which was the scene of much fighting between Mohammedans and Hindus as debatable land during the 16th century. The district has an area of 6,791 sq. mi. and a population of 922,322. The town contains a well-preserved fort and palace. It is a thriving center of trade, with a number of cotton ginning and pressing factories.

RAIGARH, a feudatory state of India in the Chhattisgarh division of the Central provinces. Area 1,444 sq. mi., population (1941) 312,543. It is traversed by the Bengal-Nagpur railway with a station at Raigarh Town, 363 mi. from Calcutta. Fine tussore silk is produced at Raigarh Town, pop. (1941) 20,327.

RAIL, the general English name for birds of the family *Railidae*, to the two British species of which it originally applied. The first of the latter is the corncrake or land rail, *Crex crex*, recognizable by its monotonously repeated grating cry which has been aptly likened to the sound made by a rusty gate hinge. It is a summer visitor to north Europe, retiring south in winter. The plumage is of various shades of brown above and yellowish white below, rendering it very inconspicuous. It haunts the open country and agricultural land, the nest being on the ground, usually in long grass. Nine to 11 eggs are laid, of a cream color blotched with light red and gray. The young are hatched clad in black down.

The water rail, *Rallus aquaticus*, is less abundant than the preceding, but has a wide distribution, extending all over the old world north of the tropics. The call is harsh, loud and uttered only at intervals. It has a long, partly red bill and the plumage is darker than that of the land rail. It inhabits marshes. Closely related is the sora, or Carolina rail, *Porzana carolina*; also the coot (*q v*), moor hen (*q v*) and ocydrome.

The finfoots (*Ehormus* and *Podica*) show the extreme in adaptation to aquatic life in the development of a fringe round the toes (see Coot).

RAILWAY EXPRESS AGENCY, INC., THE, was formed in 1929 by the class I railroads of the United States to take over and carry on the express business formerly handled by the predecessor company, American Railway Express. It is a common carrier under jurisdiction of the Interstate Commerce commission. Express is earned on approximately 10,000 passenger trains daily. The air express service was established Sept. 1, 1927.

See also EXPRESS.

RAILWAYS. The term "railway" or "railroad" is commonly applied to a method of transportation, and the facilities therefor, consisting of a permanent way whose distinctive feature is a line, or lines, of steel rails, in pairs, over which roll, on flanged wheels, freight and passenger cars pulled by locomotives. In the United States "railway" and "railroad" are used interchangeably, with the latter probably favoured, "railway" is preferred in British usage.

Transportation by railroad is based upon four familiar elements. They are (1) track, a roadway unlike anything else, affording strong support and a smooth surface with a minimum of friction, and thereby facilitating a high ratio of load to tractive effort; (2) trains made up of separate cars assembled according to the needs of traffic; (3) flanged wheels, which cause the trains of cars to "track," or follow the line of the rails; and (4) locomotives to haul the trains over the tracks.

Economics of Location.—The ideal location for a railway line is one which contains large centers of trade and travel, in a straight line and over level ground. The actual location usually

is the best available compromise between cost for construction and annual costs for operation and maintenance, topography considered on the one hand, and the probable flow and revenue value of traffic on the other hand. The usual result is that in older and more highly developed and industrialized regions it is common to find lines which represent large capital costs for original construction and subsequent improvement to provide easy gradients and curvature for high train speeds with heavy loads, with low annual maintenance and operating costs. By contrast, in countries of more recent development, with sparse population and low agricultural and industrial output, the railway line is more likely to represent a relatively low initial investment for construction, costlier forms of improvement being deferred until warranted by traffic development.

Gauges.—The distance between the inner edges of the running surface of the pair of rails comprising a track is called the "gauge." That which has come to be known as standard gauge is 4 ft 8½ in. The origin of this curious measurement is not definitely known, and has become a matter of legend. Of total world mileage of railway line, approximately three-fifths is of standard gauge. This gauge is practically universal for Canadian, United States, Mexican and Cuban railways. Main trunk lines of Austria, Belgium, Bulgaria, Czechoslovakia, Denmark, France, Germany, Great Britain, Greece, Hungary, Italy, the Netherlands, Norway, Sweden, Turkey and Yugoslavia are all 4 ft 8½ in., or so close to that gauge as to permit through running of locomotives and rolling stock. In Ireland the gauge is mainly 5 ft 3 in., while in Spain and Portugal the lines are mainly 5 ft 6 in. and in the U.S.S.R. 5 ft. On the European continent there are considerable mileages of metre (39.37 in.) and other smaller gauges, especially in mountainous districts, such as parts of Germany and Switzerland.

The South American railways are mainly of metre gauge, but with substantial mileages also of 5 ft 6 in. and of standard gauge. In addition, there are smaller mileages of several other gauges. Railroads of Central America are all narrow gauge, mainly 3 ft and 3 ft 6 in., with a small mileage of 5-ft gauge in Panama.

The gauge in India is mainly 5 ft 6 in., but there are large mileages of metre and other narrow gauges. In Japan the normal gauge is 3 ft 6 in. The South African railways are of the 3 ft 6 in. gauge, as also is the Sudan government system, but the Egyptian state lines are built to standard gauge, while the Kenya and Uganda railway is built to a metre gauge.

Development of railways in Australia has suffered because of the difference in gauges adopted by the various state systems. These include 3 ft 6 in., standard gauge and 5 ft 3 in. New Zealand railways are 3 ft 6 in. gauge.

History and Development.—The steam railway originated in Great Britain. It was a development of the wagonway or tramway for horse-drawn vehicles, frequently employed there during the 16th, 17th and 18th centuries to haul minerals to rivers and ports, notably in the areas of the Clyde (Scotland) and the Tyne (England) and in South Wales.

Invention of the steam engine induced Richard Trevithick (1771-1833) (q.v.) to design a steam engine, mounted on wheels, which generated sufficient power to move itself, in fact, it became a locomotive. (See LOCOMOTIVE.) In Feb 1804 this engine successfully pulled "10 tons of iron, 5 waggons and seventy men" on a tramway at Pen-y-darrian, near Merthyr, Wales. It was not a commercial success, and horse traction continued to prevail on the wagonways and tramways. In 1811 John Blenkinsop (1783-1831) patented a design of a rack railway, a toothed wheel on his locomotive working into a toothed rail, this system proved successful on his Middleton colliery railway at Leeds, and is still employed in different form on some mountain railways with very steep gradients. In 1813 William Hedley built two steam locomotives for the Wylam colliery near the Tyne, which relied on their own weight for traction by adhesion, and in 1814 George Stephenson (1781-1848) (q.v.) built his first locomotive.

The success Stephenson achieved enabled him to propose steam locomotives as the means of traction on the Stockton and Darlington railway. Projected in 1818 and opened Sept 27, 1825, this was the first public passenger-carrying railway in the world. It

was of single track, 38 mi. long, with passing places every quarter mile. Stephenson drove the first train, weighing about 90 tons, from Brüsselon Incline, nine miles above Darlington, to Stockton, for some years the passenger traffic was carried by horse-drawn coaches but these were withdrawn in 1833.

Before 1830 several short railroads were incorporated, but the Liverpool and Manchester was noteworthy because from the first it adopted locomotive power as the sole form of traction, and was built to carry passenger traffic as well as freight. Opened Sept 15, 1830, it was 31 mi. long, with double-track line throughout. The average time for a passenger train to complete the journey was about 90 min.

In 1829 a contest was held among various locomotive designers, and the engines were tested at Rainhill, near Liverpool, George Stephenson's "Rocket" carrying off the prize of £500. Other locomotives in the contest were the "Novelty" of John Braithwaite and the "Sans Pareil" of Timothy Hackworth. Both the "Rocket" and "Sans Pareil" are preserved in the Science museum, South Kensington, London.

In the western hemisphere, John Stevens (q.v.), called in the United States "the father of the railroads," and his associates received from the state of New Jersey on Feb 6, 1815, the first American railroad charter, but he could obtain neither the money nor the credit to do the work. About this time, there was considerable use of tracks of wood, iron or stone, over which cars were drawn by horses or stationary engines, the latter used principally in the operation of inclined planes. In 1826 Gridley Bryant built in the United States such a set of tracks, called the Quincy railroad. The little line, three miles long, was used for hauling granite, by horsepower, from quarries near Quincy, Mass., to the Neponset river. It was not a passenger line nor did it use a locomotive. It was built of pine ties, atop which were laid oak timbers faced with iron.

Also in 1826 the Delaware and Hudson Canal company was authorized to build a 16-mi. line of rails between Carbondale and Honesdale, Pa., connecting its canal with coal mines. This was the first railroad on which a locomotive was ever operated in the western hemisphere. The "Stourbridge Lion," a British-built locomotive, made one trip on it in Aug 1829, without cars, but the track structure was too light for the locomotive to be operated with safety. Thus early was demonstrated the inescapable relationship between the size, weight and speed of the vehicle and the strength of the way on which it runs.

The Baltimore and Ohio, the first railroad built in the United States for general transportation of passengers and freight (but not projected specifically for the use of locomotives), was chartered by the state of Maryland on Feb 28, 1827, and construction was formally commenced on July 4, 1828. In Feb 1829 work began on laying the track of the South Carolina Canal and Rail Road company between Charleston and Hamburg, S.C., the first railroad in the United States built for public transportation by use of steam locomotives, without a path down the middle for horsepower. On Dec 25, 1830, the "Best Friend of Charleston," a locomotive built in New York to the railroad's own design and shipped by ocean to Charleston, pulled on the railroad's first six-mile stretch of completed track the first train of cars ever drawn by a steam engine upon a track on the American continent.

World Mileage.—From these beginnings, railroads developed to a world total of approximately 780,976 mi., distributed by continents as follows:

Continent	Miles of road
North America	281,802
Europe	265,271
Asia	65,558
South America	61,937
Africa	151,820
Australasia	31,551
Central America and Canal Zone	7,834
Total	780,976

Subsequent discussion will review the railroads of the several continents in the order of their mileage.

In some instances, especially in Europe, it has been necessary

to use figures for 1937. Mileage includes so far as possible only intercity main-line railroads open for public traffic. However, difficulties of consistent definition and inclusion are such that mileage figures should be regarded only as approximate and perhaps not always comparable.

NORTH AMERICA

Railway mileage in North America, by countries, for the years indicated was as follows

	Year	Miles of road
United States	1948	225,449
Alaska	1948	107
Canada	1948	41,000*
Newfoundland	1948	705*
Mexico	1940	12,517
Cuba	1945	1,015
Total		283,893

*All 3 ft 6 in. gauge. Newfoundland became a province of Canada on April 1, 1949

UNITED STATES

General Description.—With scarcely more than 6% of the world's population and 5% of its land area, the continental United States has 29% of the world's railway mileage, and probably an even larger share of its freight and passenger transportation capacity. The United States has about four-fifths of the railway mileage of North America.

Origin and Growth of Railways.—In 1815, when John Stevens received the first state charter for construction of a railroad in the United States, approximately four-fifths of the country's total population of 8,350,000 resided along the Atlantic seaboard. Most of the remaining one-fifth was in the Ohio valley, with scattering but growing settlements elsewhere in the Mississippi valley.

The War of 1812, the Napoleonic wars and the tariff of 1816 had given an impulse to domestic manufactures and to internal trade and had created aspirations toward an economic progress that would require transportation facilities far larger and better than then existed. Territorial division of labour had commenced, promising enormous expansion of internal commerce. Machinery, iron products and textiles for use west of the Allegheny mountains were being manufactured in the Atlantic states, farms west of these mountains produced grain and food supplies for the south. The east, because of the increased population of industrial centres following a rush of foreign immigration, had also become dependent upon the west for food supplies, the southern states were experiencing a rapid expansion of the cotton-growing industry, and their exports made up two-thirds of total United States exports.

The great obstacle to interstate trade and internal development was slow and costly transportation. Routes of movement had assumed sharply defined lines, at first following natural waterways. Areas not served by such channels had demanded facilities to enable them to compete with their more fortunate neighbours. Turnpikes and canals had been constructed, but the services of these two agencies were sharply restricted by geographic and climatic conditions. In short, the picture was that of a growing number of economically detached communities, increasing rapidly in population and industrial importance, and each possessing the foundation for profitable commercial interchanges, if only the machinery for interchange could be created.

Government Aid to Construction.—In early years there was keen competition among communities in promoting for themselves the benefits of railway service, and railroads (as well as turnpikes and canals) were granted substantial amounts of public land and various other types of aid by the federal government, states and other public bodies. The extent of such aid to railroads is often exaggerated. Only about 8% of present route mileage of the country had the benefit of federal land grants-in-aid toward construction. In few instances, moreover, did these aids take the form of outright gifts; rather they were business transactions. In return for the federal land grants, the railroads agreed to handle government traffic at reduced rates, which reductions, up to the time the agreement was abrogated by act of congress in 1946, had amounted to more than nine times the original value of the grants.

In other cases, government bodies made loans to pioneer railroads which were expected to be, and for the most part were, repaid with interest. In some other cases, government bodies invested in the stock of railroad companies, and thus acquired a share in the ownership of the property. Some government bodies—for example, the states of Virginia, North Carolina and Georgia and the city of Cincinnati, O—still (1950) retain these ownership interests in railroads.

Railway Construction.—Within ten days after Charles Carroll of Carrollton, the sole surviving signer of the Declaration of Independence, formally initiated construction of the Baltimore and Ohio, on July 4, 1828, by turning a bit of soil, bids were requested for work on the first 12 mi. of line from Baltimore to Ellicott City (then Ellicott's Mills), and on May 24, 1830, this section was opened for operation. The line reached Harper's Ferry, W Va., in 1834, Cumberland, Md., in 1852 and Wheeling, W Va., in 1853. The branch line from Relay, Md., to Bladensburg (near Washington, D C) was opened on Aug. 25, 1835. Subsequent additions and acquisitions extended the road to the Ohio river, the Great Lakes, Chicago and St. Louis.

The South Carolina Canal and Rail Road company (now part of the Southern Railway system) started in Feb. 1829 in Charleston, S C. When this 136-mi. railroad was completed to Hamburg, S C., across the Savannah river from Augusta, Ga., in 1833, it was the longest in the world. Southern Railway system lines now interlace the southeastern states and reach Washington, D C., Cincinnati, O., and St. Louis, Mo.

The Mohawk and Hudson Rail Road was chartered by the state of New York on April 17, 1826, to build a railroad between the Hudson and Mohawk rivers. After legal delays, construction was started in July 1830, and the first train ran on Aug. 9, 1831, between Albany and Schenectady. Other sections of the present New York Central system which were incorporated and opened for operation between 1836 and 1842 made up together the first line of railroad connecting Lake Erie and the Hudson river. The Hudson River railroad, from New York to Troy, near Albany, was opened in 1852, and the West Shore railroad, from a point on the west shore of the river opposite New York to Buffalo, in 1883. The Lake Shore and Michigan Southern, from Buffalo to Chicago, was formed by the consolidation of several small lines and acquired by the New York Central in 1869. The Michigan Central, begun at Detroit in 1836 and partly constructed by the state of Michigan from 1837 to 1846, was completed to Chicago in 1852. Consolidation of other independent lines formed the "Big Four" route, connecting the Great Lakes with the Ohio and Mississippi rivers. Subsequent acquisition of these and other lines resulted out what is now the New York Central system.

The first New England railroad was the Boston and Lowell (now part of the Boston and Maine railroad), which was chartered in 1830 and opened for traffic in June 1835. Also in June 1835 the Boston and Providence (earliest ancestor of the present New York, New Haven and Hartford railroad) was opened from Boston to Providence, R I. Completion in July 1835 of the Boston and Worcester (now part of the present Boston and Albany railroad, which is part of the New York Central system) established rail communication between those two Massachusetts cities.

In the south, the Pontchartrain railroad (later absorbed by the Louisville and Nashville Railroad company) was chartered in Jan. 1830 to build a short line connecting New Orleans, La., with Lake Pontchartrain, an inland extension of the Gulf of Mexico. This road opened for business in April 1831. The Richmond and Petersburg railroad, incorporated in 1836, was the start of the present Atlantic Coast Line Railroad company, while the Seaboard Air Line Railroad company had its inception with the charter in March 1832 of a short line between Roanoke and Portsmouth, Va. The City Point railroad, chartered in 1836 and started in April 1837, was the parent of the Norfolk and Western railway. The Louisville and Nashville railway was chartered by the states of Kentucky and Tennessee early in 1850, and the first through train was operated between these cities at the end of Oct. 1850. The Chesapeake and Ohio railway originated with the charter in Feb. 1836 of the Louisa railway in Virginia, and was completed from

Chesapeake bay to the Ohio river in 1873.

The Pennsylvania railroad had its inception in popular demand for a through rail line from Philadelphia to Pittsburgh, eliminating the canals and inclined planes then existing between the Susquehanna river and Pittsburgh. It was incorporated in April 1846 and construction began in 1847 at both Harrisburg and Pittsburgh. A continuous rail route from Philadelphia to Pittsburgh was opened Dec. 10, 1852, and on Feb. 15, 1854, the use of inclined planes to cross the Alleghenies was discontinued. Before its own rail line was completed, the Pennsylvania was extending financial aid to western connections. By purchases of securities, by traffic arrangements and eventually by long-term leases and corporate consolidations, the present system was built up with lines from the eastern seaboard to the Great Lakes, Chicago, St. Louis, Louisville and Cincinnati.

In 1851 the Erie railroad was completed from Piermont, N.Y. (on the Hudson river just above New York city), to Dunkirk, N.Y., on Lake Erie, affording the first connection by a single railroad between the Atlantic ocean and the Great Lakes.

Railroads began to extend westward from Chicago in 1848 when the Galena and Chicago Union (now part of the Chicago and North Western railway) reached the Des Plaines river, ten miles from the city. However, the Chicago and Rock Island (now part of the Chicago, Rock Island and Pacific Railroad company) was the first to link Chicago with the Mississippi river, which it reached in 1854, two years after construction was begun in 1852. Its bridge was the first across that river. Soon after the bridge was placed in service, a steamboat collided with it and caught fire, and both the bridge and the steamboat were burned. A subsequent lawsuit to prevent the bridge from being rebuilt was successfully defended for the railroad by Abraham Lincoln.

Lines now part of the Chicago, Burlington and Quincy Railroad company reached the Mississippi at a point opposite Burlington, Ia., in 1855 and at Quincy, Ill., in 1856. An extension of the Galena and Chicago Union (C & N W) reached the Mississippi river at Fulton, Ill., in 1855. As a result of these extensions much of the trade along the west bank of the Mississippi and of that part of Illinois which is contiguous to the navigable portion of the Illinois river was diverted from New Orleans. In 1856 the Illinois Central was completed between Chicago and the junction of the Mississippi and Ohio rivers at Cairo, Ill. Using this line, there was by 1860 a through rail route between Chicago and New Orleans, except for an 18-mi. ferry trip between Cairo and Columbus, Ky.

Railway construction west of the Mississippi river began in July 1851, when the Pacific railway of Missouri broke ground for a line which by July 1853 had reached 37 mi. to the westward. On it the first locomotive operated west of the Mississippi made a five-mile run from St. Louis in Dec. 1852. This railroad later became part of the Missouri Pacific system, which operates to New Orleans, La., Denver, Colo., and the southwest.

In 1859 rails were extended to the Missouri river by the completion of the Hannibal and Saint Joseph railroad (now part of the C B & Q), a C & N W line reached the Missouri at Council Bluffs, Ia., early in 1867.

A railway journey completely across the continent was made possible in 1869, when the Union Pacific, building from the Missouri river at Omaha, Neb., met at Promontory, Utah, the Central Pacific (now part of the Southern Pacific lines), built from Sacramento, Calif., making a line 1,776 mi. long. Active construction was started by both lines in 1864, ground having been broken the preceding year. Many hardships and difficulties were encountered in completing this feat of railroad engineering.

Other great transcontinental lines, opening up large areas of rich territory, were then under way and still others were to come. Work commenced in 1868 on the Atchafalaya, Topeka and Santa Fe railway, building southward from Kansas City and on the Southern Pacific route, building eastward from California at the end of the following year. In 1881 the A T & S F and the S P joined rails at Deming, N.M., forming the second transcontinental rail route to the Pacific coast and the first direct rail route to southern California.

In 1883 the Southern Pacific opened its eastern extension to New Orleans, completing the first through rail connection between the Pacific coast and the Gulf of Mexico. In the same year the last rail was laid in the connection of the present Northern Pacific railway route between Lake Superior and Puget sound with the line of the Oregon Railway and Navigation company, which had been built 210 mi. eastward from Portland, Ore. The Northern Pacific reached tidewater with its own rails at Tacoma, Wash., in 1887. In 1888 the rails of the Oregon Short Line and the Oregon Railway and Navigation company were joined, forming the United Northern Railway company completed its road from St. Paul, Minn., to Puget sound. And in May 1909 construction of the Chicago, Milwaukee and St. Paul was completed to form still another rail route from Chicago to the Pacific northwest.

On Nov. 1, 1909, rails of the Western Pacific railroad being extended eastward from Oakland, Calif., and those being pushed westward from Salt Lake City, Utah, met near Keddie, Calif., completing the final link in the last transcontinental railway route. This line connected at Salt Lake City with the Denver and Rio Grande Western system of lines, incorporated in 1870 and extended to Salt Lake City and Ogden, Utah, in 1883.

In 1830 the total length of railway lines in the United States was less than 40 mi.; in 1831 it had increased to 95 mi.; in 1832 to 229 mi.; and by 1835 to 1,089 mi. The growth of mileage, by state groups, from 1840 to 1948 is shown in Table I.

TABLE I—Length of Railway Lines

Year	New England*	Middle Atlantic†	North central‡	South§	West of Mississippi river	Total length of line
1840	517	1,566	86	616	Negligible	2,785
1850	2,097	3,103	1,772	1,709	Negligible	8,683
1860	4,660	6,353	9,959	8,818	1,840	30,583
1870	4,404	5,991	13,702	11,501	12,701	48,301
1880	5,027	15,940	26,382	14,908	11,415	66,672
1890	6,718	19,824	36,021	20,403	20,629	103,597
1900	7,137	24,591	41,500	25,110	31,492	129,810
1910	7,922	27,379	44,940	27,025	31,084	148,350
1920	7,945	28,505	44,955	26,538	32,347	150,285
1930	7,865	27,003	43,771	27,000	32,313	148,952
1940	6,597	25,703	41,281	24,483	31,526	139,590
1948	6,457	24,089	40,588	23,919	31,285	136,338
1947	6,457	24,784	40,053	23,824	31,070	136,208
1948	6,107	24,524	39,015	23,005	31,157	133,808

*Includes Maine, New Hampshire, Vermont, Massachusetts, Rhode Island and Connecticut. †Includes New York, Pennsylvania, New Jersey, West Virginia, Maryland, Delaware and District of Columbia. ‡Includes Michigan, Indiana, Illinois, Ohio and Wisconsin. §Includes states south of the Ohio and Potomac rivers and east of the Mississippi river, Louisiana also included. ||Including Minnesota.

Consolidation of Railroads—Early railroads were local affairs, designed to accommodate the limited commercial needs of fairly small areas. This local character was reflected in the large number of separate companies; there once were more than 6,000 operating railroads in the United States. As settlement and general development of the country progressed, economic considerations brought about the voluntary consolidation of these many small local railroads into a much smaller number of relatively large systems. As a single and not unusual example, the present New Haven railroad is composed of what were once about 200 separate enterprises. The decision of the supreme court of the United States, in the Northern Securities case (1904), that the Sherman Anti-Trust act applied to railroad consolidation retarded such projects, especially where any element of reduction in competition may have been present.

In the Transportation act of 1920 (see *Governmental Regulation*, which follows) under which the railroads were returned to independent private operation after two years of operation under governmental control during World War I, the Interstate Commerce commission was directed, among other things, to prepare a plan for consolidation of the railroads of the country into a limited number of large systems of fairly equal earning power. This represented a considerable change in national policy from the previous emphasis on competition.

The commission's tentative plan was published in 1921. After prolonged discussion thereof, and many fruitless requests by the commission that it be relieved of the task, the final plan was published in Dec. 1929. It called for 21 consolidated systems. The

great business depression, then in its first stages, diverted attention from the plan, and the low levels of railway earnings through 1931-38, which threw many railroads into the hands of receivers or trustees, were severe deterrents to plans for consolidation. The Transportation act of 1940 omitted former provisions in respect to the commission's consolidation plan, leaving consolidation entirely subject to economic impulse. However, the act requires commission approval as a condition of any consolidation.

Instead of a country-wide, comprehensive plan of consolidation imposed by statute, present emphasis is on voluntary consolidations along natural economic lines, subject in each case to a finding by the Interstate Commerce commission that the plan proposed is sound and in the public interest. Illustrative is the development of the present Gulf, Mobile and Ohio Railroad company, beginning with consolidation of three small lines in 1916 to form the Gulf, Mobile and Northern, followed by merger with the Mobile and Ohio railroad in 1940 and acquisition of the Alton railroad in 1945-46.

Governmental Regulation—Railway companies are incorporated under the laws of a state or states. Because the availability and character of railway transportation have such great economic importance and value to the public, and also because the large investment in facilities and equipment required for construction and operation of a railroad tends to hinder easy entrance into the field, the railway industry has come to be customarily regarded as "affected with a public interest" which warrants its supervision and regulation by government.

From their beginning in the late 1820s until after the end of the American Civil War, railroads were subjected to little regulation. However, as the economic importance of the new form of transportation grew and became more apparent, and as contemporary commercial pricing practices were reflected in railway usages, there was increasing public sentiment in favour of governmental regulation of railroads, and especially of the rates charged for their service.

The initial steps were taken by individual states, through creation of railway commissions with supervisory powers. In the early 1870s this tendency received an impetus in central western states in what was known as the Granger movement, as a result of which several states enacted regulatory legislation. State commissions created under this legislation were clothed with extensive powers over railway management, particularly with respect to rates. Experience indicated, however, that regulation of rates by individual states was ineffective, as most traffic was interstate in character and therefore not subject to state regulation. The demand for interstate regulation was met in 1887 by congressional enactment of the Interstate Commerce act (Act to Regulate Commerce), based on the constitutional power of congress to regulate commerce between states. The regulatory powers authorized under the original act were subsequently increased and broadened by enactment of several amendments, notably the Elkins act of 1903, the Hepburn act of 1906, the Mann-Elkins act of 1910, the Panama Canal act of 1912, the Valuation act of 1913, the Clayton Anti-Trust act of 1914, the Transportation act of 1920, the Emergency Transportation act of 1933 and the Transportation act of 1940. Several laws, generally designated as the Safety Appliances acts, also were added.

Under the Interstate Commerce act, the Interstate Commerce commission was created by the congress in 1887 as its agent to administer the provisions and carry out the purposes of the act.

and earnings of railroads. By 1920, however, there had come to be increasing realization that restrictive policies had been carried too far. For the first time there was incorporated in the basic regulatory statute an affirmative recognition of the need and importance, in the public interest, of adequate railway earnings.

In the Transportation act of 1920 the commission was directed to set rates so that the railways, as a whole or in territorial groups, should be able, under honest, efficient and economical operation, to earn a fair return on the value of property devoted to public service, such value and the rate of "fair return" thereon to be determined by the commission. The fair return, originally set at 6%, was, in 1922, reduced to 5.75%, but the railroads as a whole did not, while this provision of the law was in effect, attain such a return, even in the prosperous years 1926-29.

The provision for a prescribed rate of return was repealed in the Emergency Transportation act of 1933, but this did not alter the basic legislative policy in favour of adequate railway earnings. The declaration of policy of the Emergency Transportation act of 1933, slightly amended in 1940, explicitly declared the intent of the congress that policies and methods of regulation carried on under the Interstate Commerce act should be such as to encourage "sound economic conditions . . . among the several carriers." As adequate earnings are an essential element of sound economic conditions, the congress expressed its legislative approval of such earnings, leaving the exact measure of adequacy to the administrative judgment of the commission.

In view of the importance of this declaration, it is quoted in full, as follows:

It is hereby declared to be the national transportation policy of the Congress to provide for fair and impartial regulation of all modes of transportation subject to the provisions of this Act, so administered as to secure the highest practicable degree of efficiency, economy, and service to the public.

STATES, OF THE POSTAL SERVICE, AND OF THE NATIONAL DEFENSE

The nature and extent of regulation by the Interstate Commerce commission (often paralleled by regulatory commissions of the states) may be indicated by the following summary of present regulatory provisions.

Railroads are required to establish and observe just and reasonable classifications, rates, fares and rules relating to the movement of freight and passengers. Preferential rates, rebates and other forms of discrimination are forbidden. Except upon special authority from the commission, a higher rate may not be charged for transportation for a shorter than for a longer distance over the same line or route, in the same direction, the shorter being included within the longer distance. The commission has authority to correct discriminatory or unreasonable rates and to prescribe maximum, minimum or precise rates. It may establish through routes over the lines of two or more railroads, prescribe joint rates for service over these routes and prescribe the division of these rates among the participating carriers. Rates and fares must be published in tariffs prepared in prescribed manner. Without special permission, they may not become effective except after 30 days' notice. Rates may be suspended for up to seven months pending public hearings as to their reasonableness or other compliance with the law.

Railroads are required to furnish adequate car service under reasonable rules and regulations. The commission has authority in emergency to suspend the operation of these rules and issue such orders with respect to car service and joint or common use of terminals as it considers to be in the public interest. It also may give directions as to priority for movement of traffic.

A railroad may not construct a new line, extend an existing line or acquire or operate any new line without first obtaining a certificate of convenience and necessity from the commission. A

restrictive in character, with emphasis on restraining the rates

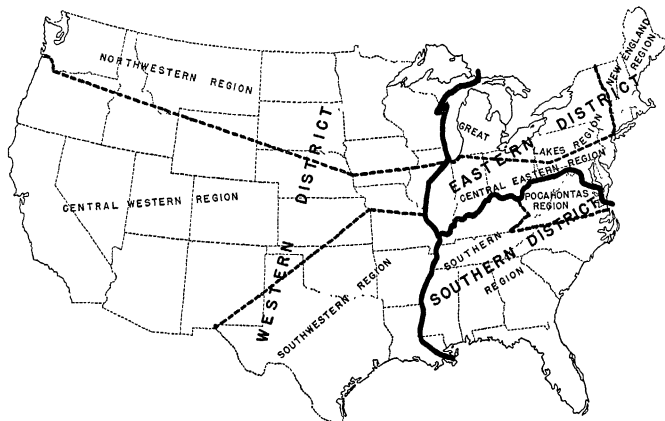

FIG. 1—GEOGRAPHICAL GROUPING OF U.S. RAILROADS BY THE INTERSTATE COMMERCE COMMISSION

similar certificate must be obtained before it can abandon any portion of a line or the operation thereof. A railroad may not contract or combine with another carrier for the pooling or division of traffic or earnings without specific approval of the commission, upon a finding that such pooling will be in the public interest and will not unduly restrain competition.

As heretofore stated, consolidations and mergers of carriers are subject to commission approval in the light of certain specific factors. A railroad must obtain the approval of the commission before it may issue capital stock, bonds or other evidences of ownership or indebtedness, or assume any obligation with respect to the securities of others.

The commission also has extensive jurisdiction over the installation and operation of safety appliances, including automatic signals of various types. Under the Transportation of Explosives act, it formulates regulations for the safe transportation of explosives and other dangerous articles. The Safety Appliances acts, the Ash Pan act, the Locomotive Inspection act and the Accident Reports act, among others, extend the responsibilities and authority of the commission in matters of safety.

The principal framework of economic regulation is built around the rate provisions—the requirements that rates shall be published and observed, and that they shall be just, reasonable and not unduly discriminatory. Through issuance of certificates of convenience and necessity, the commission has broad powers to control development of the transport structure. Through controls over acquisition, influence can be exercised to prevent lessening of competition thought to be desirable in the public interest. Associated with these three large groups of authority are those having to do with the duty of common carriers to serve adequately and without discrimination in service. The finance powers are also important, as they afford opportunity to supervise carriers' financial structures and practices.

The Interstate Commerce commission also can and does prescribe the form and manner in which accounts of the railroads must be kept. All railway accounting must conform to its rules, and railroads are required to file with the commission periodic

reports in extensive detail covering numerous particulars of their operations and finances. Of few industries do public authorities and the public generally have so much and such prompt information as about the railway industry.

For accounting and statistical purposes, railroads were allocated by the Interstate Commerce commission, on a roughly geographical basis, into three districts: eastern, southern and western. These districts were similarly subdivided into regions as follows:

Eastern district: New England region, Great Lakes region and central eastern region.

Southern district: Pocahontas region and southern region.

Western district: northwestern region, central western region and southwestern region.

Location of districts and regions is shown in fig. 1. Railroads were assigned to the district and region in which most of their mileage lies.

Employee Relations—Collective bargaining between management and employees on matters relating to wages and working conditions is traditional on the railroads, antedating its development in most other industries. Unionization of railroad employees began with an association of locomotive engineers in 1855. By 1950 there were 22 so-called "standard railroad labour organizations." These represented various crafts or classes of railway employees, such as engineers, firemen, trainmen, shopmen, clerks, yardmasters and so on. The so-called operating unions are those composed of men who actually move engines, cars and trains. They comprised about 21% of the total railway organization. The nonoperating unions represented other classes of employees, including clerks, telegraphers, track and shop workers and the like. In addition, there were several other union organizations, not generally referred to as among the standard organizations, but which represented varying numbers of employees on some railroads.

Wages and working conditions on railroads are negotiated directly by local representatives of the respective organizations with individual railroad companies. When negotiations are continued beyond the local level, representatives of the national labour organizations negotiate as a group with railroad officers.

RAILROAD CONSTRUCTION AND MAINTENANCE

1. Rail-laying machine
2. Adzing machines cutting uniform seats for tie plates before the laying of new rail
3. Multiple tie tamper, used in maintaining roadway, which tamps four ties per minute to a uniform surface
4. Specially constructed rug cleaning room for weekly cleaning of pas-

senger-train carpeting. The automatically fed cleaning solution is later removed by vacuum suction, and the rugs placed in a drying compartment

5. Sweating a tire on a locomotive wheel
6. Refuelling a diesel-electric locomotive

authorized to represent the individual railroad companies. In recent years, railroad labour organizations, especially in dealing with questions involving pay increases, generally divided themselves into two groups, comprising the operating employees group and the nonoperating employees group.

Bases of Pay.—Nonoperating railroad employees are paid on an hourly, daily or monthly basis. In a few instances, certain shopcraft workers are paid on a piecework basis. For most nonoperating employees, eight hours is a basic day's work, time worked in excess of eight hours per day is paid for at 150% of the basic rates. As the result of recommendations by a presidential emergency board, nonoperating employees were placed from Sept. 1, 1949, on a five-day 40-hour work week and their rates of pay were adjusted upward so as to produce for 40 hours of work as much as had previously been paid for 48 hours. Penalty pay at one and one-half times straight-time rates is paid for all hours in excess of eight hours per day, as well as for all hours in excess of 40 straight-time hours per week.

The operating group of railway employees may be divided for pay purposes into two classifications: yard employees and those on road trains. Yard employees, representing about 40% of the operating group as a whole, are paid on an hourly or daily basis. Eight hours constitutes a day's work, and overtime thereafter is paid at the rate of 150% of the basic rate.

Road employees are paid on the basis of miles run. However, if it takes longer than a certain time to run the miles paid for, they then receive overtime in addition to payment for the mileage made. For all employees in road freight service, "eight hours or less—100 miles or less" constitute a day's work for pay purposes. For engineers and firemen in through passenger service, "five hours or less—100 miles or less" constitute a day's work for pay purposes. For conductors and trainmen in through passenger service, a day's work is "seven and one-half hours or less—150 miles or less."

Contract rates of pay for operating employees are expressed in amounts per basic day. The employee receives at least one day's pay if he actually commences work, no matter how few miles he runs or how few hours he works. On the other hand, where an employee runs more than his basic day's mileage, he is paid proportionately for each excess mile run. Average earnings of road employees per run, therefore, are more than the average basic daily rate. In the case of engineers and firemen, basic daily rates of pay are graduated according to the weight on the driving wheels of the locomotives they operate.

Employees in engine service, and to a limited extent in train service, have for many years imposed a limitation on the mileage that a man may run in a calendar month. Mileage limitations vary somewhat on different railroads. Generally, they are 4,800 mi. per month for regular engineers and firemen in passenger service, and 3,800 mi. per month for engineers and firemen in freight service. Where mileage limitations apply to trainmen, the maximum limit runs from about 5,500 mi. to 6,600 mi. per month for passenger trainmen, and 3,500 mi. to 4,500 mi. per month for freight trainmen.

As a result of changes incident to World Wars I and II, and in accordance with findings of governmental boards in a number of instances, average earnings of railway employees of all classes increased during the period 1922 through 1949 to the extent indicated in Table II. After the beginning of World War II,

TABLE II—Average Earnings of Railway Employees

	Average straight-time hourly earnings (in cents)	Average compensation per employee	
		per week	per annum
1922	50.6	\$31.11	\$1,652
1930	59.1	\$31.88	1,715
1940	77.5	\$39.50	2,073
1946	116.4	\$58.85	3,068
1947	131.4	\$67.74	3,529
1948	136.8	\$68.74	3,594*
1949	150.6	\$71.14	3,709

railway employees were granted general wage increases effective in 1941, 1943, 1946, 1947, 1948 and 1949.

Settlement of Labour Disputes.—Legislative action to promote

peaceful settlement of disputes grew out of the belief that a matter of such importance deserved statutory recognition. The first such legislation was enacted in 1888, one year after enactment of the original Interstate Commerce act. Even prior to that time, however, mediation and arbitration for the settlement of railway labour disputes had received considerable attention. As far back as 1873, the chief officer of a union of locomotive engineers publicly stated that his organization had always favoured arbitration.

The act of 1888 was the initial federal legislation on this subject and the foundation stone upon which all subsequent legislation of this character has been built. Its essential elements remain in the law to this day: voluntary arbitration, investigation and fact-finding recommendations by a presidential board in case of emergency having to do with the impending possibility of a strike, and reliance upon the force of public opinion after such investigation. The only really significant change is that under present legislation an award of an arbitration board may be enforced in court, whereas under the 1888 statute, an award had no sanction other than the force of public opinion.

Title III of the Transportation act of 1920 set up procedure for dealing with disputes between railroads and their employees. Its provisions included the establishment of the Railroad Labor board, to hear disputes and make decisions. This enactment was superseded by the Railway Labor act of 1926, amended in 1934. By custom on the railroads, disputes not settled locally are referred to joint management-employee conferences. Under the Railway Labor act, the next step is handling by the National Mediation board (which replaced the Railroad Labor board). If the board cannot induce a settlement or obtain agreement to arbitrate, and considers that a substantial interruption of interstate commerce is threatened, it so advises the president of the United States. He is authorized by the act to create an emergency board to investigate the controversy and report to him within 30 days. After creation of an emergency board and for 30 days after it has reported to the president, no change may be made, except by agreement, in the conditions out of which the dispute arose. This completes the procedure provided in the act, and the findings of an emergency board are not binding on either party to a dispute.

One of the most fundamental changes in the Railway Labor act was its amendment in 1934 to provide for establishment of the National Railroad Adjustment board. This board consists of 36 members, half selected by the railroads and half by railway labour organizations. It is divided into four divisions, each having jurisdiction over disputes involving certain particular crafts or classes of employees. Upon failure of a division to agree, a neutral referee is selected by the division or, upon its failure to agree on such selection, by the National Mediation board. The adjustment board has jurisdiction over disputes growing out of the interpretation or application of agreements concerning rates of pay, rules and working conditions. If a carrier does not comply with an order of the adjustment board, any person for whose benefit such order was made may sue for enforcement in a federal district court, in which suit the findings and order of the adjustment board are prima-facie evidence of the facts.

Railroad Social Security.—Pension plans voluntarily established by individual railroads for the benefit of superannuated employees were among the earliest pension systems in the United States. The Railroad Retirement act of 1935, as amended in 1937, established a pension system for railway employees on a national basis. This system is distinct from and more liberal than parallel provisions for workers in other industries covered by the Social Security act. The companion Carriers Taxing act of 1937 levied a pay roll tax on the first \$300 per month of compensation paid to railway employees, the tax to be borne equally by the railroad and the employee. Subsequent amendments enlarged the scope and amount of benefits and also increased the pay roll tax for retirement purposes to a maximum of 1.24% beginning Jan. 1, 1952, half to be borne by each, as before.

The Railroad Unemployment Insurance act of 1938 removed the railroads from the unemployment provisions of the various

state unemployment compensation laws established under the Social Security act of 1935 and brought them under a separate national system of unemployment compensation. The system under the 1938 act was financed by a pay roll tax of 3% on the first \$300 per month of compensation paid to railway employees, which tax is borne entirely by the railroads. An amendment in 1946, besides increasing unemployment benefit payments, added to the unemployment system an entirely new system of benefit payments to railway employees for illness and accidents, whether or not these were in any way related to or connected with railway employment.

Prior to 1948 the railroad unemployment system contained no provision for merit or experience ratings whereby the pay roll tax rate assessed against railroads might be scaled in accordance with actual unemployment experience, as was the case in most states in regard to other industries covered by the Social Security act. The railroad unemployment pay roll tax rate was, therefore, much higher than that of other industrial employers and much higher than was required to meet benefit payments accruing under the Railroad Unemployment Insurance act. As a result, by early 1948, the amount to the credit of the unemployment reserve fund exceeded \$900,000,000. An amendment in 1948 modified the railroad tax rate by establishing a sliding scale which varied according to the size of the reserve fund. The rate, which applied to wages and salaries up to \$300 per month, ranged from 0.5% while the fund was \$450,000,000 or more, up to 3% whenever the fund fell below \$250,000,000.

Both the Railroad Retirement act and the Railroad Unemployment Insurance act are administered by the Railroad Retirement board. This board, composed of three members appointed by the president of the United States, has the somewhat unusual feature that one of its members is nominated by representatives of the employees and one by representatives of the railroads, the chairman being appointed without designated recommendations, as a representative of the public.

Number of Railways and Mileage.—For statistical purposes the Interstate Commerce commission divides operating railways of the United States into four groups: classes I, II and III and switching and terminal. Class I includes line-haul railroads with operating revenues of more than \$1,000,000 annually; class II, those with revenues of \$100,000 to \$1,000,000; and class III, those with annual revenues of less than \$100,000. Switching and terminal companies perform the named types of service for line-haul railroads, are usually owned by one or more such railroads and for the most part derive their revenues from payments made by their user railroads. For the latter reason, they are customarily omitted from revenues and earnings statistics of class I railways, to avoid duplication.

Besides operating companies, there also are lessor and proprietary companies. Lessor companies maintain a separate legal existence, but their properties are operated by the lessees, who may or may not be financially interested in the securities of the lessors. Proprietary companies are also nonoperating companies, but are distinguished by the fact that their outstanding capitalization is owned by other railway companies. Statistics of the Interstate Commerce commission also include those from a few small railroads which file only brief circulars or do not submit official returns.

Table III shows the number, miles of road and percentage distribution of revenues of operating railroads, the number of lessor and proprietary companies, and also the number of circular and

unofficial railroads. While the table shows 133 class I operating companies, many of these are operated as parts of systems under unified or co-ordinated management. Figures shown for miles of road operated include some duplication of road owned by one company and used by another company under agreements for this purpose which are called trackage rights. They do not include multiple running tracks nor yard tracks and sidings. Neither do they include the many miles of industry-owned sidings and connecting tracks.

Because data for class I railways are more promptly available and more comprehensive than those pertaining to classes II and III, and because figures for classes II and III are relatively small, statements in the following text will, unless otherwise specified, apply to class I railways only.

The total mileage of trackage, of all kinds, operated by class I railways is shown in Table IV.

TABLE IV.—Total Miles of Trackage Operated by Class I Railroads,*

Year (Dec. 31)	Road—first main track	All other main track	Yard track and sidings	Total all trackage
1921	223,017	32,739	103,672	360,688
1930	230,602	36,792	115,772	383,076
1940	220,288	34,823	105,087	360,298
1945	215,488	34,380	105,359	355,439
1948	214,726	34,375	106,383	355,484

*Excludes duplication of trackage owned by one company and used by another company under trackage rights. Figures include mileage operated by United States railroads in Canada.

For every road mile operated in 1948 there were 1.69 mi of track, including yards and sidings. The ratio of track miles to road miles had changed little since 1918, and was considerably higher in the eastern district than elsewhere.

Total miles of road operated by class I railways declined after its peak in 1930, when it was 330,602, as mileage abandoned exceeded mileage of new railway constructed. The abandoned mileage consisted mainly of unprofitable branch lines, on which the volume of traffic, adversely affected by depletion of natural resources or by competition of motor vehicles, had been so seriously diminished as to not warrant continued operation. From 1931 to 1948, inclusive, the road miles constructed by class I railways totalled 948 and the miles abandoned totalled 12,157. (Because of changes between 1930 and 1948 in classification of some railroads as between class I and other classes, these figures are not in agreement with changes indicated in Table IV for all class I railways.)

Investment and Capitalization.—The value of railway facilities and properties as represented in the investment accounts on the books of the railroads is shown in Table V.

TABLE V.—Investment in Railroad Property: Railroads of Classes I, II and III and Their Lessors

Year (Dec. 31)	Investment in road and equipment* (millions)	Investment per mile of road owned	Total property investment†	
			Before depreciation (millions)	After depreciation
1921	\$10,329	\$ 82,699	\$21,450	\$20,273
1930	20,057	102,061	26,956	24,895
1940	21,546	110,449	26,611	23,546
1945	20,608	110,664	26,881	23,031
1948	20,555	127,025	30,463	24,183

*Road and equipment investment of switching and terminal companies on Dec. 31, 1948, was \$2,085,000,000, making a total of \$20,750,000,000 for railroads of all classes reporting to the Interstate Commerce commission.

†Property investment includes investment in road and equipment, material and supply inventories, and cash on hand.

Stocks, bonds and other forms of capitalization outstanding against the values represented in the investment of the railroads are shown in Table VI.

With a total investment in road and equipment of \$19,800,000,000 at the end of 1920, the railroads in the 29 years 1921-49 made capital expenditures for improvements and additions to their property exceeding \$17,100,000,000, or at an average annual rate of more than \$590,000,000. (This \$17,100,000,000 represents gross expenditures, before allowance for retirements of worn-out and obsolete facilities.) During these 29 years the railroads put \$2.34 into their properties in improvements for every \$1 paid out in dividends to stockholders.

TABLE III.—Number of Railway Companies and Their Classification (1948)

Item	Line-haul			Total	Switching and terminal	Grand total
	Class I	Class II	Class III			
Number of operating companies	133	171	176	480	113	693
Lessors to operating companies	102	0	8	110	13	123
Proprietary	—	—	—	137	15	152
Circulars and unofficial	—	—	—	32	43	75
Miles of road operated	236,704	8,550	2,483	247,737	*	257,751
Percentage of total revenues	90.7	1.0	0.2	91.9	8.1	100.0

*Miles of road not reported for switching and terminal companies, which operated 7,430 mi of track in 1948. (Includes 1,384 mi in Canada.)

TABLE VI—*Railway Securities Outstanding and Net Capitalization: Railways of Classes I, II and III and Their Lessees*
(in millions of dollars)

Year (Dec 31)	Total railway securities outstand- ing	Capital stock*	Total funded debt unmatured†	Net capitaliza- tion‡	Ratio to gross investment in road and equipment (per cent)	
					Net capitali- zation	Funded debt unmatured
1921	\$20,248	\$ 8,800	\$11,358	\$17,083	84.0	55.0
1930	22,793	10,012	12,771	19,665	73.2	49.0
1932	22,831	10,043	11,780	18,804	74.4	44.0
1940	21,047	9,770	11,777	17,530	68.7	44.0
1948	18,682	9,423	9,458	15,667	58.1	34.3
1948	18,340	9,412	9,507	15,497	54.0	31.4

*No-par stock included at book value. †Funded debt includes equipment obligations
‡Amount in the hands of the public, not held by railway companies

The railroads greatly reduced their funded debt and annual interest charges between 1932 and 1948. During those 16 years there was a net reduction in outstanding unmatured funded debt of all railroads of \$3,782,000,000, or at the average annual rate of \$236,000,000. More than half this decrease (\$2,019,000,000) was effected in the five years 1941-45. While court reorganizations of bankrupt railroads accounted for part of the reduction in debt, for every \$1 of reduction thus brought about there was a reduction of almost \$2 by voluntary action of solvent railroads in paying off or buying back outstanding debt.

As the result of additions to investment and reductions in debt, the ratio of net capitalization in the hands of the public to investment in road and equipment for all railroads fell from 84% in 1921 to 54% in 1948. In relation to total investment, debt fell from 56% in 1921 to 31% in 1948. Annual interest and rental charges (total fixed and contingent) of the railroads of class I were reduced from \$666,000,000 in 1932 to \$463,000,000 in 1949.

Rolling Stock—Locomotives and cars owned and operated have declined in number from their peak in the 1920s, the trend over a considerable period has been toward fewer, larger and more efficient units. Average tractive effort of locomotives has increased by about one-half and average freight-car capacity by about one-quarter since 1921. Such increases in tractive capacity and efficiency of locomotives and in capacity and efficiency of utilization of freight cars have enabled railroads to handle a much greater volume of freight traffic than in the 1920s with fewer units of equipment.

Table VII shows number of units of locomotives and cars and illustrates increases in capacity and efficiency of utilization.

In addition to railway-owned freight cars, the railroads also haul freight in 266,700 privately owned freight cars belonging to car rental companies, oil companies, meat packers and other shippers with large use of specialized types of cars. The loaded car mileage made by these cars is included in Table VII. Freight-carrying car ownership of class I railroads and private-car lines on

TABLE VII—*Locomotives and Cars of Class I Railways*

Year (Dec 31)	Locomotives					All Locomotive units
	Number	Average tractive capacity (in pounds)	Diesel (units)	Electric (units)	Other (units)	
1921	64,585	36,935	—	364	—	36,081
1930	35,875	45,595	74	811	75	45,265
1940	40,041	50,005	707	858	25	51,005
1948	38,853	53,217	3,856	822	19	53,528
1948	38,614	55,170	3,689	819	19	55,466

Year (Dec 31)	Cars			
	Passenger train cars* (number)	Freight cars* (number)	Average capacity per freight car (in tons)	Loaded freight car-miles (million)
1921	54,332	9,315,692	48.5	12,591.4
1930	52,130	9,376,897	48.6	15,845.4
1940	37,817	7,653,663	50.0	24,660.0
1948	38,472	7,766,597	51.2	24,575.0
1948	39,142	7,759,561	51.0	26,651.6

*Includes passenger, mail, express, baggage and combination cars.

Dec 31, 1948, was divided by types as shown in Table VIII. These types are described and discussed later in this article.

TABLE VIII—*Freight-Carrying Cars, by Types*

	Owned by class I railways	Owned by other railways	Total railway- owned	Private	Grand total
Box	731,872	3,715	735,588	2,263	740,851
Refrigerator	20,210	173	20,383	11,179	23,562
Grain and hopper	823,718	16,715	840,433	8,169	848,602
Flat	63,688	3,244	67,932	247	67,470
Stock	40,872	46	40,918	1,727	21,505
Tank	8,659	717	9,376	241,519	120,935
Others	8,793	1,590	10,383	1,114	11,498
Total	1,750,561	25,506	1,785,067	266,731	2,051,798

*Includes class II, class III and switching and terminal railways

Railroads also have more than 120,000 cars devoted to use incident to their own operations. These include 24,700 of the familiar caboose or cabin cars, which are the headquarters of the train crew while en route, and 95,900 company service cars for housing workers and hauling materials incident to maintenance and operating activities.

Passenger-train car ownership of class I railroads and the Pullman company, by types, on Dec. 31, 1948, is shown in Table IX.

TABLE IX—*Passenger-Train Cars, by Types*

Passenger-carrying*	23,750
Mail	2,724
Baggage, express and all other	14,958
Total railroad owned	38,142
Pullman company cars	5,305
Total railroad and Pullman cars	44,447

*Includes coach, combination coach, parlor, sleeping, dining, club, lounge and observation cars

Freight Traffic—In the wartime year 1918, freight traffic of the railroads exceeded all previous records. There was a postwar recession in 1921, followed by traffic in 1929 which established a peak not exceeded prior to World War II. The low spot of the general business depression of the 1930s was in 1932. Figures as to freight traffic immediately before entry of the United States into World War II, the peak during that war (1944) and for various postwar years are shown in Table X.

TABLE X—*Revenue Freight Traffic, Class I Railways*

	Tons originated (millions)	Ton-miles* (millions)	Average miles of haul	Revenue per ton-mile (in cents)
1928	1,263.3	465,379	367	0.849
1929	940.2	306,849	326	1.215
1930	1,339.1	447,323	337	1.076
1932	865.2	233,977	271	1.046
1939	1,007.7	333,438	331	0.973
1944	1,491.5	737,246	494	0.949
1947	1,537.5	624,748	406	1.046
1948	1,606.9	637,017	397	1.212
1949	1,326.5	520,437	400	1.340

*One ton carried one mile is equivalent to one ton-mile

Freight Commodity Classifications—For purposes of accounting and statistics, the Interstate Commerce commission has prescribed certain commodity classifications for railroad freight. As of Jan. 1, 1947, all commodities—except forwarder traffic and merchandise (or less-than-carload) freight—were allocated into 260 classifications, assembled into five major commodity groupings. Prior to that date, there were 156 corresponding commodity classifications. Tonnage and revenue statistics covering movement of these commodities on all class I railroads are published periodically by the commission. According to the commission's accounting rules, any shipment of 10,000 lb or more from one consignor to one consignee is statistically recorded as a carload, even though the minimum weight on which the carload rate applies may be higher than 10,000 lb. Distinctions between carload and less-than-carload (often expressed as LCL) shipments are further discussed hereafter. Freight forwarders engage in the business of assembling numerous LCL shipments for consolidation by them into carload shipments.

Classified by principal commodity groups, the 1949 revenue freight traffic of the class I railroads was as shown in Table XI.

TABLE XI—Revenue Freight Traffic, by Commodity Groups, Class I Railways, 1949

	Tons originated (thousands)
Products of agriculture	160,380
Animals and products	15,284
Products of mines	653,758
Products of forests	50,237
Manufactures and miscellaneous	351,664
Forwarder traffic	3,665
Total carload freight	1,213,011
Less-than carload freight	12,502
Total freight originated	1,226,503
Received from connections	1,076,577
Total freight carried	2,303,080*

*Freight carried on more than one railroad is counted by each railroad involved in the haul.

Of products of agriculture, by far the principal items of tonnage are grain and its products, mainly flour and wheat, followed by fresh fruits and fresh and dry vegetables. Meats and other packing-house products are the leading commodities in the animals and products group, with hogs next. Among products of mines, coal greatly predominates in tonnage, sand, gravel and stone make up the next largest tonnage, followed by iron ore. Lumber, shingles and lath constitute much the largest tonnage of products of forests, with pulpwood as the second largest tonnage. Among manufactures and miscellaneous, the greatest individual tonnage group is iron and steel products, other important tonnages are made up of petroleum products, chemical products, food products and vehicles.

In terms of tons originated by class I railways in 1949, the 10 leading commodities, together with the rail tonnage of each, are shown in Table XII. These 10 commodities constituted 54% of all tonnage originated on these railroads in that year.

TABLE XII—Ten Principal Commodities, Class I Railways, 1949

	Tons originated
Dittoous coal	361,200,000
Iron ore	91,151,000
Gravel and sand	51,507,000
Stone and rock broken, ground and crushed	43,207,000
Wheat	37,135,000
Anthracite coal	30,820,000
Manufactured iron and steel	28,280,000
Cement, natural and portland	27,546,000
Lumber, shingles and lath	23,468,000
Pulpwood	20,742,000
Total	663,489,000

Passenger Traffic—Years shown for passenger traffic in Table XIII mark the highest level attained during World War I (1918), the all-time peak in number of passengers carried (1920), the first full year of private operation after the railroads were returned to their owners following World War I (1921), the interwar low (1933), the level just before World War II (1939), the peak attained during that war (when longer average trips resulted in the highest passenger mileage ever performed) (1944) and a three-year period following the war.

TABLE XIII—Revenue Passenger Traffic, Class I Railways

Year	Passengers carried (millions)	Passenger-miles (millions)	Average miles travelled†	Revenue per passenger-mile (in cents)
1918	1,085.0	42,677	39	2.444
1920	1,214.8	46,849	38	2.745
1921	1,035.5	37,313	36	3.086
1933	433.0	16,347	38	2.013
1939	459.4	18,952	50	2.890
1944	910.3	95,540	105	2.874
1945	793.4	45,932	65	2.907
1946	612.8	41,170	66	2.911
1949	554.5	35,100	63	2.452

*One passenger carried one mile is equivalent to one passenger-mile.
†A passenger may travel on two or more railroads during one trip, and this figure represents the average journey on an individual railway line, not the average for the entire trip.

Statistics in Table XIII include commutation travel to and from suburban areas of certain metropolitan centres. In 1949 commutation passengers numbered 309,000,000, transported for a total of 5,500,000,000 passenger-miles, with an average journey per passenger of 17.8 mi. Other than commutation passengers numbered

246,000,000, transported for 29,600,000,000 passenger-miles, with an average journey of 120 mi.

Other Service by Railroads—Besides transporting freight and passengers, railroads also transport baggage, express, mail and milk in passenger trains and provide meal service for passengers on trains and at stations. Meal service on trains is made available in dining or cafe cars, which are restaurants on wheels. Sleeping accommodations also are available for passengers who desire them, in what are usually termed Pullman cars, after their original designer, George M. Pullman. The charge for transportation in Pullman (and also in parlour) cars is higher than the basic or coach passenger fare, in addition to which there is a charge for the accommodations used. The transportation charge in these cars is higher because of the fact that the average weight hauled per passenger transported is much greater than for coaches.

Railroads carried in 1948 approximately 142,000,000 express shipments, averaging about 45 lb each in weight and travelling an average of about 650 mi. They carried almost all the parcel post shipments and the newspapers and magazines which moved in mail service. They also carried more than 90% of the poundage of intercity first-class mail, for which they received from the post office department not quite 2 cent per piece of mail, or less than one-seventeenth of the postage paid. This payment to the railroads covered not only the transportation of the mail but also the provision of special railway post office (R.P.O.) cars, with facilities for sorting mail en route.

Record of Wartime Performance—The demands of World War II challenged the elasticity and efficiency of the railroads—a challenge which was successfully met. The extent of the test to which the railroads were subjected is reflected in the fact that the freight service which class I railways were called upon to perform jumped from 290,000,000,000 ton-miles in 1938 to 737,000,000,000 ton-miles in 1944, multiplying more than two and one-half times within six years. Passenger travel climbed even more spectacularly. From 21,600,000,000 passenger-miles in 1938, it rose to more than 95,500,000,000 passenger-miles in 1944, or more than four times as much.

During 45 months from Dec 1941 through Aug 1945, railroads transported 97.6% of all military personnel moving in organized groups and 90.5% of all military freight hauled by inland transportation. These figures do not include the movement of raw materials which went into military products and of supplies for the civilian population engaged in war work. Moreover, railroads supplied about 40,000 officers and men for army transportation corps rail units, in addition to more than 300,000 railway employees in other branches of the armed services.

An outstanding example of the emergency war service of the railroads was the greatly increased volume of oil traffic which they successfully handled. When enemy submarines interrupted the operations of tank vessels which normally supplied the great bulk of oil consumption in the northeastern part of the country, the railroads were called upon to take care of this movement. As only a small fraction of the traffic in question normally moved by rail, extraordinary procedures had to be set up for the emergency. From 11,250 bbl daily in the summer of 1941, the movement quickly mounted until by July 1943 a peak of more than 1,000,000 bbl of oil daily was being delivered by rail from the southwest to the east.

Safety of Operation—Railroads were among the pioneer industries to undertake organized campaigns for promotion of safety among their employees and for their users. Training of railway workers in habitual use of safe working methods and practices is thoroughly organized, both through collective activities of the industry and on individual railroads. Despite handicaps growing out of the far-flung nature of railway operations, with workers distributed over thousands of miles, many of them in more or less isolated groups, this training begins with entrance into railway service and goes on continuously during the worker's active career. It takes many forms, including safety manuals and pamphlets, constant reminders by posters, bulletin boards, employee publications and the like, group meetings for the discussion of safety, organized safety contests among various units of a railroad, and

also among the railroads; and daily observation and admonition by supervisors. Every book of rules for railway workers enjoins "safety first," prescribing safe methods in detail and stressing the general rule that "in case of doubt, the safe method shall be followed."

The railway industry also co-operates with national organizations sponsoring and promoting activities in the entire field of safety. The Harriman safety awards, made annually by one of these organizations to railroads in various categories of size, are objects of keen competition throughout the industry.

Although human error and misunderstanding and failures of materials cannot be wholly avoided, the safety-promotion activities of the railroads have been fruitful of substantial progress in safety. During the 28 years from 1921 to 1949, the safety of passenger travel doubled and the safety of workers more than trebled. In relation to total transportation service performed and total hours worked, the chance of the average passenger or worker's being fatally injured is infinitesimal—too small for figures to have meaning. The chance of the average passenger's sustaining even a nonfatal injury amounts to about 1 for every 14,000,000 mi (1949) of travel, while a railway worker averages only about one chance in a lifetime of sustaining injury on the job.

Efficiency of Operation—Performance by the railroads in regard to efficiency and economy of operation from 1921 through 1949 are illustrated in Table XIV, which shows results attained in factors which are recognized indicators of operating performance.

TABLE XIV—Statistics of Railway Operating Performance, Class I Railways

Freight					
Year	Cars per train	Net tons per train	Net ton-miles per train-hour	Gross ton-miles per ton of fuel	Miles per locomotive per day
1921	37.4	651	7,406	12,367	13.2
1929	47.9	1,184	10,310	16,427	89.0
1939	48.5	813	13,450	17,774	104.0
1949	53.0	1,139	17,623	17,450	223.8
1947	52.9	1,146	18,110	17,885	120.0
1948	54.5	1,176	18,778	17,080	117.2
1949	56.8	1,138	19,623	*	113.5

Passenger			
Year	Passenger-miles per train-hour	Miles per locomotive per day	
1921	not available	143.0	
1929	1,881.1	165.7	
1939	2,049	184.2	
1944	6,075	222.9	
1947	4,000	219.0	
1948	3,710	220.9	
1949	3,417	228.5	

*No longer compiled
1936, earliest available

Table XIV shows that between 1921 and 1949 cars per freight train increased by half, and tons of net load (exclusive of the weight of cars) handled by the average freight train increased by three-quarters. Net ton-miles per freight-train-hour—an especially significant indicator because it combines the factors of net load per train and train speed between terminals—were more than two and one-half times as much in 1949 as in 1921. Work done per ton of fuel in freight service was almost half again as much in 1948 as in 1921. Gains in efficiency of passenger operation also were notable, passenger-miles per hour of train operation increased by more than four-fifths from 1926 to 1949. Both passenger and freight locomotives performed about half again as much work each day in 1949, compared with 1921.

Revenues, Expenses and Income—The revenues, expenses and income of class I railways for 1926, 1933 and 1949 are shown in Table XV. The year 1926 represented the year of peak gross revenues prior to World War II, 1933 marked the low point of the depression. Total operating revenues of these railroads reached a wartime peak of \$9,437,000,000 in 1944.

The excess of dividends over net income in 1933 results from the fact that the figures are aggregates for all class I railways, some of which earned much more than the dividends paid but which earnings were offset in the aggregate figures by deficits of other

TABLE XV—Condensed Income Account, Class I Railways (millions)

Item	1926	1933	1949

From surplus	175	68	—
Total	399	96	253
Return on net property investment* (net railway operating income divided by net property investment)	\$22,070	\$23,422	\$21,624
	5.35%	2.93%	2.95%

*Net property investment includes investment in road and equipment, material and supply inventories and cash on hand, less depreciation. Figure shown for 1949 is investment at the beginning of the year. Percentage return on net property investment is computed on this investment.

railroads, also, dividends were paid in some instances from earnings set aside for that purpose in previous years.

The primary financial problem of the railroads of the United States is lack of adequate earnings from their operations. This lack, despite notable advances from year to year in operating efficiency and economy and reductions in debt and annual fixed charges, results principally from increased costs of materials and labour, without fully compensating increases in the rates which railroads may charge for their services. In part, the failure of rates to keep pace with operating costs is a result of competition from other means of transportation. In part, it is a result of the effect of federal and state regulation upon railway rates.

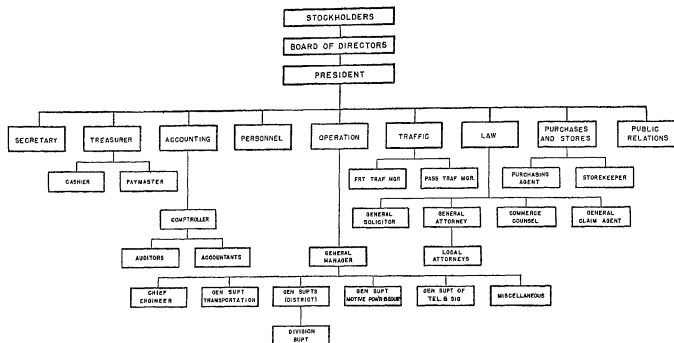

The result of the disparity between rates and costs is that during the 29 years from 1921 through 1949 the return earned by the railroads on their net investment in transportation property (after depreciation) averaged less than 3½% yearly. This was the average return for a period which included the good business years of the 1920s and the five years of World War II when railroads performed their greatest service and collected their greatest revenues. With the rapid rise in costs following the end of the war, the average return earned in 1946 dropped to 2.75% on the net property investment, although total traffic in that year far exceeded any previous peacetime peak. However, the average unit charges at which this traffic was handled actually were below the levels of the 1920s and closely approximated those of years just before the war.

In recognition, and toward the improvement, of this situation, the Interstate Commerce commission, during a period of about three years beginning in the middle of 1946, authorized increases in rail freight rates. These increases in the aggregate were estimated to have raised the general level of these rates by approximately 57%. Increases in levels of passenger rates, varying according to types of service and in different parts of the country, also were authorized during approximately the same period; their aggregate effect was to raise passenger rates by approximately 34%. The percentage of increase in 1949 unit costs of railway operation, compared with prewar (1939), was about double the increase in average freight charges per ton-mile and treble the increase in average fares per passenger-mile.

Operating Methods and Procedures—The Railroad Organization—A modern railroad is an intricate and highly developed transportation plant, requiring for its maintenance and operation many types of facilities and skills. All these must be closely and continuously integrated and co-ordinated, in order to perform

RAILWAYS

TYPICAL GENERAL ORGANIZATION OF A RAILROAD

(Organizational plan and titles of positions vary somewhat among the different railroads)

FIG. 2—TYPICAL GENERAL ORGANIZATION OF A RAILROAD

safely and efficiently their appointed task of moving great numbers of heavy vehicles at high speeds, over all sorts of terrain, day and night, in all kinds of weather. Consequently, there must be a well-knit organization, with established channels of communication and lines of authority.

The basic unit in the railroad industry is the individual railroad. Although the corporate form is common to all railroads, there are many variations in the type of functional organization. Differences are dictated in part by size and individual characteristics, and in part by the desire of each company to evolve the form of organization considered most effective for its activities.

The general functions of a railroad organization are

1. To procure traffic for the railroad and promote the economic development of the area traversed by its lines.

Basically, these functions are performed by each railroad in somewhat similar departments. The organizational plan of a typical railroad in the United States is illustrated in fig. 2. Not all railroads are organized exactly in accordance with this chart, plans of organization, lines of authority and titles of positions vary somewhat among different railroads.

Paramount in the organization are the stockholders, who own the company. They elect a board of directors to represent them in supervising its management. One or more higher officers of the company often are elected as members of the board to assist in its deliberations and to keep it informed as to operations of the company. The board holds frequent meetings, at which matters of policy are discussed and decisions made or advice given on problems of the company, including such matters as authoriza-

tion of large capital expenditures and declaration of dividends.

Heading the actual management, and having responsibility for day-to-day conduct of the company's affairs, is the president, who usually has certain personal assistants. The president determines general policies and sees to their proper execution. He may be elected to that office directly by the stockholders. More often he is elected by the board of directors, who also elect or appoint the secretary, treasurer, vice-presidents and other officers of the company whose responsibilities are of such importance as to suggest that board approval be required. Under the direction of the board, the president and his executive staff (usually the department heads) supervise and direct the business of the company. On most roads, periodic meetings are held by the president and his staff, so that they may keep fully informed at all times on important matters and bring forward matters requiring discussion and decision.

Operating Department.—The operating department, usually under the direction of a vice-president or a general manager, carries all responsibility incident to moving the traffic, and is by far the largest organization on every railroad. A railroad generally divides its lines into a number of smaller units, such as regions, districts and divisions. As a rule, divisions are the primary operating units, essentially, they are small railroads in themselves. Each division is the responsibility of a superintendent.

Functions of a division are subdivided into three major categories: maintenance of way, mechanical (or maintenance of equipment) and transportation, which may be described briefly as follows.

Maintenance of Way.—Maintenance-of-way functions pertain to right of way, track, bridges and signals, as well as stations and structures along the line. The division engineer is responsible for their upkeep, renewal and frequent inspection. He has a staff of supervisors in charge of various phases of the work on his division. Track is divided for maintenance purposes into sections, with a section gang in charge of work on each section. Extra gangs supplement the work of section gangs when necessary, and gangs specialized for various types of work construct and maintain other roadway facilities. On some railroads, responsibility for

track and structures is segregated in an engineering department, separate from the operating department.

Mechanical—Mechanical functions are primarily the inspection, servicing and maintenance of rolling stock—cars and locomotives—and the operation of shops, roundhouses and other mechanical facilities. The division staff is usually headed by a master mechanic, under whom are foremen in charge of engine-houses and other maintenance shops, and motive-power and car inspectors. The division organization usually is responsible for minor repairs and for necessary servicing between trips, major repairs and periodic overhauling are performed as a rule in large centralized shops equipped for those tasks. In some cases, these latter shops are under the division superintendent's direction, in others, they are in charge of the principal mechanical officer of the railroad.

Transportation—Transportation functions are concerned directly with the receipt, movement and delivery of freight and the transportation of passengers, mail and express. The transportation staff of the division is headed by the trainmaster, who has immediate supervision over all trains and terminal activities. His subordinates include yardmasters, who have charge of switching and terminal work, dispatchers, who direct train movements, stationmasters and agents, and the engine, train and yard crews.

Departmental or Divisional Organization—Although organization structures of most railroads follow the same general pattern, with variations as to detail, there may be substantial difference in organization of the operating department. Some railroads have adopted what is known as the departmental type of organization, while others are organized along divisional lines. Other railroads utilize various combinations of both types of organizations.

Under a departmental organization, each of the three general functions (maintenance of way, mechanical and transportation) is the responsibility of a department extending from top to bottom of the railroad's organization. Thus, the divisional trainmaster or superintendent of transportation reports to a transportation department in the general or headquarters offices, the master mechanic reports to a mechanical department and the division engineer reports to a maintenance or engineering department. This plan finds justification in the technical character of these functions and places reliance upon reports, interdepartmental co-operation and carefully designed working arrangements for co-ordination. The function of the division superintendent in a departmental organization is to co-ordinate and supervise the departmental activities in his territory.

In the divisional plan, the superintendent is in command of the division, and the trainmaster (perhaps more than one on some divisions), master mechanic and division engineer report to him. This arrangement places responsibility for all divisional functions on the superintendent, with the officers just mentioned functioning as his staff. Higher echelons are similarly organized, with each operating executive flanked by staff maintenance, mechanical and transportation representatives.

In one form of combination arrangement, the division superintendent applies himself mainly to supervision of train movement, with some supervisory attention to mechanical and maintenance-of-way activities, especially as they affect train performance, however, detailed supervision of mechanical and maintenance-of-way matters is exercised by the departmental head in charge.

Other Operating Activities—Besides its three principal components—maintenance of way and structures, mechanical (or maintenance of equipment) and transportation—the typical operating department has a number of other subdepartments. These latter may variously include such functions as mail service, highway transport service, car service and distribution, station and freight transfers, police protection, safety promotion and supervision and labour and wage bureaus.

There were in 1949 about 1,200,000 workers on the U.S. railroads, of whom about 90% were in the operating department. Those who actually manned the trains numbered about 130,000

and another 120,000 or so were in the yards and terminals. With this force of train and yard workers, the railroads performed in 1949 more than 526,000,000,000 ton-miles of freight service and 35,000,000,000 passenger-miles of travel service. This relatively small number of workers could perform so great a volume of transportation service because of efficient plant and facilities and because of the co-operation received from their teammates in the railroad organization—the 235,000 who maintained the roadway and track, the 320,000 who worked in the shops and storehouses, the 145,000 working in stations or out on the line as station agents, telegraphers, towermen, crossing flagmen, etc., and the numerous clerks and supervisors having to do with these and miscellaneous other activities of the department.

Traffic Department—The traffic department is the commercial or sales organization of the railroad. It is responsible for development and procurement of traffic and for formulation of rates and charges, plus the duty of keeping the public informed as to the various services provided by the railroad. Usually it is divided into freight and passenger departments, and often there are other departments in charge of industrial development, agricultural matters and foreign or other specialized traffic.

The chief traffic officer and the traffic manager, his lieutenant, keep constantly informed of conditions affecting traffic along their lines, and also conduct relations with customers of the railroad and with connecting carriers in respect to interchange of traffic. The general passenger and general freight agents, working under the direction of department heads, seek freight and passenger traffic for the railroad, compile and publish rates and rules pertaining to the movement of traffic, and directly attend to special needs and problems of patrons. Subordinate traffic agents are located along the line and in principal off-line cities to serve shippers and passengers.

The industrial development officer assists new industries to find locations along the line, and in general seeks to increase the railroad's traffic by increasing business activity in the territory it serves. The agricultural development officer is concerned with promoting productivity and general welfare of agriculture in the railroad's territory. The foreign traffic officer seeks to develop export and import traffic. In addition, the traffic organization may include some or all of the following: coal traffic manager, livestock agent, mail and express manager, baggage agent, superintendent of dining car service and others.

Secretary, Treasurer and Finance Department—The secretary is responsible for keeping the records of the board of directors; he maintains custody of its minutes, and the contracts and agreements authorized by it. In addition, he keeps books showing the ownership of capital stock, and he issues, transfers and cancels stock certificates.

The treasurer is custodian of the company's funds and securities. He is responsible for collection of all money due the company and for payment of all money owed by it. The same person may be both secretary and treasurer.

On large railroads, the treasurer generally performs his duties under the direction of a vice-president in charge of finance, who has the responsibility of seeing that financial needs of the company are properly met. The finance department is responsible for the issuance and acquisition of the railroad's own securities and the sale or exchange of stocks, bonds and other securities owned by the railroad.

Accounting Department—The accounting department, usually headed by a vice-president, comptroller or general auditor, records transactions of the railroad, performs accounting required in connection with its operations and makes reports thereof to the management and to regulatory authorities as required. Among its responsibilities are the auditing of accounts, bills, vouchers and pay rolls and the compilation of statistics.

Law Department—The law department advises the management on financial and corporate matters and legal matters generally, and represents the railroad in litigation. It is concerned with all the legal problems which confront any large employer or the owner of large holdings of real estate and other property. In addition, it also has to do with many special legal problems arising

from the fact that the railroad industry is subject to comprehensive regulation, with respect to rates and innumerable other features, by federal, state and municipal authorities. Duties of the law department cover a wide field, including corporate matters, all forms of taxation, labour disputes, damage suits and claims, contracts, and rate cases and other proceedings before governmental regulatory bodies.

Purchasing and Stores Department—The purchasing and stores department procures stocks of materials and supplies—including 100,000 or more items—required by the railroad and distributes them as and where needed. It is responsible for seeing that materials and supplies ordered meet the specifications of the railroad, are purchased at a fair price and are received at the proper time. Stocks must be maintained at an efficient level, avoiding unnecessary investment in inventory while ensuring availability of quantities needed for current requirements. They must be properly and economically received, checked, stored and issued upon requisition, with proper maintenance of necessary records. Conservation and reclamation of materials and the preparation, classification and sale of scrap also are responsibilities of the purchasing and stores department.

The department is usually headed by a vice-president or purchasing agent. Supervision of the stores of materials and supplies, both at central locations and at convenient distribution points along the line, is customarily the responsibility of a general storekeeper. Materials inspectors check the quality and uniformity of supplies received. The department also may include such subordinate officers as a fuel purchasing agent, stationer, equipment assistants, division and local storekeepers, managers of scrap and reclamation, and so on.

Personnel and Public Relations—Because of the increased complexity and importance of employee relationships and the negotiation and administration of the contracts between railway management and labour organizations, many railroads have set up special personnel departments in charge of such matters. The head of such a personnel department is usually a senior officer of the railroad, reporting directly to the operating vice-president or to the president. On some railroads he has the rank of vice-president.

Responsibility for the railroad's relations with the public is and must be that of the chief executive officer. He alone can give direction to the policy of the entire organization as it affects these relations. Therefore, public relations usually is a function of the president's office, under the immediate direction of a staff assistant, in some instances a vice-president. An important part of his work is to provide public information.

Other Departments—Some railroads have other departments, the names of which describe their functions. These include the medical department, the real estate and tax department, the insurance department and the police department. On large railroads, these are good-sized departments, on small railroads, their functions often are part of departments already described.

Close Working Relations Among Railroads—Every railroad (or system of railroads) in the United States has its own separate organization and is operated by its own management for the profit of its owners, subject to government regulation. At the same time, co-operation and reciprocal working relations among these railroads have progressed to such a degree that, so far as users of their service are concerned, they constitute in a real sense a unified and integrated system of transportation. This close working relationship also embraces railroads of Canada and is shared in important respects by those of Mexico and Cuba.

The extent of such co-operation among railroads in serving the

public is indicated by the fact that any shipper anywhere may load a freight car for direct movement, without transfer or other break of bulk, to any receiver of railroad freight anywhere in the United States, and also in Canada and large areas of Mexico and Cuba. Moreover, co-operative arrangements among railroads are such that a freight shipper need have only one transaction with one railroad—although his shipment may travel over lines of several railroads on way to its destination. Similarly, a passenger may buy a ticket in one transaction for a journey of any length, although he may actually ride in cars and over lines owned by several railroads during his trip. All accounting and financial procedures for collection of charges for such interline movements, and their distribution, are handled by joint arrangements in which all railroads participate.

All this standardization and co-operation, and other features which will be described, have come about entirely through the initiative of private ownership and management and not through force of governmental direction or compulsion. Some of the co-operative arrangements along these lines had their beginning as far back as the 1860s.

Railway Associations—A large share of the standardization and co-operation of the railroads of the United States—with those of Canada, Cuba and Mexico also participating in important respects—has come about through activities conducted by or under the auspices of the Association of American Railroads (and its predecessor groups). This association is a voluntary organization in which are represented approximately 200 of the principal railroads of the United States, Canada, Cuba and Mexico. Other railroads all over the world, numbering more than 160, are associate members and share in the benefits of the association's work. Activities of the association are carried on under the supervision and guidance of a board of directors, elected by votes of the member railroads.

Among accomplishments of co-ordinated joint activities are standardization of gauge of track, standard time, standard rules of operation and standard equipment of cars. Others include effective arrangements for interchange of cars among railroads, for return of cars to their owning railroads after use by or on other railroads, for establishment of charges for such use, for repair of cars when away from owning railroads, for collection and remittance of revenue from interline movements, and other interline working arrangements. These joint arrangements enable the user of railway service to have the benefit of facilities of several railroads while dealing with only one railroad.

The American Short Line Railroad association serves a membership of somewhat more than 300 smaller railroads (including some which also are members of the Association of American Railroads). Other associations through which standardization, co-operation and progress in the railroad industry are promoted include the American Railway Car Institute, American Railway Engineering association, National Railway Appliances association, Railway Association of Canada, Railway Business association, Railway Supply Manufacturers association, Railway Tie association and numerous regional and professional groups.

American railroads also co-operate with those of other countries. In the western hemisphere this co-operation is through participation in activities of the Pan American Railway Congress association, with headquarters in Buenos Aires, Arg. The United States government is an official member of this hemispheric organization, by act of congress. The Association of American Railroads also is a member and takes part in the activities of the International Railway Congress association, with headquarters in Brussels, Belg., and with membership composed of railroads all over the world.

Track, Structures and Communications—The track is the responsibility of the engineering branch of the operating department—or, on some roads, of a separate engineering department. This responsibility includes also the numerous bridges, tunnels,

FIG. 3.—TYPICAL SECTION OF RAILROAD ROADBED AND TRACK

passenger and freight stations, water and fuel facilities, crossing-protection devices, whistle posts, mileposts and right-of-way markers, snow fences and cattle guards, and all the other large and small structures that go to make up a railroad. In addition, the chief engineering officer may have charge of the communications department, including the signal, telephone, telegraph, printing telegraph and radio communications systems.

Track—Track has three main functions, simple to state but involving many difficult problems of economics and technical skill. It must support the load, provide a smooth surface for easy movement and guide the wheels of the train.

Grade and Curvature of Line—The railroad line should be as level and straight as can be achieved without excessive cost, because grades and curves increase the burden on the locomotive and the wear on track. The tractive effort required to pull a load up a 1% grade is about five times what is required on straight level track, and a curvature of 1° requires an increase of from 12½% to 25% in tractive effort.¹ The effect is greatly to reduce the load which a given locomotive can pull, or the speed it can make, or both.

This is an important question of transportation economics, often involving intricate calculations of cost of avoiding or removing grades and curvatures against operating savings which may be expected to accrue from so doing. The key factor in such a calculation usually is the volume of traffic, present or expected, as traffic volume increases, additional operating costs caused by grades and curves also increase, thereby tending to encourage investment to flatten and straighten the line.

Where it is uneconomical or physically impossible to avoid or remove heavy grade or curvature—as in mountainous country—additional locomotives must be used to handle a given tonnage at a prescribed speed. The extra power may be assigned either to the individual train, by double-heading with two or more locomotives or units, or by assigning helper or pusher locomotives to assist all trains at some particular locality, such as the approaches to the summit of a mountain pass.

Roadbed—Good track starts with the roadbed, or foundation, which should be firm, well drained and of adequate dimensions. It may be necessary in some localities to dig out the original soil to the proper depth and replace it with suitable earth or other material brought in from elsewhere. (Fig 3 shows a cross section of roadbed and track on a typical single-track railway line.)

Rail—Steel rails support the load which locomotives and cars impose on the track, ties support the rails and ballast supports the ties. To get the right combination of materials and design requires extensive and continuing research and experimentation. The present shape and weight of rail have evolved gradually to meet operating needs. At the beginning of the 20th century, rail weighing as little as 56 lb to the yard was not uncommon. Today, rail weighing as much as 150 lb or more to the yard is in use, on lines handling heavy traffic. The average weight, per yard, of rail in main tracks of railroads in the United States increased from 83 lb in 1922 to 101 lb in 1948.

The use of the so-called T-rail (from its shape) has persisted in the United States since about the middle of the 19th century, because experience has shown that it is the most practical and economic form of rail. Recent development and use of methods of electronic measurement, by means of which strains in any portion of the rail under service conditions may be accurately determined, has made possible marked refinements and improvements in the contour, or cross section, of rail.

Ties and Appurtenances—The tie keeps the rails the proper distance apart, supports them and transmits the load to the ballast cushion or shock absorber beneath. There are 1,000,000,000 ties in the tracks of American railroads, and approximately 35,000,000 to 40,000,000 of them are replaced each year because of decay or mechanical wear. With modern methods of chemical treatment, the service life of ties has been approximately trebled, from less than 10 years to more than 20 years on the average.

In many places, treated ties which have been in use for 25 to 30 years are still giving good service. To reduce mechanical wear from impact of loads transmitted through the rail, metal tie plates are inserted between the rail and the tie. These plates spread the rail burden over a wider tie area, and thus help to protect the tie from the cutting or wearing effect of the rail base. Much study has been given to improving the design of tie plates. Wheel friction causes a tendency for rails to "creep" longitudinally, especially on multiple tracks where the trains generally run in the same direction on each track. Small anchors, or "anti-creepers," applied to the rail and bearing against the edge of the tie, are used to check this movement.

Ballast—Ballast, usually of crushed rock, cinders, gravel or mine waste and tailings, supports and cushions the ties and helps to keep them in proper position, as well as helping to distribute the track load over the roadbed. It also facilitates drainage, thereby promoting firmness and smooth-riding qualities of track. Ballast tends after a time to become foul with dirt, which impedes its drainage qualities. It then needs to be cleaned or replaced. Grass, weeds and other vegetation also must be removed or prevented from growing.

Superelevation—As a train enters a curve, its natural tendency is to continue going straight ahead. It turns only because the outside rail forces it to do so. To permit trains to traverse curves with safety and greater smoothness, the outer rail is super-elevated, or raised above the height of the inner rail, so as to balance the forces set up when the movement of the train is diverted from a straight line by the rails of a curve. Too little superelevation throws excess weight and pressure on the outside rail, too much throws it against the inside rail. The right amount of superelevation for a given curve depends on the train speeds which the track must accommodate; high speeds call for more superelevation, but the amount needed for a fast train may constitute an appreciable excess for a heavy freight train. In practice, therefore, the superelevation on a curve usually is a compromise between the speed ranges of the trains which use the curve. A 2° curve can be smoothly and safely rounded at 80 mi an hour with a superelevation of five inches for the outside rail. For sharper curves, or if the track is also used for slow trains which do not permit so much superelevation, speed must be reduced. For smooth riding qualities, both superelevation and curvature are introduced gradually, being slighter at the approaches to the curve, building up gradually as the curve is fully entered, and then tapering off again as the end of the curve is approached.

Track Developments and Improvements—Developments in track have proceeded along two principal lines: (1) strengthening and improving it to bring about better riding qualities and permit greater wheel loads and train speeds, and (2) providing a track structure which can be more economically and efficiently maintained.

Maintenance-of-way work has become increasingly mechanized for greater productivity and economy. Railroads now use large numbers of adzing machines, power augers, ballast cleaners, ballast plows, bolt wrenches, bulldozers, ditching machines, power jacks, rail cranes, power rail drills, power rail saws, power shovels, spike drivers, spike pullers, tamping machines, tie borers, track motor cars, weed burners, weed mowers and power wood saws. Many of the larger items of track machinery are self-propelled and work from alongside—instead of on—the track, thus both avoiding interference with train movements and saving certain costs.

Bridges—About 3,750 mi of railway line in the United States are on bridges, made of wood, steel or concrete. (See also BRIDGES.) Railway bridges involve unique problems of design to allow for forces resulting from the pounding wheels of cars and engines, the thrusting motion set up by the sideways of the train, the initial, concentrated impact when the engine first comes onto the bridge; the drag effect of the train should it be braked on the bridge, and the push of the driving wheels when it starts again.

All these forces vary with the size, weight and other character-

¹A grade of 1% means a rise of 1 ft in a distance of 100 ft. A curvature of 1° means that a rail drawn from the ends of a 100-ft chord of the curve form the sides of a 1° angle.

istics of cars and engines to be used. After a bridge is built, newer types of locomotives and cars often come into use, setting up greater stresses and strains than the original design anticipated. The bridge then must be strengthened, or else train operation must be restricted as to weight or speed, to keep stresses within safe limits.

Much the same is true with respect to other roadway structures; the design must conform to and be integrated with other phases of operation. For example, inauguration of larger types of locomotives may entail lengthening stalls and raising roofs in round-houses to accommodate them, and call for changes also in train sheds at stations. It may also require strengthening turntables or installing larger ones. Again, a change to diesel locomotives requires the provision of facilities to store and deliver their fuel oil and otherwise service them.

In short, every important change in any one aspect of railway operation involves more or less extensive changes elsewhere. Hence, new equipment and devices for railroading must be thoroughly tested and their performance fully demonstrated before they are adopted on a general scale. Railroad service is the sum of many interacting and co-ordinated details, each of which must measure up to prescribed standards of reliability and efficiency.

Communications—Speedy, safe and dependable operation of trains requires good communication between operating headquarters and train crews, way stations, signal towers, yards and so on. The far-flung nature of railroad plant and organization also requires good communication for managerial co-ordination and control of operations. Communications systems generally consist of telephone, Morse telegraph, telegraphic typewriter, radio, induction and loudspeaker facilities.

Telegraph and Telephone—With development of the telegraph, the telegraphic train order was used to supplement rules and running rights for train operation prescribed in the operating timetable. By 1889 a standard code of rules had been adopted by all major railroads to systematize and standardize the issuance and interpretation of train orders. The telephone, too, has become indispensable to railway operation since it was first installed on the railroads in 1877. The telegraphic typewriter, by means of which messages typed out at the sending end are transmitted by telegraph and automatically retyped at the receiving end, likewise has made for itself an important place in railway operation. Morse telegraph is still used to some extent for train orders in dispatching trains, and also for reports and other communications.

Over the years, the telephone and telegraph systems of the railroads have become closely interrelated, especially since it has become practicable to use the same wires for both telephone and telegraph circuits. It is possible for the same group of wires to carry two train-dispatching circuits between train-order offices, several message circuits to freight houses, yard offices, passenger ticket offices and other points, a so-called "overhead" system for messages and conversations, and printing telegraph circuits.

Radio—Radio is extensively and advantageously used on the railroads in the following ways: end-to-end train communication—between men in the engine or caboose and the conductor, or other employee on the ground, and between one train and another train when approaching or passing each other, fixed point and train—for yard operation and between a dispatcher or other fixed point and a moving train (including emergency situations where communication is desirable between a central point and a derrick, snowplow, fire-fighting apparatus or the like), emergency service to bridge gaps in communications resulting from flood, storm or accident, remote direction and control of train operations in areas where centralized traffic-control systems (described under *Signals*) are used.

Induction Systems—Results similar to those obtainable by the use of space radio are achieved on railroads through the use of induction systems. Such a system makes use of the rails and of wire lines adjacent to the track to convey telephone messages by means of a carrier current, picked up by induction. Continuous wire connections are not needed, as with ordinary telephone communication. Induction systems have sometimes been described as "wired wireless."

Radar—Radar is being used by railroads for speeding up, with safety, the operation of ferryboats and of tugboats used in connection with railroad lighters and car ferries in large port cities. However, there are important physical differences between using reflected-beam electronic devices on an aircraft above the earth's surface, or a ship at sea, with free radio or radar access to any point on the surface within range of its radio equipment, and the use of these devices on a surface vehicle passing roadside obstructions and threading around curves, through hills or tunnels and across bridges. (See also *RADAR*.)

Signals—Signals are a form of communications which are addressed to employees in charge of trains, and especially to the locomotive engineer, to inform them concerning the track ahead. Originally, trains in the same direction were spaced on a time-interval basis, and meets of trains moving in opposite directions were made either according to operating timetables or on special instructions from the dispatcher, delivered to engine and train crews in the form of written train orders. As traffic density increased, on certain lines, the principle of block signals was developed to substitute space intervals for time intervals between trains. Under this system, a line of railroad is divided into blocks or segments of various lengths, depending on traffic conditions, and trains are restricted in following or moving against each other into any one block. On lines of still greater traffic density, the manual block system has been largely replaced by automatic block systems, which by 1950 were in use on more than 105,000 mi of track. In that year, more than 90% of all railway passenger travel was over tracks equipped with block signals.

Automatic Block Signals—With automatic block-signal systems, the train itself operates the signals. The key to the system is the track circuit, with the rails acting as conductors of an electric current. If the normal flow of current is short-circuited, or shunted, by the wheels of a train in the block, or interrupted by the opening of a switch, a break in a rail or otherwise, the signal automatically displays a "stop" indication at the entrance to the block. At the same time, the next signal back (and ahead, on single track) will also change, to show that the second block forward is occupied.

With this development, train movement is not dependent on a block-signal operator or other employee to obtain the necessary information and set the signals, and the capacity of the individual line is greatly increased. More trains can be handled, and service is improved.

New methods of transmitting electrical impulses have increased the flexibility and efficiency of block-signal systems. The faster the train, the more space needed to stop it. One way to meet this need is to increase the length of blocks, but this means that slower trains are impeded by the greater distance between signals. With the use of "coded circuits," it is feasible to have signals display five indications—clear-proceed, three degrees of caution and stop—the position of signals being controlled by means of coded variations in rate of pulsations in the current. Thus, it is possible to give the engineman information on conditions three blocks ahead. In at least one installation, there were five-indication signals which covered the situation four blocks ahead.

Cab Signals—Cab signals, located on a panel in the locomotive cab, facing the engineer, are sometimes used to supplement or replace signal indications on a pole or mast beside the track. The cab signal reproduces in miniature the indication of the wayside signal. Where cab signals are used, any change within a block after the train has passed the wayside signal at the entrance is immediately conveyed to the engineer.

Automatic Train Control—Further in connection with the use of block-signal systems, automatic train-control (A.T.C.) devices are used in some situations. Different methods have been adopted, but their common purpose is to stop a train, or reduce its speed, automatically, if the engineman fails to act in accordance with requirements of the signal indication.

Automatic Interlocking—Where tracks cross, automatic interlockings are extensively used to increase safety and reduce costs. In these devices, switches, locks and signals are so interconnected that their movements must follow each other in predetermined

order, thus ensuring that conflicting movements cannot take place. Thus, when switches and signals have been set for a train to move over the crossing, the mechanism is automatically locked against any conflicting movement until the first movement has been completed, and signal indications are displayed, close to the crossing and also at a considerable distance from it, against any such conflicting movement. The interlocking mechanism may function either electrically or mechanically.

Interlocking devices not only provide positive protection at track crossings but also obviate the necessity for many train stops, either to see if the crossing is clear, or to wait for another train to clear it. Thus, they often save the considerable cost of stopping and starting a train.

Route-Type Interlocking—A similar device, for the same purpose and also based upon the automatic-interlocking principle, is the "entrance-exit" (NX) or route-type mechanism, which has been installed in many large passenger and freight terminals and other localities where movements are made through an intricate track layout. With such an installation, the tower operator presses a button for the track on which the layout is to be entered and another for the track of exit. The mechanism then automatically selects the proper route of movement through the layout, sets all the switches and signals involved and locks them against conflicting movement, the locks being released as the engine or train clears various points on the route.

Centralized Traffic Control—As a further development of block-signalling techniques, it is possible by means of centralized traffic control (CTC) to direct train movements entirely by remote control. Orders to train crews are not needed. Instead, switches and signals over many miles of line are controlled by a single operator, sitting before a panel or switchboard in a control room. Before him, the location of each train is shown automatically on an illuminated diagram of the line. Below the diagram are knobs which govern each signal and small levers which govern each switch on the line. By his exact visual knowledge of where trains are, the operator can arrange closer meets between opposing trains as well as faster run-arounds of slow trains by fast ones. Track capacity is so greatly increased under CTC operation that this increase often postpones or eliminates the expense of multiple tracking.

Rolling Stock—Design and upkeep of railroad locomotives and cars and, usually, their construction are under the charge of the mechanical department of a railroad. Men involved, at headquarters and on the divisions, include the chief mechanical officer, chief of motive power, chief of fuel and locomotive performance, mechanical engineer, electrical engineer, superintendent of rolling stock, machinery supervisors, chemists, engineers of tests, master mechanics, shop superintendents, chief locomotive and car inspectors, air brake and steam heat supervisors, supervisors of electrical equipment, supervisors of boilers and welding and so on. Functions of the mechanical department are carried on in locomotive and car shops, roundhouses and engine terminals and lake locations.

Locomotives—Locomotives may be classified in several ways: according to use, as freight, passenger and switch (or yard); according to kind of power, as steam, electric or diesel, according to fuel used, as coal, oil, gasoline or distillate; and according to method of power production or utilization, as diesel-electric, reciprocating-piston, steam-turbine and gas-turbine. Whatever the source of power or method of its utilization, all locomotives depend on adhesion of wheels to rails to transform power into motion. Given enough weight, the application of power will cause the wheels to turn along the rail, instead of slipping and spinning in one spot, and the locomotive will move in the desired direction. (See also LOCOMOTIVE.)

Steam Locomotives—Capacity and efficiency of the modern steam locomotive have been increased steadily by improvements in its component elements. Higher sustained speeds, with greater economy of operation, are achieved through increased boiler pressure and improvements in combustion efficiency. The modern locomotive produces more steam per pound of fuel used and accomplishes more work per pound of steam produced than its predecessors.

Steam locomotives are often described in terms of wheel arrangement, listing in order the numbers of leading or "pony" wheels, the drivers and the trailing wheels. In a 2-8-4 locomotive, for instance, the engine has two small wheels on a leading axle, then four axles with eight driving wheels, connected, and finally a trailing truck with four small wheels. The leading axle helps to support the front end and also is important in guiding the locomotive around curves. The trailing truck supports the firebox and part of the boiler.

A modern 2-8-4 steam freight locomotive in working order weighs about 375,000 lb. Contained within its 49-ft. length is a boiler developing steam pressure of about 270 lb. per square inch. Its tender carries 30 tons of coal and 20,000 gal. of water. The coal is burned in a firebox approximately 13 ft. long and 8 ft. or 9 ft. wide—the size of an apartment bedroom. The heating surface provided by its many tubes and flues is about 6,000 sq ft., and superheaters add another 3,000 sq ft. An articulated type of locomotive with two sets of driving wheels, such as the 4-8-8-4, is even larger. These huge machines have the frames hinged in the middle to facilitate movement around curves, hence the term "articulated."

Much research and many new devices contributed to the attainment of this stage of development. For example, the power of a locomotive increases in direct proportion to the steam pressure in the boiler (other factors being equal), and working pressures now commonly used are 25% to 50% higher than before World War I. By passing steam through nests of small tubes inside the fire flues of the boilers, it is superheated and dried so that its temperature can be brought up from around 375° F. to 700° F. or more, and the power of the locomotive thus further increased, without additional increase of steam pressure.

Good combustion of fuel is an important element of steam locomotive efficiency. Elimination of smoke is important, not only because smoke indicates imperfect combustion but also because it is otherwise objectionable. Therefore, special research has been devoted to improvement of combustion by locomotives. Overfire air jets, which inject additional air to bring about more complete burning of coal particles in the firebox, and new designs of air passages are among means adopted to this end.

Similar research and development have taken place all along the line. The automatic stoker feeds coal into the firebox to supply the quantities of fuel needed by large modern locomotives and to keep the right kind of fire over the entire grate area. Arch tubes, circulators and siphons installed in the firebox promote water circulation in the boiler and increase heating surface. Feed-water heaters draw heat from otherwise wasted exhaust steam and use it to preheat water passing from the tender to the boiler. Welded boilers reduce both weight and maintenance cost. With improvements in foundry practice, the entire frame of the locomotive can be cast as one huge, integral part, thus solving certain important technical problems. Roller bearings permit easier starts and increase the availability (working time) of locomotives. Automatic oils provide lubrication to the multitude of working parts. Booster engines, working through gears on the trailing axles, give additional tractive power for starting and for slow-speed operation. Flues, valves, grates, pistons, cylinders and so on have been improved as research produced new materials and new designs.

Changes such as these do not ordinarily attract general public notice. Their greatest effect has been on the type and amount of work output of the locomotive. In 1918 the railroads had 63,500 steam locomotives in service, in 1943 they had approximately 33,000. During these three decades, however, the pulling power of the average steam locomotive had increased by about 60%, and the work performed by a freight train in one hour, measured in tons carried one mile, had increased by about 150%. This increase of 150% represents advances not only in locomotive work output but in general operating efficiency in all its elements.

Improvements for one purpose often bring problems in some other direction. Treatment of boiler water for locomotives affords an illustration. Virtually all water contains natural impurities. Certain of these impurities may damage the boiler or form a scale

which shortens the life of the metal and also reduces the ability of the surfaces to conduct heat. Numerous chemicals have been developed to treat water by eliminating or neutralizing impurities, either in the boiler, the tender or the wayside water station, and to prevent or remove scale deposits in the boiler by flushing out the impurities as sludge. Water-softening plants treat the water before it is delivered to the tenders. Automatic blowoff systems are installed on locomotives to control foaming and sludge. Experimental installations have been made with ion-exchange resins, which remove calcium and carbonate materials.

Electric Locomotives—The electric locomotive draws its power from central generating stations, unlike other locomotives, which are limited to the capacity of their own power equipment. Since a relatively small percentage of all trains use maximum power at any one time, large reserves of power are available when needed. The initial investment in power lines and other appurtenances of electrified train operation is high, but operating cost is low. Hence, electrification is most efficient under dense traffic conditions, where current for power can be centrally generated in great volume and delivered to motors on trains at low cost. Systems of electrified operation vary in type and voltage of current used, methods of transmitting current to the locomotives and types of locomotives. Later installations use an overhead line carrying 3,000 v to 11,000 v.

Because the electric locomotive does not contain power-generating equipment, it is generally lighter in proportion to horsepower than the steam or diesel-electric locomotive. Its ability to draw on reserves of power provides overload capacity which enables it to accelerate rapidly and smoothly. It also has a high degree of availability for service, and can be used interchangeably for freight and passenger operations. A distinctive feature is that on long downgrades electric motors on the locomotive may be used as generators. In so doing, they serve to hold back the train without using the regular brakes, which has some operating advantages. This regenerative braking produces electricity which flows back into the power line. Thus, the weight of a descending train helps to provide power for ascending trains.

Electrified service was operated on approximately 2,700 mi of road as of 1950, with about 6,600 mi of trackage of all kinds. Among principal operators were (in descending order of track mileage), the Pennsylvania railroad; the Chicago, Milwaukee, St. Paul and Pacific railroad, the New York, New Haven and Hartford railroad, the Illinois Terminal railroad, the New York Central railroad, the Long Island railroad, the Virginian railway, the Norfolk and Western railway, the Reading company; the Sacramento Northern railway, the Delaware, Lackawanna and Western railroad, and the Illinois Central railroad.

Diesel-Electric Locomotives—The diesel-electric locomotive is essentially an electric locomotive which supplies its own power instead of drawing it from a central generating station. It thus provides some of the distinctive operating advantages of the electric locomotive, while avoiding the high initial investment required for electrification. Its power supply is derived from an internal-combustion engine that compresses air in a cylinder and then introduces a spray of oil fuel, which is ignited by the heat of compression. Because the diesel engine burns its fuel right in the cylinders where it is to work, instead of in a separate boiler, it gets out of a pound of fuel about four times as much work as does the steam locomotive. It also is able to use compression ratios much higher than those of gasoline engines, which means that again it gets more work out of its fuel.

Illustrating its high degree of fuel efficiency, the diesel engine can produce 625 gross ton-miles of service with one gallon of diesel fuel oil. By comparison, the average automobile produces only 20 to 30 gross ton-miles on a gallon of gasoline, and a four-engine cargo aeroplane produces 30 to 40 gross ton-miles on a gallon of high-octane gasoline. A tankful of 5,000 gal. of diesel fuel will take a 100-car freight train about 650 mi.

The steam engine drives the wheels directly, with the power controlled through the amount of steam admitted to the cylinders to drive the pistons. By contrast, the diesel engine, like the

automobile engine, requires a transmission arrangement to vary the power application from a high level in starting to lower levels as required. Mechanical, hydraulic and pneumatic methods of transmission have been used, especially on smaller units, but most diesels now in use on railroads have electric transmission, and hence are called diesel-electric locomotives. In these locomotives the diesel engine drives a generator, producing a variable current of electricity to operate electric motors, which are geared to the wheels.

Perhaps the greatest advantage of the diesel-electric over the steam locomotive—surpassing in importance the high fuel efficiency—is its high availability factor, it can work more hours of the day and more days of the year without the time out needed by the steam locomotive for attention to its fires, boiler, coal and water replenishment and the like. The diesel can carry enough fuel for long nonstop runs, and it needs little water other than that required to generate steam for heating the train. Like the electric locomotive, the diesel-electric also can reverse its motors to use them as brakes on long downgrades. Since there is no trolley wire into which the electricity thus generated can be fed, it is dissipated as heat, through radiators in the roof.

Questions of weight and size make it desirable to build diesel locomotives in units, each of which may have one or two engines. It is not uncommon for trains to be pulled by three or four of these units, each having a capacity of from 1,350 h p to 2,000 h p. A high-speed passenger locomotive may comprise three units, producing a total of 6,000 h p. One or more of these units can be cut out of use at times, as needs for power vary during the run, thus enhancing flexibility and economy of operation. A 5,400-h p freight locomotive with four units may be more than 190 ft long and weight 900,000 lb in working order. Each of its eight sets of trucks has two traction motors, with gear ratios according to type of service.

Diesel-electric locomotives are more costly to build than steam locomotives of equivalent power, but where they can be scheduled so as to keep them intensively working they can make at least twice the monthly mileage of similar steam locomotives. Thus, their higher costs may be distributed over enough mileage to obtain the benefits of diesel-electric service at no additional, or in many cases substantially less, cost per mile.

The distinctive advantages of diesel-electric locomotives under favourable conditions led to rapid progress in their utilization. In 1949 these locomotives performed somewhat more than one-third of all freight service and approximately one-half of all passenger and switching service of class I railways (including switching and terminal lines).

New Types of Locomotives—Tests of turbine locomotives indicate that they have considerable promise in the way of greater fuel efficiency, lower operating costs and smoother operation. There were several types of turbine locomotives under development in 1950. Coal-burning steam turbine, coal-burning gas turbine and oil-burning gas turbine, with some variations among these according to whether the power is mechanically or electrically transmitted. In the steam-turbine locomotive, steam under pressure is directed against the blades of a turbine wheel, instead of against reciprocating pistons operating in cylinders. In one type of gas turbine, a crushing process using compressed air breaks up coal into fine powder. This powder is burned under pressure to produce a very hot gas, which drives the turbine. Similar experiments were being made with the use of oil for fuel.

Choice of Power Types—With steam, electric and diesel-electric locomotives already developed to high degrees of efficiency, and with several types of turbine locomotives under energetic research, development and test, railroads have a wide range of types of power supply. Each type has certain characteristics which adapt it for certain kinds of service, thus facilitating selection on the basis of operating economy and efficiency.

Passenger-Train Cars—Passenger-train cars are of two principal types, passenger-carrying and "head-end." The latter, so called because in trains they usually are placed just behind the engine, include cars for transporting mail, baggage and express or some combination of two or more of these. There also are some

combination head-end and passenger-carrying cars. Mail cars are of two principal types—cars for transportation only, and railway post office (RPO) cars, in which mail is received, distributed and otherwise handled enroute by postal clerks, as in any other post office.

Passenger-carrying cars are of several types. They include coaches and sleeping, parlour, dining, club, lounge and observation cars. Some of these types also are combined. Virtually all passenger cars now in regular use are built of steel or some metal or alloy of equivalent strength and are equipped with air conditioning. Great strides have been made in designing passenger cars to save weight while maintaining ample safety factors. One innovation in car design is a type of car permitting passengers to sit high up in a glassed enclosure, whence they can see in all directions. Other features of modern passenger equipment include tight-lock couplers, holding cars tightly together and thus helping to provide smooth starts and stops, rubber insulation to serve as a buffer against transmission of noise and vibration, fluorescent lighting, circulating ice water, provided by an electric cooling unit which pumps the water to rooms in the train, double panes of glass, sealed into the sash, to improve vision by preventing fogging of windows, rooms having radio service, with channels for wire-recorded programs and for radio reception, public-address systems for transmitting information of interest and making announcements such as for dining-car service (reception being under push-button control by the passenger); and telephone service to and from trains while moving. On many trains, the services of a stewardess, hostess or secretary are available.

An important development in passenger-train car equipment was the introduction in 1934 of the lightweight streamline passenger train. The first of these trains to be constructed was the Union Pacific railroad's aluminum alloy streamliner "City of Salina." It entered regular service Jan. 31, 1935, after a year of exhibition. The stainless steel streamliner "Pioneer Zephyr" of the Chicago, Burlington and Quincy railroad was the first train of this type to use diesel locomotive power and the first operated in regular, scheduled service, which began Nov. 11, 1934. Incorporating many novelties of design and appearance, and decorated in bright, distinctive colours, these new trains met with instant popularity and were quickly followed by many others, on railroads in every part of the country. In 1949 there were almost 300 streamline trains in operation in the United States.

The sleeping car was developed and popularized by the Pullman company, which operates these cars over most railroads under contracts. In 1947 the Pullman company was acquired by a group of 59 railroads, without material change in its operations except that a large proportion of the sleeping cars in regular use are now owned by individual railroads and operated by the Pullman company.

For many years sleeping cars were essentially open-section cars, featuring lower and upper berths, with some drawing-room and compartment accommodations. Commencing in 1927, several new types of rooms were introduced, such as the bedroom and roomette and duplex (or staggered-level) rooms. The trend away from open-section accommodations became quite evident in sleeping-car construction with the advent of lightweight streamline cars. Sleeping cars with open-section accommodations were largely replaced by cars having principally or entirely room accommodations.

Passenger-Car Operating Features—There is much more to a passenger car than the seats, lights, windows and other details that engage the traveller's personal attention. It is the complex of equipment under the car that contributes most to his safety, comfort and convenience. This equipment includes the car trucks and running gear, the automatic air brakes and appurtenances, and the electrical system which supplies current for lighting and for fans, ventilators and air-conditioning mechanism. Design of all such equipment must be such as to require minimum upkeep and repair, and if repairs are needed, to promote their speedy accomplishment, so that cars can be kept moving.

Car trucks, comprising the wheel assemblies, have many important parts besides wheels. The wheels themselves, despite their

apparent simplicity, perform many functions. They not only roll on the rails but they also must support the weight of the car and contents (140,000 lb. or more or less) under varying conditions of load stress, and must transmit the braking forces to the rail.

Passenger-car wheels may be made of cast iron, cast steel or wrought steel. They may be one-wheel, two-wheel or multiple-wheel types. A multiple-wheel wheel is one that can be reground or machined back into its original contour after it has been worn down in service. The multiple-wheel wrought-steel wheel is now the standard passenger-car wheel. Because conditions vary, there are three classes of multiple-wheel steel wheels, of varying metallurgical composition and adapted to different operating conditions. For example, one such class is used when loads are light but braking is severe, and high resistance to thermal cracking is needed.

Wheels are pressed on the axle, and turn with it. The part of the axle projecting at each end forms the journal, which turns in a journal box that holds oil and "waste" to lubricate the journals. Resting on the journals are brasses—friction-reducing bearings—which support the weight of the car on the journals. On many passenger cars, these brasses are replaced by roller bearings. Springs absorb shocks, and various snubbing devices reduce the vibration of cars at high speeds.

Developments in tracks, motive power and other plant facilities to promote greater speeds of train operation would be of little avail without a correspondingly developed braking system for trains, because safety demands adequate brake control at all times. The power required to stop a moving train is tremendous. Engineers have calculated that stopping a train running at 60 mi. an hour uses as much power as would be needed to lift the train vertically to a height of 120 ft.

Braking is now performed by means of the automatic air brake. Each car has such brakes, controlled from the engine by varying the air pressure. Compressed air from the locomotive is distributed to reservoirs on each car, through air pipes and hoses which connect all cars. Each car has a "triple" valve, which so controls the air pressure as to set the brakes when there is a reduction in the air pressure from the engine. As long as pressure in the train line is full, usually about 110 lb. per square inch for passenger trains, the valve simply passes air into the reservoir. But when the engineer reduces air pressure, or when pressure in the line drops for any other reason, such as a break in the air line, the valve closes the passage to the reservoir and opens a vent from the reservoir to the brake cylinder. Pressure of the air stored in the reservoir then operates a piston against the brake rigging, which forces the brake shoes against the wheels, and brings the train to a slowdown or a stop.

Automatic slack adjusters on passenger cars keep the slack in the brake rigging uniform throughout the train and thus equalize brake tension, helping to prevent uneven brake applications on the various cars. Wheel-slip protectors and speed-pressure regulators automatically adjust the application of braking force as train speed is reduced. The "decelostat," which electrically regulates brake pressure, permits greater refinement in the proper adjustment of braking force. Wheel-slide controllers on individual axles release and reapply brakes when a pair of wheels is about to slide.

A primary essential in the development of the present co-ordinated system of nation-wide interchange of cars was the development of a standard coupler between cars which would work with every other coupler in use. The early link-and-pin coupling, in almost universal use in 1880, accomplished this purpose but presented serious safety hazards. Tests of a number of proposed devices to improve this situation were held near Buffalo, N.Y., beginning in 1885 and continuing for two years. These tests resulted in the adoption as standard of a coupling (of which there were various designs) based on the idea of a swinging knuckle and working like the hooked fingers of two hands—the principle still in use. The new coupler closed automatically upon impact and could be released without requiring a man to go between the cars, by use of a safety lever projecting out to the side of the car. Further progress in standardization through the years resulted in adoption in 1917 of a single design of coupler,

with all its parts standard and interchangeable. This design has undergone subsequent improvement, and since 1938 a new tight-lock coupler for passenger cars has been available.

Freight Cars—Freight cars haul an almost innumerable variety of products, using various types of cars for different kinds of traffic.

The boxcar, of which there are about 740,000 in use (1950), is the most numerous type of freight car. About 688,000 are plain boxcars, or general-service cars, and are equipped with inside lumps for both the sides and ends. Other boxcars are specially designed for the movement of special types of freight, such as automobiles and automobile parts. Some boxcars are equipped with special bulkheads and other devices for better handling of less-than-carload merchandise shipments. Still other boxcars are equipped with ventilated side doors and end or side louvers and are used for carrying fruits and vegetables at certain seasons in certain sections of the country.

Inside length of boxcars varies from 36 ft to 60 ft 6 in., standard lengths being 40 ft 6 in. and 50 ft 6 in. Inside width ranges from 8 ft 6 in. to 9 ft 4 in., the standard being 9 ft 2 in. Height from floor to eaves may be as low as 8 ft. or in some special cases as high as 11 ft., the standard being 10 ft 6 in. Capacity ranges from 2,900 cu ft. to 5,900 cu ft. and load limits from about 80,000 lb. to 120,000 lb.

Another important type of roofed car is the refrigerator car, designed to protect loads against either heat or cold. There are several classes. One large class consists of cars designed for the transportation of fresh fruits and vegetables. Others are designed for transporting meats, dairy products, frozen foods and so on. The improvement of refrigeration equipment and methods is the subject of extensive research by the railroads. This research also extends to protection against low temperatures during winter months.

Principal classes of open-top cars are gondola cars and hopper cars. Gondolas have flat bottoms, with fixed sides varying in height from 2 ft 6 in. to 4 ft 8 in. (even 8 ft in the case of coke cars), and having either fixed ends or drop ends which may be lowered to facilitate loading and unloading. Inside length of "gons" varies from 37 ft 6 in. to 65 ft., and capacity from 100,000 lb. up to 200,000 lb. Hopper cars have drop bottoms, sloped to be self-unloading. Some hopper cars dump outside the rails, but most dump between the rails, through one to four hoppers. Capacity varies from 100,000 lb. to 220,000 lb. There are also covered hopper cars for bulk commodities, such as cement, which require protection from weather.

The tank car is used for carrying liquids in bulk. It consists of a large tank, sometimes divided into compartments, and sometimes with special linings, mounted on a steel underframe and forming an integral part of the car. Numerous products are carried in such cars, including crude oil and various refined oils, wine, milk, chemicals of many kinds, compressed gases, liquefied petroleum gases and chlorine gas, and a growing list of other liquid or liquefied-gas products.

Most tank cars are owned by companies specializing in their production and rental, and the railroads pay a specified rate per mile for their use. Much the same is true of refrigerator cars.

Other types of freight cars are flatcars and stockcars. Some flatcars have depressed centres, to accommodate loads so high that otherwise they might not clear bridges and other structures; these are called "well" or "depressed centre" cars. Stockcars might be described as boxcars with slatted instead of continuously closed sides, to provide ventilation for animals and help keep them cool in summer. Some are equipped with a second deck, to enable them to handle small animals, such as hogs or sheep, on two levels.

While the variety of cars provides better service to industry, it also increases the complexity of the car-supply and maintenance phases of railway operation. Maintenance problems have been greatly eased, however, by standardizing freight cars from the floor down—the working parts. Wheels to roll the load, axles to hold the wheels, frames and springs to support the body, couplings to connect cars, draught gear to absorb the push-pulls of train

and yard movement, brakes to control speed and stops—all have been so standardized that any of these parts can usually be replaced or repaired without regard to distance from the owners' rails or headquarters. This is a result of the development and general adoption by the railroads of a code of rules to govern the interchange of cars and their movement and repair on "foreign" lines (that is, lines other than their owners'), which has been a major factor in the advancement of transportation and industry in the United States. This arrangement makes possible the nation-wide movement of cars, so that from the standpoint of shippers the cars of all railroads comprise one great national pool. At the same time, the railroads also have developed methods whereby each railroad knows the location of each of its cars at all times, and collects an agreed amount per day for the use of its cars from other railroads on whose lines they may be located.

Freight-Car Operating Features—Many items of the trucks and running gear of passenger cars have their counterparts on freight cars, in some instances with modifications to take account of differences in the characteristics of the two kinds of service. In freight service normal pressure in the air-brake line from the locomotive to the cars approximates 70 lb., compared with 110 lb. in passenger service. It is now possible to follow a normal application of brakes with an emergency application, or to slow down to very low speed, then release the brakes and pick up speed, without bringing the train to a stop, which in earlier days could not be done. The present freight air brake, because of the greater speed with which the application of brakes is transmitted through the length of the train, also makes possible smoother stops.

Back of the coupler of the freight car, and connecting it to the centre sill or principal structural member of the car, is the draught gear—a combination of steel wedges, plates, rings and springs. In a space about two feet long, with a cross section of less than one square foot, the draught gear must absorb the shock of coupling loaded cars, under which it must recoil no more than two and three-fourths inches. Hence, the device has to be strong, rugged, long-lasting to reduce maintenance, and simple to facilitate upkeep and repair. Improvements were under development in 1950 to make this device still more flexible in responding to light blows and yet having greater ability to diminish shock to the car itself and thus avoid damage to goods in transit.

Freight-car trucks also are important to efficient rail service. Lighter weight is a goal gradually being achieved. The two four-wheel trucks which support a car weigh about 14,000 lb., approximating one-third of the total weight of a boxcar. Wheels and axles alone account for about 8,000 lb. of the total. Tubular axles and lighter materials for side frames, bolsters, brake beams and so forth serve to reduce weight.

Truck springs are vital to smooth riding of car body and load. At high speed, the freight-car body moves vertically because of harmonic oscillation and sidewise because of lateral sway. Improved springs and snubbers are means of achieving greater stability. As with draught gear, the problem is one of shock absorption.

Maintenance of Rolling Stock—With all the mechanical equipment on approximately 42,000 locomotives, 2,000,000 freight cars (counting privately owned and all other units), 44,000 passenger-train cars (including diners, mail and baggage, etc.), plus 120,000 cars for company-service needs, upkeep and repair of rolling stock is a considerable responsibility of the mechanical department.

The operation of locomotive shops involves tasks like those of any heavy manufacturing industry. Powerful cranes and hoists are needed, along with furnaces, grinders, presses, machine tools, steam hammers, punches, shears, pipe forges and cutters, tanks and many other types of tools and equipment.

Besides routine servicing during and after each trip, locomotives are given running repairs and minor adjustments as needed. This work is commonly performed in the roundhouse. In addition, locomotives also are given periodical general overhauls in the "back shop." These overhauls, performed after a prescribed amount of mileage, are classified according to varying degrees of comprehensiveness, scaled according to the service performed since the last overhaul, and hence are often referred to as classi-

fied repairs or back shopping.

A locomotive due for classified repairs usually moves to the back shop directly from road service. In the case of a steam locomotive, fires are dumped, the ashpan cleaned and the boiler "blown down" and drained. Front end, ashpan, and firebox are washed out. Coal on the tender is removed for later use. On a designated track, the locomotive is stripped of fittings and appurtenances—pipes, gauges, mountings, boiler jackets, side rods and so on. Moved thence into the main erecting shop, a giant crane may pick up the entire locomotive and move it to an assigned repair pit.

On the pit, the engine is stripped down to its component parts, and each part is examined. Sandblasting, machining, welding, painting and so on are performed at the proper time and place. Each step is carried out according to a prearranged time schedule. With scientific layout and scheduling of hundreds of individual operations, a locomotive can be almost entirely rebuilt in three weeks.

As diesel locomotives came into more widespread use, specialized facilities were needed to service them. A diesel locomotive terminal provides a wide range of services (some of which also are common to steam locomotives). Routine servicing requires oil storage and dispensing equipment, water-filling connections, sand towers, lubricating equipment, pits for inspection of running gear, and the like. For regular or periodic inspection and running repairs, the terminal shop may have travelling cranes, hoists, jacks, various machine tools, testing equipment, an electrical repair room, facilities for cleaning fuel-injection and other equipment, a lubricating oil reclaiming, battery chargers and perhaps even a machine for washing the outside of the engine.

Practices vary with respect to back shopping or general overhaul of diesel locomotives. Some railroads have no diesel back shops, considering them unnecessary with a well-planned program of parts replacement. Others prefer a system of general repairs at definite periods, as with steam locomotives, and provide extensive back-shopping facilities, often concentrated at one or two points on the railroad. When heavy repairs are needed, either the locomotive is moved to one of these shops or the particular items are sent to the main shop and replaced by others at the regular servicing point. For example, an entire engine can be removed from a diesel locomotive for overhaul and replaced by another, thus keeping the locomotive continuously in service.

Repairs to electric locomotives are handled in much the same manner as repairs to diesels.

Car repair shops are organized much like locomotive shops, carrying on many operations, often simultaneously. For heavy repair or rebuilding programs involving considerable numbers of cars, operations usually are set up on a progressive or assembly line basis, with various stages of the work performed at successive shop stations. Some of these stations are fed parts and materials from subassemblies or other departments of the shop. Power tools and other modern devices are extensively used.

Cars undergoing general overhaul or rebuilding are completely stripped. Rivets and perhaps other items are removed by flame-cutting in a burner shed. Wheels are removed and turned, or rebored. There are straightening stalls for various car parts such as side sills, centre sills and bulged ends. A fitting-up shop builds up or rivets or welds complete sides for cars. Doors and accompanying parts are assembled. Test racks for air brakes establish whether they are functioning properly. The truck shop makes necessary repairs to truck parts and packs journal boxes. The paint shop applies the railroad's distinctive colours and adds the car number and other information on the sides of the car. Battery chargers and mechanical washers help to condition passenger cars. Numerous testing devices make sure that all work has been accurately and adequately done.

Train, Yard and Station Operations.—Movement of passengers and freight in trains and operation of yards, terminals and stations are responsibilities of the transportation department. This department usually is headed by a general superintendent of transportation, aided by a chief of freight transportation, and his counterpart for passenger service, titles varying among different

railroads. Stations and transfer points for LCL (less-than-carload) merchandise, highway transport service, car service, mail service, police protection and labour and wage bureaus are supervised by subordinate officers. The transportation organization on a division includes the train, engine and yard crews and the dispatchers involved in actual movement of cars and engines, and the agents, clerical forces and warehouse forces at stations.

Yards and Terminals.—Yards and terminals are key points of the railroad system. From, to and through them flow cars and trains. In them cars are serviced, assembled and classified, and locomotives are housed and serviced.

Class I line-haul railroads operated in 1950 approximately 355,000 mi of all tracks (excluding trackage rights). About 53,500 mi, or about 1 mi. out of every 6½ mi. of all tracks, were required for yard switching operations. In the industrial east such proportion exceeded 1 mi. out of every 5 mi. This did not include approximately 7,430 mi. of tracks operated by carriers organized exclusively as terminal belt-line and switching railroads.

Classification of Freight Cars.—The principal function of a freight yard is to sort and classify cars for further movement. Inbound trains are broken up and the cars, to the extent necessary, are reclassified and reassembled into groups bound in the same direction, or to the same destination or to the same connecting railroad. Cars terminating locally or for interchange to local connections are sorted out for delivery to their respective destinations in the terminal area, and cars originating locally or received from local connections are distributed to the proper outbound tracks. Most yards of any considerable size also include, or have adjacent, facilities for servicing of, and running repairs to, cars and locomotives.

Classification and distribution of cars is performed by switching engines, in either hump or flat yards. Freight-car movements are made in accordance with a switching list prepared in the yard-master's office.

The primary distinction between a hump yard and a flat yard is that in the latter the trackage is level, as the name implies, and movements of freight cars are powered in their entirety by switching engines, instead of partly by gravity from the hump. Another distinction is that in a hump yard the movement of cars progresses in a single direction.

In a hump yard, a humping engine slowly moves an entire freight train up grade to the top of the hump, at constant speed. Working from the switching list, a crew member uncouples one or more cars at the summit, whence gravity carries them into the classification tracks. The selection of tracks is controlled by power switches, operated from one or more control towers at strategic points in the yard. A typical yard may contain 50 or more tracks, depending on type of traffic and number of classifications required.

Car Retarders.—In earlier installations of hump yards, cars moving down the hump to classification tracks were controlled by car riders, to operate the hand brakes and avoid excessive impact. Their sole job was braking, other men were assigned to throwing switches as the cars moved down to the appropriate track. After delivering a car, perhaps at the far end of the yard, these men returned to the hump, either on foot or by riding a motor car. An improvement on this type of operation was the installation of car retarders. The retarder is a braking device, located along the track, which clasps each side of the car wheel at the rim. It is actuated from the control tower. With the combination of retarders and power switches, the tower operators control both the direction and the speed of car movement.

Other Yard Activities.—Classification of freight cars is the principal but not the only element of yard work. Numerous related activities add to the complexity and importance of the yard. Fuelling and watering facilities for locomotives are provided. There may be car or locomotive shops equipped for extensive repairs, or merely a special track for running repairs. Many yards set aside cleaning tracks, where cars containing damage or debris are emptied and made ready for reloading. Scales are usually provided for weighing loaded and empty cars. Where perishable traffic is handled, car-icing platforms, an icehouse and associated

trackage may be part of the yard facilities. In a large terminal yard there is also a roundhouse for engine storage and repair. There may be stockyard tracks and sheep barns.

Typically, the complete yard embraces primary elements consisting of a receiving yard, hump tracks, a classification yard and a departure yard, in the order named, with auxiliary features that include car repair tracks, caboose tracks and necessary running or intercommunication tracks. At industrial centres, a major function is the switching of cars in and out of manufacturing establishments; special storage tracks are usually provided for this operation. Team tracks are another usual feature; alongside them are paved or otherwise improved driveways where motor or horse-drawn vehicles can load into or out of the cars.

Blocking Cars in Trains—In switching freight cars for assembly into outbound trains, efforts are made to assemble cars into "blocks," grouped according to destination. This requires more work at the origin point, but results in a substantial net saving of switch moves for the complete movement. Later switch moves also are saved by arranging cars in trains so that those to be dropped off at intermediate points can be switched out without needless movement—and delay—of other cars. Wherever practical, solid trains are made up, to move through intermediate terminals without breakup.

Yard Communication—Rapid and effective communication is essential in minimizing waste motion and unproductive time in the operation of a freight classification yard. Telephones, of course, are in general use, but there are many occasions when yard forces are not near a telephone or other fixed communication facility. Consequently, a number of other devices and methods have been developed. Loudspeaker systems are frequently used when rapid instructions are needed. Developments in two-way radio communication opened new possibilities for improved yard efficiency. In switching to and from industries, where engines may be operating several miles from the yard proper, radio reduces time needed for obtaining and executing new or revised instructions.

Other Improvements in Efficiency—Ordinarily, when a freight train arrives at the receiving track in the yard, the conductor brings the waybills (one for each car, showing origin, destination, commodity, weight, routing, etc.) to the yard office. Alternatively, he may dispatch them through a pneumatic tube. After waybills have been checked, a clerk copies certain of the information for a switch list, or for car cards, depending on local practices. In large yards a photographic process replaces hand copying. While the train is being inspected and the cars are being switched for further outbound movement, a train list is compiled from the waybills for all cars in outbound trains. In many yards an interchange report also must be made for cars delivered to or received from connecting lines. Waybills are arranged in order according to the position of each car in the train, and a "wheel report" or train consist is prepared from them. The conductor then picks up the waybills and wheel report, and the train departs. Alternatively, the wheel report may be prepared by the conductor while the train is en route.

Some roads in areas of heavy traffic have adopted various mechanical systems involving use of punch cards (such as are used in electric tabulating machines) combined with use of printing-telegraph equipment. Waybill data are punched on cards at the originating station or the first yard thus equipped, instead of being transcribed by hand. The cards are then used to reproduce automatically, by printing telegraph, at distant receiving yards and in headquarters car-record bureaus, such information as interchange reports and wheel reports on trains before they arrive. This automatic reproduction reduces delays and eliminates possibilities of error in typing or copying by hand. With such a system, the wheel report can be prepared and transmitted after the train has departed.

By having a printing-telegraph consist of incoming trains before they arrive, the yardmaster can plan in advance the amount and type of work to be done, with a minimum of switch-engine moves and minimum delay to cars. Data from the wheel report are automatically and immediately transmitted to the superintendent of car service at headquarters for record purposes, so that the location of all cars on the line can readily be ascertained.

In addition to greater speed and accuracy, other potential operating benefits include quick, accurate information to show car detention, location of cars by type, turn-around time and so on. Car movements can be better controlled, and cars distributed to loading points with a minimum of avoidable car-days and nonproductive car mileage and train mileage. While installations of this character were largely in the experimental stage as of 1950, with new uses for the punch-card data still being explored, such systems promised considerable increases in economy and efficiency in many situations.

Inspection of Cars—"Safety first" is a basic tenet in all railroad operations. At virtually all yards and terminals and at all points of interchange between railroads, inspectors check all equipment as trains pull in. These inspectors customarily go up one side and down the other, the length of each train, looking for defects in wheels, axles, brakes, journals or other car parts or in the loadings. Sometimes a shifted load, for example, may make further movement of the car hazardous. Should any unsafe condition be found, the car is marked for removal to the repair (or "rip") track.

In large terminals, cars frequently are inspected as they move at slow speed above sunken pits and past inspection towers, in which inspectors are stationed, flanked by batteries of strong floodlights. Normal activities can be continued while this takes place. Defects that call for switching particular cars out of the train are immediately reported, with a substantial saving in time and handling.

Passenger-Yard Operations—In large cities, certain of the freight-yard facilities also have their counterparts, as appropriate and needed, for passenger operations. Examples are storage tracks, cleaning tracks and turn-around tracks for passenger cars. Also provided are commissaries, with adjacent tracks, for stocking dining cars. At large stations, terminal facilities often include tracks for loading and unloading mail and express. There are a number of other specialized facilities and activities in individual yards, varying with local conditions and needs.

Railroad Use of Highway Vehicles—Railroads have extensively availed themselves of the advantages of highway vehicles for certain types of operations, both freight and passenger.

Bus Operations by Railroads—In many instances, buses provided railroads with an alternative to the dilemma of whether to continue operating passenger trains which did not pay for themselves or to abandon the field entirely.

Motorbus operations in which railroads are engaged are generally carried on (1) by the railroad directly, (2) by a contractor under railroad supervision or (3) by an affiliate or a wholly owned subsidiary of the railroad. Affiliates often are associated with one of the several bus systems which operate on a national basis. By far the greater number of bus operations by railroads have resulted from substitution of bus service for curtailed rail service.

Truck Operations by Railroads—Railroads operate highway-freight trucks both to improve service and to effect economies by the substitution of truck service for local freight-train service, especially on lines with light traffic. Railroads also use trucks locally for pickup and delivery service for less-than-carload shipments and for transferring such freight between stations, especially in large terminal areas.

Truck operations of railroads usually are carried on (1) by use of existing railroad organizations, (2) by wholly owned subsidiaries of railroads, (3) by contract with the Railway Express Agency, Inc. (which is wholly owned by the railroads), or (4) by use of other contractors under railway supervision.

Directly or through subsidiary companies, the Railway Express agency performed at the end of 1949 intercity truck service supplementing or replacing rail service on about 480 routes with a total of approximately 19,000 route miles. Types of traffic thus moved consisted generally of United States mail, baggage, milk and cream, express, I. C. L. freight and railway supplies. In addition to these operations, the railroads themselves operated, directly or through subsidiary companies, several times as much route mileage of intercity truck service.

The Interstate Commerce act imposes on railroads seeking au-

thority to operate truck or bus service requirements which do not apply to other applicants. In nearly all cases where such authority is granted, it is surrounded by regulatory restrictions not imposed upon other carriers.

Rail-Water Terminals.—As most freight which moves by water also requires rail transportation at one or both ends of its journey, adequate port facilities for interchange of freight between cars and vessels are of great importance. This applies not only to ocean ports but also to rail-water terminals on the Great Lakes and inland waterways. For service of this character, railroads have invested approximately \$250,000,000 in piers, wharves, grain elevators, coal dumpers, harbour vessels and other facilities for economical and efficient handling of freight between shore and ship. The so-called "railroad navy" comprises approximately 1,900 units of floating equipment of all kinds, including tugboats, barges, car floats, lighters, floating derricks and so on.

Ordinary merchandise or package freight may be either switched in cars to marginal tracks within reach of ship's tackle, or brought alongside the ship in lighters or car floats, or else unloaded into a wharf warehouse and thence trucked to ship's tackle. For handling exceptionally heavy weights, cranes and floating derricks usually are provided. Conveyor systems, either overhead on rails or using endless belts or rollers, may be utilized for moving freight through warehouses. Small electric or internal-combustion motor trucks, sometimes hauling trailers, also are used in many terminals for expediting such movement. These methods are patterned on those developed by railroads for handling L.C.L. freight through their stations (see later section on *Improvements in Handling L.C.L. Shipments*).

Bulk Freight on the Great Lakes.—Large volumes of iron ore, coal and grain are handled in bulk by vessels on the Great Lakes, and virtually all this traffic also receives some rail movement. There is intensive co-ordination of rail and water facilities on the Great Lakes to achieve efficient, economical service. Vessels are specially built for the trade and integrated with terminal facilities likewise specially designed, with provision for ship-to-shore radio communication, to permit loading, unloading and interchange of cargoes with utmost dispatch.

Over-loading facilities at upper Great Lakes ports consist of docks ranging from 900 ft to 2,300 ft in length and from 60 ft. to 80 ft in height, equipped with bins and pockets into which ore is dumped from specially designed railroad cars. At lower Great Lakes ports, unloading gear consists of electrically operated ore unloaders, equipped with buckets ranging in capacity from 5 tons to 17 tons. Those of the larger type can discharge a 10,000-ton vessel in from three to four hours. As ore is removed from the ship, it is weighed and moved to railroad cars on tracks under the unloading machines, for shipment to interior points.

Loading equipment for coal at Great Lakes ports is usually of the car-dumper type. Loaded cars roll by gravity to a pit, are drawn by cable up to a loading platform, clamped to a cradle, and then raised and inverted, the contents being dumped into a pan, whence the coal travels by telescopic chute into the vessel's hold. Unloading facilities consist of electrically operated traveling bridge cranes, equipped with clamshell buckets with capacity of 5 tons to 12 tons.

Similar facilities also have been provided at many ports to handle coal, phosphate rock, bauxite ore and other bulk materials. As a rule, these facilities, as well as the Great Lakes coal and ore docks, are provided and owned by railroads.

Grain.—Most U.S. ports—ocean and Great Lakes—are equipped with large marine grain elevators. Grain is sucked out of the ship or cars and deposited on conveyors, passing through a drier to bins. Loading of ships or cars is done by gravity, the grain flowing through chutes leading to the hold or car.

Car Ferries.—Ferries to move cars or trains across inland or sheltered bodies of water have been operated by railroads in the United States and elsewhere for many years. Notable North American examples are such services across Lakes Michigan, Erie and Ontario, and the St. Lawrence, Mississippi and Tennessee rivers, and on Chesapeake bay, Puget sound, between Vancouver and Vancouver Island, and around San Francisco bay.

Another development is the operation of ocean car ferries between Florida points and Cuba and between New York city, Havana, New Orleans and Texas City, Texas. The ships used are built to standard international specifications for ocean-going vessels. They are of two principal types. With one type, cars are pushed over floating track connections onto tracks in the hold of the ship, through wide doors at the stern, somewhat in the manner used during World War II for loading trucks and tanks on L.S.T. vessels. With the second type, cars are individually lifted bodily by special cranes and lowered through hatches into position on several decks of tracks in the hold.

Connecting Railroads and Switching Lines.—Adequate rail facilities to service port operations have been provided at all port cities—an almost all cases by railroads. Primarily essential are trunk lines capable of moving the requisite volume of traffic to and from the port. Equally important are belt lines or other rail interconnections among trunk lines serving the port, and yard trackage of adequate capacity for classification and storage of outbound and inbound cargo. Other facilities include many special types to meet corresponding needs, such as bonded warehouses and storage space to accommodate shipments from abroad pending reshipment or payment of import duties.

Co-ordination.—An important element of railway operations is joint use of facilities and co-ordination of services among railroads.

Whereas consolidation may be defined as any form of integration or unification of carrier properties under a single control or management, co-ordination involves joint use or ownership of equipment or facilities, or the joint performance of a service or transportation function, by two or more independent railways. In some instances another agency, such as a terminal company, is especially created to provide joint facilities and perform joint service. More than 200 such terminal companies were in operation at the end of 1948, with a total of approximately 7,400 mi of tracks, utilizing approximately 1,700 locomotives, 14,000 freight-train cars and 1,000 company-service cars of their own, and representing a total investment in road and equipment of \$1,085,000,000.

Through co-ordination and joint use of facilities and services, the many hundreds of railways in the United States, no one of which serves more than a limited area, have been integrated into a truly national transportation system. Such co-ordination and co-operation have been practised ever since tracks of one small railroad first touched those of another and the economies of joint action and use began to be apparent.

Standardization necessary for interchangeable use of equipment and facilities among railroads, and related intercompany arrangements which underlie them, are fundamental to co-ordination. Uniform designs and practices, however, have enabled facilities to be jointly used, or services to be jointly provided, on such a broad scale, and such practices have become so coextensive with the railway industry, that they may not always be recognized as co-ordinated activities. Thus, while co-ordination is as literally present when a western-owned boxcar moves in a freight train in the east, or when a passenger ticket sold and issued in Maine is honoured by the conductor of a train in California, it is nevertheless true that the word is usually confined to such instances as one railroad using tracks or terminals of another, or the pooling of services between certain competitive points.

As railways spread over the United States, much capital investment was avoided, and subsequent maintenance expense saved, by one railroad obtaining trackage rights (i.e., use of an existing line of another railroad) which made it possible to avoid construction of parallel routes. More than 28,000 mi of trackage in the United States (not counting miles of trackage of joint switching and terminal companies) is used by two or more railroads. Usually, one railroad is an owner and the others tenants, but occasionally two (or more) railroads are common owners of the route, each possessing an undivided share.

Types of Co-ordination.—Just as one railroad uses tracks of another, or two or more own trackage in common, so they also use yard and other facilities through owner-and-tenant arrangements, or by provision of jointly owned properties, which may or may not

entail use of a separate owning (and possibly operating) company.

The most common examples of railway joint facilities are passenger and freight stations used by two or more railroads, of which there are thousands. Joint facilities of this nature vary from the simplest small country stations through every stage of relative development to the most complex terminals in the country, in large metropolitan centres.

This joint use of facilities is more common than the pooling of services, which latter is sometimes done, subject to the specific consent of the Interstate Commerce commission, pursuant to requirements of the Interstate Commerce act. In each such case the participating railroads operate noncompetitively and provide their agreed proportions of the total train service. Revenues and expenses of operation of the pool of trains are apportioned in accordance with terms of the agreement.

Difficulties Met in Co-ordination.—Many conflicting interests must be adjusted satisfactorily for successful accomplishment of most co-ordination undertakings. Co-ordinations must generally obtain approval of regulatory or other public bodies. Political and labour considerations also enter into such proposals.

Railway Research—Technological Research.—Engineering and mechanical research in the railway industry is a continuing activity. Equipment, devices and materials are being daily subjected to the test of actual operation, with new facts being learned about them and about better ways of using them. In addition to this widespread daily routine of applied research on the railroads, numerous research activities of more specialized nature are conducted.

The Association of American Railroads (A. A. R.) makes important contributions to technological advancement within the industry. This voluntary organization of principal railroads in the United States, Canada, Cuba and Mexico maintains a research centre and laboratory in Chicago, Ill., in its own building on the campus of the Illinois Institute of Technology. The bulk of A. A. R. research work is under the direction of committees made up of experienced railroad men.

Subjects embraced in the research work of these groups include: metallurgy in relation to bridges, rails, locomotives and cars, preservation of ties and other timbers against decay and mechanical wear; electrical equipment and methods for air conditioning, communications and signals, design and application of braking devices, standards for testing locomotives and parts, measurement of service stresses in, and improvements in design of, track, bridges and rolling stock and the like. The list could be greatly prolonged, but the foregoing summary is illustrative of one type of railway research.

Yet another type of railway research, directly affecting the field of customer relations, aims toward prevention of loss or damage to shipments, with consequent reduction of claim payments and of annoyance to shippers. Extensive laboratory and road tests are conducted to improve freight-car trucks and springs so that loads may ride more smoothly. Through the A. A. R. the railroads also maintain continuing research having to do with the protective characteristics of various types of freight containers, and of various methods of packing, stowing and bracing shipments.

In addition to this collective research, much technological research of similar or supplementary nature is conducted by individual railroads (several of which have their own laboratory and testing facilities), by groups of railroads working on common problems, and in co-ordination with certain industries, by industries which supply the railroads with equipment of various kinds; and by colleges and other research institutions. Much of this work is co-operative, for example, rail manufacturers, the A. A. R. and the University of Illinois (Urbana) have collaborated in research on rail; a draught-gear laboratory is operated by the A. A. R. at Purdue university, West Lafayette, Ind., in co-operation with that institution; several railroads and coal companies are working toward development of a coal-burning gas-turbine locomotive. Other co-operative research projects include freight cars for high-speed service, various parts and equipment for freight cars and methods of refrigeration. This work is supplemented both by test installations and by close observation of results of

actual operation.

Traffic Research and Development.—Of ever-increasing emphasis and importance is the attention given by railroads to traffic and economic research and development. This work is pursued by various methods on different railroads, in some cases by a special department, in others by branches of certain departments working in co-ordination, and in still others by "task groups" organized for specific assignments. Where a separate research department is maintained, its main functions in general are (1) to gather a wide range of facts and statistics pertaining to the railroad's economic climate and traffic performance, so that performance can be measured against known potentials; (2) to conduct exhaustive studies on particular commodities or traffic practices, (3) to undertake specific projects assigned by the department head, and (4) to furnish a wide variety of economic and traffic data to management, including forecasts of business activity.

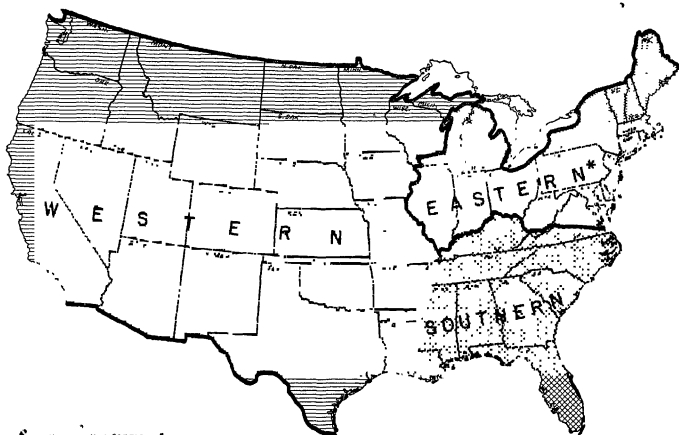

Many railroads have long maintained separate bureaus or departments charged with fostering industry and agriculture in the railroad's territory. Railroad industrial development activities include (1) attraction and establishment of new, permanent industries, (2) establishment of new, temporary industries, such as construction projects; (3) retention or expansion of existing industries, and (4) development of raw material resources. Railroads and civic, state and business organizations co-operate in providing complete information concerning available sites, buildings and facts on the economic and civic conditions in their territories. In addition, railroads undertake to develop sidetrack facilities and new structures, as well as to help find new sources of raw materials and new markets for industries. Another vitally important aid is their co-operation in working out rate adjustments to assist industries.

The railroads exert similar efforts to develop agriculture along their lines. The extent of each railroad's program is determined largely by the nature of the territory it serves. In the main, the following activities are embraced in railroad agricultural development: (1) preservation of the resources of agriculture, (2) development of higher-yielding and better-quality crops, (3) improvement of livestock, (4) technological improvements in marketing, processing and distribution, (5) development of new uses of agricultural products by industry, (6) improvements in farm machinery, buildings and equipment, (7) co-operation with educational institutions in the improvement of agricultural methods, and (8) support of land settlement, reclamation and drainage programs.

Procurement and Handling of Freight Traffic.—Freight traffic of the railroads comprises literally every kind of article that moves in commerce. It takes in shipments large or small, of all kinds of commodities, from and to all points. Rail freight traffic is made up of carload (C. L.) and less-than-carload (L. C. L.) shipments. Carload shipments move at lower rates than L. C. L. shipments, one important reason being that the railroad provides loading and unloading services for the latter which are performed by the shipper and receiver of carloads. Another reason is that the heavier weight of carloads makes for lower unit costs of handling. Generally speaking, for every commodity there is a specified minimum carload weight, shipments weighing less than that minimum are charged the L. C. L. rate (unless the shipper prefers to pay for the minimum carload weight at the carload rate).

Rates are usually expressed in cents per 100 lb. or per ton of 2,000 lb., or in some cases, in cents per gross ton of 2,240 lb. Rates per carload also are published on some commodities.

Rail Charges for Freight Movement.—By law, all charges assessed by railroads for movement of freight must be made public, in compilations called tariffs, stated and published in a manner conforming with rules prescribed by federal and state regulatory authorities. Tariffs must be officially filed with regulatory bodies and be available for public inspection. Rates provided are subject to protest by shippers and suspension by the several commissions, they must meet certain standards provided by law and they may not be changed except after public notice for

*Sometimes called "OFFICIAL"

FIG 4—RAILROAD FREIGHT CLASSIFICATION TERRITORIES

a prescribed period of time, moreover, railroads in nearly all cases publish rates only after full discussion with shippers and other interested parties. The Interstate Commerce commission and the various states prescribe methods by which shippers may file and pursue complaints against rates. In no industry does the purchaser have a greater voice in determining the price of what he buys than the shipper who purchases railroad transportation.

Rates are in general of three types, according to their method of application. These types are class rates, exceptions to the classification, and commodity rates. Both carload and less-than-carload traffic move on all three types of rates, but the great majority of all carload shipments move on commodity rates, while less-than-carload traffic moves preponderantly on class rates. Carload traffic constitutes nearly 99% of all rail tonnage, and only about 5% of all rail traffic moves on class rates.

Class Rates and Classifications—Class rates apply to all articles comprised within certain specified classes or groups for rate-making purposes. The system of class rates based upon commodity classifications was devised to enable railroads to comply with their legal obligation to have a published rate available for application to any shipment which might be tendered to them for movement. In some—and probably many—instances, the classification applies to articles of commerce which seldom move in certain parts of the country, or which do not move in any considerable quantity in any part of the country.

Class rates apply between any origin and destination, being scaled within each class broadly (though not exactly) according to mileage. The basis of the system of class rates is the first-class rate. Successive classes bear a descending percentage relationship to first-class, this relationship varying somewhat in different areas of the country.

The rate classifications of various articles are formulated by the railroads through their territorial classification committees, also after and largely as the result of consultations with shippers. They are published in the same manner as tariffs, and are also subject to complaint as to their reasonableness and to investigation and suspension.

Classification and Rate Territories—There are three major freight-rate classifications. They are called, after the geographical areas in which they apply, the eastern (frequently referred to as the "official" because it was the first territorial classification adopted), the western and the southern classifications. The descriptions of the more than 20,000 articles classified are uniform in the three classifications. However, there have been some differences in classification ratings on the same commodities among the three territories, arising out of variations in transportation and economic conditions. For convenient reference, all three classifications are assembled and published in one volume, called the *Consolidated Freight Classification*. A uniform classification, which allocated commodities into the same classes in all territories, thus replacing the existing three classifications, was nearing completion in 1950. Meanwhile, the Interstate Commerce commission has generally determined which classification shall govern on interterritorial shipments. Sometimes it has required the classification applying in the destination territory to govern, and at other times it has specified one classification to apply in both directions.

Exceptions to the Classification—For various reasons (including economic development and technological progress) it may become advantageous to transfer commodities from their previous classification and apply rates on a lower basis to stimulate movement. Two methods by which this may be accomplished are to reduce the classification rating or to publish an exception to the classification covering a more limited territory than the classification itself. Rates made by the latter method are termed classification exceptions. Such rates usually are made on the basis of a percentage relationship to the first-class rates.

Commodity Rates—For commodities which move in substantial volume between fairly well-defined areas of origin and destination, commodity rates, on a still lower basis, are often made. Such rates apply on named commodities between named origins and destinations and are designed more nearly to fit the needs of the traffic than is possible under general classification or classification-exception ratings. Origins and destinations may be either a single

community or a relatively large area, in which latter case the rates are said to be "blanketed" over the area in question. By far the greater part of the country's railway traffic moves on such commodity rates, established with the definite aim of encouraging maximum development of traffic.

In some instances, it has become customary to regard certain rates on a commodity between key points of large movement as the standard or base, with rates for movement to or from other points being related to the base rates. In other instances, rates between the same origin and destination may vary according to the route designated. In such cases the lower rates are called differential rates. All rates thus made, however, must conform to legal requirements of fairness to all concerned, and are by law subject to complaint as to their propriety.

Considerations Which Influence Rates—The primary aim of the railroads in establishing rates is to have them at a level which will cover the cost of suitably performing the service. At the same time, the level should be that which will best stimulate industry and commerce and encourage the widest movement of traffic. Commercial, and usually competitive, relationships also must be observed in making rates. Thousands of revisions of rates are voluntarily made by railroads each year to take care of changing conditions.

Joint or Interline Rates—Many shipments move from points on one railroad to points on another railroad, often passing over lines of one or perhaps several intermediate railroads. To provide for such movements, the railroads involved establish through routes with through rates, in which two or more railroads participate. These joint rates, and the division of the revenues therefrom among the participating railroads in the event of failure of the railroads to agree on such division, are under the jurisdiction of the Interstate Commerce commission.

In addition to joint rates established by two or more railroads, there also are joint rates applying between railroads and carriers by highway (see *Railroad Use of Highway Vehicles*) and by water. These joint rates are called rail-truck, rail-barge, rail-ocean, rail-lake or other combinations, the order shown in the name indicating as a rule the order in which the respective carriers share in the movement. Thus, a rail-ocean-rail movement would describe a shipment routed to move by rail from Buffalo, N.Y., to New York city, thence by steamship to Mobile, Ala., and by rail again from there to Birmingham, Ala.

Charges for Accessorial Services—In addition to providing rates for the movement of shipments between points of origin and destination, the railroads also provide, by published tariffs, rates or charges for what are called accessorial and terminal services. These latter include such services as storage, switching, refrigeration, weighing, and stoppage in transit for various purposes, such as milling in the case of grain or lumber, or compressing in the case of cotton. The transit tariff specifies the conditions under which the commodity may be stopped en route for processing or storing and the extra charges, if any, assessed for the privilege.

Improvements in Carload Freight Service—Great strides have been made in improvement of the speed and reliability of freight service. Freight schedules have been shortened and time from shipper to consignee reduced by more efficient operating methods. For example, substantial reductions have been made in the amount of time cars spend in terminals, being switched, classified and assembled into or distributed from trains. Through freight trains are operated between important terminals without stops for intermediate yard handling, and many freight trains are operated on fast, regular schedules similar to those applicable for passenger trains, being given distinctive names to identify them and add to their prestige. The car equipment in which freight is handled also has been improved. Illustrative of advances in the efficiency of freight service, the average freight train in 1950 performed two and one-half times as much movement of freight in an hour as it did in 1921.

Supplementing their research work, already outlined, toward prevention of loss and damage to freight in transit, railroads continuously carry on among shippers and their own employees campaigns illustrating proper methods of packing, handling, loading

and bracing freight. They also have developed, and are using on a large scale, machines called impact registers which record the degree of any rough handling, and also the time and therefore the approximate place where it occurred.

Many railroads maintain a separate service bureau organization for expediting and directing freight shipments. These bureaus act as intermediaries between shippers and various traffic offices in tracing and expediting, in furnishing special equipment, in effecting diversion and reconsigning, in checking clearances, in handling complaints and delays and in preparing and publishing freight schedules. Because its work is of a combined traffic-operating nature, the service bureau is sometimes operated jointly by the traffic and operating departments. The most characteristic and fundamental feature of every service bureau is its extensive communication network, which reaches into every yard, terminal and office by printing telegraph, telephone, telegraph and mail. Some railroads maintain a separate LCL merchandise service bureau. The largest companies have subbureaus or branch bureaus in regional headquarters.

Handling Merchandise—LCL Traffic—Merchandise traffic (often referred to as less-than-carload or LCL traffic) refers to small lots of goods moving in quantities of less than a carload, as previously defined. Aside from size of shipments, it differs from carload traffic in that the latter is loaded and unloaded by or at the expense of shipper and consignee, whereas merchandise traffic is usually loaded, unloaded and otherwise handled at the expense of the railroad.

A development in the handling of merchandise traffic is forwarder service. Forwarders specialize in soliciting and assembling merchandise shipments, which they consolidate into carloads (or truckloads) and ship at the carload (or truckload) rate. Their incentive is the difference between the LCL rate which they charge the shipper and the considerably lower carload (or truckload) rate which they pay the carrier for the line-haul transportation of goods. In some cases, however, they also make rail shipments in LCL quantities.

A large share of the merchandise traffic handled by forwarders is shipped by them as carloads over the railroads. To this extent, some part of the decline in railroad merchandise traffic which has taken place is offset by increased rail carload traffic shipped by forwarders. Carload forwarder traffic of the railroads in 1949 was 3,700,000 tons, compared with 12,600,000 tons of LCL traffic originated by the railroads themselves.

Merchandise shipments may reach the custody of the railroad in any of several ways. At many points the shipment may be picked up at the shipper's door by a truck, at the expense of the railroad. In such case the truck may be operated either by the railroad itself, or by an affiliate, or by a local trucking concern operating under contract with the railroad. If the shipper prefers, he may deliver the shipment to the railroad with his own vehicle, in which case he usually receives an allowance from the railroad for performing the service, where such service is in effect, in lieu of having the railroad perform it. Both the pickup by the railroad and the alternate allowance to the shipper are prescribed in published tariffs, and are subject to the shipment moving at a specified minimum rate per 100 lb.

If the shipper has a considerable volume of merchandise traffic, he may prefer to load it (at his own expense) into an empty freight car at his warehouse or plant, to be switched to the railroad freight or transfer station. Such cars are termed "ferry" or "trap" cars. Again, a large shipper may at his option load several lots of merchandise into a car for direct intercity movement. In such cases the railroad either will send a representative to check the contents of the car as loaded, or will accept the shipper's certification as to the contents. In large port cities, such as New York city, a considerable volume of merchandise deliveries to railroads is made by lighters or car floats.

Deliveries of merchandise from railroads to consignees takes place in general by the reverse of procedures just outlined.

Scheduled Merchandise Cars—As the great bulk of the traffic of a railroad moves in carloads, and railway operations are geared to carloads, methods of handling merchandise traffic in trains

have been largely adapted to fit in with the carload operations with maximum efficiency and economy. Generally speaking, the procedure is for the railroad to consolidate merchandise shipments so far as possible into larger quantities which can be handled the maximum distance in carloads. For this purpose, there are on every railroad numerous points where such consolidation operations are performed. These may be stations with a considerable volume of outbound shipments of merchandise, or they may be other points, called transfer stations, which are strategically situated for the consolidation of merchandise traffic from numerous origins. Between these large stations or transfer points, merchandise cars are scheduled for regular operation, often for moves of many hundreds of miles or even across the continent.

In the case of a small station not loading scheduled merchandise cars in the desired direction, the shipment would be moved by the railroad to the nearest station or transfer point from which such a car is operated. The shipment then will either move directly to its destination or be taken to another station or transfer point which does have a scheduled car to its destination.

If a shipment is destined to a point not the terminus of a scheduled merchandise car, the shipment will be handled in such a car to a nearby scheduled destination. Thence it will move to its ultimate destination either by truck service, which many railroads operate for this purpose, or it may be put with other merchandise shipments for other such small points in a car moving on a local freight train which stops at each station en route. Such a car is known as a way car.

Cars Used for Merchandise.—Generally, railroads use boxcars for handling merchandise freight. Where the volume of traffic needing such protection warrants, scheduled refrigerator cars also are operated. Occasionally, and for appropriate loads, flatcars or gondola cars may be used. Some railroads make use of metal containers into which merchandise shipments may be placed and sealed, for movement without disturbance and with maximum protection of contents, these containers are usually transported on flatcars or gondola cars. A number of railroads use refrigerated containers for handling small lots of perishable merchandise traffic. These containers are equipped with wheels for mobility, and also have special doors. They ordinarily are used only between specified points on the same railroad.

Some railroads use boxcars especially equipped for high-speed operation for the movement of merchandise in passenger-train service, or on passenger-train schedules, between certain points.

Improvements in Handling L. C. L. Shipments.—The railroads promote speed and economy in handling merchandise freight by moving shipments the maximum distance in scheduled cars. Another step is improvement in the layout and equipment of facilities for handling this traffic. Special arrangements at transfer points reduce the time and distance of movement from inbound to outbound cars. Many improvements have also been made in the design and installation of devices for handling freight speedily and efficiently. One such method is by use of pallets or platform trucks on which freight is loaded (or "unitized") so that it may be handled or temporarily stored as a unit, instead of being handled as individual packages. Another method is the use of automotive vehicles in freight stations and between cars. These vehicles are equipped with devices by means of which platform trucks are towed to the desired location, or pallets may be lifted from the floor, transported to cars or storage places, and then stacked, if necessary. The sealed metal containers, previously mentioned, are another step in the direction of minimizing and expediting physical handling of merchandise.

Among further steps for improvement of merchandise service by rail is the operation of high-speed merchandise trains, on special schedules to fit the needs of the traffic. Much progress has been made in development and provision of cars with adjustable blocking devices, to secure the load and minimize damage. Clerical work connected with waybilling and handling this traffic is being lessened and expedited by use of modern office equipment, including photographic devices. Substitution by railroads of truck service for consolidation and distribution of merchandise traffic also will continue, the benefits of such substitution under appro-

priate conditions having been demonstrated by many railroads.

Passenger Traffic.—Transportation of passengers by rail has been, since the early days of railroad operation, an important service to the public as well as a considerable source of revenue to the carriers.

Prior to the advent of the automobile and the construction of hard-surfaced intercity highways, almost all except local travel overlaid was by rail. The major portion of common-carrier travel still is rail-borne, but of the total intercity travel—private as well as common-carrier—private automobiles accounted for 85% between 1937 and 1941, when travel conditions were relatively normal. In terms of passenger-miles (i.e., the total of intercity mileages travelled by all passengers by all means of transportation, private and public) between 1930 and 1940, total intercity passenger travel increased more than 460%, but travel by use of common carriers decreased by 20%.

In 1948, compared with 1940, there was a marked return to common carriers. Railroad passenger-miles increased by 78%, while travel by private automobile increased by 21%, between these years. Undoubtedly of much influence in this connection were the many new streamline trains and new and improved types of other passenger equipment installed by railroads when the close of World War II again made such equipment obtainable. However, the private automobile in 1948 accounted for almost five-sixths of the total movement by all carriers.

Table XVI illustrates these trends in travel habits.

TABLE XVI—*Intercity Traffic*
(In billions of passenger-miles)

	1930	1940	1948
Railroads (except commutation travel)	40.8	19.8	35.3
Buses	—	11.6	23.6
Air lines	—	1.0	5.9
Total	40.8	32.4	64.8
Private automobiles	7.0	338.4	387.4
Grand total	47.8	370.8	452.2

The proportion of their total operating revenues which railroads derived from passenger traffic declined during the years preceding World War II to about 10% on class I railroads. In 1949 it was somewhat more than 10%.

Types of Trains.—Passenger service is provided by three types of trains: commutation, local and through. Commutation trains are operated principally within a relatively few large metropolitan areas, for carrying passengers to and from the city for work, shopping and pleasure. The term "commutation" is derived from the reduced-fare, multiple-trip tickets used by most such patrons. Local trains provide service to all or most stations along the railroad. In addition to handling passengers, these trains frequently pick up and deliver mail and express at way stations. Through trains, often called express trains because of their fast schedules, operate between principal cities and make infrequent stops en route. These trains usually consist of equipment especially designed for long trips, such as sleeping cars, lounge and parlour cars, dining cars and, in many cases, specially arranged coaches. Much equipment on such trains has been streamlined. Many passenger trains have distinctive names by which they are widely known. Some of these names are of such long standing that they have become traditional.

Railroads in Relation to Other Carriers.—Types of transportation other than railway service are performed by freight and passenger motor vehicles on highways, vessels operating in coastwise and intercoastal ocean service and on the Great Lakes and inland waterways, aeroplanes and pipe lines.

Tables XVII and XVIII show percentage distribution of commercial intercity freight and passenger traffic among the various types of carriers. Years shown represent the first official compilation of this information by the Interstate Commerce Commission (1926), the last peacetime year (1941), the peak of the war effort (1944) and a postwar year (1949).

Use of Public Facilities.—Railroads and pipe lines are the only transport agencies which own substantially all facilities used in producing their service. Carriers by highway, water and air own

TABLE XVII—Percentage Distribution of Commercial Intercity Freight Traffic

	1926	1931	1944	1949
Steam railroads (including mail and express)	76.8	64.3	70.0	61.8
Great Lakes*	14.1	73.9	9.9	11.0
Rivers and canals	1.6	1.6	3.5	4.5
Motor trucks	8.8	17.7	6.9	10.5
Oil pipe lines	4.4	10.4	12.4	12.3
Electric railroads	0.3	0.1	0.1	0.1

their vehicles, and in varying degrees furnish some of their own terminal facilities. However, highways used by highway transport and channels used by water transport are constructed and maintained at public expense, as also are airways, beacons, emergency landing fields and other navigational aids utilized by operators of air transport. Operators of water and air transportation pay nothing toward the cost of waterways (except the Panama canal) and airways they use, and it may be questionable whether tax payments by commercial intercity highway transport operators are fully compensatory.

CANADA

Canada had (in 1948) 41,909 mi. of railway line (exclusive of 339 mi. operated in the United States by Canadian railroads) and 57,005 mi. (including U.S. mileage, which cannot be separated) of all classes of tracks. More than 93% of the mileage was owned or operated by two systems, the Canadian National railways and the Canadian Pacific Railway company. The former, and somewhat the larger, is owned by the government of Canada. Both these systems were truly transcontinental, extending from ocean to ocean. In addition to the two large systems, there were a number of smaller railroads, some of them owned by provincial governments. The total gross investment in Canadian railroads at the end of 1948 was \$3,600,000,000.

Table XIX compares principal statistics of Canadian railroads for the last prewar year (1939), the peak wartime year (1944) and a postwar year (1948).

TABLE XIX—Statistics of Canadian Railroads

	1939	1944	1948
Gross revenues (000)	\$367,170	\$796,637	\$873,812
Operating expenses (000)	\$304,373	\$634,774	\$606,136
Operating ratio	\$2.95	70.75	69.35
Net income (000)	\$72,797	\$161,863	\$167,676
Employees, number	120,369	175,095	180,663
Average annual compensation	\$2,149	\$2,125	\$2,696
Tons of freight transported (000)*	84,831	156,350	154,603
Revenue per ton-mile (000)	37.44	65.18	60.78
Average haul (in miles)	372	424	381
Revenue per ton originated	\$3.18	\$3.72	\$4.21
Revenue per ton-mile (in cents)	9.09	8.90	11.53
Passengers carried (000)	20,482	60,336	38,280
Passenger-miles (000)	1,751,071	6,873,188	3,477,273
Average trip (in miles)	86	114	91
Revenue per passenger carried	\$1.76	\$2.28	\$2.18
Revenue per passenger-mile (in cents)	2.06	1.92	2.40
Locomotives in service	4,373	4,410	4,581
Freight-train cars in service	160,018	164,067	173,460
Passenger-train cars in service	6,387	6,265	6,009

*Includes receipts from foreign connections

Freight traffic of Canadian railroads in 1948 was made up, by major groupings, as follows.

	Tons
Products of agriculture	27,565,000
Products of animals	3,890,000
Products of mines	3,733,000
Products of forests	19,449,000
Manufactures and miscellaneous	44,105,000
U.S.C.I. (merchandise)	4,107,000
Total	154,033,000

The first railroad construction in Canada was in 1835, comprising a 16-mi. line between Laprairie and St. Johns, Que., to facilitate travel between Montreal and New York city. In 1850 there were 66 mi. of railroad in Canada. Subsequent development has been as follows (the figures including a small mileage in the United States which is owned and operated by Canadian railroads)

	Miles of road
1860	2,065
1880	7,194
1900	17,697
1920	38,805
1940	44,573
1948	41,909

The 1948 mileage was located as follows

	286
Prince Edward Island	1,396
Nova Scotia	1,835
New Brunswick	4,765
Quebec	20,464
Ontario	4,436
Manitoba	8,738
Saskatchewan	5,643
Alberta	3,888
British Columbia	38
Yukon	—
Total in Canada	41,909
Total in United States	339
Grand total	42,248

The foregoing mileages do not include 705 mi. of 3 ft 6 in gauge line in Newfoundland, which on April 1, 1949, became a province of Canada. The Newfoundland mileage is now operated by the Canadian National railways.

The first transcontinental line in Canada was the Canadian Pacific railway, completed in 1885. The terms under which British Columbia entered into confederation in 1871 bound the Dominion of Canada to commence a transcontinental railroad within two years and complete it within ten years. Construction as a public work started in 1874 but was not pushed very rapidly. In 1880 the project was taken over by the Canadian Pacific railway under a contract calling for completion by May 1, 1891. Under the contract, the railroad was granted 25,000,000 ac of land, \$5,000,000 and certain other inducements.

A second transcontinental line grew out of the extension of the Grand Trunk railway, chartered in 1852, which about the end of the century extended via Canada from Portland, Me., to Chicago, Ill. Under an agreement in 1903, the government constructed a line from Moncton, N.B., to Winnipeg, Man., which was completed in 1915. Its extension to Prince Rupert, B.C., was completed in 1914, with financial assistance from the government. A third transcontinental line was completed in 1915 by the extension westward to Vancouver and eastward to Montreal of the Canadian Northern railway, which by 1902 had been completed from Winnipeg to Port Arthur, Ont., by several predecessor companies. This construction also had the benefit of government financial assistance.

The hopes of development which had inspired the construction of the second and third transcontinental lines were disappointed in consequence of World War I and its aftermath, and the government had to give financial assistance to these railroads. In 1917 the government acquired the capital stock of the Canadian Northern, and the insolvency in 1919 of the Grand Trunk Pacific led to the acquisition of that railroad and its parent, the Grand Trunk, by the dominion government. The Intercolonial railway, built as a condition of confederation and completed by 1876 from Halifax, N.S., to a point east of Quebec, and the Prince Edward Island railway, opened in 1875, had been owned and operated by the dominion government since their construction. Unification of these various lines into the present Canadian National railways came about in 1923.

The Hudson Bay railway, extending 510 mi. from The Pas, Man., to Churchill, Man., on Hudson bay, constructed by the Canadian government, was completed in 1929. Its purpose was to stimulate development of northern Manitoba Saskatchewan

and Alberta by providing a shorter and cheaper route for movement of grain. These hopes have not been fully realized, and the line has had operating expenses in excess of revenues in all but one year since it was opened (to 1950). It is operated by the Canadian National for the Canadian government.

In most physical respects, railroads of Canada conform to standards of those of the United States, and there is an extensive and regular movement of locomotives and cars, both freight and passenger, across the border. In fact, the railroads of the two countries operate as a single system so far as their users are concerned. Principal Canadian railroads are members of the Association of American Railroads, and conform in general to A.A.R. standards and specifications of equipment. An important difference between railroads of the two countries is that the two large Canadian systems operate all types of transportation, a privilege denied or severely restricted by law and by administrative rulings in the United States. These Canadian railroads operate, in addition to their rail service, ocean and coastal ships, vessels on inland lakes and rivers, highway transport service, air lines, express companies, telegraph and radio communications, hotels and other commercial enterprises.

The Canadian National-Canadian Pacific act of 1933 directed the two railroads to try to agree on co-operative measures to effect economies and bring about more remunerative operations. Pursuant to this act, many passenger services have been pooled and other types of co-ordination effected.

Regulation of railroads in Canada follows much the same lines as in the United States, although it is not so comprehensive. Responsibility for regulation rests with the Board of Transport Commissioners, organized by statute in 1938, with enlarged responsibilities, as successor to the Board of Railway Commissioners, organized in 1904. It consists of a chief commissioner, an assistant chief commissioner, a deputy chief commissioner and three commissioners. Passenger rates are standard and special freight rates are standard, special and competitive. Standard rates are maximum and are the only ones which must be approved by the B.T.C. Special and competitive rates may be applied if the change of rates has been advertised. In 1947 the B.T.C. established a Bureau of Transportation Economics to co-ordinate all economic studies pertaining to air, rail and water.

There is competition with railroads by water carriers and highway carriers. Water carriers operate principally on the Great Lakes and the St. Lawrence river and canal system, otherwise, there is relatively little competition by inland water carriers. An extensive amount of coastwise service is operated on the Pacific coast, partly supported by the national government, but relatively little of this could be considered truly competitive with rail service, because of the geographical situation. There is no federal regulation of highway service, this being left in Canada to the provincial governments. Some of these governments exercise no economic regulation over commercial carriers. In consequence, there is lively competition with the railroads in these provinces, which are the principal centres of industry and population.

Wages for railway employment in Canada are influenced to some extent by those in the United States, but average somewhat lower. During World War II, several cost-of-living bonuses were awarded to workers generally, including railway employees. In 1943 there was a wage increase of 6 cents an hour for railway employees, with further increases of 10 cents an hour in 1946 and 17 cents an hour effective March 1, 1948. Further demands presented by railway employees for a general wage increase and a shorter work week were followed in Aug. 1950 by a nation-wide railroad strike. This was ended only after parliament had passed emergency legislation which called for resumption of negotiations and provided that the workers receive a provisional four-cent-an-hour wage increase.

Freight rates in Canada were unchanged for 26 years prior to 1948. In the aggregate, they average somewhat lower than those of the United States. In large part, this is the result of the Crownsnest Pass agreement of 1897 and the Maritime Freight Rates act of 1927. The Crownsnest Pass agreement was entered into between the Canadian government and the Canadian Pacific

Railway company. Under it, the Canadian Pacific railway was granted a subsidy of \$3,630,000 to aid in construction of a railway line from Lethbridge, Alta., through the Crownsnest pass to Nelson, B.C. In return, the railroad agreed to make certain reductions in rates on specified commodities. Enacted as a statute, and subsequently amended, the agreement has the present effect of binding that railroad—and, for competitive reasons, the Canadian National as well—to maintain rates at the 1897 level on grain and flour from the prairie provinces (Manitoba, Saskatchewan and Alberta) eastward to Port Arthur and Ft. William, Ont., at the head of Lake Superior, and, in the case of these commodities for export, westward to the ports of Vancouver and Prince Rupert. Under the Maritime Freight Rates act of 1927, the Canadian government ordered the Canadian National to make effective a reduction of 20% on all freight on lines east of Quebec. For competitive reasons, other railroads were allowed to make the same reduction. The difference between normal rates and the reduced rates is made up to the railroads in payments by the Canadian government. These payments average about \$3,500,000 yearly.

Wages and materials prices entering into railroad operation having moved sharply upward during and after World War II in Canada as well as in the United States, their freight rates having remained unchanged for 26 years prior to 1948, Canadian railroads experienced increasingly difficult financial problems by reason of their greatly increased costs. To cope with these problems, the railroads in Oct. 1946 applied for a general increase of 30% in freight rates, and in March 1948 were granted an increase of 21%, subject to some exceptions. Because of objections to this increase by the prairie and maritime provinces, the Canadian government ordered a general rate investigation by the Board of Transport Commissioners. In addition, the government early in 1949 established a royal commission on transportation, composed of three men and a counsel, to make a general survey of transportation in Canada.

In response to a petition of the railroads in July 1948 for a further general increase of 20% in freight rates, the Board of Transport Commissioners in Sept. 1949 authorized an interim increase of 8%, which in March 1950 was expanded to authorize rates 16% above the July 1948 level. A further increase authorized in May 1950 brought the rate level up to the full 20% increase over the July 1948 level which the railroads had sought.

The Canadian Pacific railway has operated profitably in most years. The contrary is true of the Canadian National, which customarily experiences large deficits, borne by the Canadian government. However, the Canadian Pacific has important advantages of location by reason of its priority of construction. Moreover, the Canadian National is in many respects an instrument of governmental policy as well as a transportation enterprise. Thus, many of its lines have been constructed, and many of its activities are conducted, primarily to aid in developing the territory traversed and in promoting the commerce of Canada.

MEXICO

The common-carrier railroads of Mexico comprise 12,517 mi. of which 11,409 mi. are standard gauge. Substantially all the remainder is three-foot gauge. Much the greatest portion of the total mileage is owned by the federal government.

The nucleus of the Mexican railway system is the government-owned National Railway of Mexico (*Ferrocarril Nacional de México*).

The National Railway of Mexico operates a network of lines extending from the Gulf of Mexico to the Pacific Ocean, and from the north to the south, and from the east and southeast of Mexico City, to Puebla and Oaxaca.

Besides the National railways system, the federal government also owns other lines. One is the Kansas City, Mexico and Orient

railway, whose line runs southwestward from Ojinaga (opposite Presidio, Tex.) through Chihuahua to a projected connection with the port of Topolobampo, on the Gulf of California. There is a gap of 190 mi. in this line, between a point 78 mi. northeast of Topolobampo and a point about 190 mi. southwest of Chihuahua. Other government-owned lines not incorporated in the national system include the Mexican Railway company, linking the capital and Veracruz, the Southeastern railway, southeastward from Veracruz, and the Sonora-Baja California railway. The last-named has completed a line 325 mi. long, which directly connects the head of the Gulf of California with San Diego, Calif., on the northwest and with the main rail network of Mexico to the south-eastward, via Benjamin Hill, Sonora.

In the western part of the country are the Southern Pacific Railroad of Mexico, the Mexico North-Western railway and some smaller lines, which remain under private ownership. The territory of Quintana Roo and the state of Yucatan also own railway lines within their respective areas. Until 1949 the Yucatan railroad was completely isolated from any other, but the government-owned Southeastern railway extended its line from Veracruz to connect with it.

The main trunk lines of railroad reach the most populous areas and converge on Mexico City. There is direct contact between the capital and the United States via eight border points between Mexcal-Calexico and Nogales, on the west, and Matamoros, on the east. Lines also connect the capital with Suchiate, on the Guatemalan boundary, with seaports on both coasts, and with the most productive industrial, commercial, mining and agricultural regions of the country. There is considerable interconnection of lines, with additional mileage under construction or projected to increase such interconnection.

Table XX shows principal statistics of the National Railways of Mexico for the years 1939, 1944 and 1947.

TABLE XX—Statistics of National Railways of Mexico

	1939	1944	1947
Gross revenues (in thousand pesos)	238,128	297,780	410,707
Operating expenses (in thousand pesos)	135,054	285,080	457,644
Operating ratio	86.2%	95.6%	111.4%
Operating ratio (number)	271	272	155
Average annual compensation (in pesos)	2,057.75	3,107.80	5,540.33
Tons of freight (thousands)	9,810	11,920	13,644
Revenue ton-miles (thousands)	2,867,312	3,084,129	4,190,110
Average haul (in miles)	286	314	308
Revenue per ton (in pesos)	10.46	15.15	20.49
Revenue per ton-mile (in pesos)	0.83	0.54	0.66
Passengers carried (thousands)	17,364	74,519	104,848
Passenger-miles (thousands)	137,721	1,535,942	1,825,970
Average trip (in miles)	42	62	59
Revenue per passenger carried (in pesos)	42	94	3.50
Revenue per passenger-mile (in pesos)	0.007	0.15	0.003
Locomotives (number)	963	947	1,290
Freight-train cars (number)	74,743	15,582	17,097
Passenger cars (number)	595	491	519

Generally speaking, facilities and rolling stock are of United States origin or pattern. During World War II a United States mission operated in Mexico to assist in rehabilitating about 1,900 mi. of overcast key lines so as to facilitate the movement of Mexican materials needed for the war effort. As regards weight of rail, maximum grades and curvature of line, types of locomotives and other rolling stock, and other operating characteristics, the standards of the Mexican railroads on the whole are less advanced than those in the United States.

Oil is the principal locomotive fuel, but much coal and gasoline also are used, and wood on a few small lines. The country has insufficient productive capacity to satisfy its needs for rail, track material and rolling stock, and the United States is the principal source of supply.

Railroads of Mexico are to some extent integrated with those of the United States. Passenger and freight cars of United States railroads are operated to and from points in Mexico. However, Mexican rolling stock does not enter the United States (except within border terminals), freight loads destined to interior points in the U.S. being transhipped at the border. Mexican cars thus unloaded often are reloaded with freight transhipped in the opposite direction.

CENTRAL AMERICA

The six countries of Central America (Canal Zone excluded) have a total of 1,783 mi. of common-carrier railway lines, all of which is narrow gauge, 735 mi. being 3 ft 6 in. and 1,048 mi. being 3-ft gauge.

The following table shows location of this mileage

	Miles and gauge	
	3 ft 6 in.	3 ft
Costa Rica	410	—
El Salvador	—	586
Guatemala	—	538
Honduras	88	—
Nicaragua	437	—
Panama	—	124
Total	735	1,048

Government ownership embraces 562 mi., including all mileage in Honduras, Nicaragua and Panama and some mileage in all countries except El Salvador. In addition to the common-carrier mileage, there are about 1,250 mi. of 3 ft 6 in. and 3 ft private railroads, owned and operated by banana companies.

Except in Guatemala and El Salvador, railroads are isolated and serve only small areas of the country. The Guatemala-Salvador lines form a fairly well-integrated system of three-foot gauge lines. This system extends from the Mexico-Guatemala boundary at Ayutla, Guat., through the length of Guatemala and El Salvador to Cutuco, on the Gulf of Fonseca. Branches connect with four Pacific ports and with the Caribbean port of Puerto Barrios, Guat.

The system connects at Ayutla with the National Railways of Mexico line to Suchiate but, as the latter is standard gauge, freight must be transferred.

The railroads of Costa Rica consist chiefly of an interoceanic route through San José, the capital; the remainder of the country is without railway service, except for local banana lines. In Honduras, railroads serve small areas inland from a few Caribbean ports in the western part of the country, and are used primarily for hauling bananas. The Nicaraguan railroad runs inland a short distance from and paralleling the Pacific coast, linking Managua, the capital, with the Pacific port of Corinto and with Lake Nicaragua. In the republic of Panama, the only common-carrier railroad serves a small area inland from the Pacific port of David.

All railroads in Central America are of relatively light construction. Virtually all equipment and supplies are imported, principally from the United States.

Oil is the principal locomotive fuel, with some relatively small use of coal and wood. The government railroad in Costa Rica is electrified.

Canal Zone.—The Canal Zone has 51 mi. of interoceanic railroad, five-foot gauge, from Colón to Panamá City, with 112 mi. of terminal and passing tracks. It operates 17 road engines and 12 switch engines, 655 freight cars and 48 passenger cars. The railway properties are an adjunct of the canal and are owned and operated by the United States government, through the Panama Railroad company. This company is supervised by a board of directors under the secretary of the army of the U.S. It has been the policy to elect the governor of the Canal Zone as the president of the railroad company.

CUBA

Railroads of Cuba operated for public service comprise 3,015 mi. of line, of which 2,492 mi. are main line and 523 mi. are branches, with 623 mi. of yard tracks and sidings. Substantially all this mileage is standard gauge, there being a few short narrow-gauge lines. Of the mileage of line, 82% is operated by two companies, of British and United States ownership, and 95% by a total of nine companies. The other 5% of total mileage is divided among 11 companies. The railway mileage extends virtually from end to end of the island, reaching the coast at numerous points, and is well interconnected. Public-service railroads operate approximately 587 steam and 24 electric locomotives, 667 passenger-

train cars and 15,227 freight cars. In the year ended June 30, 1944, these railroads originated 23,000,000 metric tons of freight, of which more than 19,000,000 metric tons was sugar cane and its products. Passengers carried approximated 14,000,000.

In addition to the public-service railroads, sugar mills operate a total of 7,037 mi. of railroad (of which 270 mi. perform public service and are included in the public-service mileage above). Of this total trackage, 4,232 mi. is standard gauge, and substantially all the remainder is 36-in and 30-in gauge. Sugar-mill railroads operate approximately 800 locomotives and 33,000 cars of all types.

Through the service operated by ocean car-ferries, freight cars of United States railroads carry loads to and from points on Cuban railroads.

SOUTH AMERICA

The continent of South America has a total of 61,937 mi. of railway line, of which 23,575 mi. is standard- or wide-gauge and 38,362 mi. is narrow-gauge track. All wide-gauge track is 5 ft 6 in in Argentina and Chile and 5 ft 3 in in Brazil. Narrow-gauge track is principally of metre (39.37 in) gauge, which amounts to 87% of such mileage. Table XXI shows wide-, standard- and narrow-gauge mileage by countries.

TABLE XXI—Miles of Road, South America

Country	Wide gauge	Standard gauge	Narrow gauge	Total
Argentina	11,881	2,044	9,999	26,915
Brazil	1,258	—	19,959	21,217
Bolivia	—	—	1,593	1,593
Chile	1,798	—	2,830	4,628
Colombia	—	—	1,850	1,850
Ecuador	—	94	563	656
Paraguay	—	974	—	974
Peru	—	2,218	704	2,922
Uruguay	—	1,878	11	1,889
Venezuela	—	—	507	507
1 French Guiana	—	—	11	11
British Guiana	—	60	19	79
Dutch Guiana (Surinam)	—	—	107	107
Total	17,957	5,608	38,362	61,937

Whereas most of the railway mileage of North America comprises, and to a large extent is operated as, an integrated whole, there is no comparable situation in South America. Indeed, no individual South American country has an integrated railway system that is truly national in comprehensiveness. For the most part, railroads of South America are individual operations, more or less localized, relatively few of the operating companies having any great length of mileage. Many lines run inland for a short distance from a coastal or river port, or connect with a highway. Railway mileage usually is concentrated in relatively small areas of each country.

A trend in South America, especially marked during the decade 1940-50, was toward nationalization of railroads. Argentina and Uruguay were particularly active along this line. There was in 1950 no country in South America in which the government did not own and operate some railroad mileage, and in several countries government ownership was the predominant or only type.

There is little interconnection of lines. Indeed, interconnection in many if not most cases is physically impossible because of differences of gauge. There is a wide variety of gauges, ranging from 5 ft 6 in (1.676 m) down to 23.5 in (60 cm). Only Bolivia, Paraguay and Uruguay have all or substantially all their mileage of the same gauge. Differences of gauge mean little so long as lines are isolated, but they become increasingly troublesome and uneconomical as railway development progresses and interconnection and integration are sought.

Equipment of South American railroads also is varied as to both gauge and origin. Virtually all equipment has been purchased abroad, derived variously from England, Belgium, France, Germany, Spain and the United States. This situation complicates maintenance problems. It also handicaps integration of lines, because of diversity of types and parts. Two varieties of telegraph instruments and codes, the Morse and the Spagnoletti, are in use. Lack of standardization extends also to terminology and therefore to statistics as well.

Grades and curves often are severe, partly because of the rugged and difficult topography traversed (especially in the west where mountains rise steeply from the seacoast) and partly because railroads in their developmental stages characteristically sacrifice easy grades and curvatures to economy of construction. The Central Railway of Peru climbs 15,806 ft from Callao in 108 mi., averaging about 2.8% gradient. The Guayaquil and Quito railway (Ecuador) climbs 9,651 ft in 49 mi., averaging 3.7% gradient. The former North Central Argentine (now part of the Ferrocarril General Belgrano) railway crosses into Bolivia at an elevation of 11,287 ft. The same railroad's line to the Chilean border rises at one point to 14,520 ft. (The highest point reached by a standard steam railroad in the United States is 11,319 ft., and grades in excess of 2.2% on main lines are uncommon, even in mountainous country.)

Climatic conditions further increase difficulties of railway construction, maintenance and operation. Torrential rains cause landslides, rockslides and washouts, and on some lines the ground becomes so soft during the rainy season that the track will not support locomotives. Deep snows in the mountains are another serious problem, as also are earthquakes in certain localities. These conditions often cause disruptions of service, sometimes of considerable duration, and because of the hazards trains in some localities are operated only in daylight.

Track as a rule is of relatively light construction. Ties generally are of native woods, but some wooden ties are imported, coming from the United States, Australia and elsewhere. Some railroads also use ties made of steel or iron. Most of the rail weighs from 60 lb to 70 lb to the yard. Much track is ballasted with earth. Automatic signalling is seldom found, and sometimes there is no central train dispatching, trains proceeding from station to station by telephoning the next station ahead to ascertain if the track is clear.

In keeping with the light track, rolling stock in South America also is relatively small and light. Freight cars often have capacity of 20 tons to 25 tons or less. Some modern passenger equipment is operated on a few lines, and more is being acquired.

A great problem of railway operation throughout South America is procurement of fuel. The continent has little coal, and what there is does not make good locomotive fuel, besides being situated in remote areas. Likewise, domestic oil production is inadequate to supply needs for oil for locomotive fuel, and it also is remotely situated. Some railroads, especially in the north, depend entirely on wood for locomotive fuel. Not only have large areas of country adjacent to railway lines been deforested thereby, but procurement of wood requires the services of a large proportion of available cars and locomotives.

Good ballast also is a problem. In the Argentine pampas there is no rock or wood for many miles, and parts of Brazil and Bolivia also have no rock. Rock and sand sometimes have to be hauled many miles.

Partly because of differences in gauge, relatively few railroad lines cross national boundaries, and there are still fewer transcontinental lines, with boundary service. A 39-mi. standard-gauge line connects Tacna, Peru, with Arica, Chile. Continuous lines (metre gauge) connect La Paz, Bol., with Arica and Antofagasta, Chile. Another continuous through line (standard gauge) links Buenos Aires and Asunción, the capitals of Argentina and Paraguay. Crossing the Uruguay river on the international railway bridge at Paso de los Libres, a branch of this line also extends to a junction with a metre-gauge Brazilian railroad at Uruguayana, Brazil.

Between La Paz and the Peruvian seaport of Mollendo there is a route made up of a Bolivian metre-gauge line to Lake Titicaca, vessels on the lake, and thence a Peruvian standard-gauge line.

A transcontinental route, metre gauge, is available from Buenos Aires to Antofagasta, but it is quite circuitous, involving use of part of the line extending between La Paz and Antofagasta. Use of this route to La Paz also affords access to Mollendo, as above described. However, washouts in the rainy season annually disrupt traffic on the Argentine portion of the route. Another transcontinental metre-gauge route, completed in 1948, connects

Buenos Aires and the Argentine port of Santa Fé, via Salta and Socompa pass (elevation 12,512 ft.), with Antofagasta.

From Buenos Aires and Santa Fé still another metre-gauge line and also a broad-gauge (5 ft 6 in.) line extend westward to Mendoza, whence another metre-gauge line extends to a connection with a Chilean metre-gauge line, which in turn connects with the main Chilean rail network. This route is subject to interruption by snowslides and floods. It was reopened in 1944 after several years' interruption by flood damage west of Mendoza.

Two other transcontinental routes were under construction in 1950. One involved the completion of about 65 mi. in Chile and 50 mi. in Argentina, south of the line via Mendoza, to connect the principal Argentine and Chilean rail networks through Zapala, Arg., and Lonquimay, Chile, respectively. The other project involved construction to complete a route between the Brazilian port of Santos and the Chilean port of Arica, through Bolivia. Completion of the remaining portion, in eastern Bolivia, involved serious difficulties in terrain and supply.

Other construction projects under way or contemplated included lines in Bolivia connecting with the projected Santos-Arica line (including a connection with the Argentine railway system), lines in Argentina and Uruguay toward their respective borders, a link in Brazil to give that country a continuous north-south metre-gauge line, several branch lines in Chile and lines in other countries to reach ports or link existing lines.

During the 1930s and 1940s there appears to have been a trend in South America toward development of highways instead of railroads. Air transportation also has had considerable development, especially in the north, where large areas have no other means of access.

EASTERN HEMISPHERE

The eastern hemisphere has approximately 435,403 mi. of railroad, distributed as follows.

Continent	Miles
Europe	269,875
Asia	95,588
Africa	43,580
Australasia	31,557
Total	435,403

EUROPE

Of all mileage of railroad in the eastern hemisphere, Europe has 61%, distributed as follows.

Country	Miles
Austria	4,450
Belgium	3,900
Bulgaria	2,224
Czechoslovakia	8,383
Denmark*	9,903
Estonia	921
Finland	3,523
France	40,348
Germany	36,226
Great Britain*	19,863
Greece	1,521
Hungary	5,773
Ireland, Northern*	754
Ireland, Republic of*	2,460
Italy	11,383
Latvia	2,602
Lithuania	1,045
Luxembourg	312
Netherlands	2,174
Norway	2,760
Poland	13,575
Portugal*	9,109
Rumania	7,565
Spain*	10,563
Sweden*	10,318
Switzerland*	3,545
U. S. S. R.*	57,487
Yugoslavia	6,026
Total	269,875

*In view of political and territorial changes, and wartime destruction, it is not possible to include comparative figures more up-to-date than for 1937, except in respect of the countries thus indicated.

Developments in Europe.—Later railway history in Europe falls into three main periods, that terminating with the outbreak of World War II in 1939, the war period itself (1939-45) and the postwar years. Technical developments had been outstanding

during the prewar decade, though competition, chiefly from road transport—the private automobile, the intercity and local coach and bus, and the motor truck—had limited the return earned, if any, on capital investment, to meagre rates. International co-operation among the European railways had increased steadily through the activities of the International Union of Railways, with headquarters in Paris, in a wider and more technical sphere, the older International Railway Congress association, centred in Brussels, Belg., had held a meeting at Paris in 1937.

Other international railway bodies, based in Berne, Switz., had done much to assist the flow of international railway traffic. For example, meetings at Berne produced as far back as 1890 the so-called CIM. (Convention Internationale sur le Transport des Marchandises), an international arrangement under which goods may be moved by rail across national borders in Europe with a single transport document—the international waybill. From the same source later developed the CIV (Convention Internationale sur le Transport des Voyageurs), a similar agreement relating to international travel. The CIM and CIV conventions are, multilateral governmental treaties, forming an extensive codification of international law concerning movement of goods, passengers and baggage by rail under tariff arrangements. They determine the rights and obligations of the railways and their users, regulate the extent of responsibility of railroads taking part in a given movement and contain provisions for settlement of accounts and rights of recourse among participating railroads. Other international arrangements of long standing are the RIV (Regolamento Internazionale Vecoli) and the RIC (Regolamento Internazionale Carrozzi), which are the successors to arrangements dating well back into the 19th century covering international movement and interchange of freight and passenger cars. Similar arrangements provided for annual international passenger timetable conferences, to which was added a similar freight timetable conference.

Another notable trend in Europe was the rapid development of electrified operation. In some respects, this was the counterpart of the trend toward dieselization in the United States. There had been some development of the use of light diesel locomotives for switching in Europe, but operation of diesel locomotives on main lines had not progressed beyond a few experiments. Widespread availability of sources of hydroelectric power in Europe, contrasted with lack of domestic sources of oil, perhaps accounts in large measure for this difference in trend. Electrified traction was increasing in Europe after World War II, even in countries with abundant domestic supplies of coal. The three basic power systems in Europe were 3,000 v. D.C., 1,500 v. D.C. and 15,000 v. A.C., of which the two direct-current systems mentioned were gaining in use. Belgium and Italy used 3,000 v., while France and the Netherlands used 1,500 v. New lines in Spain used 1,500 v., while older lines had 3,000 v.

Railways of Great Britain.—Turning to individual countries one may first consider Great Britain, the only European country (Northern Ireland and the Republic of Ireland excluded) at the outbreak of World War II to rely entirely on privately owned and operated railways.

Growth and Development.—The railway systems of Europe had their earliest beginnings in Great Britain. The commercial success of the Stockton and Darlington and the Liverpool and Manchester railways, opened in 1825 and 1830, led to construction of numerous small railroads, starting in the northeastern counties of England. Gradually, these were consolidated in larger units. Though parliament throughout the 19th century based railway policy mainly on the necessity of keeping competition alive, World War I finally broke down that policy and created a complete reversal of it in the Railways act of 1921. This act forcibly amalgamated practically all the railways into four great systems, in certain cases amalgamating lines which had been refused permission to do so some years before. The four systems were the London Midland and Scottish, the Great Western, the Southern, and the London and North Eastern railways. Other than these four big systems, certain smaller lines were jointly owned by some of them.

In the London area was a group of electrified passenger traffic lines, mainly constructed in tunnels and known collectively as the Underground. There was also the Metropolitan, a line electrified within London itself but still worked by steam traction north of Rickmansworth. In 1933 these, with other public passenger-carrying undertakings in the London area, were amalgamated under the London Passenger Transport board (L.P.T.B.), a public-trust enterprise which purchased the security holdings of the former owners of the component lines.

Lastly there were certain small light railways in various parts of Great Britain, some of a gauge narrower than the standard of 4 ft 8½ in., notably the Eskdale line in the Lake District, and the Romney, Hythe and Dymchurch line in Kent. In north Wales was the Snowdon Mountain rack railway.

Growth of British railways is seen in the following table of mileage statistics (excluding railways of London Transport)

TABLE XXII.—Growth of British Railways

Year	Route miles	Year	Route miles
1825	96	1900	21,865
1844	2,230	1910	23,187
1850	6,655	1920	23,734
1860	10,410	1926	20,305*
1870	15,310	1933	20,251*
1880	17,935	1945	19,853*
1890	20,973		

*Not including Irish Free State

Since 1890 there have been only comparatively small additions to railway mileage, route mileage taking no account of the presence of second, third or fourth tracks, but widenings have taken place and the figures for track mileage, which measures all tracks and converts them to a basis of one track only, are in 1913, 36,448 mi., in 1933 (including sidings), 52,638 mi., in 1945 (including sidings), 52,592 mi.

Pre-World War II Activities—The British railway system at the outbreak of World War II consisted of the four large railways already mentioned by name, while the London Passenger Transport board held from 1933 a monopoly of public passenger services in the London area, embracing electric railways (largely in subways or so-called tubes), buses, trolley buses and electric tramways (street railways). The four main-line railways—unlike the French railway situation prior to 1938, when the latter became nationalized—were to some extent competitive on the main traffic routes, such as London-Birmingham, London-Leeds, London-Perth and London-Exeter, but pooling of receipts in such cases tempered the measure of competition. In the London area, all passenger receipts were pooled between the main-line railways and the Passenger Transport board.

Outstanding activities of the individual main-line railways may be summarized briefly. On the Great Western, which had retained its identity for more than a century, a high degree of standardization had been achieved with its locomotive power, culminating, in regard to express locomotives, with the four-cylinder "King" class, which had originally visited the Baltimore, Md., fair in 1927. Retention of the cream and brown livery for passenger equipment emphasized the individuality of the Great Western. A pioneering development on this line was a zonal system of rail and highway co-ordination, whereby much mileage of pickup freight trains was eliminated and a better freight service offered to small consignments, through a system of railhead working served by the railway's own highway vehicles. A unique feature of Great Western practice was the fitting of virtually all main lines with automatic train-control apparatus on the intermittent system, with nearly all locomotives so equipped.

The Southern had developed by 1939 the largest system of suburban electrification in the world, extending over about 600 route miles and stretching from London to such coast towns as Hastings, Brighton and Portsmouth. The operation was wholly by multiple-unit electric trains, using the third-rail system at 660 v.; electric passenger cars numbered about 1,500. The Southern specialized in the use of colour-light automatic signals on extensive mileages of main lines.

The London and North Eastern had become famous for its

steam-hauled, limited-train flyets from King's Cross (London) to Newcastle (the "Silver Jubilee"), to Edinburgh (the "Coronation") and to Leeds (the "West Riding"), speeds ranged up to 100 m.p.h. and one of its "Pacific" (4-6-2) locomotives, "Mallard," in 1938 had touched 126 m.p.h., believed to be a world record. The L.N.E.R.'s "Flying Scotsman" provided the longest nonstop daily run in the world, between London and Edinburgh, 392 mi.

On the London Midland and Scottish railway attention may be directed to the scientific research department located at Derby, where was also the residential school for staff training. This company's "Coronation Scot" express between London (Euston station) and Glasgow was its most famous train. Its progressive (assembly line) system for rolling-stock repairs, and for new construction, was a unique feature of European railway practice and development.

Nevertheless, most of the progress to be recorded on the British railways was of necessity on a four-company basis. Typical instances were development of container working, a system by which a vehicle body can be transferred by crane from rail car to motor truck and vice versa. This system had formed an effective method of meeting intensive highway competition, being ideally suited to British rail transport, with its small average consignment of less than six tons, and the retail nature of its short-distance freight traffic, with an average haul of about 70 mi. Approximately 14,000 containers were in service in 1938. Other effective methods of competing with highway transport included the quotation of agreed charges (also in use in Canada), by which the traffic of a large firm, such as Woolworth's, would be held to rail movement with a block payment for all consignments over a period, based on a census of traffic previously handled.

Co-ordination of rail and highway services was probably carried further in Britain than almost anywhere else. On the passenger side, the four railways had, by 1938, invested about £10,000,000 in bus-operating concerns, thus ensuring a measure of co-operation between bus and train travel, in the form of connecting schedules, and the replacement of unremunerative rail mileage by bus routes. On the freight side the railways, besides operating their own horse and motor collection and delivery road vehicles, to the number of nearly 36,000, had also acquired the old-established road concerns, Pickfords, Ltd., and Carter, Paterson and Co., Ltd., at a cost of £3,000,000.

In truth, the British railways were transport concerns, operating not only railways and road vehicles, but also owning some of the country's greatest ports—Southampton, Hull, Cardiff and Newport—as well as steamer services to France, the Netherlands, Belgium and Ireland. They owned extensive canal mileages, and also operated a big chain of hotels, chiefly at railway termini and holiday centres. They also operated internal air services under the name of Railway Air services.

Capital expenditures on the British railways system by 1938 had reached the immense total of almost £1,175,000,000 (exclusive of the L.P.T.B.).

On Sept. 1, 1939, the government assumed wartime control of the British railways and the L.P.T.B. Though arrangements for financial compensation to the companies were changed during the war period, the final agreement embodied an annual rental of approximately £43,000,000 to the four companies and the L.P.T.B. All receipts were credited to a common pool, after meeting current expenditures, the remainder accrued to the government, which, after payment of the annual rental of £43,000,000, obtained a 1941-45 profit of £195,000,000 in the aggregate. However, net revenue in 1946 and 1947 was insufficient to meet the £43,000,000 annual rental, and the balance had to be made good by the government, approximately £11,000,000 in 1946 and £59,000,000 in 1947 (of which latter figure £16,000,000 covered items accruing in earlier years). At the close of 1947, by the provisions of the Transport act, 1947, the British main-line railways and the L.P.T.B. were nationalized.

War Damage—The British railway system suffered heavily from enemy air attack over the period 1940-45, there being 9,339

incidents reported, but only 662 of these affected traffic facilities for more than one week. Nearly 400 railwaymen were killed by enemy action and 2,444 injured. Illustrative of property damage and destruction, passenger cars demolished numbered 637, and 13,487 were damaged.

Nationalization—The British Transport act, 1947, was the most important legislation in the railway world for many decades. By its nationalization of the British railways, the United States was left as the sole major country reliant on a privately owned and operated railway system, though the Canadian Pacific still remained such in Canada. Whereas the Railways act, 1921, consolidated the main-line railways into four systems, the Transport act, 1947, not only nationalized the railways, together with their ancillary services—docks, steamers, road vehicles, hotels and canals—but also provided for government ownership of the long-distance highway transport industry and nationalization of canals.

Under this far-reaching act, there was set up the British Transport commission, which in 1949 included five full-time members and one part-time member. Its duties included the provision of an efficient, adequate, economical and properly integrated system of public inland transport and port facilities within Great Britain for passengers and goods. The business of the commission was to be regarded as one undertaking, and it was to be so conducted and such charges levied as would ensure the undertaking paying its way, taking one year with another, after making provision for all charges properly allocated to revenue.

Under the commission there was set up a series of executives. The Railway executive is responsible for the management and working of the main-line railways. Other executives are responsible for London Transport (former LPTB), Docks and Inland Waterways, Road Passenger, Road Haulage, and Hotels, respectively. The Railway executive consists of a chairman, six functional and two part-time members. The four main-line railways were divided into six regions: Western (former GWR), Southern (former SR), London Midland (former LMSR), Eastern (former LNER) and North Eastern (former LNER), while the LMS and LNE mileage in Scotland comprised one Scottish region. All equipment was to be relettered "British Railways," with a new and distinctive system of liveries.

Carriages—All carriages (passenger-train cars) built for long-distance train services in Great Britain are designed to permit travellers to pass from one end of the train to the other, either by means of a side corridor or a centre vestibule. The former are known as compartment-type corridor vehicles, while all dining cars are built to the latter design. Corridor trains permit collection and examination of tickets by railway officials while the journey is in progress, thereby also enabling time at stations to be cut to a minimum, while permitting passengers to distribute themselves more evenly throughout the train. On the other hand, it lowers seating capacity of carriages by at least two seats per compartment, which constitutes a serious consideration in the case of suburban passenger traffic, especially during the hours of peak traffic, or rush hours. Consequently, suburban passenger trains in Europe are sometimes of the noncorridor type, though in certain countries, notably Switzerland, all carriages are vestibuled.

The typical British corridor eight-wheel bogie carriage contains seven first-class compartments or eight third-class compartments, seating respectively 42 and 64 persons on an empty, or "tare," weight of about 30 (long) tons. It usually possesses a lavatory at either end, and is about 60 ft long by 9 ft wide, with a height of about 13 ft from rail level to top of roof centre. Carriages usually possess steel frames and wooden bodies, sometimes metal sheeted, and in some cases a metal roof, although a wooden roof is more common. On continental railways the modern all-steel express-train carriage often weighs 40 tons to 45 tons, a greater degree of safety is claimed for that type of construction, but the all-metal design is usually very much more noisy than the wooden carriage. The noncorridor bogie carriage for British suburban service contains nine or ten compartments, each seating 10 or 12 third-class passengers and 8 first-class passengers, on an empty or tare weight of at least 27 (long) tons. A typical British express train often weighs between 400 and 500 (long) tons

empty, exclusive of engine and tender, on the continent a train of similar seating capacity would be heavier because of the continental carriage design. Pullman, dining and sleeping cars are the heaviest cars on European railways.

The screw coupling and side buffer are used on nearly all western European carriages. In Britain automatic couplings of the "buck-eye" type, the two jaws closing when the carriages are pushed together, were standard for long-distance corridor-vestibuled vehicles on the London and North Eastern and the Southern railways and also for Pullman cars. The LNER has constructed many "articulated" sets of two, three or five vehicles, the bogie being placed under two vehicles instead of at the ends of each. By this method weight is saved and, it is claimed, less oscillation and smoother running result.

In addition to passenger-carrying vehicles, many other railway vehicles frequently form part of the composition of a passenger train, they consist of vans for luggage and parcels, horse boxes, vans for milk, fruit, theatrical scenery and motor cars. These vehicles are all fitted with vacuum automatic brakes for working on fast passenger trains. Electric multiple-unit cars use the Westinghouse air brake.

Total passenger-train vehicles operating at the end of 1948 approximated 55,700, of which about 40,400 were passenger carriages and 15,300 were nonpassenger vehicles for mail and parcels.

Passenger journeys (passengers handled) in 1948 totalled 996,000,000, transported for a total of 21,259,000,000 passenger-miles. The average journey per passenger was 21.3 mi and the average revenue per passenger-mile was 1.38d.

Wagons—For the carriage of merchandise and mineral traffic the British railways employ open or covered wagons (freight-train cars), the latter sometimes known as box vans. For general merchandise traffic, shipments often are covered with creosoted tarpaulin sheets, a practice used to any extensive degree only in Great Britain, where use of covered vans is rendered difficult by the large percentage of traffic which has to be handled by crane at the numerous ports. The size of the British railway wagon has grown steadily but slowly as compared with railway wagons elsewhere, but the internal trade of the country is largely retail in its nature, while the average distance travelled by a consignment is comparatively short. The general practice is to offer a frequent railway freight service, as is done with passenger service, often with comparatively light trains. The average weight of paying or net load in a British freight train is about 156 long tons (compared with about 1,000 long tons in the United States).

However, the engine has also to haul the weight of the wagons themselves. Hence, the wagon designer is faced with the problem of constructing a wagon to hold the maximum weight and volume of capacity on the lightest tare, or empty, weight, with increase of wagon capacity the less becomes tare weight per ton of capacity. Thus, a wagon to carry 6 tons may easily weigh 5 tons, but a wagon to carry 20 tons can be constructed to weigh only 10 tons. The high-capacity wagon, as it is called, also occupies less space on sidings, which is very important, but difficulties are experienced on British railways in the use of such wagons by reason of the small clearances for such fixed structures as mine screens and the sharp curves on many sidings.

The average capacity of the railway-owned wagon in Great Britain is almost 13 long tons, varying according to types of cars, though the standard to which all new wagons conform, other than special wagons for rails, boilers, plate glass and so forth, provides for a 12-ton capacity. Policies have been urged which aim at the adoption of a standard wagon of at least 20 tons, which would doubtless result in economies of railway operation, but it is very difficult for the railways to build a type of wagon which the trading community does not desire, and the latter in Great Britain has always insisted upon its preference for the small wagon unit, in view of the retail nature of the country's trade.

Many important developments have taken place in wagon design beyond the steady growth in size. Spring buffers are now universal in Great Britain, as well as on continental railways. Though the latter employ a screw coupling as with passenger trains, the British lines adhere to the "loose-link" coupling which permits easier at-

taching or detaching of extra wagons. This difference is, once again, the result of the short average length of haul on British railways, and the frequency of junctions where trains have to be reformed for different sections of the line. British wagons are fitted with hand brakes which, according to a government order of 1911, must be fitted on both sides of wagons. The modern wagon has almost invariably a metal frame, but the body may be of steel or timber on a metal framework; coal wagons in many countries are now made of metal.

Wagons operating at the end of 1948 totalled 1,180,000, of which about 544,000 formerly were privately owned and 636,000 were owned by the railways prior to nationalization. In addition, there were approximately 25,000 privately owned wagons of special designs, such as tank wagons, which were not nationalized.

Freight originated in 1948 totalled 276,117,000 (long) tons, which were transported for a total of 21,457,000,000 ton-miles. The average haul was 72.1 mi. and the average revenue per ton-mile was 2.04d.

The total railway staff at the end of 1948 (including road-haulage employees of railroads) was approximately 649,000.

Locomotives, both freight and passenger, operating on the British railways at the end of 1948 totalled 20,352, of which 67 were diesel and 17 were electric.

Under accounting methods of the British Transport commission, financial results of the railways alone are no longer precisely ascertainable. For the year 1949 operations of the commission as a whole showed a loss of £50,700,000.

Railways of Continental Europe.—France.—The first railway in France, opened in 1827 from St Étienne to Andrézieux, was, like early British lines, mainly for haulage of coal. It used horse traction, and did not carry passengers until 1832, the St Étienne-Lyon line of 1830 used steam locomotives from its opening. In 1833 the French government began to encourage railway construction, and among earlier lines authorized were those from Paris to St Germain and Versailles. By 1842 French railways totalled 360 mi. An act of the same year provided for construction of lines which were later to form the great trunk railway routes from Paris to Nancy and Strasbourg, Lyon and Marseilles; Bourges and Toulouse, Tours, Bordeaux and Bayonne, Nantes, Rouen and Le Havre, and, finally, Lille and Belgium. In addition were cross-country routes from Bordeaux to Marseilles, and Dijon to Mulhouse. By Jan 1, 1852, there had been authorized 3,125 route miles and 2,185 were being operated. Rapid development occurred during the next two decades. Leases granted to private companies to operate railways were to last 99 years, and the companies operating in any one territory were amalgamated to reduce competition. By 1870, 16,685 mi were authorized, of which 11,250 were being operated—figures which by 1875 had become 21,375 and 13,562 respectively. Soon afterward a state-operated system (in addition to the private companies) was created.

Total mileage of the seven big French railway systems at the end of 1937 was 26,538 mi. These seven were the Paris-Lyon-Méditerranée, the Paris-Orléans, the Midi, the Est and the Nord, which were private companies operating under the terms of a long lease. In addition, there were the État (*i.e.*, the State system) and the Alsace-Lorraine railways, which latter became French national property as a result of World War I. Each system was practically a rail monopoly in its own territory. Additional to the seven large railways was an important mileage of narrow-gauge lines.

At the beginning of 1938, the government took over the lines operated by the private companies and welded them, with its own State railway and the Alsace-Lorraine lines, into the French National railroads (Société Nationale des Chemins de Fer Français, or SNCF). The reorganized system consisted of five regions: Nord, Est, Ouest (former État railway), Sud-Ouest (former Paris-Orléans-Midi) and the Sud-Est (former Paris-Lyon-Méditerranée). The reorganization had not been completed when war stopped further developments. A new Mediterranean region, based on Marseilles, was set up in 1947.

The railway network suffered material damage in the military campaign of 1940. During the German occupation about 3,400

locomotives and 270,000 wagons, stores, etc., were removed from France. Bridges and other facilities had hardly been repaired when the Allied forces landed in Normandy in June 1944. A key to the success of the Allied campaign had been the paralysis of the railway system of western Europe by air attack, and, on the liberation of Paris, out of more than 40,000 km (about 25,000 mi) of line being operated in 1939 only 18,000 km were then available. France was severed into two parts through the destruction of all rail bridges over the Loire from Roanne to the sea.

The outstanding energy with which the SNCF tackled the problem of reconstruction is one of the remarkable railway efforts of the century. By May 1946, about 40,000 km of line were again in service, while the electrified main lines Paris-Bordeaux-Hendaye, Paris-Le Mans and Paris-Montauban-Cerbère were all working by 1946. By June 1, 1947, 2,468 bridges and viaducts had been reconstructed, 62 tunnels rebuilt and 4,536 km. of line restored. Signalling and telephone wire to a length of 66,000 km. was replaced and 610 signal cabins rebuilt. Out of a total of 17,058 steam locomotives in 1939, only 10,500 were left in Sept 1944—of these only 3,000 were usable. However, 1,200 steam and 100 diesel locomotives were obtained from the United States and 140 from Canada, while by June 1947, 1,750 locomotives had been recovered from Germany, as were 90,000 wagons.

Prewar standards of speed and comfort had been largely re-established by 1947. As a measure of recovery, in the year 1947 the number of passengers carried was nearly 21% above 1938, passenger-kilometres up by 43%, tons carried up by 6% and net ton-kilometres up by 40%. In addition to reconstruction of the great railway centres and classification yards such as Juvisy, Tours, Orléans and Rouen (Sotteville), major improvements were well under way.

Electrification had been completed by 1950 on lines radiating from Paris to Le Mans, Bordeaux and Toulouse, and the line from Bordeaux through Dax, Tarbes and Toulouse had been electrified as far as Nîmes. In addition, numerous extensions from the latter line toward the Spanish border were electrified. Conversion of the great artery Paris-Dijon-Lyon was expected to be completed by the end of 1952; the Paris-Dijon section being scheduled for earlier completion. Several sections of line in the east of France, including the Colcoz-Modane line, also had been electrified.

A scientifically designed basis of freight charges was inaugurated in March 1947, with the older systems of *grande vitesse* and *petite vitesse* being replaced by a *régime accéléré* and a *régime ordinaire*. Many unremunerative branch lines had been closed to passenger traffic, and economies had been effected by the extensive use of diesel rail cars on country services, main and branch line, however, there had been no large-scale development of main-line use of diesels. A postwar feature of interest was the use of oil as fuel on many of the steam locomotives built in the United States.

Germany.—In Dec 1835 the first German railway was opened between Nuremberg and Furth. The first interstate line was that from Magdeburg, Prussia, to Leipzig, Saxony, opened in 1840, and as early as 1847 there was formed an association of German railway administrations. Strict state control was exercised throughout the period of rapid construction commencing in 1846, and by 1855, 5,410 mi had been completed. Uniformity of gauge resulted from importation of British locomotives and rolling stock.

An important characteristic of German railways had been, from the first, the large part played by international traffic, a second characteristic had been the great degree of state construction and ownership. The first state line was opened in Brunswick in 1838, by 1855 throughout Germany nearly 50% of the railway mileage was state-owned. The Austro-Prussian War of 1866 strengthened the Prussian railway system, as also did the Franco-German War of 1870. By the latter year, the main trunk network was largely complete, though few branch lines had been constructed. Lines of the French Est railway in Alsace and Lorraine became the property of the German empire in 1871, while 1873 saw the establishment of an imperial railway department.

From 1876 onward, privately owned railways were gradually absorbed by governments, Prussia acquiring the Berlin-Stettin and Cologne-Minden lines, among many others, by an act of 1879. By

1885 private railways in Prussia were practically nonexistent. Bavaria had always favoured state railways and finally bought up the Pfalz railway in 1908. Saxony had adopted the same policy and took over the Leipzig-Dresden line in 1876. In Hesse-Darmstadt, the Hesse-Ludwig railway became state-owned in 1896, the Mecklenburg railways being purchased by the state in 1889. Oldenburg, Württemberg and Baden owned and operated their railways from the first.

The total route mileage in Germany in 1909 was 35,625. In 1920 the various German state railways became the property of the Reich, but in 1924, consequent on the recommendation of the Dawes plan, their status was altered to a publicly owned company, so far as operation was concerned, on a lease of 40 years. Under the Hitler regime, control again was assumed by the government.

The German railway after 1945 was divided into four sections, corresponding to the four zones of occupation—United States, British, French and Russian. The two former were worked under bizonal control. Little information was definite as regards the soviet zone, but it was known that many double-tracked main lines had been reduced to single track and that electrified mileage had been reduced consequent on removal of apparatus. War destruction and neglect of railroads in Germany would take many years to make good, and progress was slow because of shortage of materials.

Austria—The Austrian Federal railways, taken over by Germany in 1938, were restored to separate operation in Nov. 1945. The system (as of 1950) was divided into four regions, with regional managements at Vienna, Linz, Villach and Innsbruck, regions approximately corresponding with the respective zones of occupation of U.S., British, French and soviet military forces. The federal ministry of transport in Vienna exercised directing and supervising authority over the entire system. Difficulties occurred in regard to free flow of traffic among different zones of occupation. Because of shortage of coal supplies there was an extensive program of electrification between World Wars I and II, and postwar electrification in the Linz-Villach areas continued slowly.

Other European Railways—State-owned railway systems exist in the U.S.S.R., Italy, Switzerland and Denmark, dating back to the 1840s; in Sweden, Norway and Portugal, dating back to the 1850s, and in Greece to the 1860s, although state ownership and operation usually came many years after the opening of the first lines. Belgium has a state-owned system, leased for 75 years from 1926 to an operating national company. This small country has the greatest density of railway mileage in relation to area of any country in the world. In Spain, where railways date back to 1848, and in the Netherlands, where they date from 1839, the lines were taken over by those states in 1947 and 1938, respectively. Rumania, Czechoslovakia, Bulgaria and Yugoslavia all own and operate their systems. In the majority of cases small private lines also exist, but they are usually only of local importance.

Belgium—The Belgian situation following World War II was similar to the French, but on a smaller scale; damage was less in 1940, not quite so grievous in 1944-45, and the efforts of the Belgian National railways (Société Nationale des Chemins de Fer Belges, or S.N.C.B.) were hardly less spirited and energetic than the French in the postwar reconstruction period. By 1947 train services were approaching pre-1939 standard. However, as in France, steep rises in the level of salaries and costs of fuel and stores, coupled with inability to obtain a proportionate increase in the level of charges, prevented the Belgian railways, like the French, from meeting their financial obligations in regard to interest on capital.

Netherlands—The Netherlands railways suffered grievously from war damage and wanted destruction. Following a strike of railway workers in the Allied interest in Sept. 1944, the northern section of the railway system was systematically demolished by German forces between then and May 1945. Not a single diesel-electric multiple-unit set was left at the liberation, while 99% of the multiple-unit electric cars, 94% of the passenger cars and 84% of the steam locomotives had been removed or destroyed. Of the bridges, 70% were destroyed or damaged, as were 68% of the signal cabins. Postwar reconstruction was rapid and thorough.

It also made provision for long-term improvements involving heavier track, extensive conversion to electric traction and the turnover to diesel traction on most of the other lines. The great Moerdijk bridge, 1,100 yd. long, was reopened in Aug. 1946, and 17 other large bridges, including Zaltbommel, had been reconstructed by 1947.

Italy—The Italian State railways had a somewhat similar post-war problem of destruction and reconstruction to face and met it efficiently. Electrification had been re-established on all the lines previously so equipped by 1948, and further conversions to electric traction were undertaken, as, for example, the Simplon main line between Milan and Domodossola.

Switzerland—In Switzerland, practically the entire federal railways system had been electrified (as of 1950), and nearly all single-track sections on the Gotthard line had been converted to double track. A complete revision of passenger fares had been carried through, and the freight-rates structure was under review. Shortage of electric energy derived from hydroelectric power had placed a limit at times on train mileage, just as shortage of coal had limited railway services in Britain, France, Spain and many other countries. Lightweight equipment had been developed scientifically by the Swiss railways, and a network of high-speed services introduced. Switzerland was the first country to develop and test a gas-turbine locomotive in main-line service.

Spain—The Spanish National railways (Red Nacional de los Ferrocarriles Españoles, or R.N.F.E.) were formed in 1941 of a consolidation of the Norte, the Madrid, Saragossa and Alicante, and the government-owned Andalusian and Western railways. Conversion to electric traction is a feature of Spanish railway policy, since coal is of poor quality or must be imported, but shortage of materials has delayed progress. Certain cutoff lines were under construction in 1950, and the section Cuenca-Utiel (Madrid-Valencia) was opened in 1947, another line was completed from Zamora to Corunna in 1943.

Sweden—Swedish State railway progress has been centred primarily on electrification. Nearly all main lines employ electric traction, the electric line from Malmö and Göteborg in the south to the Norwegian frontier near Narvik being one of the world's longest continuous stretches of electrification—2,140 km. Sweden provides another example of the extension of government ownership, many of the privately operated lines have been merged with the state-owned system, a notable instance being that of Göteborg-Gävle traffic group, including the Bergslagens railway, which was absorbed into the state system in 1948.

Norway—The Norwegian State railways had by 1950 electrified approximately one-sixth of their mileage, and had extensive plans for further electrification, as the country possesses abundant water-power resources. Since World War II, the Sorland railway had been completed, linking Stavanger with Oslo, and the line also had been electrified throughout. The Norland railway, north from Trondheim, had reached Lonsdal en route to Bodø. Both these lines were of considerable wartime importance during the German occupation, and much work was done on them by the Germans.

U.S.S.R.—The nationalized railways of the U.S.S.R. are said to form the largest single railway system in the world. They are said to be divided into 22 distinct systems administered under a central all-union collegium. The 22 divisions are Southern, Catherine, South Eastern, Moscow-Kursk and Moscow circuit, Moscow-Kazan, Samara-Zlatoust, Perm, Omsk, Tomsk, Baikal, Ussunsk, South Western, Western, Moscow-Baltic, October, Murmansk, Northern, Ryazan-Uralsk, North Caucasus, West Caucasus, Central Asia and Turkestan. Little information of any kind after 1939 was available concerning these railroads. It was known that after World War II there had been considerable development of the trans-Siberian main line in Asia and of alternative routes over certain sections. Various lines near Moscow were said to have been electrified, and a beginning was also said to have been made in the electrification of heavy lines in the Caucasus.

Greece—In 1920 the government of Greece took over control of three private companies and nationalized them as the Hellenic State railways. Demolitions by the retreating German army late in 1944 placed the entire system out of action except for about 260

mi War damage on the system was so extensive that many years would be required for restoration to prewar standards

Baltic and Eastern European Countries—Little that was definite could be said about the postwar railway situation in the Baltic countries and those of eastern Europe, reliable information from these countries being inadequate

ASIA

Railway mileage in Asia was approximately as follows in 1950

Country	Miles
Burma	7,739
Ceylon	911
China	12,950
Formosa	2,440
India and Pakistan	40,851
Indo-China	7,836
Iran	7,553
Iraq	660
Japan*	20,471
Korea	2,107
Malaya	1,068
Manchuria	5,581
Netherlands Indies†	4,596
Pakistan	626
Philippine Republic	843
Sri Lanka	510
Thailand (Siam)	2,126
Turkey‡	4,672
U.S.S.R. (included in Europe)	
Total	95,588

*Includes Karafuto (Sakhalin)

†Pre-World War II mileage

‡Includes 210 mi. in Europe

Developments in Asia after 1940.—Among notable railway developments in Asia since 1940 may be mentioned the completion during World War II of the coastal railway in Lebanon, from Beirut to Tripoli, thus affording facilities for through-running of standard-gauge trains from Haifa on the Bosphorus to Cairo and the Nile valley. Similarly, completion of the standard-gauge line to Baghdad brought about through-running between the Bosphorus and that city. The projected train-ferry service across the Bosphorus would make possible through-running from Scotland and London to Cairo and Baghdad, since the cross-channel train ferry between Dover and Dunkirk was restarted in 1947. The trans-Iranian railway was completed prior to the outbreak of World War II.

Railways of Asiatic Regions.—**India**—India possesses an extensive railway system, mainly constructed to 5 ft 6 in and metre gauges. Railways are divided into three classes based upon gross earnings, similar to the method used in the United States. There are 13 class I lines with gross revenues of Rs. 5,000,000 or more per annum, of which the largest are the Great Indian Peninsula, the East Indian, the Bombay, Baroda and Central India, the North Western, the Oudh Tirhut, the Bengal-Nagpur, the Bengal and Assam (changed in 1945 to Bengal Assam railway), the South Indian and the Madras and Southern Mahratta. Some of the Indian lines formerly were privately owned and operated, and others were state-owned but privately operated under contracts, however, the state has gradually taken full control of principal lines. Remaining railroads of private ownership and operation are mainly small lines, of mostly local importance.

A major railway event was a result of the partition of India into Pakistan and India, which disrupted the North Western railway system, requiring redistribution of railway mileage north of Calcutta. The former Bengal Assam railway was divided into the Assam railway in India and the Eastern Bengal in Pakistan.

China—Ranking next to India in point of railway mileage is China (including Manchuria and Formosa). Numerous lines were constructed in China while the country was at war. China's railway history dates from 1876, when the first line, built by foreign capital, was opened, as soon as the money had been repaid the Chinese tore up the rails. Except about 1,900 mi on Formosa, lines are under either national or provincial ownership. Most Chinese mileage is standard gauge.

After the surrender of Japan in 1945, Manchuria was restored to China, and its railways were placed under a special commissioner, for rehabilitation. The lines are principally standard gauge, the Japanese having converted former narrow-gauge lines in south Manchuria to standard gauge and re-equipped them with rolling stock chiefly of U.S. design and construction.

Formosa (or Taiwan) also was restored to China after the close of World War II. The provincial government operates about 560 mi of 3 ft 6 in and 2 ft 6 in gauge lines.

Japan—Japan ranks third as to railroads among Asiatic countries, with a state-owned and operated system of 3 ft 6 in gauge, approximately (pre-World War II) 10,500 mi. The first section was opened in 1872, but by 1887 only 240 mi of railway had been constructed. In 1906, when route mileage was almost 4,800, a railway nationalization bill was passed and nearly 450,000,000 paid for almost 2,800 mi.

A feature of the Japanese railway system is the use of ferry steamers for connecting up the islands over which the railway system extends; some of these steamers are train ferries. There is also a railway tunnel, about 2 1/2 mi long, connecting the islands of Honshu and Kyushu.

Turkey—Turkish railroads date from the completion in 1866 of a line from a point opposite Istanbul to Ankara and Konya. They are state-owned, existing private railways having been nationalized beginning in 1934, and are mainly standard gauge. Between World Wars I and II, the Turkish republic undertook an extensive construction program, adding approximately 2,100 mi to the system. After World War II an extensive program of rehabilitation and modernization was undertaken, in furtherance of which the aid of U.S. consultants was enlisted.

Other—Railroads of the Netherlands Indies were badly damaged under Japanese occupation during World War II. Standard-gauge lines were broken up or converted to narrow-gauge lines, and large quantities of materials and rolling stock were transferred by the Japanese to other occupied territories. The state railways of Thailand are metre gauge, converted from standard gauge, the first line was opened in 1893. The state railways of Iran are of recent construction, dating from about 1938. Because of topographical conditions, some of this construction ranks among the most difficult and costly in the world.

AFRICA

Railway mileage in Africa was approximately as follows in 1950

	Miles
Abyssinia (Ethiopia)	487
Algeria	2,790
Belgian colonies	2,070
British possessions	8,518
Egypt	4,092
Former Italian colonies	411
French territories	3,497
Morocco	1,063
Portuguese colonies	2,700
Spanish Morocco	19
Sudan	5,043
Tunisia	1,573
Union of South Africa	13,580
Total	43,580

Developments in Africa after 1940—Among major railway developments in Africa after 1940 was the rapid development of diesel traction on the North African coast. This seemed likely to result in steady replacement of steam locomotives in Algeria and possibly Morocco. On the west coast, the narrow-gauge Nigerian railways were hard put to it to handle the groundnut (peanut) crop, which is of immense importance to Europe's food resources, and consistent efforts were being made to develop this traffic in East Africa. There, the Kenya and Uganda railway system had been merged with the neighbouring Tanganyika railways to form the new East African Railways system, as from May 1948. The trend to government ownership was evidenced in Rhodesia, where the company-owned and managed Rhodesian railways were taken over in 1947.

Much attention had been given to standardization of gauges in Africa, and later equipment for some of the metre-gauge systems had been so designed as to allow conversion to 3 ft 6 in in the future. A feature of African railway practice had been the growing use of the Garrett type of locomotive, especially suited for heavy haulage on light rails and tracks.

Railways of African Regions.—The largest railway system in Africa is that of the South African Railways and Harbours administration, a government-owned and operated system of 3 ft 6 in gauge in the Union of South Africa. In 1860 a standard-gauge (4 ft 8 1/2 in) line was opened at Natal, followed by a line of similar gauge between Cape Town and Wellington. By 1887 the gauge had been changed to 3 ft 6 in, and Cape Colony and Natal had commenced state ownership. Kimberly could be reached by rail in 1885 and Bloemfontein in 1890, the Orange Free State taking control of this section in 1897, the year when the railway first reached Bulawayo (in Rhodesia). When the railways were amalgamated under the Union government, in 1910, the gauge amounted to more than 7,000, which had increased to 6,500 in 1920.

The South African Railways and Harbours has become one of the most extensive railway administrations in the world. It is almost unique in operating not only the railway system but the main harbours of the country, much of the highway transport, and even the air services, domestic and international. Construction of locomotives and rolling stock was being undertaken in South Africa, and electrified mileage had been extended, especially in the Johannesburg area. With revenue totalling in 1946-47 £(SA) 75,000,000 per annum, the 3 ft 6 in gauge SAR had a route mileage of close to 13,500, of which 584 mi were electrified, and owned about 2,300 steam and 200 electric locomotives, with 65,000 freight cars. Even so, the traffic offered was handled only with great difficulty.

The Rhodesia railway, 2,445 mi of 3 ft 6 in gauge owned and controlled by the Southern Rhodesia government, operate lines from Bulawayo northwestward through Victoria Falls and Broken Hill, to the Belgian Congo border, and northeastward through Salisbury to Umtali, connecting there with the former Beira railway to reach the

port of Beira in Portuguese East Africa. The Beira railway was purchased by the Portuguese government in 1904, but was temporarily worked by the Rhodesia railways. Altogether, Portuguese East Africa has 1,097 mi. of railroads, nearly all 3 ft 6 in gauge. From Beira there runs north the 3 ft 6 in gauge Trans-Zambia railway, terminating at Murruga on the Zambezi, where commences the Central Africa railway. This line crosses the Zambezi river on one of the world's longest railway bridges, and connects with the more important Shire Highlands line at Fort Eriand, Nyas. Both these lines are 3 ft 6 in gauge, and the latter runs through Blantyre in Nyasaland and terminates at Domua bay on the west shore of Lake Nyasa, thus, there is through rail connection from Capetown to the lake itself. North of Nyasaland run the metre-gauge Tanganyika railways, westward from Dar es Salaam to Kigoma and Mwanza, a further line runs westward from Tanga to Arusha. Near Moshi connection is made with the Kenya and Uganda railway, this latter line, of metre gauge and more than 1,600 route miles long, is based on Mombasa, Kenya, and penetrates to Kisumu, Kenya, on Lake Victoria, with important branches and lake, river and motor services. Northward to El Obied, in the Sudan, there is no railway connection, thus frustrating present realization of the long-desired Cape-to-Cairo railroad.

The Sudan system, of 2,073 mi. of 3 ft 6 in gauge, stretches from El Obied north through Khartoum to Wadi Halfa, whence Nile steamers connect with the Egyptian railways near Aswan. Sudan railway branches extend to Kareima, Kassala, Port Sudan and Suakin. The metre-gauge Franco-Ethiopian line runs inland from Jibuti, Fr Somalid, to Addis Ababa, Aby. The three segments of lines in the former Italian colonies of Libya and Eritrea total 417 mi. of 95-in gauge.

In North Africa, Egypt has more than 4,000 mi. of railroads, of which 607 mi. is a system of 3 ft 6 in lines serving villages of the Nile delta. The Egyptian state railways system comprises about 3,000 mi. of standard-gauge line and 221 mi. of 2 ft 6 in line serving the western oases. The first railroad on the African continent was a line started in 1852 between Alexandria and Cairo, of which the first section was opened in 1854.

The Algerian railway system of 2,786 mi. has about half its mileage of standard gauge (with 702 mi. electrified), the remainder being 3 ft 6 in and metre gauge. The system is operated for the country by a special department. The railroads of Tunis are partly government-owned and partly company-owned. There are 315 mi. of standard-gauge line, the remainder being metre gauge. Moroccan railroads, all of standard gauge, are company-owned and operated. In the French territories of West Africa, metre-gauge lines extend from the ocean ports of Dakar, Konakry, Abidjan, Cotonou and Lomé principally to inland points on the Niger river. Another metre-gauge line runs inland from Duala, in the Cameroons. From Pointe Noire, in French Equatorial Africa, a short 3 ft 6 in gauge line runs to Brazzaville, near the mouth of the Congo.

The 3 ft 6 in Nigerian railway system, comprising 1,400 mi., runs inland from Lagos and Port Harcourt to Nguru, connected by water with Lake Tchad, and Kaura Namoda, on a tributary of the Niger river. Other railroads in British West Africa extend inland from Freetown (Sierra Leone) with 2 ft 6 in gauge, and from Takoradi and Accra (Gold Coast) with 3 ft 6 in gauge.

The 1,400 mi. of line in the Belgian Congo were mostly developed as the result of the great copper deposits in the Katanga district. They are principally 3 ft 6 in gauge, with some 2-ft and metre gauge. A 3 ft 6 in line in the Belgian Congo, having connection with the Benguela line, in Portuguese West Africa, also runs northward from Ndola, on the Rhodesian frontier, to Port Franquo (on a tributary of the Congo river). Isolated metre-gauge railroads, linking water routes, serve Stanleyville and Albertville, and a 3 ft 6 in gauge line runs inland from Matadi to Leopoldville, on the Congo river.

The Benguela railway, 3 ft 6 in gauge, in Angola (Portuguese West Africa), also owes its existence to the copper deposits in the Belgian Congo, affording a much shorter haul for the copper to England than the former route via Beira (Portuguese East Africa). Besides the Benguela line, there are also in Angola shorter lines running inland from the ocean ports of Loanda (metre gauge) and Porto Amboim and Mossamedes (60 m).

The French islands of Madagascar and Réunion have 530 mi. and 78 mi., respectively, of metre-gauge railroads, and there are 106 mi. of standard-gauge line on the British island of Mauritius.

AUSTRALASIA

Railway mileage in Australasia in 1950 was approximately as follows:

	Miles
Australian commonwealth government*	2,201
Queensland	6,630
New South Wales	6,104
Victoria	4,756
South Australia	2,547
Western Australia	4,011
Tasmania	750
New Zealand	3,532
Total	31,551

*Includes mileage in South and Western Australia, Northern Territory, New South Wales and Australian Capital Territory.

Australasia's railroads date from 1854, when there was opened for operation the section between Flinders St., Melbourne, and Port Melbourne, now part of the Victorian government system. Portions of lines were opened in New South Wales in 1855 and in South Australia in 1856. Practically all mileage in Australasia is state-owned and operated, the principal exceptions being two lines in Western Australia totalling somewhat more than 525 mi.

The commonwealth government's Trans-Australian (standard-gauge) line has what is said to be the longest stretch of straight track in the world. Crossing the Nullarbor plain in Western and South Australia, the line runs for more than 300 mi. without a curve.

Through movements in Australia are hampered by the use of three gauges on the railroads. Of the commonwealth government lines, about half are standard gauge and half are 3 ft 6 in gauge. Queensland lines are 3 ft 6 in, those of New South Wales are standard gauge, while Victoria has the 5 ft 3 in gauge. Lines in South Australia are 5 ft 3 in and 3 ft 6 in. Western Australia has the 3 ft 6 in gauge, as also have Tasmania and New Zealand. Small mileages of other narrow gauges also are found.

A courageous plan was prepared by Sir Harold Clapp, former chief commissioner of the Victorian railways, aiming at standardization of gauges of the various state-owned railway systems of Australia. Much preliminary work was accomplished to achieve throughout the continent the standard (4 ft 8 1/2 in) gauge used by the commonwealth Trans-Australian and New South Wales government railways. The task and the cost would be immense, as Victoria uses the 5 ft 3 in gauge, while both the Queensland and Western Australian railways are 3 ft 6 in gauge. There would be striking defense, commercial and economic advantages from unification, but the raising of necessary capital and the shortage of labour create severe practical difficulties.

In New Zealand, the policy has been to link up previously existing isolated sections of line with main systems in the North and South Islands, a program almost completed. The New Zealand government railways have gone far in developing co-ordination of rail and highway services, but even so the financial situation, with increased wages and costs for fuel and stores, has outweighed the rising revenue from record traffic.

Nearly all the Australasian railways had, in general, failed to earn interest on their capital expenditure. Shortage of coal had hit these systems hard, some were experimenting with oil fuel, and the Victorian railways were making extensive tests with pulverized coal as fuel. Air competition was proving severe in the case of long-distance interstate movements.

RAILWAYS, TUBE. The term "tube railways" is applied generally in Great Britain to deep-level underground railways constructed with a metallic lining and usually of round section. For the construction and the ventilation of the tube, see the article TUNNEL. The tube railway is a form of subway. The latter is discussed under TUNNEL. (See also TRACKWAYS.)

Stations are constructed, as a rule, by building a tunnel of twice the dimensions of the running tunnels. The station tunnel is sufficiently large to accommodate the platform as well as the track. Tube railways are generally operated at about 600 v, direct current being fed to the conductor rails from substations. The substations are usually of the rotary converter type. High-tension current is supplied from a central power station. From the substations also run cables supplying current for station lighting, elevators, escalators and pumps.

In the London area, metropolitan and district lines are shallow subsurface railways, the other underground lines, also part of the London Transport, and the Southern region line from Waterloo to the city are tube railways proper.

RAIN: see RAINFALL, METEOROLOGY

RAINBOW, formerly known as the iris, the coloured rings seen in the heavens when the light from the sun or moon shines on falling rain, on a smaller scale they may be observed when sunshine falls on the spray of a waterfall or fountain. The bows assume the form of concentric circular arcs, having their common centre on the line joining the eye of the observer to the sun. Generally only one bow is clearly seen, this is known as the primary rainbow, it has an angular radius of about 42°, and exhibits a fine display of the colours of the spectrum, being red on the outside and violet on the inside. Sometimes an outer bow, the secondary rainbow, is observed, this is much fainter than the primary bow, and it exhibits the same play of colours, with the important distinction that the order is reversed, the red being inside and the violet outside. Its angular radius is about 54°.

Among the Greeks and Romans various speculations as to the cause of the bow were indulged in, Aristotle, in his *Meteor*, erroneously ascribes it to the reflection of the sun's rays by the rain, Seneca adopted the same view. The introduction of the idea that the phenomenon was caused by refraction is to be assigned to Vitellio.

The most valuable of all the earlier contributions to the scientific explanation of rainbows is undoubtedly a treatise by Marco Antonio de Dominis (1566-1644), archbishop of Spalato. This work, *De radibus visus et lucis in vitris perspectivis et iride*, published at Venice in 1611 by J. Bartolus, although written about 20 years previously, contains a chapter entitled "Vera iridis tota generatio explicatur," in which it is shown how the primary bow is formed by two refractions and one reflection, and the

secondary bow by two refractions and two reflections. René Descartes strengthened these views, both by experiments and geometrical investigations, in his *Meteor* (Leyden, 1637). "Descartes could advance no satisfactory explanation of the chromatic displays, this was effected by Sir Isaac Newton (See Newton's *Opticks*, book i, part 2, prop g.)

The geometrical theory, which formed the basis of the investigations of Descartes and Newton, afforded no explanation of the supernumerary bows, and about a century elapsed before an explanation was forthcoming. This was given by Thomas Young, who, in the Bakerian lecture delivered before the Royal society on Nov. 24, 1803, applied his principle of the interference of light to this phenomenon.

His not wholly satisfactory explanation was mathematically examined in 1835 by Richard Potter (*Camb. Phil. Trans.* 6, 147 [1838]), who, while improving the theory, left a more complete solution to be made in 1838 by Sir George Biddell Airy (*Camb. Phil. Trans.* 6, 379 [1838]).

Geometrical Theory.—The geometrical theory first requires a consideration of the path of a ray of light falling upon a transparent sphere. Of the total amount of light falling on such a sphere, part is reflected or scattered at the incident surface, so rendering the drop visible, while a part will enter the drop. Confining our attention to a ray entering in a principal plane, we will determine its deviation (δ), the angle between its directions of incidence and emergence) after one, two, three or more internal reflections. Let EA be a ray incident at an angle i (fig. 1), let AD be the refracted ray, and r the angle of refraction. Then the deviation experienced by the ray at A is $i-r$. If the ray suffers one internal reflection at D, then it is readily seen that, if DB be the path of the reflected ray, the angle ADB equals $\pi-2r$; i.e., the deviation of the ray at D is $\pi-2r$. At B, where the ray leaves the drop, the deviation is the same as at A, viz., $i-r$. The total deviation of the ray is consequently given by $D = 2(i-r) + \pi - 2r$.

FIG. 1

Similarly it may be shown that each internal reflection introduces a supplementary deviation of $\pi-2r$, hence, if the ray be reflected n times, the total deviation will be $D = 2(i-r) + n(\pi-2r)$.

The deviation is thus seen to vary with the angle of incidence, and by considering a set of parallel rays passing through the same principal plane of the sphere and incident at all angles, it can be readily shown that more rays will pass in the neighbourhood of the position of minimum deviation than in any other position (See REFRACTION). The drop will consequently be more intensely illuminated when viewed along these directions of minimum deviation, and since it is these rays with which we are primarily concerned, we shall proceed to the determination of these directions.

Since the angles of incidence and refraction are connected by the relation $\sin i = \mu \sin r$ (Snell's law), μ being the index of refraction of the medium, then the problem may be stated as follows to determine the value of the angle δ , which makes $D = 2(i-r) + n(\pi-2r)$ a maximum or minimum, in which δ and r are connected by the relation $\sin i = \mu \sin r$, μ being a constant. By applying the method of the differential calculus, we obtain $\cos i = \sqrt{\{(\mu^2-1)/(n^2+2n)\}}$ as the required value, it may be readily shown either geometrically or analytically that this is a minimum. For the angle i to be real, $\cos i$ must be a fraction, that is, $n^2+2n > \mu^2-1$, or $(n+1)^2 > \mu^2$. Since the value of μ for water is about $\frac{4}{3}$, it follows that n must be at least unity for a rainbow to be formed, there is obviously no theoretical limit to the value of n , and hence rainbows of higher orders are possible.

So far we have only considered rays of homogeneous light, and it remains to investigate how lights of varying refrangibilities will be transmitted. It can be shown, by the methods of the differential calculus or geometrically, that the deviation increases with the refractive index, the angle of incidence remaining constant. Taking the refractive index of water for the red rays as $\frac{13}{10}$ and for the violet rays as $\frac{17}{10}$ we can calculate the following values for the minimum deviations corresponding to certain

assigned values of n

n	Red	Violet
1	$\pi - 42^\circ 1$	$\pi - 40^\circ 22$
2	$2\pi - 120^\circ 3$	$2\pi - 125^\circ 48$
3	$3\pi - 231^\circ 4$	$3\pi - 227^\circ 08$
4	$4\pi - 317^\circ 07$	$4\pi - 310^\circ 07$

To this point we have only considered rays passing through a principal section of the drop, in nature, however, the rays impinge at every point of the surface facing the sun. It may be readily deduced that the directions of minimum deviation for a pencil of parallel rays lie on the surface of cones, the semivertical angles of which are equal to the values given in the above table. Thus, rays suffering one internal reflection will all lie within a cone of about 42° , in this direction the illumination will be most intense, without the cone the illumination will be fainter, while, outside of it, no light will be transmitted to the eye.

Fig. 2 represents sections of the drop and the cones containing the minimum deviation rays after 1, 2, 3 and 4 reflections, the order of the colours is shown by the letters R (red) and V (violet). It is apparent, therefore, that all drops transmitting intense light after one internal reflection to the eye will lie on the surfaces of cones having the eye for their common vertex, the line joining the eye to the sun for their axis, and their semivertical angles equal to about 41° for the violet rays and 43° for the red rays. The observer will, therefore, see a coloured band, about 2° in width, and coloured violet inside and red outside. Within the band, the illumination will be faint, outside the band there will be perceptible darkening until the second bow comes into view. Similarly, drops transmitting rays after two internal reflections will be situated on covertical and coaxial cones, of which the semivertical angles are 51° for the red rays and 54° for the violet. Outside the cone of 54° there will be faint illumination, within it no secondary rays will be transmitted to the eye. We thus see that the order of colours in the secondary bow is the reverse of that in the primary, the secondary is half as broad again (3°), and is much fainter, because of the longer path of the ray in the drop, and the increased dispersion.

Similarly, the third, fourth and higher orders of bows may be investigated. The third and fourth bows are situated between the observer and the sun, and hence, to see them, the observer must face the sun when looking at the water drops which produce the bows. But the illumination of the bow is so weakened by the repeated reflections, and the light of the sun is generally so bright, that these bows are rarely, if ever, observed except in artificial rainbows. The same remarks apply to the fifth bow, which differs from the third and fourth in being situated in the same part of the sky as the primary and secondary bows, being just above the secondary.

FIG. 2

Physical Theory.—Usually the most conspicuous colour in the principal rainbow is the red; but wide variations are noted from one bow to another, not only in the brightness and purity of the different colours, but also in their angular width. This is not in accordance with the elementary theory, which would require all rainbows to be similar in the distribution of colours as well as in their relative intensity. The fuller treatment of the theory which is based on the undulatory theory of light will be found in J. M. Pernter and F. Exner's *Meteorologische Optik*, or in W. J. Humphreys' *Physics of the Air*. It can be shown that the phenomena depend in a very marked way on the size of the water drops, and that the width of the coloured bands increases as the

size of the drop decreases. The elementary theory leads to the result that there is a direction of maximum illumination along the direction of minimum deviation, but the more detailed theory leads to the result that there are other directions along which there is considerable illumination. The subsidiary maxima account for the spurious bows, whose distance from the main bow is greater for small drops than for larger drops. The actual primary rainbow observed is thus the effect of the superposition of a number of bows. If the red of the second bow falls upon the green of the first, the result is to give a bow with an abnormally wide yellow band, since red and green lights when mixed form yellow. This is a very common type of bow, one showing mainly red and yellow, with little or no green or blue. If the drops are smaller the red of the second bow may fall within the blue of the first bow, so that we should then see a second bow (spurious bow) within the first. The phenomena are further complicated by the variation in the size of raindrops within the cloud. Since the smaller drops occur in the upper levels, the spurious bow is generally observable only near the top of the bow.

With very small drops, whose diameter is 0.1 mm or less, the colours become superimposed, and the rainbow becomes almost a pure white. This type of rainbow, sometimes known as Ulloa's ring or as a fogbow, is seen distinctly only when the observer is very near the cloud which produces it.

The centre of a rainbow is at the same angular distance below the horizon as the sun is above the horizon. Rainbows can be formed by light coming from the reflection of sunlight in a water surface. The observer then sees more than a semicircle of this rainbow, the centre being above the horizon, and he will at the same time see the rainbow formed in the usual way by direct rays from the sun. The two rainbows intersect, and are commonly referred to as intersecting rainbows.

Rainbows can also be formed by moonlight, but the colours are then very faint and difficult to distinguish.

The physical theory of rainbows is given in R. W. Wood, *Optics*, T. Preston, *Theory of Light*, 5th ed. (1928), W. J. Humphreys, *Physics of the Air*, 2nd ed. (1929), J. M. Pernter and F. Exner, *Meteorologische Optik* (D. Baur).

RAINBOW TROUT (*Salmo irideus*) see SALMONIDAE

RAINER, ARCHDUKE OF AUSTRIA (1827-1913), was born on Jan. 11, 1827. His father, Rainer, the eighth son of the emperor Leopold II and of his consort Maria Luisa of Spain, was born in Florence in 1783, and from 1818 to 1848 was viceroy of the kingdom of Lombardo-Venetia, his mother was the princess Elizabeth, sister of Charles Albert, king of Sardinia. The archduke was in 1857 placed at the head of the permanent Imperial council organized in 1851, which stood immediately under the emperor and had among its functions the preparation of laws. His experience in this office convinced him that the transition to a constitutional form of government on a liberal and centralized basis was necessary. In 1860 he conducted the negotiations for a strengthened Imperial council, in 1861 he was associated with the promulgation of the charter of the constitution of Feb. 26, 1861, elaborated by the liberal A. von Schmerling administration. In the same year he became curator of the Academy of Sciences. In 1865 he retired from public affairs. In 1872 he was appointed to the supreme command of the newly established Austrian *Landwehr*, to the organization of which he devoted many years. The archduke purchased the papyrus discovered at Fayum, which was called, after him, the Rainer papyrus. He married in 1852 Marie Caroline, daughter of the archduke Charles, the victor of Aspern, but died childless on Feb. 27, 1913.

RAINFALL occurs when active lifting of moist air brings expansional cooling to below the saturation or dewpoint temperatures and causes the cloud droplets to grow to a size where they must fall to earth. The capacity of air for moisture is determined solely by its temperature. Radiation, conduction and mixing are relatively inefficient atmospheric cooling processes producing the less spectacular forms of condensation such as dew, frost, fog and drizzle. Air cooled by lifting may be internally stable and require forced lifting, such as produced by mountains, or it may be potentially unstable and require only an initial impulse to

establish free convection. Rain drops have limited fall-velocities and may be deposited some distance downward from their point of formation but, in general, rates of precipitation are closely related to rates of condensation. Both are limited by the initial moisture charge and the extent and rate of lifting. Rapid and extensive lifting by free convection in unstable air masses produces the intense rainfalls associated with showers and, in the warmer, more humid air masses, thundershowers.

Passive lifting processes are represented by air gliding upward over mountain slopes or over wedges of cooler air. Active processes are represented by free convection, underdraining by cooler wedges of air, and large-scale dynamic convergence or net horizontal inflow of air at lower levels. The last is the most effective natural lifting process since large masses of air are forced upward to seek escape by divergent flow at a higher level. Any or all of the passive or active lifting processes may operate on stable or unstable air within the life cycle of one major rainstorm. Orographic lifting of stable air gliding upward over gently sloping cooler wedges of air produces the typical winter rains which are uniformly light, steady and extensive. The flash floods of south-eastern Texas represent the other extreme, in that highly unstable and very moist maritime air is lifted by the combined effects of horizontal convergence and upglide over cooler continental air and orographic lifting up the Balcones escarpment.

Forced lifting of maritime westerlies produces more than 100 in. of rainfall a year on many windward points on western mountain ranges, leaving the leeward continental areas with 10 in. or less per year. Rainfall is greatest on windward coastal slopes, near tropical waters and in areas of marked cyclonic activity. Rainfall is least near the centre of continents, in colder higher latitudes, leeward of mountain ranges and within areas of persistent anticyclonic activity. Mt Waialeale, Hawaii, with a 20-yf average of 460 in. from tropical easterlies is the wettest known point. The nearest competitor is Cherrapunji, Assam, with an annual average of 426 in. from the moist tropical monsoon. Less than 10 in. and more than 60 in. per year represent approximate extremes of rainfall for all of the continents. Rainfall is slight in the central regions of the subtropical anticyclones, which are therefore the desert regions of the earth. In parts of the desert no appreciable rain has ever been observed. Over most of Europe, South America, eastern North America and central

Asia are quite rare but these intensities on occasion have been more than doubled for the respective durations.

Average annual rainfall plus melted snow water is given in the table for some of the chief cities of the world. Data for other places will be found in standard textbooks on climatology. See W. G. Kendrew, *Climates of the Continents* (Oxford, 1937), U. S. Department of Agriculture, *Climate and Man* (1941). Detailed rainfall data for specific areas is best obtained by inquiry directed to any of the more prominent national meteorological services.

(A K S)

RAINIER MOUNT, a peak of the Cascade range in Pierce county, Wash., about 60 mi. from Seattle, and 50 mi. from Tacoma. It is about 14,408 ft. above sea level, the third highest peak in the United States, excluding Alaska. Rainier, as were the other peaks of the Cascade range, was built up by successive layers of material (chiefly andesite) thrown out of its crater. The volcano has long been extinct, but small craters still give forth steam and sulphurous fumes. Its base is set in the green of the Puget sound forest and its snowy cone rises 10,000 ft. Along its sides are 28 glaciers and a number of permanent ice fields, the largest in the United States, which extend down the scarred slopes to the forests, below which they give rise, to dashing streams. Beautiful subalpine wild-flower fields follow the receding snow in summer.

Mt. Rainier was first discovered by George Vancouver, who, disregarding the Indian name "Tacoma," named the peak in honour of Adm. Peter Rainier of the royal navy. The first successful ascent was made in 1870 by Gen. Hazard Stevens and P. V. van Trump.

Mt. Rainier national park (241,219 sq. ac. in area) was set aside by the U. S. government to preserve the wild mountain scenery in its natural beauties and to make the mountain accessible to the public. Entrances to the park can be reached from Seattle or Tacoma in a few hours by automobile or railway.

BIBLIOGRAPHY—F. W. Schmoee, *Ow Greatest Mountain, Mount Rainier* (1925), E. S. Meany, *Mount Rainier, a Record of Exploration* (1916), *Information Circulars* issued by the U. S. Department of the Interior.

RAINIS, JÓZSEF: see PLIEKANS, JAN

RAINPROOF FABRICS. Rainproof fabrics can be divided into two general classes—apparel fabrics and nonapparel fabrics. Included in the first group are fabrics used in raincoats, slickers, umbrellas, etc. Among those in the second group are fabrics employed in making tents, tarpaulins, etc. Rainproof fabrics may be actually waterproof or merely water-repellent. Waterproof fabrics are impervious to water, the interstices or pores in the cloth being completely covered or filled by the waterproofing agent or sufficiently stopped up that water will not pass through them at the maximum pressure to which the fabric is exposed under conditions of use.

Water-repellent fabrics, on the other hand, are not impervious to water, the repellent effect being obtained not by closing or materially reducing the size of the interstices or pores, but by treating the cloth with a compound which increases the surface tension between the fibres and the water and thus makes it more difficult for the water to penetrate into and through the fabric.

Thus, a raincoat made from a lightweight water-repellent fabric may withstand a light shower, but not a heavy, driving rain. The degree of water repellency depends on the type and twist of yarn, weight and closeness of weave and efficacy of the water-repellent compound. In general, heavy, closely woven fabrics are more water-repellent than are light, loosely woven fabrics.

Other important applications of waterproof and water-repellent fabrics, in addition to those mentioned above, include shower-bath curtains, spotproof table covers and sheetings for hospital use. Fabrics which are both waterproof and chemical-resistant find use in such applications as protective clothing for workers engaged in the handling of chemicals. Fabrics which are both waterproof and gasproof or airtight are employed in the aeronautical industry and as a protection against noxious gases.

Many different processes are employed for rendering fabrics waterproof or water-repellent. In general, truly waterproof fab-

Africa the annual rainfall exceeds 20 in., while over most of Asia, excluding India, Tibet and China, the annual rainfall is less than 20 in., being less than 10 in. in a long tongue extending from Arabia across to northeast Mongolia. The central regions of Australia, most of northern and a part of southwest Africa, portions of the intermontane area of the United States, portions of the west-central coast and southern interior regions of South America also have less than 10 in. of rain in the year. Portions of the west coast of Africa, between the equator and 10° N., a strip of the west coast of India, parts of Assam, a coastal strip of Burma, windward mountain slopes in the temperate latitudes of North and South America, and many isolated tropical stations average more than 100 in. of rain in the year. Rainfall intensities greater than 1 in. in five minutes, 4 in. in one hour or 20 in. per

rics are obtained by impregnating or coating the cloth with rubber, synthetic rubber, pyroxylin (cellulose nitrate solution), cellulose acetate, linseed oil, tar or synthetic resins. Various degrees of water repellency can be imparted to fabrics by treating them with such materials as aluminum acetate, paraffin wax emulsions, metallic soaps, cuprammonium solution or quaternary ammonium compounds.

Raincoats are made from cotton, silk, rayon or wool fabrics which have been rendered rainproof or showerproof by any one of several processes. One of the earliest methods employed was that invented by Charles Macintosh, which made use of rubber as a waterproofing agent, raincoats made from cloth treated in this way were known as mackintoshes. Oilskins are made by applying boiled linseed oil, together with a suitable drier and pigments to give the desired colour, to lightweight or mediumweight cotton fabrics. Silk fabrics treated in a similar manner, and known as oiled silk fabrics, are being rapidly superseded for use as raincoats by silk or rayon fabrics which have been waterproofed by treatment with a vinyl resin lacquer or another synthetic resin. Another type of waterproof raincoating is made by rubberizing cotton fabrics.

Water-repellent fabrics employed for raincoats are usually made from cotton or wool. One of the best-known methods is to treat the fabric in solution of aluminum acetate and then in a soap solution or an emulsion containing soap and paraffin or Japan wax. Another method makes use of a water-repellent agent consisting essentially of a solution of aluminum acetate containing paraffin wax in colloidal dispersion. Still another process employs long-chain quaternary ammonium compounds that actually combine with the fibre to form a durable, water-repellent coating.

Mixtures of various materials are employed for coating canvas, duck and other heavy cotton fabrics used for tents, tarpaulins, etc. Among these are included asphalt, paraffin, tar, beeswax and lead oleate. An effective method for waterproofing cotton fabrics, which also renders the fabric mildew-resistant, makes use of cuprammonium solution.

See H. P. Pearson, *Waterproofing Textile Fabrics* (1924); S. Mierzenski, *The Waterproofing of Fabrics*, trans. by A. Morris and H. Robinson, 3rd ed. rev. by H. B. Stocks (1931). (W. W. Crt.)

RAIN TREE (*Pithecellobium nanan*), a tropical South American tree, so called from the fact that the ejection of juice by cicadas (*q.v.*) upon it causes it to appear to be always raining under its branches. *Andira inermis*, which belongs to the same family (Leguminosae), is also called rain tree for the same reason.

RAIPUR, a town and former district of India in the Chhattisgarh (*q.v.*) division of the Central Provinces. The town is 188 mi. E. of Nagpur and has a station on the Bengal-Nagpur railway. There are ruins of an immense fort with many tanks and old temples. The town and civil station is situated on a red laterite plain and the climate is extremely hot. Besides the usual institutions at the headquarters of a division and district, there is the Rajkumar college, where the sons of the chiefs of Chhattisgarh, as well as of chiefs of Orissa, are educated under a European principal. The college also admits sons of the greater landholders. Pop. of the town (1941) 63,465.

The District of RAIPUR, area 8,205 sq. mi., pop. (1941) 1,516,686, occupied the south and centre of the Chhattisgarh rice plain (see CHHATTISGARH). The district was traversed by the Bengal-Nagpur railway from Bombay to Calcutta, and numerous roads were constructed in the famines. Raipur is connected by rail with Vizianagaram on the east coast section of the Bengal-Nagpur railway and from there with the port of Vizianagaram.

RAIS (or **REIZ**) **GILLES DE** (1404-1440) marshal of France, the central figure of a 15th-century *romance célèbre*, was the son of Guy de Montmorency-Laval, the adopted son and heir of Jeanne de Rais, and of Marie de Craon. He was born at Machecoul in Sept. or Oct. 1404 and was brought up by his grandfather Jean de Craon. Chief among his great possessions was the barony of Rais (erected in the 16th century into the peerage-duchy of Reiz), south of the Loire, on the marches of Brittany. He joined the Montforts supporting John V. of Brittany against the house of Penthièvre. He helped to release Duke John from

Oliver of Blois, count of Penthièvre, and was rewarded by extensive grants of land, subsequently commuted by the Breton parliament for money payments. In 1420 he married Catherine of Thouars, a great heiress in Brittany, Vendée and Poitou. In 1426 he raised seven companies of men-at-arms and, under Richemont (Richmond) (see ARTHUR III of Brittany), began active warfare against the English. He accompanied Joan of Arc to Orléans, fighting by her side there and afterward at Jargeau and Patay. He had advocated further measures against the English on the Loire before carrying out the coronation of Charles VII. at Reims. On July 17, 1429, he was made marshal of France at Reims. In the winter of 1430 he was in Normandy at Louviers, perhaps with a view to the release of Joan, then a prisoner at Rouen. His military career ended in 1436. He expended great sums in the king's service and maintained a court more suited to royal than baronial rank. He was a munificent patron of literature and of music, and his library contained many valuable works, he himself being a skilled illuminator and binder. At the chief festivals he gave performances of mysteries and moralities, and it has been asserted that the *Mystère de la Passion*, acted at Angers in 1420, was staged by him in honour of his own marriage. The original draft of the *Mystery of Orleans* was probably written under his direction. He ran into financial difficulties and began to sell his estates for small sums, providing his heirs with material for many lawsuits. Among those who profited by his prodigality were the duke of Brittany and his chancellor, Jean de Malestroit, bishop of Nantes, but in 1436 his kinsfolk appealed to Charles VII., who proclaimed further sales to be illegal. John V. refused to acknowledge the king's right to promulgate such a decree in Brittany and replied by making Gilles de Rais lieutenant of Brittany and by acknowledging him as a brother-in-arms.

Gilles hoped to redeem his fortunes by alchemy and also spent large sums on necromancers, seeking to guarantee himself from evil consequences by extravagant charity and splendid celebration of the rites of the church. The abominable practices of which he was really guilty seem to have escaped the notice of his equals or superiors, though suspected by the peasantry. His wife left him in 1434-35, and when his brother René de la Suze seized Champtocé, family considerations no doubt imposed silence. His servants kidnapped children, generally boys, whom he tortured and murdered. The number of his victims was stated in the ecclesiastical trial to have been 140. In 1440 he came into conflict with the church by an act of violence which involved sacrilege and infringement of clerical immunity and in the autumn he was arrested and cited before the bishop of Nantes on various charges, the chief of which were heresy and murder. With the latter count the ecclesiastical court was incompetent to deal, and Gilles refused to accept its jurisdiction (Oct. 8). Terrified by excommunication, however, he secured absolution by confession.

A parallel inquiry was made by Pierre de l'Hôpital, president of the Breton parliament, by whose sentence he was hanged (not burned alive as is sometimes stated) on Oct. 26, 1440, with two of his accomplices. In view of his confessions his guilt seems certain, but the irregularities of the proceedings, the fact that his chief accomplices went unpunished, taken together with the financial interest of John V. in his ruin, have left a certain mystery over the trial. His name is connected with the tale of Bluebeard (*q.v.*) in local tradition at Machecoul, Tiffauges, Pornic and Chéméré. The records of the trial are preserved in the Bibliothèque Nationale in Paris, at Nantes and elsewhere.

Gabory, *La Psychologie de Gilles de Rais* (Fontenay-le-Comte, 1925) and *La Vie et la mort de Gilles de Rais* (Paris, 1926); N. Valois, *Le Procès de Gilles de Rais* (Paris, 1913).

RAISIN, the name given to the dried fruits of certain varieties of the grapevine, which grow principally in the warm climate of central California and the Mediterranean coasts. Leading countries of production are the United States, Turkey, Australia, Iran, Greece and Spain. Dried grapes, or raisins, are rich in fruit sugar, which acts as a natural preservative of the product, and are of great antiquity as a human food (Numbers vi, 3; I Samuel xxv, 18). "Raisins of the sun" are obtained by letting the fruit

remain on the vines after it has come to maturity, where there is sufficient sunshine and heat in the autumn, till the clusters dry on the stalks. The more usual process, however, is to cut the fully ripened clusters and expose them, spread out, for several days in the rays of the sun. In unfavourable weather, they may be dried in a heated chamber, but are then inferior in quality. Sun-drying may be hastened by first dipping the grapes in a soda or lye bath to puncture the skin, but this process is not generally followed in growing areas that afford a drying season free from rainfall, such as the interior valleys of California. Some varieties are dried and retained on their stems and sent into the market as clusters for table use, but the greater part are separated from their stems in the process of drying and cleaning.

Raisins are of three types (1) large seeded raisins made from the Muscat or Alexandria variety of grape, or Gordo Blanco, called Malagas in general world commerce and muscats in California, (2) small seedless raisins made from the Sultanina grape, called sultanas in most parts of Europe and Thompson seedless in California, (3) very small seedless raisins made from a black grape known in most countries as the Black Corinth. In commerce they appear as Zante currants or Greek currants.

There are also miscellaneous varieties of grapes dried in some countries, especially in those bordering on the eastern end of the Mediterranean, which are inferior as raisins and are termed "dried grapes."

Malaga-type raisins of commerce come chiefly from the provinces of Malaga, Valencia and Alicante in Spain, and from California and Australia. The variety grown in California, called the muscat, is sweet and extensively used in desserts. It is packed for household purposes by the removal of seeds by automatic machinery, and so processed that the raisins can be separated easily as they come from the box.

Sultanina-type raisins are cultivated extensively in California, Smyrna and Australia. Those grown in Smyrna are soda-dipped in the curing process, having a golden-yellow colour and a thin, translucent skin. Those grown in Australia are also usually dipped in the curing process, but those grown in California are exclusively sun-dried except for a limited quantity intended principally for certain portions of the export market.

Zante currants are grown in small quantities in a number of countries, but the principal world supply comes from Greece and Australia.

After 1918 world demand for raisins shifted from seeded to seedless varieties. Seedless varieties are successfully cultivated in California and in Australia, and the United States and Australia are large exporters. Almost all the raisins grown in the United States are produced in the San Joaquin valley of California within a radius of 100 mi. of the city of Fresno. Approximately 10,000 growers are engaged in the production of raisins in this district, and the processing of these raisins centres in Fresno, where there is the largest dried fruit plant in the world. (W. N. K.)

RAJAH, a Hindu title for a chief, or prince, derived from the same root as the Latin *rex*. Other forms are *rao*, *rana* and *rahal*, while chiefs of high rank are styled *maharaja*, *maharao* and *maharana*.

The Hindustani form is *rai*, and the title of the Hindu emperor of Vijayanagar in south India was *raya*.

RAJAHMUNDRY, a town of India, in the East Godavari district of Madras. Pop. (1941) 74,564. It is a growing place on the left bank of the river Godavari, at the head of the delta, 360 mi. N. of Madras, and has a station on the East Coast railway, which is there carried across the river by a bridge of 56 spans.

Tradition divides the merit of founding Rajahmundry between the Orissa and Chalukya princes. In 1470 it was wrested from Orissa by the Mohammedans, but early in the 16th century it was retaken by Krishna Raja. It continued under Hindu rule till 1572, when it yielded to the Mohammedans of the Deccan under Rafat Khan. It passed into the possession of the French in 1753, but they were driven out by the British in 1758.

RAJASTHANI LANGUAGE, the language of Rajasthan or Rajputana, an Indo-Aryan vernacular closely related to Gujarati (q.v.). It is spoken in Rajputana and the adjoining parts of

central India, and has several dialects, the principal of which are Jaipuri, Marwari, Mewati and Malvi. Harauti, an important variety of Jaipuri, is spoken in the states of Kota and Bundi.

See vol. ix of the *Linguistic Survey of India* for a full account, see also GUJARATI.

RAJGARH, a former Indian state in the Bhopal agency of central India. Area, 926 sq. mi. Pop. (1941) 148,609. The chief, who had the title of *rajah* and a salute of 11 guns, was a Rajput of the Ponwar clan. This state and Narsinggarh were the result of a partition in the 17th century. It afterward became tributary to Scindia, but fell under the general settlement of Malwa in 1818. It was merged with the state of Madhya Bharat in 1948. The town of Rajgarh had a population of 7,638 in 1941.

RAJGIR HILLS, a range of hills in former British India, in the south of the Patna district of Bihar. They form part of a range, extending northeast from near Bodh-Gaya for 40 mi., and at one place rise to 1,462 ft., but elsewhere seldom exceed 1,000 ft. in height. The hills in Patna district consist of two parallel ridges. In the valley between, south of the village of Rajgir, was built the old city of Rajagriha, "the royal residence." Legend ascribes it to Jarasandha, king of Magadha (south Bihar), who had his capital at Girinagara, "the city of hills." The outer fortifications can be traced on the crests of the hills over a distance of more than 25 mi.; they are 17½ ft. thick, built of massive undressed stones without mortar. According to Sir John Marshall, we can assign these ruins only to "some uncertain age before the dawn of history and rank them, as their stupendousness entitles them to be ranked, among the greatest wonders which primeval man has bequeathed to us." The remains of New Rajagriha, the reputed capital of Bimbisara (c. 520-490 B.C.), lie two-thirds of a mile north of the valley.

The Rajgir hills are associated with the life of Buddha, who often taught there. Chhatagiri is the old Gridhrakuta, or vulture's peak, which was one of his favourite resorts. One of the towers on the Baibhar hill (Vaubhargiri) has been identified as the Pipara stone house in which Buddha lived. The Sattapanna, the cave in which after his death the council of his disciples was held to record the tenets of the faith, has been identified with different sites on this hill and with the Soubhandar cave at its foot, the latter is now believed to have been excavated by Jains in the 3rd or 4th century A.D. A brick mound, topped by a Jain shrine, stands in the centre of the valley. Rajgir is a place of pilgrimage. There are modern Jain temples built on the hills round the valley. There are also hot springs in the valleys surrounded by Hindu shrines.

BIBLIOGRAPHY—M. A. Stein, "Notes on an Archaeological Tour in South Bihar and Hazaribagh," *Indian Antiquary* (1901), Sir J. Marshall, "Rajagriha and Its Remains," *Report Arch. Surv. India* (1905-06), V. H. Jackson, "Notes on old Rajagriha," *Report Arch. Surv. India* (1913-14), *District Gazetteer of Patna* (Patna, 1924).

RAJKOT, a town in India, in Saurashtra state. Situated in the middle of the peninsula of Kathiawar, it is a railway centre and formerly included an area known as the Civil station, leased to the British government for the headquarters of the Western India States agency.

The Civil station contained the Rajkumar college, the first of the several schools of its type to be established in India for the education of the cadets of the ruling families of the states. The former princely state of Rajkot, which merged with Saurashtra in 1948, had an area of 282 sq. mi. and pop. (1941) of 102,051, the town (1941) 52,178.

RAJMAHAL, a former capital of Bengal, India, now a village in the district of the Santal Parganas, situated on the right bank of the Ganges, where that river makes a turn to the south. Pop. (1941) 4,676.

Rajmahal was chosen for its capital by Man Singh, Akbar's governor, in 1595-96, but in 1608 the seat of government was transferred to Dacca. It was again made the seat of government by the prince Shah Shuja in 1639, and was a second time superseded by Dacca 20 years later.

Even in 1665 Manucci found that it had fallen into ruin, being full of dilapidated palaces, great fallen mansions and neglected gardens. A pavilion called the Sangi Dalan is all that survives of Shah Shuja's palace. Rajmahal has given its name to a range of

hills, comprising an area of about 2,000 sq mi, which rise to a height of about 2,000 ft. They are inhabited by an aboriginal race known as Maler (the Malis of Megasthenes) or Sauria Paharias, i.e., "hillmen". The valleys are inhabited and cultivated by the Santals, a different aboriginal race.

RAJPIPLA, formerly one of the Gujarat states in India, occupying a hilly tract between the rivers Narbada and Tapti, area 1,515 sq mi; incorporated into the Broach district of Bombay in 1949. Pop. (1941) 249,032. The soil is fertile, cotton being the chief crop, and there are teak forests in the hills. A light railway, constructed at the cost of the state, connects Rajpipla with Anklesvar in Broach district. The old fort of Rajpipla, in the hills, is now deserted. The modern city of Rajpipla is situated on the river Karjan, 32 mi from Surat. Pop. (1941) 15,855.

RAJPUT, the generic term for a number of castes, which gives Rajputana (q.v.) its name and is widely spread over the rest of northern India. Claiming to have replaced the ancient Kshatriyas (q.v.), the Rajputs are a dominant fighting, land-owning class. Of Indo-Aryan type, they have been also recruited from earlier ethnic elements which rose to power and from invading races, notably the Huns. As a body they are physically robust, brave and chivalrous, cherishing the feudal spirit and traditions. Pride of birth makes them punctilious in questions of honour, but poor cultivators when in reduced circumstances. They still hold somewhat aloof from the civil professions, regarding military service as their proper métier.

Rajput history is a bardic adaptation of myth to courtly adulation. It asserts that to their two original races, the Solar and the Lunar, were added four, the Agnikula, "fire sprung," purified by Brahmins in the great *agnikunda*, "fire pit," on Mt. Abu to fight the Daityas, "Titans." Being interpreted, this must mean that the four clans were Brahmanized, or Hinduized, to suppress some anti-Brahmanical people or foreign foes. The four were the Chalukya, modern Solanki, a Sanskritized patronymic of Chalkya, a dynasty in the Deccan, but immigrant from Kashmir and probably Gurjara by race; the Pruthara, now Parihar, "durdur," known to be Gurjars, the Pramara, now Panwar, and Chahamana, now Chauhan. These became eponyms of leading Rajput tribes, and the legend traced their origin to Rudra, Brahma, Indra and Vishnu. Folk etymology also derived Chahamana from Chaturbhuya, "four-armed." From these, by some incoherent process, were derived 36 "royal races," never the same in any two versions of their names, but in some including the Jat, Hun, Ahar and Bar-Gujar clans.

To these must be added clans like Chandel, doubtless of Gond origin. Below them were ranged the 84 mercantile tribes, chiefly of Rajput origin, in whom we may see the Bhatias and recall the ancient Vaisyas.

RAJPUTANA was the name formerly given to a group of Indian states under the political charge of an agent to the governor general of India, lying between lat. 23° and 30° N. and between long. 69° 30' and 75° 15' E. By a series of constitutional changes in 1848-49, the states of Alwar, Banswara, Bharatpur, Bikaner, Bundi, Dholpur, Dungarpur, Jaipur, Jaisalmer, Jhalawar, Jodhpur, Karauli, Kotah, Partabgarh, Shahpura, Tonk and Udaipur (Mewar) were formed into the united state of Rajasthan, as a unit of the Union of India. In Jan. 1950 part of Sirohi was added. Rajasthan had an area of 128,424 sq mi in 1951 and a population (1951) of 15,297,979, compared with the former Rajputana's area of 132,559 sq mi, and population (1941) of 13,670,208 (13,282,105 being in the areas taken into Rajasthan). The difference arises from the incorporation into the province of Bombay of the small states of Danta, Sirohi and Palanpur. All the Rajputana states were under Rajput rulers, except Tonk, which was Mohammedan, and Bharatpur and Dholpur, which were Jat.

Within the geographical area of Rajputana or Rajasthan is the chief commissioner's province of Ajmere-Merwara, with an area of 2,425 sq mi, and a population of 602,506 in 1951.

Jaipur was made provisional capital of Rajasthan. Its population was 175,810 in 1941 and 291,183 in 1951.

As constituted at mid-20th century, Rajasthan was bounded on

the west by the Pakistan provinces of Sind and West Punjab; on the north by Delhi, the Patana and East Punjab States Union, and East Punjab, on the east by the United Provinces (Uttar Pradesh) and the United State of Madhya Bharat, and on the south by the province of Bombay.

Physical Features.—The Aravalli range of mountains intersects the country from southwest to northeast. About three-fifths of Rajputana lies northwest of the range and comprises the states of Bikaner, Jaisalmer and Jodhpur. With the exception of the districts of Jodhpur which lie immediately below the Aravallis, this division is sandy, ill-watered and unproductive, improving gradually from a desert in the northwest and west to comparatively fertile land in the east. The country to the east and southeast of the Aravallis includes fertile lands, hill ranges and long stretches of forest, where fuel and fodder are abundant. The chief rivers are the Luni, the Chambal and the Banas. The Chambal rises in the highlands of the Vindhya and discharges itself into the Jumna after a course of 560 mi. There are several important artificial lakes, constructed for storing water. The only basin of any extent is the Sambhar salt lake, of about 50 mi in circuit.

From the geological point of view, the country may be divided into three regions—the central and largest, comprising the whole width of the Aravalli system, formed of very old submetamorphic and gneissic rocks, an eastern region, with a sharply defined boundary, along which the most ancient formations are abruptly replaced by the great basin of the Vindhyan strata or are overlaid by the still more extensive spread of the Deccan trap, forming the plateau of Malwa, and a western region, of ill-defined margin, in which, besides some rocks of undetermined age, it is more or less known or suspected that Tertiary and Secondary strata stretch across from Sind, beneath the sands of the desert, toward the flanks of the Aravallis. Rajputana produces a variety of metals. Ore of cobalt and zinc blends are peculiar to it. Copper and lead are found in several parts of the Aravalli range and of the minor ridges in Alwar and Shaikhwati, and iron ores abound in several areas. Alum and blue vitriol (sulphate of copper) are manufactured from decomposed schists at Khetri in Shaikhwati.

The climate over the whole of Rajputana is very dry and hot during the summer, whereas in the winter it is much colder in the north than in the lower districts, with hard frost and ice on the Bikaner borders. The rainfall is unequally distributed.

Social Structure and Occupations.—The territory was called Rajputana because it was politically possessed by Rajputs (see RAJPUT). The whole number of this race was only about 650,000 at the beginning of the 20th century, and nowhere did they form a majority of the whole population in a state; but they are strongest, numerically, in the northern areas and in Udaipur. The Bhatias rank first, with them may be classed the Bhatas, the keepers of secular tradition and of the genealogies. Next come the mercantile castes, mostly belonging to the Jain sect, these are followed by the powerful cultivating tribes, such as the Jats and Gujars, and then come the so-called aboriginal tribes, chief of whom are the Minas, Bhils and Meos. Rajasthan (and its dialects) is the chief language, being spoken by more than 70% of the population.

The main occupations of the people are occupation in agriculture. The chief manufactures are cotton and woollen goods, carvings in ivory and working in metals, etc., all of which handicrafts are chiefly carried on in the eastern states. The system of agriculture is very simple, in the country west of the Aravallis only one crop is raised in the year, while in other parts south and east of the Aravallis two crops are raised annually, and various kinds of cereals, pulses and fibres are grown.

History.—Before the invasion of upper India by the Mohammedans, Rajputana was subject for the most part to two or three powerful tribal dynasties. Chief of these were the Rahtors, who ruled at Kanau, the Chauhan of Ajmer, the Solankis of Anhilwara, in Gujarat, the Gohels with the Sisodhya sept, which remained in Jaipur. Mewar or Udaipur, and the Kachwahas, which remained in Jaipur. These tribal dynasties of Rajputs were gradually supplanted by the Moslem invaders of the 11th century and weakened by internal feuds. The clans were finally either conquered, overruled or conciliated by Jalal Ud-Din Mohammed Akbar—all except the distant Sisodhya clan, which, however, submitted to Jahangir in 1616. The Marathas, having been called in by the Rahtors to aid them, took possession of Ajmer about 1750, thereupon Rajputana became involved in the general disorganization of India. By the end of the 18th century nearly the whole of Rajputana had been virtually subdued by the Marathas. On the outbreak of the Pindari War in 1817, the British government offered its protection. The Pindaris were put down, Amir Khan sub-

muting and signing a treaty which constituted him the first ruler of the existing state of Tonk. By the end of 1818 similar treaties had been executed by the other Rajput states with the paramount power. The political history of Rajputana then became comparatively uneventful. The great storm of the mutiny of 1857 was short, as most of the rajahs remained loyal.

Rajputana is of great archaeological interest, possessing some fine religious buildings in ruins and others in excellent preservation. Among the latter are the mosques at Ajmer and the temples on Abu. But the most characteristic features of architecture in the country are shown in the forts and palaces of the chiefs.

RAJSHAHI, a district, division and town of India, in the province of Bengal. The administrative headquarters are at Rajshahi, formerly called Rampur Boalia, pop. (1941) 40,778. Area of district 2,526 sq mi., pop. (1941) 1,571,750. Rajshahi comprises an alluvial plain seamed with old river-beds and studded with marshes, but on the north and west a slightly elevated country is found in the Barind. Rice is the staple crop, with pulses, oilseeds and jute. Indigo has disappeared and the silk industry is moribund. The hemp grown on a small tract in the north of the district supplies all the *ganja* that is consumed in Bengal. The district is traversed from south to north by the main line of the Eastern Bengal state railway. The town is 28 mi. by road from the Nator station of the Eastern Bengal state railway and has a steamer station on the Ganges. It also has a government college and the museum of the Varendra Research society.

The Division of RAJSHAHI is coterminous with northern Bengal, from the Ganges to the mountains. It comprises the districts of Rajshahi, Dinajpur, Jalpaiguri, Malda, Darjeeling, Rangpur, Bogra and Pabna. Area, 19,642 sq mi. Pop. (1941) 12,040,465.

RÁKÓCZY, the name of a noble Hungarian family, which in the 10th century was settled in the county of Zemplén, members of which played an important part in the history of Hungary during the 17th century.

GEORGE I., prince of Transylvania (1591-1648), who began his career as governor of Onod, was the youngest son of Sigismund Rákóczy (1544-1608), who was for a short time prince of Transylvania. He took a leading part in the rebellion of Bethlen Gábor, who made him commandant of Kassa, and was elected prince of Transylvania by the diet of Segesvár on Nov. 26, 1630. He followed Bethlen's national Hungarian policy, allied himself with Gustavus Adolphus of Sweden and on Feb. 2, 1644, with the consent of the Pope, declared war on the Emperor Ferdinand III., drove him out of most of Hungary, and forced him to conclude the Peace of Linz (Sept. 16, 1645), which accorded full religious liberty to the Magyars, and ceded to Rákóczy the fortress of Regéc and the Tokaj district. On the death of Wladislaus IV. (1648) Rákóczy aimed at the Polish throne also, but died before he could accomplish his design. His capital, Gyula Fehérvár, was a great Protestant resort and asylum.

See Sándor Szilágyi, *The Rákóczy Family in the 18th Century* (Hung.) (Pest, 1861).

GEORGE II., prince of Transylvania (1621-1660), was the eldest son of George I. and Susannah Lorántffy. He was elected prince of Transylvania during his father's lifetime (Feb. 19, 1642), and married (Feb. 3, 1643), Sophia Báthory. On ascending the throne (Oct. 11, 1648), he hoped to realize his father's Polish ambitions, and he allied himself, in 1649, with the Cossack hetman, Bogdan Chmielnicki, and the hospodars of Moldavia and Wallachia. In 1657, as the ally of Gustavus Adolphus, he led his allies against the Polish king, John Casimir, took Cracow and entered Warsaw with the Swedes, but the moment his allies withdrew the whole scheme collapsed, and it was only on the most humiliating terms that the Poles finally allowed him to return to Transylvania. Here (Nov. 3, 1657) the diet, at the command of the Porte, deposed him for undertaking an unauthorized war, but in January 1658 he was reinstated by the Medgyes Diet. Again he was deposed by the grand vizier, and again reinstated. The Turks again invaded Transylvania, and Rákóczy died at Nagyvárad of the wounds received at the battle of Gyula (May 1660).

See Imre Bethlen, *Life and Times of George Rákóczy II.* (Hung.) (Nagy-Enyed, 1829), *Life* (Hung.) in Sándor Szilágyi's *Hungarian Historical Biographies* (Budapest, 1891).

FRANCIS I., prince of Transylvania (1645-1676), was the only son of George Rákóczy II. and Sophia Báthory. He was elected prince of Transylvania during his father's lifetime (Feb. 18, 1652), but lost both crown and father at the same time, and withdrew to the family estates, where, at Patak and Makovica, he kept a splendid court. His mother converted him to Catholicism, and on March 1, 1666 he married Helen Zrínyi. In 1670 he was implicated in the Zrínyi-Frangepán conspiracy, and only saved his life by the interposition of the Jesuits on the payment of an enormous ransom.

See Sándor Szilágyi, *The Rákóczy Family in the 17th Century* (Hung.) (Pest, 1861).

FRANCIS II., prince of Transylvania (1676-1735), was born at Borsó, Zemplén, on March 2, 1676. Having lost his father during infancy, he was educated under the guardianship of his mother, Helen Zrínyi, in an ultra-patriotic Magyar environment, though the Emperor Leopold I. claimed a share in his tutelage. In 1683 his mother married Imre Thokoly, through whose speculations Rákóczy lost the greater part of his estates. As a child of eleven he witnessed the heroic defence by his mother of his ancestral castle of Munkács against Count Antonio Caraffa (d. 1693). On its surrender (Jan. 7, 1688) the child was transferred to Vienna that he might be isolated from the Hungarian nation and brought up as an Austrian magnate. Cardinal Kollonics, the sworn enemy of Magyar separatism, now became his governor, and sent him to the Jesuit college at Neuhaus in Bohemia. In 1690 he completed his course at Prague, and in 1694 he married Maria Amelia of Hesse-Rheinfels, and lived for the next few years on his Hungarian estates. Rákóczy's birth, rank, wealth and brilliant qualities made him the natural leader of the Magyar nation. On the eve of the war of the Spanish Succession Rákóczy, with some other magnates, entered into correspondence with Louis XIV. for assistance through one Longueval, a Belgian general in the Austrian service. Longueval betrayed his trust, and Rákóczy was arrested and imprisoned at Eperjes. His wife saved him from certain death by enabling him to escape to Poland in the uniform of a dragon officer. On June 18, 1703 he openly took up arms against the emperor, but the Magyar center stood aloof, and his ill-supported peasant levies (the Kuruczes) were repeatedly scattered. He had, indeed, some initial success, but the battle of Blenheim made any direct help from France impossible, and on June 13, 1704 his little army of 7,000 men was routed by the imperialists at Koronca and subsequently at Nagyszombat. Want of arms, money, native officers and infantry, made, indeed, any permanent success in the open field impossible; yet he drilled his army into some degree of efficiency, and even after the rout of Padmenacs (Aug. 11, 1705), disposed of 100,000 men.

Rákóczy, who had already been elected Prince of Transylvania (July 6, 1704), now surrounded himself with a council of state of 24 members. But his efforts to secure toleration for his Calvinist followers alienated the pope, who dissuaded Louis XIV. from assisting him. Peace negotiations with the emperor during 1705 came to nothing, the latter refusing to acknowledge the independence of Transylvania, while France would not recognize the rebels officially till they had formally proclaimed the deposition of the Habsburgs, which last desperate measure was actually accomplished by the Onod diet on June 13, 1707. This measure, however, alienated both the emperor's foreign allies and the majority of the Magyar gentry, while, after all, Louis XIV. sent no effective help. On Aug. 3, 1708 Rákóczy was heavily defeated at Trencsen (Trenčín), and again at Róhmány (Jan. 22, 1710). A desperate effort to secure the help of Peter the Great also failing, Rákóczy quitted his country for ever on Feb. 21, 1711, refusing to accept the general amnesty conceded after the peace of Szatmár. (See HUNGARY, History.) He lived for a time in France on the bounty of Louis XIV., finally entering the Carmelite Order. In 1717, with forty comrades, he volunteered to assist the Turks against the Austrians, but his services were not utilized. He lived for the rest of his life at Rodostó, where he died on April 8, 1735. *

See *Autobiography of Prince Francis Rákóczy* (Hung.) (Miskolc, 1903), E. Jurkovich, *The Liberation Wars of Prince Francis Rákóczy*.

(Hung.) (Besztercebánya, 1903); S. Endrodi, *Kurucz Notes, 1700-1720* (Hung.) (Budapest, 1897)

RAKOVSKY, CHRISTIAN GEORGIEVICH (1873-), Russian politician and diplomat, of Bulgarian descent and Rumanian nationality, was born on Aug. 13, 1873 at Kotel, Bulgaria. His father's home in the Dobruja passed after the Russo-Turkish war to Rumania, and the family became Rumanian. Rakovsky's Bulgarian ancestors, especially his grandfather, had organized risings against the Turkish rule, and the revolutionary traditions of the family were revived in Christian Rakovsky. In 1890 on account of his socialist activities all appointments in Bulgarian schools were closed to him. He therefore went to Geneva, where he joined the international social democratic student movement, and came in contact with Plekhanov and other Russian social democrats, and also to Germany, where he met Liebknecht. He was expelled from Prussia in 1894, went to France, where he graduated as a doctor of medicine at Montpellier, and wrote his thesis on *The Etiology of Criminality and Degeneration* (1897). Returning to Bulgaria, he recommenced revolutionary activities, and in *Russia in the East* (1898) denounced Tsarist politics. In 1900 he served as an officer in the Rumanian army. During the peasant riots of 1907 he was expelled from Rumania, his title to Rumanian citizenship not being considered adequate, and his civil rights were only restored in 1912. The five years of Rakovsky's exile were interrupted by illicit homecomings and consequent labour troubles.

After Rumania entered the World War Rakovsky was arrested and imprisoned in various places, and finally at Jassy, whence he was released by the Russians on May 1, 1917. After the Soviets came into power in November he became a member of the central executive committee of the Union, and in 1919 he became a member of the central committee of the Communist party. Rakovsky was well known as a writer on political and economic subjects under the pen name of "Insarov," and a number of his books were written and published in Russia (*Modern France*, 1900; *Metetruck and His Time*, etc.).

Rakovsky's diplomatic career began with his appointment as head of the delegation entrusted with the peace negotiations with the Ukrainian central rada. In 1919 he was appointed president of the soviet of people's commissars of the Ukraine, and in 1922 represented Russia at the conference of Genoa. In 1924 he was the Soviet chargé d'affaires in London, and in 1926-27 he was Soviet ambassador to France. His support of Trotsky led, in 1928, to his expulsion from the Communist party and exile to Stalingrad. He was re-admitted in 1934, and was a departmental chief in the Commissariat of Health until 1937, when he was dismissed. He was among the 21 members of the "Right Trotskyist bloc" arrested in Feb. and tried in March 1938. Rakovsky was sentenced to 20 years' imprisonment.

RALEIGH, SIR WALTER (c. 1552-1618), British explorer, was born about 1552, the son of Walter Raleigh, of Fardell, and Catherine, daughter of Sir Philip Chamberpown of Modbury. He was born at the farmhouse of Hayes near Budleigh Salterton Bay. In 1568 he was entered as a commoner of Oriel College, Oxford. In 1569 he followed his cousin Henry Chamberpown, who took over a body of English volunteers to serve with the French Huguenots and was perhaps present at the battle of Jarnac (Mar. 13, 1569). Nothing is known with certainty of his life until February, 1575, when he was resident in the Temple. In June 1578 his half-brother Sir Humphrey Gilbert obtained a patent for six years authorizing him to take possession of "any remote barbarous and heathen lands not possessed by any Christian prince or people." During 1578 Gilbert led a piratical expedition against the Spaniards. Raleigh accompanied his half-brother as captain of the "Falcon," and was perhaps with him in an unsuccessful voyage in 1579. In 1580 Raleigh was twice arrested for duels, and he attached himself to the earl of Leicester, and to the earl of Oxford. Late in 1580 he was serving as captain of a company of foot in Munster. He took an active part in suppressing the rebellion of the Desmond's; he advocated a ruthless policy against the Irish, and recommended assassination as a means of getting rid of their leaders.

In December 1581 he was sent home with despatches and his great fortune dates from his arrival at court, where he was already known through his correspondence with Walsingham. He had corresponded with Walsingham for some time. It is possible that Raleigh did throw his mantle on the ground to help the queen to walk dry-shod over a puddle, and that he scribbled verses with a diamond on a pane of glass to attract her attention. His tall and handsome person, his caressing manners and his quick wit certainly pleased the queen, and the stories in Sir Robert Naunton's *Fragmenta Regalia* and in Fuller's *Worthies* represent at least the mythical truth as to his rise into favour. The rewards showered on him were out of all proportion to his services in Ireland. In February 1583 he accompanied the duke of Anjou to Flanders. In 1583 he received the grant of Durban House, Strand, and in the same year the queen's influence secured him two beneficial leases from All Souls, Oxford, which he sold to his advantage, and a patent to grant licences to "vintners"—that is, tavern keepers, which he subleased. In 1584 he had a licence for exporting woollen cloths. He was knighted in 1584. In 1585 he succeeded the earl of Bedford as Warden of the Stannaries. Raleigh made a good use of his new powers in the mining districts of the west. He reduced the old customs to order, and showed himself fair to the workers. In 1586 he was given 40,000 acres of the forfeited lands of the Desmond's, on the Blackwater in Ireland. He planted English settlers, and introduced the potato and tobacco. In 1587 he received a grant of part of Babington's forfeited land.

Raleigh was now at the height of his favour, Queen Elizabeth always had several favourites at once, lest any one might be supposed to influence her. She treated Raleigh exclusively as a court favourite, but never gave him any great office, nor admitted him to the council. Even his post of captain of the Guard, given in 1587, was mainly ornamental. The patent given to his half-brother Sir Humphrey Gilbert ran out in 1584. To avert this loss Raleigh, partly out of his own pocket, provided the means for the expedition to Newfoundland in 1583, in which Gilbert died. The patent was renewed in Raleigh's favour in March 1584.

Raleigh now began the series of ventures in the colonization of Virginia. His patent gave him and his heirs the proprietary right over all territory they occupied on payment of one-fifth of the produce of all mines of precious metals to the crown. In April 1584 Raleigh sent out two captains, Philip Amadas and Arthur Barlowe, on a voyage of exploration. They sailed by the Canaries to Florida, and followed the coast of North America as far as the inlet between Albemarle and Pamlico sounds in modern North Carolina. The name of Virginia was given to a vast and undefined territory, but none of Raleigh's captains or settlers reached the state of Virginia. In the same year he became M.P. for Devonshire. His first body of settlers, sent out in 1585 under Sir Richard Grenville, landed on what is now Roanoke Island in North Carolina. The settlers got on bad terms with the natives, and deserted the colony when Drake visited the coast in 1586. Attempts at colonization at the same place in 1586 and 1587 failed (see *NORTH CAROLINA*), and in 1589 Raleigh resigned his rights to a company of merchants, preserving to himself a rent, and a fifth of whatever gold might be discovered.

After 1587 Sir Walter Raleigh's position as favourite was challenged by the earl of Essex (see *ESSEX*, and *EARL OF*). In 1588 he was in eclipse. He was in Ireland for part of the year with Sir R. Grenville, and as vice-admiral of Devon looked after the coast-defences and militia levy of the county. In 1589 he was again in Ireland, visiting Edmund Spenser at Kilkenny. It was by Raleigh's help that Spenser obtained a pension, and royal aid to publish the first three books of the *Faerie Queen*. In 1589 Raleigh accompanied the expedition to the coast of Portugal which failed to raise a revolt against Philip II. In 1591 he was at the last moment forbidden to take part in the voyage to the Azores, being replaced by his cousin Sir R. Grenville. In 1592 he was again at sea with an expedition to intercept the Spanish trade, but was recalled by the queen, having seduced one of her maids of honour, Elizabeth Throgmorton. Raleigh denied the stories in a letter to Robert Cecil. On his return he was put into the Tower, and if he was not already married was married there. To placate

the queen he made a fantastic display of despair at the loss of her favour. The maids of honour could not marry without the queen's consent, which Elizabeth was always reluctant to give and would be particularly unwilling to give when the husband was an old favourite of her own. Raleigh proved a good husband and his wife was devoted to him through life. He superintended the distribution of the booty from the Portuguese carrack "Madre de Dios". He had provided large sums for the expedition, but the queen left him barely enough to cover his expenses.

Raleigh now retired to an estate at Sherborne in Dorsetshire, which he had extorted from the bishop of Salisbury by unscrupulous use of the royal influence. A son was born to him here in 1593. But a retired life did not suit Raleigh, and in 1595 he sailed on a voyage of exploration to the coast of South America. The object was undoubtedly to find gold mines, and Raleigh had heard the wild stories of El Dorado. His account of his voyage, *The Discoverie of Guiana*, published on his return, is brilliant, but contains much manifest romance and was received with incredulity. He was now the most unpopular man in England for his greed, arrogance and scepticism in religion. In 1596 he was named with Marlowe and others as an atheist. The share he took in the capture of Cadiz in 1596, where he was wounded, was followed by a return to favour, and he was apparently reconciled to Essex, whom he accompanied to the Azores in 1597. This co-operation led to a renewal of the quarrel, and Raleigh became still more unpopular. In 1600 he obtained the governorship of Jersey, and in 1601 took a part in suppressing the rebellion of Essex, at whose execution he presided as captain of the Guard. In 1600 he sat as member for Penzance in Elizabeth's last parliament. He was a steady friend of religious toleration, and a bold critic of the fiscal and agrarian legislation of the time.

James I, who regarded Essex as his partisan, had been prejudiced, and Raleigh's desire for war with Spain was against James's peace policy. Raleigh sold his Irish estates to Richard Boyle in 1602. He was expelled from Durham House, which was reclaimed by the bishop, dismissed from the captaincy of the Guard, deprived of his monopolies and of the government of Jersey. He was concerned in the complication of conspiracies of the first months of James's reign, and was committed to the Tower on July 10, 1603. Here he tried to stab himself, but only inflicted a small wound. His trial at Winchester, November 1603, was conducted with outrageous unfairness, and his gallant bearing in face of the brutality of the Attorney-General, Sir Edward Coke, turned public opinion in his favour. Raleigh was probably cognizant of the conspiracies, though the evidence against him was insufficient to prove his guilt. Much was kept back by the council, and the jury was influenced by knowing that the council thought him guilty.

The sentence of death passed on Raleigh was not carried out, but he was sent to the Tower, where he remained till March 19, 1616. His estate of Sherborne, which he had transferred to his son, was taken by the king. A sum of £8,000 offered in compensation was only paid in part. Raleigh's confinement was easy, and he turned to chemical experiments and literature. He had been known as a minor poet, and in prison he composed the only volume of his vast *History of the World* published. He invented an elixir, a very formidable quack stimulus. Hope of release never deserted him, and he secured his freedom in a way discreditable to all concerned. He promised the king to find a gold mine in Guiana without entrenching on a Spanish possession. It must have been obvious that this was impossible, and the Spanish ambassador, Gondomar, warned the king that the Spaniards had settlements on the coast. The king, who was in need of money, replied that if Raleigh was guilty of piracy he should be executed on his return. Raleigh gave promises he obviously knew he could not keep and sailed on March 17, 1617, relying on the chapter of accidents, and on vague intrigues he had entered into in Savoy and France. The ill-equipped expedition reached the mouth of the Orinoco on Dec. 31, 1617. Raleigh was ill with fever, and remained at Trinidad. He sent five small vessels up the Orinoco under Lawrence Keyms, with whom went his son Walter and a nephew. The expedition found a Spanish settlement on the way

to the supposed mine, and a fight ensued in which Sir Walter's son and several Spaniards were killed. Keyms returned to Sir Walter with the news of his son's death and his own utter ruin, and killed himself as a result of Raleigh's reproaches. After a miserable scene of recriminations and mutiny, the expedition returned home. Raleigh was arrested, and in pursuance of the king's promise to Gondomar was executed under his old sentence on Oct. 29, 1618. When he knew his end to be inevitable he died with serenity and dignity. His wife survived him, and he left a son, Carew Raleigh. His enmity to Spain made him a popular hero.

AUTHORITIES.—An edition of his *Works* in eight volumes was published in London in 1829. It contains a *Life* by Oldys and Birch, written with all the knowledge then available. A *Life of Sir Walter Raleigh* (1866, and ed.) was much used by Southey in his biography of Sir Walter Raleigh in vol. iv of *The British Admirals in the Cabinet Cyclopaedia* (1837). Two biographies appeared simultaneously, *Life of Sir Walter Raleigh* by J. A. Saint John, and *Life of Sir Walter Raleigh* by E. Edwards (1868). E. Edwards's work is in two volumes, of which the second contains the correspondence, and is still the best authority. Smaller lives, which in some cases contain new matter, are those by E. W. Gosse, "Raleigh" in *English Worthies* (1886), W. Stebbing, *Sir W. Raleigh* (1891 and 1899); Martin Hume, *Sir Walter Raleigh* (1897), H. de Selincourt, *Great Raleigh* (1908), and M. Waldman, *Sir Walter Raleigh* (1928). For special episodes see Sir John Pope Hennessy, *Sir Walter Raleigh in Ireland* (1883), and T. N. Brushfield, *Raleighiana* (Ashburton, 1896). Two separate editions of Raleigh's poems have been published, *Poems, with biography and critical introduction* by Sir F. Bridges (London, 1813), and *Poems of Raleigh with those of Sir H. Wotton, etc.*, edited by J. Hannah (London, 1829). S. R. Gardiner made a careful examination of the events of Raleigh's life after 1603 in his *History of England from the Accession of James I. to the Outbreak of the Civil War* (1883-84). See also C. H. Firth, *Sir Walter Raleigh's History of the World* (1918), and L. Cust, *Portraits of Sir Walter Raleigh* (1920).

RALEIGH (raw"li), **SIR WALTER** (1861-1922), English man of letters, born on Sept. 6, 1861, in London, was educated at University college, London, and King's college, Cambridge. He was professor of modern literature at University college, Liverpool, and professor of English literature at Glasgow. In 1904 he was appointed professor of English literature at Oxford. He was knighted in 1911, and elected to a fellowship at Merton college in 1914. He died on May 13, 1922.

Raleigh was a good critic, and a stimulating teacher. He was not bound by the accepted judgments on individual writers, but brought a fresh and original mind to bear on literature. He did as much as any man of his time to break with what may be called the "dry-as-dust" school. His publications include *The English Novel* (1894), *Style* (1897), *Wordsworth* (1903), *The English Voyagers* (1904), *Shakespeare* (1907), *Six Essays on Johnson* (1910), *Romance* (1917), and many essays on literary subjects.

RALEIGH, the capital of North Carolina, U.S.A., and also the county seat of Wake county; in the heart of the eastern part of the state, on federal highways 1 and 70, and served by the Norfolk Southern, the Seaboard Air Line and the Southern railways. Pop (1950) 65,679. The city has an altitude of 360 ft. and an area of 12.5 sq. mi. In the centre, on the highest ground, is the beautiful Capitol park of 4 ac. The present capitol building (completed 1840) of granite from a near-by quarry owned by the state, has a Doric portico and an octagonal dome. In the immediate neighbourhood are the state supreme court, the State Office building, the Justice building, the State Law library, the State museum, the Administration building, the Agricultural building and the highway commission, and not far away is the governor's mansion (1889), set in 4 ac. of grounds. In Pullen park is the house in which Andrew Johnson was born. Among the numerous antebellum mansions still standing is that of Joel Lane (1760), from whom in 1792 the state purchased the site of the city. Most of the state institutions are located at Raleigh: the hospital for the insane and epileptics (established in 1856, through the efforts of Dorothea Lynde Dix), the prison (1866), the schools for the white blind (1845) and the Negro deaf and blind (1867), the Confederate soldiers' home (1891) and the laboratory of hygiene.* Raleigh is an educational centre, with about 5,000 students in the colleges and other schools under private auspices. The North Carolina State College of Agriculture.

and Engineering (1887) with affiliated experimental farms, occupies 486 ac. in the western part of the city. Meredith college for women (Baptist, 1891) moved in 1924 to a suburban campus of 130 ac. Shaw university (Baptist, 1895) and St Augustine's college (Protestant Episcopal, 1867) are two of the oldest institutions in the south for the higher education of Negroes. Wake Forest college (Baptist, 1833) is 17 mi. N Raleigh has a large wholesale and retail trade. Raleigh is fast becoming a town of diversified industries. Some of the products manufactured in Raleigh include cotton, rayon and worsted cloth, venetian blinds, awnings, automobile seat covers, high-grade furniture, fertilizers, vegetable oils, patent medicines, steel products, concrete products and all kinds of food and dairy products. Raleigh is a trade centre of eastern North Carolina and at mid-century contained more than 700 retail stores. Five insurance companies have their home offices there. The assessed valuation of property at mid-20th century was about \$100,000,000.

In 1787 the state convention decreed that there should be a "fixed and unalterable seat of government," and that it should be named in honour of Sir Walter Raleigh, in 1788 the site (Wake Court House) was chosen, in 1793 the land was bought and the city was laid out, with wide streets and large public squares, and in 1793 it was incorporated. Gen. William Sherman's army passed through Raleigh on April 13, 1865.

RALPH (d. 1122), archbishop of Canterbury, called Ralph de Turbine, or Ralph d'Escures from his father's estate of Escures, near Séz in Normandy, entered the abbey of St. Martin at Séz in 1079, and ten years later became abbot of this house. After Anselm's death in April 1109 Ralph acted as administrator of the see of Canterbury until April 1114, when he himself was chosen archbishop at Windsor. Claiming authority in Wales and Scotland, he refused to consecrate Thurstan as archbishop of York because the latter prelate declined to profess obedience to the archbishop of Canterbury. This step involved him in a quarrel with the papacy, and he visited Rome, but was unable to obtain an interview with pope Paschal II, who had left the city. In spite of peremptory orders from Paschal's successors, Gelasius II. and Calixtus II., the archbishop still refused to consecrate Thurstan, and the dispute was unsettled when he died on Oct. 20, 1122.

RALPH OF COGGESHALL (d. after 1227), English chronicler, was at first a monk and afterwards sixth abbot (1207-1218) of Coggeshall, an Essex foundation of the Cistercian order. Ralph himself tells us these facts, and that his resignation of the abbacy was made against the wishes of the brethren, in consequence of his bad health. He took up and continued a *Chronicon Anglicanum* belonging to his house; the original work begins at 1066, his own share at 1187. He hoped to reach the year 1227, but his autograph copy breaks off three years earlier. The tone of the chronicle is usually dispassionate; but the original text contained some personal strictures upon Prince John, which are reproduced in Roger of Wendover. He wrote a continuation of Niger's chronicle, extending from 1162 to 1178 (printed in R. Anstruther's edition of Niger, London, 1851), and short annals from 1066 to 1223.

The autograph manuscript of the *Chronicon Anglicanum* is to be found in the British Museum (Cotton, Vespasian D. X.). The same volume contains the continuation of Ralph Niger. The *Chronicon Terrae Sanctae*, formerly attributed to Ralph, is by another hand, it was among the sources on which he drew for the *Chronicon Anglicanum*. The so-called *Libellus de motibus anglie sub rege Johanne* (printed by Martene and Durand, *Ampl. Collectio*, v. pp. 871-882) is merely an excerpt from the *Chronicon Anglicanum*. This latter work was edited for the Rolls series in 1875 by J. Stevenson.

RAM. A male sheep, one kept for breeding purposes in domestication and not castrated, as opposed to the castrated wether. (See SHEEP.) For the ram as one of the signs of the zodiac, see ARIES. The word may be connected with O'Norramme, strong, or with Skt. ram, to sport. The butting propensities of the ram have given rise to the many transferred senses of the word, chief and earliest of which is that of a battering implement used before the days of cannon for beating in the gates and breaching the walls of fortified places. (See BATTERING RAM.) Many technical uses of the term have been developed from this,

e.g., the weight of a pile-driving machine, the piston of a hydraulic press and other machines or portions of machines worked by water power. (See HYDRAULIC MACHINERY.) The ancient war-vessels were fitted with a beak (Lat. *rostrum*, Gr. *ἑκβολον*), projecting from the bows, and used to ram or crush in the side of an opposing vessel, for the development of this in the modern battleship see SHIP.

RAMA, an almost extinct Indian tribe who live on Rama key in Bluefields lagoon on the east coast of Nicaragua. Formerly they occupied the north bank of the San Juan river. Linguistically the Rama are allied to the Chibchan peoples of South America. Their material culture suggests a South American connection.

See C. de Kalb, *Bibliography of the Mosquito Coast of Nicaragua* (Bulletin of the American Geographical Society, vol. xxvi No. 2, 1894), D. E. Harrower, *Rama, Mosquito, and Sumu of Nicaragua* (Indian Notes, vol. ii, 1925).

RAMADĀN (rah-mah-dahn'), the Muslim month in which absolute fasting from dawn to sunset is required. The law is based on Qur'ān 179-184, and is as follows. A fast has always been a part of religion. In Islām it falls in this month because in it the Qur'ān was revealed, and it is holier than the others. It begins when the new moon is actually seen, and lasts until sight of the next new moon, it extends each day from the time when a white thread can be distinguished from a black one and until nightfall, it is absolute in that time as to food, drink, women. The sick and those on a journey may be excused, but should fast thereafter an equivalent number of days. The last ten days of the month are regarded as especially sacred; in the course of them falls the "Night of Decree," or "of Power" (Qur'ān xc. 1), but its exact date is not known. Fasting in Ramadān is reckoned one of the five pillars, or absolute requirements, of Islām. It is followed by the Lesser Festival, the first three days of the month Shawwāl (see BAIRAM).

RAMADI, a town in Iraq in 33° 30' N 43° 30' E, about 80 m. by road from Baghdad. The town lies on both sides of the Euphrates, which is here crossed by a bridge of boats, and in the 20th century became of some importance as an airport and as the point at which the overland mail leaves the cultivated area and starts its journey over the desert.

RAMAN EFFECT. When a beam of monochromatic light passes through a transparent substance a certain amount of light is scattered from the path of the original beam which is of greater wave-length than the incident light. This effect was discovered by Raman in 1928, and is known by his name. It must be distinguished from the Tyndall effect and from ordinary fluorescence. In the Tyndall cone (see COLLOIDS) the scattered light is of exactly the same wave-length as the primary beam, supposing monochromatic light to be used; if mixed light is used each wave-length is scattered without change of frequency, but the fact that the short wave-lengths are scattered in greater intensity than the longer wave-lengths leads to an apparent modification of colour. With fluorescence the light scattered in all directions is, except in a few exceptional cases, of wave-length greater than that of the primary beam (see FLUORESCENCE AND PHOSPHORESCENCE, where the exceptions to Stokes' law are discussed), but this wave-length is characteristic of the particular fluorescent substance, and does not change with the wave-length of the incident light, so long as this is short enough to excite fluorescence at all. The Raman effect is distinguished by the fact that the frequency of the scattered light changes with that of the primary beam, the difference of frequency between the primary beam and the scattered light being independent of the frequency of the primary beam. Thus, with the light from a mercury arc as the exciting radiation, each strong line is accompanied by a group of scattered lines, the frequency intervals from the primary line being the same within each group. Further, certain classes of chemical substances, such as different organic liquids each containing the same chemical group (e.g., the CH group), give in the scattered light

groups of lines whose frequency intervals from the primary line are the same for all substances of the class, but these intervals vary from substance to substance in other cases. The Raman radiation resembles the Tyndall scattered light in that it is, in general, strongly polarised.

The effect is observed by illuminating pure dust-free liquids with an intense beam of light containing approximately monochromatic radiations, e.g., the light from a mercury vapour lamp, and photographing the scattered light from a direction more or less at right angles to the original beam. The magnitude of the shift is of the order of 100 Angstrom units. It is not a question of a minute modification of frequency. The scattered light always contains the original frequency in comparatively great intensity, the modified lines often requiring a long exposure.

The interpretation of the effect is a matter of great theoretical importance. On the quantum theory of radiation (see QUANTUM THEORY) a certain quantum of energy $h\nu$ is to be attributed to the incident radiation, and a quantum of energy $h\nu'$ to the scattered radiation, h being Planck's constant and ν and ν' the respective frequencies. The difference $h(\nu - \nu')$ must be absorbed by the molecule in some quantum change, and the order of magnitude of this difference corresponds to an infra-red frequency. There is strong support for the view that the energy communicated to the molecule appears as energy of vibration of the nuclei of certain atoms in it, that is, the distance between the nuclei of these atoms varies periodically, the energy of the oscillations being governed by quantum conditions. Thus, associated with the strong mercury line 4,358 Å in the incident light, there is a scattered line at 5,000 Å with organic compounds containing the CH group, the difference of wave-number is 10^4 ($\frac{1}{4358} - \frac{1}{5000}$) = 2946 cm^{-1} , which corresponds to an infra-red line at 3.4 μ . Such a line is present in the infra-red spectra of these compounds, and is attributed to nuclear oscillation. (See BAND SPECTRUM.) Other scattered lines lead to other infra-red frequencies characteristic of the molecules in question. The Raman effect thus furnishes spectroscopy with a new and very powerful weapon for investigating the infra-red spectra of determined molecules without the very troublesome technique of infra-red measurements. In the case of complicated molecules the vibrations can be traced to simple groups within them, as exemplified by the CH group.

Besides the lines of lower frequency than the exciting light a few lines are found in the scattered light which have a higher frequency, and thus correspond to a contribution of energy by the molecule to the quantum of energy of the incident light. Such lines find a natural explanation in the existence of molecules which, as regards the nuclear vibrations, are in one of the excited quantum states of higher energy—a quantum jump to a state of lower energy occurring in conjunction with the scattering process provides the necessary increment of energy to the scattered quantum.

The Raman effect shows an interesting similarity to the Compton effect ($g\nu$). In the Compton effect the incident light-quantum communicates part of its energy to a free, or loosely bound, electron, which energy appears as kinetic energy of this electron, the light quantum of diminished energy being scattered as radiation of greater wave-length than that of the incident quantum. The Compton effect is observed with hard X-rays, the magnitude to be anticipated for the effect with optical frequencies being too small for experimental observation. In the Raman effect the incident radiation sacrifices part of its energy in an interaction with matter, and reappears as a radiation of diminished frequency, just as in the Compton effect, but the energy lost as radiation appears as energy of molecular vibration instead of as kinetic energy of an electron.

BIBLIOGRAPHY.—The discovery of the effect was first announced by C. V. Raman in the *Indian Journal of Physics*, 1, 387, 1928, and by Raman and K. S. Krishnan in *Nature*, CXXI, 501, 1928. Other papers on the subject are Raman and Krishnan, *Indian Journal of Physics*, II, 399, 1928; Cabannes and Dauré, *Comptes Rendus de l'Académie des Sciences*, CLXXXVI, 1533, 1928; G. Rogard, *Comptes Rendus*, CLXXXVII, 1107, 1928; P. Gringsheim, *Die Naturwissenschaften*, XVI, 597, 1928; R. W. Wood, *Philosophical Magazine*, VI, 729, 1928. (E. N. DA C. A.)

RAMANUJAN, SRINIVASA (1887–1920), Indian mathe-

matician, whose correct name was Srinivasa Ramanujan Tyengar, was born at Erode, southern India, on Dec. 22, 1887. He was educated at the Town High school and at the Government college at Kumbakonam. He obtained a scholarship from the University of Madras, but after his marriage, in 1909, became a clerk in the Madras Port Trust. Correspondence with Prof. G. H. Hardy, of Cambridge, led to his obtaining a further scholarship from Madras university, and an exhibition from Trinity college, Cambridge. In spite of religious difficulties arising from the fact that he was a Brahmin, he came to England in April 1914, where Hardy, by private teaching, helped to provide the necessary mathematical background for his original work. His mathematical work is on the theory of numbers, theory of partitions and the theory of continued fractions. He came ill in 1917, returned to India in 1919, when he resumed some of his mathematical work, but died on April 26, 1920, at Kumbakonam. He was elected F.R.S. in 1918 and fellow of Trinity college later in the same year.

Most of his papers, edited by G. H. Hardy, P. V. Seshu Aiyar and B. M. Wilson, were published under the title of *Collected Papers of Srinivasa Ramanujan* (1927). See also obituary notice, with a list of Ramanujan's papers, by G. H. Hardy, in *Proceedings of the Royal Society*, vol. xcix (1921).

RAMANUJAS, followers of Ramanuja, a southern Brahmin of the 12th century. Sri Vaishnavas, as they are usually called, worship Vishnu (Narayana) with his consort Sri or Lakshmi (the goddess of beauty and fortune), or their incarnations Rama with Sita and Krishna with Rukmini. Ramanuja's doctrine is essentially based on the tenets of an old Vaishnava sect, the Bhagavatas or Pancharatras, who worshipped the Supreme Being under the name of Vasudeva (later identified with Krishna, as the son of Vasudeva). They have shrines at Srirangam near Trichinopoly, Mallikote in Mysore, Dvaraka (the city of Krishna) on the Kathiawar coast, and Jagannath in Orissa; all of them decorated with Vishnu's emblems, the tulasi plant and salagram stone. Whilst Sankara's mendicant followers were prohibited to touch fire and had to subsist entirely on the charity of Brahman householders, Ramanuja, on the contrary, not only allowed his followers to use fire, but strictly forbade their eating any food cooked, or even seen, by a stranger. On the speculative side, Ramanuja met Sankara's strictly monistic theory by another, recognizing Vishnu as identical with Brahma, the Supreme Spirit animating the material world as well as the individual souls which have become estranged from God through unbelief, and can only attain again conscious union with him through devotion or love (*bhakti*). His tenets are expounded in various works, especially in his commentaries on the Vedantasutras and the Bhagavadgita. The followers of Ramanuja have split into two sects, a northern one, recognizing the Vedas as their chief authority, and a southern one, basing their tenets on the Nalayir, a Tamil work of the Upanishad order. (See RAMATS.)

See E. Thurston, *Tribes and Castes of India*, s.v.

RAMATS, a numerous north Indian sect (*Ramanandis* or *Ramavats*). Its founder, Ramananda, flourished in the latter part of the 14th century, according to tradition.

He was originally a Sri-Vaishnava monk, who, having come under the suspicion of laxity in observing the strict rules of food during his peregrinations, and having been ordered by his superior (Mahant) to take his meals apart from his brethren, left the monastery in a huff and set up a schismatic math of his own at Benares. The main distinctive features of their creed consist in their making Rama and Sita, either singly or conjointly, the chief objects of their adoration, instead of Vishnu and Lakshmi, and their attaching little or no importance to the observance of privacy in the cooking and eating of their food. Their mendicant members, usually known as Vairagis, are, like the general body of the sect, drawn from all castes without distinction. Thus, the founder's twelve chief disciples include, besides Brahmans, a weaver, a currier, a Rajput, a Jat and a barber—for, they argue, seeing that Bhagavan, the Holy One (Vishnu), became incarnate even in animal form, a Bhakta (believer) may be born even in the lowest of castes. Ramananda's teaching was thus of a popular character. The Bhakta-matā and other authoritative writings of the sect are composed in the popular dialects.

A follower of this creed was the poet Tulsidas, the author of the Hindi version of the Ramayana (See RAMANUJAS)

RAMBAUD, ALFRED NICOLAS (1842-1905), French historian, was born at Besançon on July 2, 1842. After studying at the École normale supérieure, he completed his studies in Germany. He was appointed répétiteur at the École des Hautes Études on its foundation in 1868. His earlier historical work was done in Byzantine and Russian history. Probably his study of Russia was motivated partly by his sense of the desirability of a Franco-Russian entente. Rambaud was chef de cabinet to Jules Ferry (1879-81), and in 1883 became professor of contemporary history at the Sorbonne.

He now wrote his *Histoire de la civilisation française* (2 vol., 1885, 1887, 9th ed., 1901) and his *Histoire de la civilisation contemporaine en France* (1888, new ed. entirely revised, 1906), and undertook the general editorship of the *Histoire générale du IV^e siècle jusqu'à nos jours*. The plan of this great work had been drawn up with the aid of Ernest Lavisse, but the entire supervision of its execution was carried out by Rambaud. Rambaud held the position of minister of Public Instruction from 1896 to 1898, and sought to carry on the educational work of Jules Ferry. He died in Paris on Nov. 10, 1905.

See the notices by E. Lavisse in the *Revue de Paris* for January 15th, 1906, and G. Monod in the *Revue historique* (vol. xc, pp. 344-348).

RAMBOUILLET, CATHERINE DE VIVONNE, MARQUISE DE (1588-1665), French salonnière, was the daughter and heiress of Jean de Vivonne, marquis of Pisan, and Giulia Savelli. She was married at twelve to Charles d'Angennes, vicomte de Le Mans, and afterwards marquis of Rambouillet. The young marriage found the coarseness and intrigue that then reigned in the French court little to her taste, and after the birth of her eldest daughter, Julie d'Angennes, in 1607, she began to gather round her the circle afterwards so famous. She established herself at the Hôtel Pisan, called later the Hôtel de Rambouillet. Almost all the more remarkable personages in French society and French literature frequented it, especially during the second quarter of the 17th century. Madame de Rambouillet's natural abilities had been carefully trained, but were not extraordinary. She had genuine kindness and a lack of prejudice that enabled her to entertain on the same footing princes and princesses of the blood royal, and men of letters, while among her intimate friends was the beautiful Angélique Paulet. The respect paid to ability in her salon effected a great advancement in the position of French men of letters. The almost uniform excellence of the memoirs and letters of the period may be traced largely to the development of conversation as a fine art at the Hôtel de Rambouillet, and the consequent establishment of a standard of clear and adequate expression. Mme. de Rambouillet was known as the "incomparable Arthénice," the name being an anagram for Catherine, devised by Malherbe and Racan. Among the famous incidents in the story of the Hôtel are the sonnet war between the Uranistes and the Jobistes—partisans of two famous sonnets by Voiture and Benéserade—and the composition by all the famous poets of the day of the *Gloriette de Julie*, a collection of poems on different flowers, addressed in 1641 to Julie d'Angennes, afterwards duchesse de Montausier. Julie herself was responsible for a good deal of the preciosity for which the Hôtel was later ridiculed.

The *Précieuses*, who are usually associated with Molière's avowed caricatures and with the extravagances of Mlle de Scudéry, but whose name, it must be remembered, Madame de Sévigné herself was proud to bear—insisted on a ceremonious gallantry from their suitors and friends, though it seems from the account given by Tallemant des Réaux that practical jokes of a mild kind were by no means excluded from the Hôtel de Rambouillet. They especially favoured an elaborate and quintessenced kind of colloquial and literary expression, imitated from Marni and Gongora, and then fashionable throughout Europe. Molière's attack was probably levelled not at the Hôtel de Rambouillet itself, but at the numerous coteries which in the course of years had sprung up in imitation of it. But the satire did in truth touch the originators as well as the imitators,—the former more

closely perhaps than they perceived. The Hôtel de Rambouillet continued open till the death of its mistress, on Dec. 2, 1665, but the troubles of the Fronde diminished its influence.

The chief original authorities respecting Madame de Rambouillet and her set are Tallemant des Réaux in his *Histoires*, and Antoine Baudeau de Somaize in his *Grand Dictionnaire des Précieuses* (1660). Many modern writers have treated the subject, notably Victor Cousin, *La Société française au XVII^e siècle* (3 vols., 1856), and C. L. Livet, *Précieuses et Précieuses* . . . (1859). There is an admirable edition (1875) of the *Gloriette de Julie* by O. Uzanne.

RAMBOUILLET, a town of France, capital of an arrondissement in the department of Seine-et-Oise, 30 mi. S.W. of Paris on the railway to Chartres. Pop. (1946) 7,169. Rambouillet derives its interest from the associations connected with the ancient château. Originally a royal domain, the lands of Rambouillet passed in the 14th century to the D'Angennes family, who held them for 300 years and built the château. Francis I died there in 1547, and Charles IX and Catherine de Medici found a refuge there in the Wars of Religion, as Henry III did after them. The title became a marquise in 1612, and a dukedom under Louis XIV. It was here that in 1830 Charles X signed his abdication. The shooting of the famous covets of Rambouillet was reserved for French presidents of the republic.

RAMEAU, JEAN PHILIPPE (1683-1764), French musical theorist and composer, was born at Dijon, the son of an organist, on Oct. 23, 1683. His father wished him to study law, but the boy's head was full of music, which he could only pursue in haphazard fashion. In 1701 his father sent him to Milan to break off a foolish love-match. But he learned little in Italy, and soon returned in company with a wandering theatrical manager, for whom he played the second violin. He next settled in Paris, where he published his *Premier livre de pièces de clavecin*, in 1706. He succeeded his father as organist of Notre Dame, Dijon, in 1709, and in 1714 removed to Lyons, where he was organist at the Jacobins. In 1715 he was organist at Clermont-Ferrand and working on his *Traté de l'harmonie*. There he remained until 1722. He studied the writings of Zarlino, Descartes and other theorists.

Rameau's keen insight into the constitution of certain chords, which in early life he had studied only by ear, enabled him to propound a series of hypotheses, many of which are now accepted. While the older contrapuntists were perfectly satisfied with the laws which regulated the melodious involutions of their vocal and instrumental parts, Rameau demonstrated the possibility of building up a natural harmony upon a fundamental bass, and of using that harmony as an authority for the enactment of whatever laws might be considered necessary for the guidance either of the contrapuntist or the less ambitious general composer. And in this he first explained the distinction between two styles, which have been called the "horizontal and vertical systems," the "horizontal system" being that by which the older contrapuntists regulated the onward motion of their several parts, and the "vertical system" being that which is built up perpendicularly from the bass. From fundamental harmonies he passed to inverted chords, to which he was the first to call attention, and the value of this discovery fully compensates for his erroneous theory concerning the chords of the eleventh and the great (Angl "added") sixth (See HARMONY).

Rameau first set forth his new theory in his *Traté de l'harmonie* (Paris, 1722), and followed it up in his *Nouveau système* (1726), *Génération harmonique* (1737), *Démonstration* (1750) and *Nouvelles réflexions* (1752). After his return to Paris in 1722 he produced some light dramatic pieces, and then showed his real powers in his opera, *Hippolyte et Aricie*, founded on Racine's *Phèdre* and produced at the Académie in 1733.

Rameau wrote more than 20 operas, the most successful of which were *Dardanus*, *Castor et Pollux*, *Les Indes galantes* and *La princesse de Navarre*. Honours were showered upon him. He died in Paris on Sept. 12, 1764. Rameau was undoubtedly the greatest French musician of his day.

BIBLIOGRAPHY.—Biographies by Charles Poissot (1864), Nizard (1807), Pougin (1876) and L. de la Laurencie (1908), also Chabanon, *Éloge* (1764); Paul-Marie Masson, *L'Opéra de Rameau* (1926). His *Oeuvres complètes*, ed. by Saint-Saëns (1894 et seq.), had reached the 18th volume in 1924.

RAMEK, RUDOLF (1881-1940), Austrian statesman, was born at Teschen on April 12, 1881, and served in the Austrian army in World War I. A member of the Christian Socialist party, he was state secretary for justice in the Karl Renner cabinet (1919) and minister of the interior in the Michael Mayr cabinet (1921).

He formed a coalition government in Nov. 1924. The chief problems before him were the strengthening of the federal principle and the completion of the Austrian reconstruction scheme under the League of Nations. Involved in controversy with Benito Mussolini over the latter's reference to "carrying the Italian standard if necessary beyond the Brenner," he obtained an explanation, and the incident was regarded as closed, but in Austria he was criticized as having been too lukewarm in his defense of Tyrolean interests.

The fall of his government on Oct. 15, 1926, was immediately caused by his refusal of any increase of pay to civil servants. He retired from politics, but was arrested by the nazis after the *Anschluss* and died in Salzburg in 1940.

RAMESES or RAMESESSES (Gen. xlvii, 11, Exod. xii, 37; Num. xxxiii, 3), or, with a slight change in the vowel points, **RAMSESSES** (Exod. i, 11), the name of a district and town in Lower Egypt is notable as affording the mainstay of the current theory that King Ramesses II was the Pharaoh of the oppression and his successor Merneptah the Pharaoh of the exodus. The first three passages cited above are all by the priestly (postexilic) author and go together. Jacob is settled by his son Joseph in the land of Ramesses and from the same Ramesses the exodus naturally takes place. The older narrative speaks not of the land of Ramesses but of the land of Goshen, it seems probable, therefore, that the later author interprets an obsolete term by one current in his own day, just as the Septuagint in Gen. xlvii, 28, names instead of Goshen Heropolis and the land of Ramesses. Heropolis lay on the canal connecting the Nile and the Red sea, and not far from the head of the latter, so that the land of Ramesses must be sought in Wadi Tumilat near the line of the modern fresh-water canal. In Exod. i, 11, again, the store-cities or arsenals which the Hebrews built for Pharaoh are specified as Pithom and Ramesses, to which the Septuagint adds Heliopolis. Pithom also takes us to the Wadi Tumilat. It is possible that these names were added by a writer who knew what fortified places were in his own time to be seen in Wadi Tumilat, for the form of the story of the Hebrews in Egypt is throughout deficient in precise geographical data. The postexilic or priestly author indeed gives a detailed route for the exodus (which is lacking in the older story), but he, we know, was a student of geography and might supplement tradition by what he could gather from traders as to the caravan routes.

It appears, however, from remains and inscriptions that Ramesses II did build in Wadi Tumilat, especially at Tell Maskhuta, which Lepsius therefore identified with the Ramesses of Exodus. But Naville's excavations found that the ruins were those of Pithom and that Pithom was identical with the later Heropolis. Petrie found sculptures of the age of Ramesses II at Tel Rotab, in the Wadi Tumilat west of Pithom, and concludes that this was Ramesses. The biblical city is probably one of those named Prameses, "House of Ramesses," in the Egyptian texts.

RAMESWARAM, a town of India, in the Ramnad district of Madras, on an island in Palk straits and on the line of the South Indian railway from Madras. It has one of the most venerable Hindu shrines, founded, according to tradition, by Rama himself, and the resort of thousands of pilgrims.

RAMIE, RHEA or CHINA GRASS, the product of species of the genus *Boehmeria*, a member of the family Urticaceae and nearly allied to the stinging nettle genus (*Urtica*), from which, however, it differs in absence of stinging hairs. Some confusion has arisen in the use of the various terms *ramie*, *rhea* and *china grass*. "Ramie" is generally used by English-speaking people to designate the plant *Boehmeria nivea*, with leaves snow-white on the under surface, and also the fibre obtained from this plant. The name is of East Indian or Malay origin and is said to have been used originally to designate *Boehmeria nivea tenacissima*, a tropical form with thin leaves, green on both surfaces. "Rhea" is

used in India to designate both forms, but more especially the introduced form with leaves white on the under side, known elsewhere as *ramie*. Formerly in the London fibre market the name "ramie" was used to designate the fibre from China and Japan, and the name "rhea" for the fibre from all other sources. China grass is the hand-cleaned but not degummed fibre as it comes on the market. The name has been incorrectly used to designate the plant.

B. nivea is a shrubby plant with the growth of the common nettle but without stinging hairs, sending up each season a number of straight shoots from a perennial underground rootstock. The plant leaves resemble the nettle in their shape and serrated margin, but their backs are clothed with a downy substance and have a silvery appearance. The minute greenish-brown flowers are closely arranged along a slender axis. This variety has been cultivated by the Chinese for many years, and the fibre has been used more or less as a substitute for linen. Ramie is grown commercially in China, Formosa, Japan and the Philippines. It has been grown experimentally in most temperate and subtropical countries throughout the world. About 1855 ramie was first introduced into the United States, and shortly thereafter it found its way into a number of Central American countries. A number of attempts have been made to start a ramie industry in the United States, Central America and South America, but no industry has developed.

In the United States experiments have been conducted along the South Atlantic coast and the Gulf of Mexico coast and in California by individuals, by state agricultural experiment stations and by the United States department of agriculture. The most extensive plantings have been made by companies interested in testing new machines and methods of preparation. Between 1935 and 1943 the acreage of ramie in the US varied from approximately 100 to 300 ac., but only a few tons of ramie fibre were prepared. It is questionable if ramie can be grown and prepared in countries having high labour wage scales to compete with fibre prepared with the cheap labour of the orient.

Cultivation.—The plant, which attains a height of from 3 to 8 ft., is grown from seed, cuttings or layers, or by division of the roots. From two to four crops per season may be obtained on suitable ground, each crop yielding up to four tons or more of green moist stems per acre. The yield of crude China grass fibre is approximately 24% of the green plant material as cut in harvesting. When proper attention is given to the choice of ground, and to planting, there is not much difficulty in raising a good crop, the trouble arises in the extraction of the fibre.

The stems when ripe are cut down, and after the leaves and small branches have been removed, the outer cover and the layers of fibre are stripped off in the form of ribbons. These ribbons contain the bark, the fibre and a quantity of very adhesive gum. The Chinese remove this bark and as much of the gum as possible before the plant has dried. When it has dried this fibre is called China grass. This hand process is naturally slow and tedious.

Properties.—The fibre possesses some very valuable properties, it is not only much stronger than any other known fibre, but almost equals some kinds of silk in its brilliance. Its lustre is about equal to that of mercerized cotton but much inferior to that of artificial silk. Ramie successfully resists atmospheric changes, is easily dyed and is little affected by moisture. On the other hand, articles manufactured from it have not, because of their hairy character, the same smart appearance as those made from flax. Although the fibre is in some cases 12 in. long, it varies considerably in length, and this handicaps the operations of preparing and spinning. It is impossible to make perfect yarns from fibres of various lengths, hence it is necessary either to separate the fibres into reasonable groups or to cut them into satisfactory lengths.

Manufacture.—In general, after decortication, the first process is that of degumming. This is usually done by immersing the fibre in a hot caustic soda or patented chemical solution. After the gum is removed, the material is lifted out, the alkali or chemical neutralized and the fibre thoroughly washed. The bulk of the water may be removed by a hydro-extractor, and the fibre

is then dried. To facilitate the subsequent process, the fibre may be softened by passing it through a machine fitted with fluted rollers. Then follow the operations of dressing, roving, wet spinning and doubling, and finally the twisted thread may be passed through a flame to remove superfluous hairs.

Ramie has been in the past used for gas mantles, for which it is particularly well adapted, for paper-making, ropes, linens, nets, underwear, and for canvas and several other fabrics. If only a good dependable supply of clean uniform low valued fibre could be obtained, there is not much doubt but that manufacturers and machine-makers would quickly provide means for utilizing it on an extensive scale. (B. B. R.)

RAMILLIES, a village of Belgium, in the province of Brabant, 13 miles N by E of Namur, between the sources of the Little Gheete and of the Mehanne. It is famous for the victory of the Allies under the duke of Marlborough over the French commanded by Marshal Villeroi on May 12-23, 1706 in the War of the Spanish Succession (q.v.). The position of the French on the high ground about Ramillies was marked by the villages of Autréglise (Anderkirk) on the left, Offuz on the left centre, Ramillies on the right centre and Tavers on the right close to the river Mehanne. In front of the last was a smaller village, Franquency, which was held as an advanced post. Between these points *d'appui* the ground was mostly open upland, and the position as a whole was defective in so far that the villages were barely within cannon-shot of each other. It was particularly strong on the flanks, which were protected by the marshy beds of the Mehanne and the Little Gheete. Ramillies stands almost on the watershed of these adjacent valleys, and here Marlborough decided to deliver his main attack. The forces were about equal, and were at first equally distributed along the whole line of each army. Marlborough's local concentration of force at the spot where the attack was to be pressed home was made not before, but after the action had opened. Villeroi's left wing of cavalry and infantry was secure—and at the same time immobilized—behind the upper course of the Little Gheete, and the French commander allowed himself to be imposed upon by a demonstration in this quarter, convinced perhaps by the presence of the British contingent that a serious attack was intended. The morning was spent in arraying the lines of battle, and it was about 1.30 when the cannonade opened. Soon the first lines of infantry of the Allied centre and left (Dutch) opened the attacks on Franquency and Tavers and on Ramillies, and, when after a severe struggle Tavers fell into the hands of the Dutch, their commander, Marshal Overkirk, led forward the whole of the left wing cavalry and fiercely engaged the French cavalry opposed to it.

The ground was open, both parties had placed the greater part of their horse on this side, and it was only after a severe and prolonged engagement (in which Marlborough himself took part like a trooper and was unhorsed) that the Allies were definitely victorious, thanks to the arrival of a force of cavalry brought over from the Allied right wing. Meanwhile the principal attack on Ramillies had been successfully pressed home, the necessary concentration of force being secured by secretly and skilfully withdrawing some British battalions from the right wing. While Villeroi was trying to bring up supports from the left to take part in the cavalry battle, the French in Ramillies were driven out into the open, where the Allied cavalry, having now gained the upper hand, rode down many battalions. Most of the French cavalry from the other wing, having to force its way through the baggage trains of the army (these had been placed too near the fighting lines), arrived too late, and once Ramillies had fallen the whole line of the Allies gradually took up the offensive. It was not long before the French line was rolled up from right to left, and the retreat of the French was only effected in considerable confusion. Then followed for once a relentless pursuit, carried on by the British cavalry (which had scarcely been engaged) to Louvain, 20 m. from the field of battle. Marlborough's unequalled tactical skill and judgment thus sufficed not merely to win the battle, but to win it with so large a margin of force unexpended that the fruits of his victory could be gathered. The French army lost, in killed, wounded and missing, some 15,000 men, the Allies (amongst whom the

Dutch had borne the brunt of the fighting) scarcely one-third as many.

RAM MOHAN ROY (1774-1833), Indian religious reformer, and founder of the *Brahma Samaj* (q.v.) or Theistic Church, was born at Radhanagar, in the district of Hugh, Bengal, in May 1774. He was the son of a small landowner, and in his early life acquired a knowledge of Persian, Arabic and Sanskrit, besides his own vernacular, Bengali. At the age of sixteen he first assailed idolatry in his Bengali work, entitled *The Idolatrous Religious System of the Hindus*. This gave offence to his orthodox father, and Ram Mohan left home and spent some years in travel. He was a clerk in the British service from 1800 to 1814, when he settled in Calcutta to devote himself to religious reform. Ram Mohan wrote Bengali works on the Vedanta philosophy, translated some of the *Upanishads*, and on Jan 23, 1830, definitely established the *Brahma Samaj* "for the worship and adoration of the Eternal, Unsearchable, Immutably Being who is the Author and Preserver of the Universe". In 1830 the emperor of Delhi bestowed on Ram Mohan the title of *raja*, and sent him to England as his agent. He presented petitions to the House of Commons in support of the abolition of the suttee rite. He died on Sept. 27, 1833.

RAMNAD, a town and district of Madras, British India, at the base of the spit of land that projects towards the island of Pamban in Palk strait. The town, pop. (1941) 18,152, is the residence of a *raja* of old family, head of the Maravar caste, whose title is *setupathi*, or lord of Adam's Bridge. It is a desolate and generally barren tract, traversed by the South Indian railway. The district has an area of 4,851 sq. mi., and a pop. (1941) of 1,979,643. Fishing is carried on.

RÂMNICU SÂRAT, the capital of the department of Râmnicu Sârât, Rumania, on the railway from Buzau to Focșani, and on the left bank of the Râmnicu, a tributary of the Sereth. Pop. (1930) 15,013, about 1,500 being Jews. The town rises from a marshy plain, east of the Carpathians, and west of the comlands of southern Moldavia. Râmnicu Sârât was the scene of battles between the Moldavians and the Wallachians in 1434 and 1573, and between the Wallachians and Turks in 1634. Here also, in 1789, an Austro-Russian army defeated the Turks. In 1854 the town was almost destroyed by fire and was rebuilt.

RÂMNICU-VÂLCEA, an episcopal city and the capital of the department of Vâlcea, Rumania, situated at the foot of the Carpathians, on the right bank of the river Olit, and on the railway from Caracal to Sibiu. Pop. (1930) 15,162, including many "Saxons". The district contains the famous monasteries of Arnota, Bistrita, Cozia and Moret. Besides wine, fruit, grain and timber, the surrounding uplands yield petroleum and salt. Within a few miles are the thermal springs of Olănești and Calimanești and the salt mines of Oțelea Mari, with deposits estimated at 330 million tons. The city is said to be the ancient Castra Traiana.

RAMÓN Y CAJAL, SANTIAGO (1852-1934), Spanish histologist, was born May 1, 1852, at Pettida de Aragón (Pamplona). He graduated at the University of Saragossa, and went in 1881 as professor to the University of Valencia, and in 1886 to Barcelona, publishing in 1889 his first important work (*Elementos de Histología normal y de Técnica Micrográfica*). In that year he discovered "the laws which govern the morphology and the connections of the nerve cells in the grey substance". In 1890 and 1891 he discovered the primary changes of the neurin, and the genetic unity of the nerve fibres and the protoplasmic appendices. During this period also he discovered the axis cylinder of the fibres of the cerebellum and their continuity with the parallel fibrillae of the molecular covering, formulated the principle of the dynamic polarisation of the neurones, aided by Van Gehuchten, and worked upon the analysis of the sympathetic ganglia. In 1892 he took the chair of normal histology and pathological anatomy in the University of Madrid. In 1894, on the invitation of the Royal Society of London, he developed systematically his views on morphology and connections of the nervous cells of the spinal medulla, ganglions, cerebellum, retina and olfactory bulb. He was called upon by the Clark University (Worcester) in 1899 to

give an exposition of his investigations regarding the cerebral tegumen, and in 1900 the International Congress of Medicine, which met in Paris, gave him the Moscow International Award. He was awarded half the Nobel Prize for medicine in 1906. His work in three volumes, *Histologia del Sistema Nervioso de Hombre y de los Vertebrados*, appeared between the years 1897 and 1904. In May 1922 he was exempted, on account of long service, from his duties in connection with the chair which he held, and, on the initiative of the Government, he founded the Casal Institute in Madrid.

RAMPION, the name given to herbs of the genus *Phyteuma*, belonging to the family Campanulaceae. There are 45 species, which inhabit Europe, Asia and the Mediterranean region, two are native to the British Isles. The flowers are small, usually blue, and are massed together in heads. The pollen is driven out of the narrow tube, formed by the corolla, by the elongation of the style, and is thereby exposed to visiting insects.

RAMPOLLA, COUNT MARIANO DEL TINDARO (1843-1913), Italian cardinal, was born on Aug. 17, 1843, at Polizzi, in the Sicilian diocese of Cefalù. Having completed his studies in the Capranica College at Rome, and having taken holy orders, he studied diplomacy at the College of Ecclesiastical Nobles, and in 1875 was appointed councillor to the papal nuncio at Madrid. Two years later he was recalled to Rome and received high office. After another brief stay in Madrid as nuncio he was created cardinal, and became papal secretary of State. New to the Sacred College and free from traditional preconceptions, he was admirably fitted to carry out the papal policy under Leo XIII. (See PAPACY.) Rightly or wrongly, he was held personally responsible for the *rapprochement* with France and Russia, and the opposition to the Powers of the Triple Alliance, and this attitude had its effect on his career when Leo XIII. died. Rampolla was not selected as pope owing to the veto of Austria, and resigned his office as secretary of State. He died in Rome on Dec. 17, 1913.

RAMPUR, an Indian state, lying within the United Provinces, between the British districts of Moradabad and Pilibhit. Area, 894 sq. mi. The country is level and generally fertile, being watered in the north by the rivers Kosla and Nahul, and in the south by the Ramganga. The chief crops are wheat, barley, maize, rice and sugar cane. Pop. (1941) 477,042. The chief, whose title is nawab and who enjoys a salute of 15 guns, is a Rohilla Pathan, representing the family which established their power over this part of the country in the 18th century. When the Rohillas were subjugated by the nawab of Oudh, with the assistance of a force lent by Warren Hastings, one of their number, Faz-ullah Khan, from whom the present nawab traces his descent, was permitted to retain possession of Rampur. During the Mutiny of 1857 the nawab of Rampur rendered important services to the British. The town of Rampur is on the left bank of the river Kosla. Pop. (1941) 89,322. There are manufactures of damask, pottery, sword-blades and sugar. It was once completely surrounded by a broad bamboo hedge, which formed a strong defence. In addition to a modern fort and several fine buildings, it contains an Arabic college, which attracts students from all parts of India.

RAMPUR BOALIA, a town of British India, the administrative headquarters of Rajshahi district in Bengal, on the left bank of the Ganges. Pop. (1931), 27,064. It is 28 m. by road from the Nator station of the Eastern Bengal State railway and has a steamer station on the Ganges. The town contains a Government college, and the museum of the Varendra Research Society.

RAMSAY, ALLAN (1686-1758), Scottish poet, was born at Leadhills, Lanarkshire, on Oct. 15, 1686. He was educated at the parish school of Crawford, and in 1701 was apprenticed to a wig-maker in Edinburgh. He married Christian Ross in 1712; a few years after he had established himself as a wig-maker (not as a barber, as has been often said) in the High Street, and soon found himself in comfortable circumstances. His first efforts in verse-making were inspired by the meetings of the Easy Club (founded in 1712), of which he was an original member; and in 1715 he became the Club Laureate. In the society of the members he assumed the name of "Isaac Bickerstaff," and later of

"Gawin Douglas." By 1718 he had some reputation for occasional verse, which he published in broadsheets, and then (or a year earlier) he turned bookseller. A rough transcript (1716) of *Christ's Kirk on the Green* from the Bannatyne ms., with some additions of his own, was followed in 1718 by a new edition with supplementary verses. In the following year he printed a collection of *Scots Songs*. The success of these ventures prompted him to collect his poems in 1722. The volume was issued by subscription, and brought in the sum of 400 guineas. He then opened a circulating library (the first in Scotland) in new premises, and extended his business as a bookseller.

Meanwhile he had issued the first instalments of *The Tea-Table Miscellany* and *The Ever Green* (both 1724-27). *The Tea-Table Miscellany* is "A Collection of Choice Songs Scots and English," containing some of Ramsay's own, some by his friends, several well-known ballads and songs, and some Caroline verse. In *The Ever Green*, being a Collection of Scots Poems wrote by the Ingenious before 1600, Ramsay sought to reawaken an interest in the older national literature. He produced, in 1725, his dramatic pastoral *The Gentle Shepherd*, which passed through several editions, and was performed at the theatre in Edinburgh, its title is still known in every corner of Scotland, even if it be no longer read. Ramsay wrote little afterwards, though he published a few shorter poems, and new editions of his earlier work. A complete edition of his *Poems* appeared in London in 1731 and in Dublin in 1733. In 1736 he set about the erection of a new theatre, "at vast expense," in Carrubber's Close, Edinburgh, but the opposition was too strong, and the new house was closed in 1737. In 1755 he retired from his shop to the house on the Castle Rock, still known as Ramsay lodge where he died on Jan. 7, 1758.

The Tea-Table Miscellany was reprinted in 1871; *The Ever Green* in 1875; *The Poems of Allan Ramsay* in 1877. A selection of the *Poems* appeared in 1887. There are many popular reprints of *The Gentle Shepherd*.

RAMSAY, ALLAN (1713-1784), Scotch portrait-painter, the eldest son of the author of *The Gentle Shepherd*, was born in Edinburgh in 1713. He studied in London under the Swedish painter Hans Hysing, and at the St. Martin's Lane Academy; and in 1736 he left for Rome, where he worked for three years under Solimena and Imperiali (Fernandi). In 1767 he succeeded Shakelton as principal painter to the king, and he painted the royal portraits which the king presented to ambassadors and colonial governors, employing a number of assistants—of whom David Martin and Philip Reinagle are the best known. But this prosperous career came to an end through an accidental dislocation of his right arm. He died at Dover on Aug. 10, 1784.

His bust-portraits of Scottish gentlemen and their ladies, which he executed before settling in London, are full of grace and individuality; the features show excellent draughtsmanship, and the flesh-painting is firm and sound in method, though frequently tending a little to hardness and opacity. His work is seen at its best in the portrait of his wife, in the Scottish National Gallery.

RAMSAY, SIR ANDREW CROMBIE, knighted 1887 (1814-1891), British geologist, was born at Glasgow on Jan. 31, 1814, the son of William Ramsay, manufacturing chemist. He served for forty years (1841-81) on the geological survey. To the first volume of the *Memoirs of the Geological Survey* (1846) he contributed a now classic essay, "On the Denudation of South Wales and the Adjacent Counties of England," in which he advocated the power of the sea to form great plains of denudation. In 1866 he published *The Geology of North Wales*. He became professor of geology at University College, London, in 1848, and lecturer in the same subject at the School of Mines in 1851. In 1872 he succeeded Murchison as director-general of the geological survey.

His best known work was his *Physical Geology and Geography of Great Britain* (5th ed., 1878). He became F.R.S. in 1862. He died at Beaumaris on Dec. 9, 1891.

His publications include *The Old Glaciers of Switzerland and North Wales* (1860), *The Red Rocks of England* (1871), *The River Courses of England and Wales* (1872).

See *Memoir* by Sir A. Geikie (1893).

RAMSAY, ANDREW MICHAEL (1686-1743), French

writer, of Scottish birth, commonly called the "Chevalier Ramsay," was born at Ayr on Jan. 9 1686. Ramsay served with the English auxiliaries in the Netherlands, and in 1710 visited Fénelon, who converted him to Roman Catholicism. He remained in France until 1724, when he was sent to Rome as tutor to the Stuart princes Charles Edward and Henry, the future cardinal of York. He was driven by intrigue from this post, and returned to Paris. He died at St. Germain-en-Laye (Seine-et-Oise) on May 6, 1743. The best known of Ramsay's many works is *Les voyages de Cyrus* (London, 1728, Paris, 1727), written in imitation of *Télémaque*.

RAMSAY, SIR WILLIAM (1852-1916), British chemist, was born in Glasgow on Oct. 2, 1852. From 1866 to 1870 he studied in his native city, and in 1871 went to work under R. Fittig at Tübingen. In 1872 he became assistant in the Young laboratory of technical chemistry at Anderson's college, Glasgow, and from 1874 was tutorial assistant in the university. In 1880 he was appointed to the chair of chemistry at University college, Bristol, and made principal in the following year. In 1887 he succeeded A. W. Williamson as professor at University college, London, a position which he resigned in 1913. He was awarded the Davy medal of the Royal society in 1895; and the Nobel prize for chemistry in 1904. He was made a KCB in 1902 and died at High Wycombe, Bucks, on July 23, 1916.

Ramsay's earliest investigations covered a wide field—from a new bismuth mineral to the physiological action of certain alkaloids—in the course of which he showed that the alkalis are related to pyridine, later he specialized definitely on inorganic and physical chemistry. With S. Young and others, he investigated the critical state, the relationship between vapour pressure and temperature and other properties of liquids. With J. Shields he verified the Eotvos law of the constancy of the rate of change of molecular surface energy with temperature, and obtained evidence concerning the molecular complexity of certain liquids. In 1892 Lord Rayleigh had asked for suggestions from chemists to account for the difference between the densities of chemical and atmospheric nitrogen, and Ramsay became interested in the problem. He devised methods for removing oxygen and nitrogen completely from air, and found that there was present in addition a small quantity of a hitherto unknown gas, in Aug. 1894 Ramsay and Rayleigh announced the discovery of this new gas, afterward called argon, present to the extent of almost 1% in the atmosphere. The high density of this gas accounted for the atmospheric nitrogen's having a greater density than the chemical variety. In 1895, while searching for new sources of argon, Ramsay heated the mineral cleveite with acid and obtained a gas which gave a spectrum identical with that of helium, detected in the sun by Sir J. N. Lockyer and Sir E. Frankland in 1868, in this way helium was first obtained, but it was later found to be present in the air to the extent of about 1 part in 250,000.

Both helium and argon were found to be absolutely inactive chemically, and so were called the "inert gases." A study of their position in the periodic table led to the belief that at least three more such gases should exist, and Ramsay, with M. Travers, found them in 1898 in the liquid air residues from which oxygen and nitrogen had been removed, they were called neon, krypton and xenon, and were found to be present in the air only to an extremely minute extent (e.g., xenon, 1 part in 170,000,000). Ramsay next turned to radioactivity since he noted the association of helium with radioactive minerals, and with F. Soddy (q.v.) he found in 1903 that helium was continuously produced as a disintegration product of radium emanation, this discovery led to the transmutation theory, and its important consequences. In 1910 Ramsay obtained a small quantity of radium, and with D. Whytlaw Gray he was able, as a result of a wonderful piece of experimental work, to determine the density, and incidentally the atomic weight, of about one three-millionth part of a cubic inch of radium emanation. The atomic weight showed that this gas was the last of the inert gas series and it was called niton.

Ramsay's eminence, and his interest in educational matters, resulted in his being asked by the Indian government to advise on the best way to utilize the Tata bequest; as a consequence the Indian Institute of Science was founded at Bangalore. During

World War I he was an active member of the Royal society committee for the pooling of scientific knowledge, to be placed at the command of the government. He made strong representations on the necessity of preventing cotton and fats from reaching central Europe. Ramsay was an inspiring teacher as well as a brilliant researcher, he had remarkable skill as a manipulator, and this, as well as his spirit of enthusiasm for research, contributed to his success as an investigator.

Ramsay's works include *A System of Chemistry* (1891); *The Gases of the Atmosphere* (1896); *Modern Chemistry*, 2 vol. (1901), and *Essays Biographical and Chemical* (1908).

See Sir William Tilden, *Sir William Ramsay: Memorials of His Life and Work* (1918), and *Famous Chemists* (1921), obituary notice, *Proceedings Royal Soc.* (1916-17).

RAMSBOTTOM, urban district, Lancashire, Eng., 4 mi. N. of Bury on the London Midland Region railway. Pop. (1951) 14,587. Area 14.9 sq. mi. It has iron and brass foundries, machine factories and textile establishments. Municipal transport connects it with Bury and Rawtenstall.

RAMSDEN, JESSE (1735-1800), English astronomical instrument maker, was born at Salterhebble near Halifax, Yorkshire, on Oct. 6, 1735. After serving his apprenticeship as a clothworker in Halifax, he went in 1755 to London, where in 1758 he was apprenticed to a mathematical instrument maker. About four years afterward he started business on his own account and secured a great reputation with his products. He died at Brighton on Nov. 5, 1800. Ramsden's specialty was divided circles, which began to supersede the quadrants in observatories toward the end of the 18th century. His most celebrated work was a five-foot vertical circle, which was finished in 1789 and was used by G. Piazzi at Palermo in constructing his well-known catalogue of stars.

RAMSEY, a market town in Huntingdonshire, Eng., on the southwestern border of the Fen country, on branch lines of the Eastern Region railway, 13 mi. SSE of Peterborough. Pop. of urban district (1951) 5,772. Area 24.9 sq. mi. According to a 12th-century chronicle of one of the monks, the name Ramsey is derived from "ram," referring to the tradition of a solitary ram's having taken up its abode there, and "ey" meaning an island. Ramsey, however, was not completely insulated. The abbey was founded by Ailwin, earl of the East Angles, in 969, and a charter of King Edgar granted lands and privileges for the purpose. Ramsey abbey was noted for the school established within its walls and for its library of Hebrew works. Its abbot was mitred. The lands were granted after the dissolution to Sir Richard Cromwell. The church of St. Thomas à Becket is transitional between Norman and Early English, and has a Norman east end. The tower was built in 1672 of stone from Ramsey abbey. An oak lectern, dating from the 15th century, carries a chained copy, in a Tudor binding of brass, of Dean Comber's (1655-99) book on the Common Prayer, and a black-letter copy of Erasmus' paraphrase of the Gospels. There are many interesting tombs in the churchyard, and the church register contains several entries relating to the Cromwell family, which moved to Ramsey from Huntingdon and owned the abbey estates till 1674. Of the ancient Benedictine abbey the only remains are a part of a gateway, a lodge and some buttresses, while some broken stone arches and walls remain of the conventual buildings. Ramsey has a market for agricultural produce, potatoes being the chief product of the district, and Ramsey mere, now entirely drained, forms excellent wheat land.

RAMSGATE, a municipal borough, watering place, seaport and member of the Cinque Port of Sandwich, in the Isle of Thanet parliamentary division of Kent, Eng., 79 mi. SE of London by the Southern Region railway. Pop. (1951) 35,748. Area, 5.7 sq. mi. Ramsgate (Ramesgate) was originally a small but prosperous place united until 1827 to the parish of St. Lawrence. The charter of Charles II mentions it as a member of Sandwich. In 1884 it was incorporated by royal charter, and a commission of the peace was granted in 1893. The jurisdiction of the Cinque Ports' justices thereupon ceased within its limits, which include the parishes of Ramsgate and St. Lawrence Intra. Under Elizabeth I, Ramsgate was still unimportant, though possessed of a fair before

the reign of Henry VIII. After 1668 the growth of trade increased its prosperity, and at the beginning of the reign of George I the pier was enlarged and pier-wardens appointed to collect the *droits*. In 1749, having been selected as a harbour of refuge for the Downs, it underwent great improvements, and henceforward paid £200 yearly to Sandwich out of the *droits* for clearing the Channel and repairing the banks of the river Stour within the Liberty, but by 1790 the harbour was of small account. During World War I, a large aerodrome was established at Manston, two miles from Ramsgate and considerable damage was done by bombs dropped on the town. In World War II 8,500 houses were damaged in the German raids of 1940-41. The conversion of 33 mi. of abandoned railway tunnels provided an air-raid shelter with accommodation for 60,000 persons. Ramsgate is practically contiguous with Broadstairs to the north. Before World War II the corporation, to improve the town as a seaside resort, undertook large works, including a new bathing pool (1935), tennis courts, bowling and putting greens, and ornamental gardens. The cliff promenades were extended by about a mile. The harbour, of 42 ac, was acquired by the town in 1934. During the season steamers connect it with London and the intermediate watering-places on the north coast, and with Calais and Boulogne. A fair coasting and fishing trade is carried on. Pegwell bay, famed for its shrimps, is supposed to have been the scene of the landing of Hengest and Horsa, and at Cliff's Head (Ebbs Fleet) a monolithic cross marks the landing-place of St. Augustine in 596.

RAMUS, PETRUS or PIERRE DE LA RAMÉE (1515-1572), French humanist, was born at the village of Cuth in Picardy in 1515, a member of a noble but impoverished family, his father was a charcoal-burner. Having gained admission, in a menial capacity, to the college of Navarre, he worked with his hands by day and carried on his studies at night. The reaction against scholasticism was still in full tide, and Ramus outdid his predecessors in the impetuosity of his revolt. On the occasion of taking his degree (1536) he actually took as his thesis "Everything that Aristotle taught is false." This tour de force was followed up by the publication in 1543 of *Aristotelice Animadversiones* and *Dialectice Partitiones*, the former a criticism on the old logic and the latter a new textbook of the science. What are substantially fresh editions of the *Partitiones* appeared in 1547 as *Institutiones Dialecticæ*, and in 1548 as *Scholæ Dialecticæ*, his *Dialectique* (1553), a French version of his system, is the earliest work on the subject in France. Meanwhile Ramus had opened courses of lectures, but was interdicted (1544) on the ground of undermining the foundations of philosophy and religion. The decree against him was presently cancelled, and in 1551 Henry II made him professor of philosophy and rhetoric at the Collège de France. But in 1561 he embraced Protestantism, and was compelled to flee from Paris, and in 1568 from France. But he returned before the massacre of St. Bartholomew (1572), of which he was one of the victims.

The logic of Ramus enjoyed a great celebrity for a time, and there existed a school of Ramists boasting numerous adherents in France, Germany and Holland. There is even a little treatise from the hand of Milton, published two years before his death, called *Arts Logicae Pleior Institutio ad Petri Rami Methodum concinnata*.

See Waddington-Kastus, *De Petri Rami vita, scriptis, philosophia* (1848), and *Ramus, sa vie, ses écrits et ses opinions* (1855), in which a list of 50 writings by Ramus is given. C. Desmazes, *Petrus Ramus, professeur au Collège de France, sa vie, ses écrits, sa mort* (1864), F. Lobstein, *P. Ramus als Theolog* (Straßburg, 1898), E. Sausset, *Les précurseurs de Descartes* (1862), J. Owen, *French Skepticism of the Renaissance* (1893), Voigt, *Über den Ramismus der Universität Leipzig* (Leipzig, 1888); F. P. Graves, *Peter Ramus and the Educational Reformation of the 16th Century* (1912).

RAMUSIO, GIAN BATTISTA (1485-1557), geographer, was born at Treviso in 1485 (June 20), the son of Paolo the Elder (c. 1443-1506). Gian Battista was educated at Venice and at Padua and entered the public service (1505), becoming in 1515 secretary of the senate and in 1533 secretary of the Council of Ten. He served the republic in various missions to foreign states, e.g., Rome, Switzerland and France. He died on July 10, 1557.

Ramusio had witnessed from his boyhood the unravelling of that great series of discoveries by Portugal and Spain in East and West, and geography was his chief study and delight. It appears from a letter addressed to him by his friend Andrea Navagero, that as early as 1523 the preparation of material for his great work, *Navigazioni e Viaggi*, had already begun. The task had been suggested by Girolamo Fracastoro, his lifelong friend. Among Ramusio's correspondents were Cardinal Pietro Bembo, Damiano de Goz and Sebastian Cabot, among lesser lights, Vettor Fausto, Daniel Barbaro, Paolo Manuzio, Andrea Navagero, the cardinals Gasparo Contarini and Gregorio Cortese, and the printer Tommaso Giunti, editor after Ramusio's death of the *Navigazioni*.

Two volumes only of the *Navigazioni e Viaggi* were published during his lifetime, vol. i. in 1550, vol. ii. in 1556, vol. iii. did not appear till 1559, two years after his death. Ramusio had intended to publish a fourth volume, containing, as he mentions himself, documents relating to the Andes, and, as appears from one of the prefaces of Giunti, others relating to explorations towards the Antarctic. Ramusio ransacked Italy and the Spanish peninsula for contributions, and translated them when needful into the racy Italian of his day. The invaluable travels of Barbosa and Pigafetta's account of Magellan's voyage were not publicly known in complete form till the present century. Of two important articles at least the originals have never been otherwise printed or discovered, one of these is the *Summary of all the Kingdoms, Cities, and Nations from the Red Sea to China*, a work translated from the Portuguese, and dating apparently from about 1535, the other, the remarkable Ramusian redaction of Marco Polo (*q.v.*) *The Prefations, Esposizione and Dichiarazione*, which precede this version of Marco Polo's book, are the best and amplest examples of Ramusio's own style.

There were several editions of the *Navigazioni e Viaggi*, and its bibliography is extremely complicated and the contents of the editions vary. It must suffice here to say that a set of Ramusio, to be as complete as possible, should embrace—for vol. i, 1563 or any subsequent edition; for vol. ii, 1583 or 1606; for vol. iii, 1606.

Besides the circumstances to be gathered from the *Navigazioni* regarding the Ramusio family, see the *Iscripion Venete* of Emanuele Cignola. There is also in the British Museum *Monografia letta il 15 Marzo 1883* by Guglielmo Carradori (Rimini, 1883), but little has been found in this.

RAMUZ, CHARLES FERDINAND (1878-1947), French-Swiss author, born at Cully, in the canton of Vaud. In the opening years of the 20th century he gained a well-merited reputation in a restricted circle; but nearly 25 years were to pass before proper appreciation was accorded by foreign critics to a writer of rare talent with a purely original style owing nothing to the "Latin" and "Classical" tradition. In his numerous works (including *Aline*, *Samuel Belet*, *Amé Pacé*, *Le Règne de l'esprit nalin*, *La Guérison des malades*, *Passage du poète*, *La Beauté sur la Terre* and *The End of All Men*, etc.), Ramuz gave, with broad and simple strokes, a picture of primitive human sentiments in language, the rhythm and phrasing of which intimately recall a definite district—namely, the Leman basin above Lausanne—a narrow strip of vineyard country backed by mountains and looking out over the Rhone and the luminous expanse of Lake Geneva. Though his outlook on the world and mankind was restricted to and conditioned by the influences of this district, Ramuz was the very opposite of a regionalist. In a country where so many others abused the facile picturesque and used "local colour" without distinction, his originality was the more striking. No one approached him in his humble self-subjection to the spirit of the country; he was completely under the spell of nature seen at close quarters. His own thoughts and aspirations were expressed in his characters; nevertheless his work is a most varied and representative picture gallery of a well-defined race, universal in its appeal though in appearance exclusively *Vaudois*. He died on May 23, 1947, in London. (C. L.)

RANADE, MAHADEO GOVIND (1842-1901), Indian lawyer, reformer and author, was born on Jan. 18, 1842, at Niphad, in Nask district, of a Chitpavan Brahman family. When his father was minister at Kolhapur he attended the Anglo-

vernacular school in that town. He joined the Elphinstone institute in Bombay at the age of 14 and was one of the first graduates of the Bombay university, taking the B.A. in 1862 and the LL.B. in 1866. Having entered government service he became presidency magistrate and then fourth judge of the small cause court at Bombay in 1871, first-class subjudge at Poona in 1873 and judge of the Poona small cause court in 1884, after which, as special judge under the Deccan Agriculturists' Relief act from 1887, he came into close contact with the difficulties of the agrarian classes.

In 1886 he was a member of the finance committee appointed to report on the expenditure, both imperial and provincial, with a view to retrenchment. This service won him the decoration of C.I.E. He became a member of the legislative council of Bombay in 1885 and occupied that position until raised to the high court in 1893. Being an energetic social reformer, he directed his efforts against infant marriages, the shaving of widows, the heavy cost of marriages and other social functions and the caste restrictions on travelling abroad.

He strenuously advocated widow remarriage and female education. He was the founder of the social conference movement, which he supported till his death. In the political sphere he founded the Poona Sarva-janik Sabha. He was also one of the originators of the Indian National Congress.

In Bombay university, where he held the offices of syndic and dean in arts, he displayed much organizing power and great intimacy with the needs of the student class. Himself a thorough Marathi scholar, he encouraged the translation of standard English works and tried, with some success, to introduce vernacular languages into the university curriculum. He joined with his friends Atmaram Pandurang, Bal Mangesh Wagle and Vaman Abaji Modak in founding a new sect in Bombay known as the Parthana Samaj. This community resembles, in all essential points, the Brahma Samaj of Bengal. He died on Jan. 17, 1901.

See G. A. Mankar, *Justice M. G. Ranade* (Bombay, 1902).

RANAVALO (RANAVALONA) III (1864-1917), the last queen of Madagascar. She succeeded to the throne of Madagascar after the death of Queen Ranaivalo II, on July 14, 1883. Although nominally queen, she took no share in the government, which her prime minister, Raimilaivony, had controlled since 1864. After placing her on the throne, he married her before the close of the year. For the events which resulted in the establishment of a strict French protectorate see *MADAGASCAR: History*. Gen. Joseph Gallieni abolished the sovereignty by proclamation in Feb. 1897 and exiled Ranaivalo to Réunion. In March 1899 she was moved to Algiers. She died May 23, 1917.

RANCI, ARTHUR (1831-1908), French politician and writer, was born at Poitiers on Dec. 20, 1831, and studied law. His anti-imperialist activities led to his deportation to Algeria in 1855, but he returned to Paris at the amnesty of 1859. He sat in the commune, and in 1873 was returned to the national assembly, where he sat on the extreme left. A threatened prosecution for his share in the commune obliged him to escape to Belgium, where he remained until the amnesty of 1879, continuing his collaboration on *Le République française*. He succeeded Georges Clémenceau as editor of the *Aurore*. In 1903 he became senator for Corsica, and died on Aug. 10, 1908.

In addition to his political writings, Arthur Ranci published political novels of the second empire, *Sous l'empire* (1872) and *Le roman d'une conspiration* (1868).

RANCE, ARMAND JEAN LE BOUTHILLIER DE (1626-1700), founder of the Trappist Cistercians. He was ordained in 1651 and embarked on the ambitious and worldly career

(1715); see also Serrant, *L'Abbé de Rancé et Bossuet* (1903).

RANCHI, a town and district of India, in the Chota Nagpur division of Bihar. The town, which is situated about 2,100 ft. above sea level, is the headquarters not only of the division and the district but also of the provincial government during the hot weather months. Pop. (1941) 54,178. The town contains a cantonment, a radium institute and two mental hospitals, one for European patients from the whole of northern India, the other, which can accommodate 1,378 patients, for Indians of Bengal as well as Bihar and Orissa.

THE DISTRICT OF RANCHI, formerly called Lohardaga, after the town which was its headquarters, has an area of 7,159 sq. mi. and a population (1941) of 1,675,413. It consists of two tablelands, of which the higher rises to about 2,000 ft. The whole area is broken by hills and undulations, which are terraced for rice. The steep slopes are covered with forest, where wild animals still abound. The principal rivers are the Subarnarekha and the North and South Koel.

Rice is the staple crop. Tea cultivation was also introduced. The only industry on a large scale is the manufacture of shellac. Myrobalans are also exported. Deposits of bauxite have been found and await exploitation.

Ranchi is connected with Purubia and the main system of the Bengal-Nagpur railway by a narrow-gauge railway, which was extended through the district to Lohardaga. The most numerous and characteristic races are the aboriginal Mundas and Oraons. Nearly 200,000 persons returned themselves as Christians at the census of 1921.

RAND, a Dutch word, in use in South Africa, meaning rim, edge, ridge of hills, specifically, it is an abbreviated form of Witwatersrand, an elevated ridge in south Transvaal, forming the water parting between the Vaal river and the Olifants river. The Rand is famous for its auriferous reefs (see GOLD), and the word is often used as a synonym for the extensive gold mining industry of this area, or for Johannesburg (*q.v.*), the city which the industry created.

RANDALL, JAMES RYDER (1839-1908), U.S. journalist and poet, born at Baltimore, Md., Jan. 1, 1839. His academic education was received at Georgetown college, after which he travelled in South America and then became professor of English literature at Poydras college at Pointe-Coupee, La., where he was when the Civil War broke out. The attack made by citizens of Baltimore upon Massachusetts and Pennsylvania troops as they passed through the city was the occasion of his writing "Maryland! My Maryland!" first published in the *New Orleans Delta*. The poem was widely copied and a few days later came to the attention of Baltimore people. There it was first sung by Hetty Cary to the classic melody of "Laurel Horatius." Words and music were happily united and from that time forth the song was heard in all the homes and camps of the south and in time became a national favourite. After the war Randall became the associate editor of the *Augusta Constitutionalist* (Ga.). He was later Washington correspondent for a number of southern papers. He died at Augusta, Jan. 14, 1908.

See *The Poems of James Ryder Randall* (1910), with introduction. **RANDALL, SAMUEL JACKSON** (1828-1890), American politician, was born in Philadelphia, Pa., on Oct. 10, 1828. He was educated in the public schools and in the University academy, Philadelphia. In 1858-59 he was a Democratic member of the State senate. During the Civil War he served in the Union army, rising to the rank of captain and playing an important part in the Gettysburg campaign. From 1863 until his death he was a Democratic representative in Congress. During the session of 1874-75 he first gained a national reputation by the masterful manner in which he prevented the Republican majority from passing the Force Bill or Federal Election Law. Under his leadership discipline and party harmony were established among the Democrats for the first time after the Civil War. He was speaker of the House from Dec. 1876 to March 1881, during a period marked by rancorous debates concerning the disputed Hayes-Tilden presidential election. He was noted for his work as chairman of the committee on appropriations and as a member

of the committee on banking currency and retrenchment. He was a leader of the Protectionist wing of the party. He died in Washington, D. C., on April 13, 1890.

RANDAZZO, a town of Sicily, in the province of Catania, at the north foot of Mt. Etna, 43 mi. NW of Catania by rail and 26 mi. direct. Pop. (1951) 13,396 (commune). Remains of architecture of the 13th and 14th centuries include three Norman churches and some interesting palaces. The former contain some fine sculptures and goldsmith's work, while the Museo Vaghiassini has interesting objects from a Greek necropolis in the neighbourhood.

Randazzo is the nearest town to the summit of Etna (9 mi.).

RANDEGGER, ALBERTO (1832-1911), Italian musical composer and conductor, was born in Trieste April 13, 1832. He settled in London in 1854. He became professor of singing at the Royal Academy of Music in 1868 and at the Royal College of Music in 1896. He was conductor of the Carl Rosa company from 1879 to 1885 and conducted the Norwich festivals 1881-1905. Randegger, who died in London on Dec. 18, 1911, assisted the popular revival of opera in England. His works include *Bianca Capello* (1854) and other operas, and also *Primer on Singing*.

RANDERS, a town of Denmark, capital of the amt (county) of its name in Jutland, on the Gudenaa at the point where it begins to widen into Randers fiord, an inlet of the Kattegat. Pop. (1950) 40,098. Randers is best known in history as the scene of the assassination of Count Gerhard by Niels Ebbesen in 1340. Though a place of considerable antiquity—being mentioned in 1086 as the meeting place of insurgents against Canute IV—Randers has few remains of old buildings and bears the stamp of a compact, modern manufacturing town that owes its importance to its distilleries, manufacturing of gloves, railway carriages, etc. St. Marten's church dates from the 14th century. The high school is housed in a mediaeval monastery. The town is 15 mi. from the open Kattegat and the harbour is 15 ft. deep.

RANDOLPH, EDMUND (JENNINGS) (1753-1813), U.S. statesman, was born on Aug. 10, 1753, at Tazewell hall, Williamsburg, Va., the family seat of his grandfather, Sir John Randolph (1693-1737), and his father, John Randolph (1727-84), who (like his uncle Peyton Randolph) were king's attorneys for Virginia. Edmund graduated from the College of William and Mary and studied law with his father, who felt bound by his oath to the king and went to England in 1775. In Aug.-Oct. 1775 Edmund was aide-de-camp to Washington. In 1776 he was a member of the Virginia convention and was on its committee to draft a constitution. In the same year he became the first attorney general of the state (serving until 1786). He served in the Continental Congress in 1779 and again in 1780-82. He had a large private practice, including much legal business for Washington. In 1786 he was a delegate to the Annapolis convention and in 1787-88 was governor of Virginia. He was a delegate to the constitutional convention of 1787, and on May 29 presented the "Virginia plan" (sometimes called the "Randolph

of circuit judges, and advocated a federal code, in 1791 he considered Hamilton's scheme for a national bank unconstitutional, and in 1792-93, in the case *Chasolm v. Georgia* before the supreme court, argued that a state might be sued by a citizen of another state.

On Jan. 2, 1794, he succeeded Thomas Jefferson as secretary of state. In 1795 he wrote 13 letters (signed "Germanicus") defending the president in his attack on the American Jacobin or democratic societies. He was the only cabinet member who opposed the ratification of the Jay treaty. Before it was ratified the delicate task of keeping up friendly diplomatic relations with France fell to him. Home dispatches of the French minister, Joseph Fauchet, intercepted by a British man-of-war and sent to the British minister to the United States, accused Randolph of asking for money from France to influence the administration against Great Britain. Although this charge was demonstrably false, Randolph when confronted with it immediately resigned, and subsequently secured a retraction from Fauchet; he published *A Vindication of Mr. Randolph's Resignation* (1795) and *Political Truth, or Animadversions on the Past and Present State of Public Affairs* (1796). He died at Carter hall, Millwood, Clarke county, Va., on Sept. 12, 1813.

See M. D. Conway, in his *Omitted Chapters of History Disclosed in the Life and Papers of Edmund Randolph* (1888, 2nd ed., 1889).

RANDOLPH, JOHN, of Roanoke (1773-1833), U.S. statesman and orator, was born at Cawsons, Va., on June 2, 1773. Through his father, John Randolph, and his mother, Frances Bland, he was related to the Randolphs of Turkey Island and the Blands of Westover, two of the most conspicuous families of colonial Virginia, and, through an ancestress, Jane Bolling, he was a descendant of the Indian princess Pocahontas. He received his collegiate education at Princeton, Columbia and William and Mary colleges. In 1799 he was elected to the house of representatives, after a historic debate with Patrick Henry. In the house, his rise was so rapid that, after the election of Jefferson to the presidency in 1801, he was made chairman of the house committee on ways and means and became the leader of the house Republicans. Soon, however, he drifted away from Jefferson and lost both chairmanship and leadership. Afterward he was, for many years, a mere free-lance, but in 1820 his resolute resistance to the Missouri Compromise made him again a truly powerful figure in the house. After his first election in 1799 he was re-elected to the house every two years until 1829, except in 1813, when his opposition to the War of 1812 resulted in his defeat by John W. Epes, and in 1817 when he declined to be a candidate. After re-election to the house in 1825, he was elected to the U.S. senate, but he was defeated for re-election by John Tyler. In 1807 he was the foreman of the grand jury which indicted Aaron Burr for treason, and he was a prominent member of the famous Virginia constitutional convention of 1829-30. In 1830 he was sent by Andrew Jackson on a special mission to Russia. In the succeeding year he returned and later denounced, in a series of speeches, the nullification proclamation of Andrew Jackson. He died at Philadelphia on May 24, 1833. Randolph was a passionate partisan of state sovereignty and, therefore, opposed to a national bank, protection and federal internal improvements and interference with slavery, but he disliked slavery and freed his slaves by his will. He filled with admirable efficiency the chairmanship of the house committee on ways and means. Jefferson said that his "popular eloquence gave him such advantages as to place him unrivalled as the leader of the House."

At the time of the Missouri Compromise, his influence was so great that Henry Clay afterward declared in a speech "His acts came near shaking this Union to the centre, and desolating this fair land." After his return to the house in 1827, it was again so great that the failure of John Quincy Adams to be re-elected to the presidency was largely due to it. "Wit and genius all allowed him," Thomas H. Benton tells us. "He has probably," declared Horace Binney, "spoken to more listeners than any other man of his day, having been unrivalled in the power of riveting the attention by the force and pungency of his language, the facility

1788 he refused re-election as governor and entered the house of delegates to work on the revision and codification of the state laws (published in 1794).

Service in Cabinet.—In Sept. 1789 he was appointed by President Washington first attorney general of the United States. He worked for a revision of Ellsworth's judiciary act of 1789, and especially to relieve justices of the supreme court of the duties

and beauty of his enunciation, and the point and emphasis of his most striking manner." Some of Randolph's speeches, in congress are found in most anthologies of American eloquence. One of the most brilliant and disinterested, though by no means one of the most useful, of American public men, he was a captivating talker, a delightful letter writer, a ripe scholar and a devotee of the horse, the dog and the gun. Randolph was the scion of old and distinguished family stocks, the lonely occupant, when at Roanoke, of two rude dwellings in the heart of a primeval forest, and yet the possessor of a vast landed estate, a numerous retinue of slaves, a splendid stud of thoroughbreds and a choice library. Since he was, moreover, marked by startling peculiarities of voice, face and form which, once heard or seen, were never forgotten, always eccentric and sick and sometimes actually demented, a party to two duels and many quarrels, dauntlessly intrepid, intensely malignant at times and yet susceptible also to impulses of love and pity, it is not surprising that John Randolph of Roanoke should occupy, in U.S. history, a place that is likely forever to remain unique.

RANDOLPH, PEYTON (1721-1775), U.S. politician, was born at Tazewell hall, Williamsburg, Va., in 1721, a son of Sir John Randolph (1603-1737), the king's attorney for Virginia. He graduated at the College of William and Mary, studied law at the Inner Temple, London, and in 1748 was appointed the king's attorney for Virginia. Randolph wrote the address of remonstrance to the king on behalf of the burgesses against the suggested stamp duties in 1764. His policy was conservative and moderate, and in May 1765 he opposed Patrick Henry's radical "Stamp Act resolutions." In 1766 he resigned as king's attorney and was succeeded by his brother John (1727-84). In 1769 he acted as moderator of the privately convened assembly which entered into the nonimportation agreement, and in May 1773 he became chairman of the first Virginia intercolonial committee of correspondence. He presided over the provincial convention of Aug. 1774, was a member of the first Continental Congress, of which he was president from Sept. 5 to Oct. 22, 1774, and was re-elected to congress in March 1775. Randolph died of apoplexy in Philadelphia on Oct. 22, 1775. He was provincial grand master of the Masons of Virginia and was an intimate friend of George Washington.

RANDOLPH, THOMAS (1523-1590), English diplomatist, son of Avery Randolph, a Kentish gentleman, was educated at Christ Church, Oxford, and in 1549 became principal of Pembroke college, Oxford, then known as Broadgates hall. During the reign of Mary, Randolph, who was a zealous Protestant, sought refuge in Paris, where he cultivated the society of scholars. Returning to England after the accession of Elizabeth I, he was employed as a confidential diplomatic agent of the English queen in Scotland. Randolph's dispatches from Scotland between 1560 and 1585 supply important material for the history of the political intrigues of that period. In 1568 he undertook a mission to Russia which resulted in the concession by Ivan the Terrible of certain privileges to English merchants, in 1570 he returned to Scotland. After carrying through certain diplomatic business in France in 1573 and 1576, Randolph returned in Jan. 1581 to Scotland, where the earl of Morton, the regent, had been arrested a few days previously. Randolph, acting on Elizabeth's instructions, intrigued with Angus and the Douglases in favour of a plot to seize the person of the young King James and to save Morton by laying violent hands on the earl of Lennox. Douglas of Whittingham made revelations which imperilled Randolph, who withdrew to Berwick before the execution of Morton in June 1581. In 1585, when he next visited Scotland, he helped to arrange a treaty between England and Scotland. For the next four years he was chancellor of the exchequer in England, and he died in London in June 1590.

See M. J. Thorpe (ed.), *Calendar of State Papers relating to Scotland (1509-1603)*, 2 vol.

RANDOLPH, THOMAS (1605-1635), English poet and dramatist, was born near Darenton in Northamptonshire, and was baptized on June 15, 1605. Ben Jonson adopted him as one of his "sons." He addressed three poems to Jonson, one on the occasion of his formal "adoption," another on the failure of *The New Inn* and the third, an elegy, describing his own studies at Cambridge. He was buried in Blatherwick church on March 17, 1635.

Randolph's earliest printed work is *Aristippus, Or, The Joviall Philosopher Presented in a private shew, To which is added, The Conceited Pedlar* (1630). It is a gay interlude burlesquing a lecture in philosophy, the whole piece being an argument to support the claims of sack against small beer. His other authenticated works are *The Jealous Lovers* (1632), *The Muses' Looking-Glass*, *Amyntas*, or *The Impossible Dowry*, a pastoral printed in 1638, and some Latin and English poems. *Hey for Honesty, down with Knavery*, a comedy, is doubtfully assigned to him. His works were edited by W. C. Hazlitt in 1875.

RANDOM, an adjective originally meaning impetuous, hasty, hence done without purpose or aim, haphazard. The term "random work" is used in architecture, by the ragstone masons, for stones fitted together at random without any attempt at laying them in courses. (See MASONRY.)

RANDS, WILLIAM BRIGHTY (1823-1882), English essayist and writer for children, was born in Chelsea on Christmas eve, 1823. After miscellaneous employments he became a reporter in the committee rooms of the house of commons (1857-75). He occupied his spare time in writing for a large number of magazines and periodicals as well as for his own publications. The latter comprised under his own name, an edition of *The Poetical Works of Robert Bloomfield* (1855) and *Cham of Lilies and Other Poems* (1857), anonymous, *The Frost upon the Pane*, a *Christmas Story* (1854) and his best-known works, the books of poems for children, *Liliput Levee* (1864), *Liliput Lectures* (1871), *Liliput Revels* (1871) and *Liliput Legends* (1872), and pseudonymous, *Tangled Talk* (1864) by "Thomas Talker," *Henry Holbeach, Student in Life and Philosophy* (1865) and *Shoemakers' Village* (1871; previously in the *Argosy*, 1867) by "Henry Holbeach," and *Verses and Opinions* (1866) and the more valuable *Chaucer's England*, 2 vol. (1869), by "Matthew Browne." He died on April 23, 1882, at East Dulwich, Surrey. *Lays Lessons and Essays in Conduct* was posthumously edited by R. B. Johnson.

See A. H. Miles (ed.), *Poets and Poetry of the Century*, vol. 5 (1893).

RANELAGH, formerly a resort by the Thames river in Chelsea, London, Eng. About 1690 land lying east of Chelsea hospital and bordering the river was acquired by Richard, Viscount Ranelagh, later earl of Ranelagh. He built a mansion and laid out gardens, which in 1743 were thrown open as a proprietary place of entertainment. A building called the Rotunda was erected for concerts, and the gardens became a resort of fashionable society. By the close of the 18th century Ranelagh was ceasing to attract, and in 1803 the Rotunda was closed. The buildings were removed and the grounds passed to Chelsea hospital.

RANGABÉ, ALEXANDROS-RIZOS (1810-1892), Greek poet, archaeologist and statesman, born at Constantinople in 1810, was the son of Jean-Rizos Rangabé, a celebrated poet and scholar. In 1829 Alexandros entered the ranks of the Bavarian army, but after the establishment of the Greek republic he returned to his native country where he became successively minister of education (1833) and director of the royal printing press (1841). In 1844 he became professor of archaeology at the University of Athens, and for the next 12 years, in company with C. Bursian, he investigated the ruins of the temple of Juno, near Argos, bringing to light many statues and bas-reliefs and discovering the entire formation of the building. He died at Athens on Jan. 28, 1892.

Rangabé advocated a revival of the ancient Greek language and wrote poetry and dramas in Greek, including *Phrosyme*, *The Vigil* and *The Thirty Tyrants*. He also wrote various archaeological works in French, notably *Antiquités helléniques* (1842-55) and *Antiquités troiennes* (1874).

RANGE: 300 HOUSEHOLD APPLIANCES, GAS STOVES

RANGE FINDERS. Range finders are used to establish surveys and maps, to enable the accurate direction of gun, rocket and missile fire, to test and study air vehicle characteristics and to determine the lens focus setting for cameras. Triangulation methods have long been used for the determination of ranges, and precise optical methods have been devised for this purpose.

With the development of pulse-time techniques for use with radio equipment, a new series of instruments evolved for the determination of range. (See RADAR.) The development of radio ranging at the beginning of World War II became an important factor in naval gunnery and anti-aircraft fire; large optical range finders formerly indispensable in the direction of such fire assumed a secondary or stand-by role. Optical range finders have the advantages of high resolution, compact size, relatively simple maintenance and accuracy at short ranges, but they are unreliable during bad visibility conditions and at long ranges, require a relatively long time to make the range determination and, for most purposes, are useless at night. Radio range finders consist of a highly complex electrical network which requires large electrical power supplies and constant attendance by highly trained technicians.

Basically, an optical range finder is a triangulation device with which two angles and the included base are measured to determine the range to the target situated at the apex of the triangle so formed. The most accurate ranging is accomplished by (1) a two-station system of triangulation in which the base line is long and the optical stations are separated by distances of several hundred yards or many miles, (2) the short base monostatic range finder, a one-station system of triangulation which is a self-contained optical system, its accuracy depends on the precise mounting of its optics on an optical bar. The two-station system suffers from the difficulty of establishing time coincidence when measuring ranges to moving or intermittent targets, the complex communication network required to co-ordinate the ranging, and the difficulty of insuring that the two stations are set on a common target and the lengthy process of calculating the range. The one-station system, at the expense of accuracy, avoids these difficulties.

Two-Station System.—The two-station system of triangulation has undergone a high degree of development throughout recorded history perhaps, with the attempts of the Egyptians who were required to re-establish property lines after the annual inundation of the Nile. In modern times, the development of the optical theodolite resulted in highly precise measurements. The theodolite is used to measure angles—measurements which, in order to minimize operators' errors, are averaged from a number of readings in order to determine the true angle. By United States coast and geodetic procedure an angle is turned 16 times in a first order survey, 4 times in a second order survey, and twice in a third order survey. The accuracy of the distances so measured must not have an error exceeding 1 in 25,000 in a first order survey, 1 in 10,000 in a second order survey, and 1 in 5,000 in a third order survey. This precision is possible only because the targets are fixed and easily identifiable from each other.

In many situations, especially in military usage, the targets are either moving or intermittent, as in the determination of the ranges to vehicles or gun flashes. In such cases, a reading can be taken only once and the two base angle readings must be taken simultaneously. An elaborate communication network between the stations must be set up and timing coincidence must be established. One military system consists of a shutter assembly which is attached to the objective of a sighting telescope. A network of these instruments is established by survey, with the shutters connected over communication wires so that the shutters can be simultaneously opened or closed electrically from a central control station. This system is particularly useful in spotting muzzle flashes from artillery fire. When an observer notes a muzzle flash through his telescope he closes the shutters, thus establishing time coincidence. The operators then take a reading of the bearing of their sighting telescope and relay the bearing position to the central control station where a range plot is made.

18—CO

For proof-testing and in checking the accuracy of anti-aircraft fire, a more elaborate network is established by using photo-theodolites. A phototheodolite, as shown in fig 1, consists of a camera with a long focal length lens mounted on a theodolite base. The theodolite is turned by a hand wheel or synchronous motor directed by an operator, who sights through a telescope which is fixed to the theodolite base. Time coincidence among the phototheodolite stations is established by a signal which is transmitted over a communication system. Time markers are actuated to give an indication printed on the film; the signal may also operate the shutter. It is possible to operate the phototheodolites over base lines as long as 15 mi. The camera, usually a 35-mm movie type, takes a picture of the target being tracked by the operator, fiducial marks which establish the zero position on the film as well as pictures indicating the position of the theodolite base in both azimuth and elevation. The angular errors in tracking are reduced by developing the film and making corrections to the indicated azimuth and elevation readings by applying tracking corrections determined from the measured position of the target.

BY COURTESY OF U. S. ARMY SIGNAL CORPS
FIG 1—PHOTOTHEODOLITE

with respect to the fiducial marks. By averaging measurements made by a system of four or five phototheodolites, it is possible to obtain range accuracies of 1 in 10,000 at ranges less than 10,000 yd.

Short Base Range Finders.—Attempts were made as early as 1770 to couple two theodolites closely on a short base line to circumvent communication difficulties in military range finding. Georg Friedrich Brander in 1781 built a range finder for one operator and Alexander James Adie (1860) constructed a split coincidence range finder. Guy Barr and William Stroud in England culminated a rapid development of range finders in 1888 when they brought out their coincidence range finder, prototypes of modern instruments. Later in 1893 Carl Zeiss in Germany built a stereoscopic range finder. The Germans continued to favour the stereoscopic type made both by Zeiss and Carl Götz, the British favoured coincidence types. U.S. manufacturers, Bausch and Lomb, Eastman Kodak and Kueffel and Esser, continued to make both types. Military range finder developments were largely concerned with refinements of these two designs. Efforts were made to study methods of training operators, improving the presentation of the image, testing the psychological and physiological ability of the operator, and finally bringing the precision of the instrument to a refinement commensurate with latest optical and mechanical skill.

Coincidence and Stereoscopic Range Finders.—In the development of the modern range finder there was considerable controversy concerning the comparative effectiveness of the coincidence and stereoscopic range finders. The general advantage of one over the other had not been proved by mid-20th century. The two appear similar except that usually the coincidence type has a single eyepiece as compared with two in the stereoscopic type. Fig 2 and 3 illustrate the schematic arrangement of the commonly used coincidence and stereoscopic range finders.

Monostatic range finders are built, self-contained, with two optical extended "arms" which define the base length. The outer case usually contains windows, the optical square and the eyepieces. An inner "optical bar," insulated from temperature differentials and vibrations, contains the objectives, deviation prism

FIG. 2—COINCIDENCE RANGE FINDER

and the reticles. As the field of view is small, the range finder is mounted on bearings and must be rotated to follow the target. The range operator who observes the images formed by the two objectives adjusts the range drum to establish coincidence or stereoscopic contact, the range can then be read from the drum. Monostatic range finders having a base length of one-half yard to a yard are portable and used by armies in the field, they are accurate to several thousand yards. Larger range finders having base lengths of $4\frac{1}{2}$ ft to 40 ft are used to measure ranges up to 20 mi to adjust naval and anti-aircraft fire.

Accuracy of Monostatic Range Finders—The fundamental equation for the range finder can be stated simply from fig. 6. At O_1 is a right angle and at O_2 is an angle θ which gives the bearing to the target. As this angle is always very small, the range is given as $R = \frac{B}{\theta}$ (approximately) where B is the base

separation. The statement for the range error then becomes

$$dR = \left| \frac{d\theta}{B} R^2 \right| \quad (1)$$

The most useful function of this formula is to show that the range error varies as the square of the distance. This error may be compared with radio range finders for the radio range determination depends on measuring the time during which a radio wave travels from the target to the observer. As the velocity of a radio wave is substantially invariant, the range error is largely independent of the range. With an optical range finder, the accuracy with which $d\theta$ and B can be measured under field conditions is a complex function of the construction of the instrument, i.e. magnification, temperature stability, mechanical rigidity, backlash and the presentation of the image; a function of the target shape and size, a function of atmospheric visibility, and a function of the training and physiological condition of the operator. In measuring the accuracy of range finders the term "unit of error" (UOE) is frequently used. It may be defined as the greatest angle of deviation from the true coincidence setting or stereoscopic contact which may be detected by the operator.

FIG. 3—STEREOSCOPIC RANGE FINDER

The measurement of the angle $d\theta$ when considering only the visual acuity of the observer and the geometric magnification M of the telescope becomes $d\theta = UOE/M$. The error in optical range finding is then given by the formula

$$dR = \frac{(UOE)}{BM} R^2 \quad (2)$$

This is a very idealized formula and its application can only be considered as a goal to be achieved by eliminating all instrumental

and operator errors. In the English speaking countries a UOE of 12 sec of arc is commonly accepted. If the range is given in thousands of yards R_u , the base length in yards b , then the range error in yards is

$$dR = \frac{60}{bM} R_u^2 \quad (3)$$

An instrument having a 1-yd base and a magnification of 15X has then an ideal range error of $dR = 4R_u^2$. In actual field use, an instrument with a like base and magnification having an error factor of $dR = 10R_u^2$ would be an excellent instrument. By increasing the base distance and the magnification, the range error is decreased, although not as much as indicated by formula (3).

Construction—The two ends of the base line are defined by the optical square which changes the incoming light path at the two arms of the range finder by 90° . A penta prism P , as shown in fig. 2, is ideally suited for the purpose since it has the characteristic of changing the light path through a constant fixed angle independently of the incident angle. The prism has its two reflecting surfaces 45° to each other. In larger range finders it is necessary to use mirror surfaces M as reflecting surfaces, as shown in fig. 3, for it is impossible to obtain satisfactory prisms in the larger sizes. The choice of penta prisms or mirrors depends on the size of range finders and not on the type

FIG. 4—FIELD OF COINCIDENCE RANGE FINDER

In order to effect coincidence or establish stereoscopic contact it is necessary to displace the image which is formed through one arm of the range finder. This can be accomplished by movement of one of several optical components. To accomplish the displacement in military instruments it proved most suitable to use a deviation prism or prisms, of a large number of systems devised two were found most useful. One type of deviation device is a low power prism placed in the converging beam of one arm of the range finder (fig. 2) which if displaced to the position indicated by the dotted line results in a corresponding displacement of the image formed from that arm. The prism must be placed in the converging beam. A calibrated scale and indicator coupled to the prism indicates the range. The second type is known as a diasporimeter and is indicated in D, fig. 3. It consists of two low power prisms placed in opposition which may be placed in the parallel beam ahead of the objective lenses. In the opposition position the deviation caused by one prism is cancelled by the deviation from the other. Now if the prisms are rotated in opposite directions about the optic axis, as indicated in fig. 3, the vertical displacement caused by the two prisms will cancel and only a

horizontal displacement will result. The two prisms, which are mounted in an edge driven mount, need not be located together as is shown in figure 3 but may be separated with one placed in each arm of the range finder.

The range finder includes a telescope not only for the purpose of forming an image from the radiation arriving at the penta prisms but also to aid the operator in seeing objects at a distance. The difference in the two types of ranges is apparent in the telescopic system. The two objectives of the coincidence range finder form an image in a common focal plane which may be viewed either by a single or a binocular eyepiece. In a stereoscopic range finder two complete telescopes are used with their own objectives and eyepieces. Stereoscopic contact is established physiologically by the operator.

FIG 5—FIELD OF STEREOGRAPHIC RANGE FINDER

The coincidence in a range finder is achieved by melding the images from the two arms by a combination of prisms. In simpler types of range finders half-silvered mirrors may be used, in more precise instruments the prism combination becomes complex to achieve the proper presentation. In fig 2 the prism is only indicated, actually it is made up of a combination of roof prisms. The prism combination may be so constructed that not only the fields from the two arms are shown but also as indicated in fig 4 a scale indication of the range is made. As shown in fig 4, the target may be presented as a split image with the field divided in the centre. Adjustment of the range drum shifts one field until coincidence is established as shown by the dotted line in the figure. Other presentations might be used, as a superimposed image as shown in fig 7, as a double image one above the other, or as a double image with one inverted. The split image adjustment is particularly effective when definite vertical lines are visible on the target; the invert double image is effective with targets where the sense of symmetry aids in the adjustment. In using the split image the fineness of the dividing line is important; for precise instruments, a satisfactory line can only be produced by coincidence prisms. In order to insure the optimum performance an adjustment to correct the relative location of the two target images must be provided so that upon adjustment the images match in the field. This is done with a "halving adjustment." The adjustment may be effected by rotating a parallel plate in the converging beam of one of the arms.

The two telescopes of a stereoscopic range finder have reticles marked with a single mark or a "picket" of spaced marks. The marks are so placed that, when they are viewed by the two eyes of the observer, the marks are fused and appear to float in space

because of the stereoscopic perception of the observer. If the image of the target is positioned on the reticle with the proper spacing, the target will be seen stereoscopically in three dimensions. The effect may be altered by displacing the image on the reticle and objects will appear to approach or recede. By means of the deviation prisms the target may be displaced and stereoscopic contact is established when the target appears to be at the position in depth of the reticle spot. The reticle spot, known as the wandemark, may have various shapes such as a circle, a line or a diamond. Under adverse lighting conditions it appears advantageous to illuminate the wandemark so that a spot of light appears in the field. If the picket of wandemarks as shown in fig 5 is used, the spacing between the two reticles is such as to form a series of lines which in the field of view apparently recede into space. It may be that such an arrangement is helpful in correcting the range drum reading on targets when there is not time to establish stereoscopic contact with the central wandemark.

A large variety of novel presentation arrangements have been made by U S range finder makers in order to improve the stereoscopic range finder. One arrangement worthy of note, the pseudo stereoscopic range finder, has in addition to the normal field a second crossed field produced from opposite objectives so that a double image of the target is produced. As the adjustment for stereoscopic contact is made the two images appear to move, one moving forward toward the wandemark and the other moving away from the observer toward the wandemark.

As the range finder is a precise optical instrument, it is subject not only to the shifting of its parts because of temperature changes, vibration and shock, but is also subject to the idiosyncrasies of the operator. For these reasons it must be calibrated often in use and when operators are changed. The most effective adjustment is to range on an object at infinity such as the moon or stars. Lacking these a "flath" is used for small range finders which consists of a board

having two marks spaced in accordance with the dimensions of the optical separation of the instrument. This board when viewed through the range finder has the appearance of being at infinity. Larger range finders have a built-in optical system which forms an artificial target at infinity for use in adjustment.

Height Finders—When ranging on air targets, the range finder determines the slant range. Often the altitude or vertical component to the target is required. This, a function of the elevation angle and the slant range, may be computed mechanically by a system of cams.

Photographic Range Finder—With the development of press photography and the interest in the candid camera, rapid adjustment of the camera focus became important.

A range finder made by the Kalart company, permitting the rapid and accurate focusing of the lens, is shown in figure 7. Photographic range finders are invariably of the coincidence type and may be of either the split image or superposition of image type. They may be coupled directly to the camera through a mechanical linkage or they may be separate and give a range scale reading. An attachment is also available which projects a spot of light which under unfavourable lighting conditions forms a target reflected from the subject which can easily be brought into coincidence in the range finder. A number of range finders made by various camera manufacturers appeared on the market. These, although simple in construction, may have various complexities as described in *Coincidence and Stereoscopic Range Finders*, above.

Eastman Kodak company marketed split image coincidence finders, one type with a split image coincidence prism and adjusted by moving one objective. Zeiss made a range finder having an adjustment by a diaphragm. The Leica range finder is similar to that shown in fig 7.

Camera range finders have base lines which may be an inch and a

FIG 6

of the city to the northwest in what is called the cantonments. At Mingaladon is one of the finest 18-hole golf courses in the east. The development of Rangoon was placed in the hands of the Rangoon Development trust, which administered the Rangoon Government estate on behalf of the government. The trust developed the land, then handing over the completed roads, etc., for maintenance by the Rangoon corporation. A race course at Kyaikkasan was completed in 1926.

The affairs of the port were placed under the administration of the Rangoon port commissioners. Rangoon handles about 85% of the total trade of the province. Rangoon town is the business centre of Burma, but the rice-milling (at Dallah), oil-refining (at Syriam) and teak-working, which form the staple industries, are carried on outside the town proper. The chief exports of Rangoon (with the quantities handled in 1936-37) are: rice (more than 2,000,000 tons), bran and pollard (220,000 tons), mineral oils (880,000 tons), timber (232,000 cubic), oil cake (65,135 tons), pulse (119,000 tons), lead (75,774 tons), zinc ore (84,045 tons), wax, candles, cotton, oilseed and tobacco. The port is visited in normal years by about 1,500 vessels (steamers 7,000,000 tons gross, sailing vessels 15,000).

Until 1942 most of the labour in the port and the town was immigrant Indian labour, much of the skilled labour, especially in building trades, has been supplied by Chinese. The trading and clerical communities were also mainly Indian. Rangoon was thus by no means a typical Burmese city, in 1931 out of a population of 400,415 there were only 121,998 Burmese, compared with 140,458 Hindus, 57,535 Moslems, 30,000 Christians (mainly Europeans, Anglo-Indians and Indians) and 30,626 Chinese. As a result of the Japanese invasion of Burma in 1941-42, the Indian and European populations were much reduced, and the attainment of independence by Burma in 1948 caused a second exodus by many who had returned after the war. Rangoon became very much a Burmese city. Since World War II also caused much destruction of buildings, many squatters erected unsightly and unhealthy huts along the roadsides.

RANGPUR, a town and district in the East Bengal province of Pakistan. The town is situated on the little river Ghaghat. Pop. (1941) 34,039. It is a long straggling town, with a railway station at one end and the public offices 3 mi. away at the other.

The District of RANGPUR, with an area of 3,606 sq. mi. and a population (1941) of 2,877,847, is one vast plain. The greater part of it, particularly toward the east, is inundated during the rains, and the remainder is traversed by a network of streams. The river system is constituted by the Brahmaputra and its tributaries, chief of which are the Tista, Dharla, Sankosh and Dudhkumar. About three-fourths of the district is under continuous cultivation. The staple crops are rice, oilseeds, jute and tobacco. The east district is well served by railways. Saidpur (pop. [1941] 19,516), with the workshops of the metre-gauge system of the E. Bengal state railway, is an important railway town.

RANJIT SINGH, MAHARAJA (1780-1839), Indian ruler, was born on Nov. 2, 1780, the son of Sirdar Mahan Singh, whom he succeeded in 1792 as head of the Sukarchakia branch of the Sikh confederacy. He was by birth only one of many Sikh barons and owed his rapid rise entirely to force of character and will. At the age of 20 he obtained from Zaman Shah, the king of Afghanistan, a grant of Lahore, which he seized by force of arms in 1799. Subsequently he attacked and annexed Amritsar in 1802, thus becoming master of the two Sikh capitals. When Jaswant Rao Holkar took refuge in the Punjab in 1805, Ranjit Singh made a treaty with the British, excluding Holkar from his territory. Shortly afterward acute difficulties arose between him and the British as to the Cis-Sutlej portion of the Punjab. It was Ranjit Singh's ambition to weld the whole of the Punjab into a single Sikh empire, while the British claimed the territory south of the Sutlej by right of conquest from the Marathas. The difference proceeded almost to the point of war, but at the last

moment Ranjit Singh yielded. In 1808 Charles Metcalfe was sent to settle this question with Ranjit Singh, and a treaty was concluded at Amritsar on April 15, 1809.

The maharaja organized a powerful force, which was trained by French and Italian officers such as Generals Ventura, Jean François Allard and Paolo di Bartolomeo Avitabile, and thus forged the formidable fighting instrument of the Khalsa army, which afterward gave the British their hardest battles in India in the two Sikh wars. In 1810 he captured Multan after many assaults and a long siege, by 1820 he had consolidated the whole of the Punjab between the Sutlej and the Indus under his dominion. It was not until 1834, five years before his death, that Peshawar passed into Sikh hands. Though he disapproved of Lord Auckland's policy of substituting Shah Shuja for Dost Mohammed, he loyally supported the British in their advance on Afghanistan. He was known as the "Lion of the Punjab." Ranjit Singh died of paralysis on June 27, 1839. (See also PUNJAB History)

See Sir Lepel Griffin, *Ranjit Singh* (Oxford, 1892), Gen. Sir John Gordon, *The Sikhs* (Edinburgh and London, 1904), S. S. Thorburn, *The Punjab in Peace and War* (London, 1904), and G. L. Chopra, *The Punjab as a Sovereign State* (Lahore, 1938).

RANJITSINGH, KUMAR SHRI (1872-1933), maharajah of Nawanagar, was born at Sarodar in Kathiawar, India, on Sept. 10, 1872. By race a Rajput, he was educated first at Rajkumar college, Rajkot, and afterward at Trinity college, Cambridge.

He did not get his "blue" until his last year, 1893, but thereafter leaped at once into the highest place in English cricket. From 1895 to 1904 he played for Sussex and was captain from 1899 to 1903, his last appearance was in 1920. He went to Australia with A. E. Stoddart's team in 1897-98 and took a team to America in 1899. He made in all 14 scores of more than 200 and in 1900 made more than 3,000 runs for an average of 87 and more than 200 five times. His greatest feat was at Hove against Middlesex. On the last day of the match, on a bad wicket, he made 202, when Vane (17) was the only other man on the side to get into double figures.

In 1907 he succeeded his cousin as chief of the state of Nawanagar and proved an enlightened ruler. He provided troops for the Allies in World War I and himself served at the front. He died on April 2, 1933.

Standing, *Ranjitsingh, Prince of Cricket* (London, 1903), G. W. Beldam and C. B. Fry, *Great Batsmen* (London, 1905); Roland Wild, *The Biography of Colonel His Highness Shri Sir Ranjitsingh* (London, 1934).

RANKE, LEOPOLD VON (1795-1886), German historian, was born on Dec. 20 or 21, 1795, at Wiehe, in Thuringia. He studied classics and theology at Halle and Berlin. In 1818 he began to teach history in a school at Frankfurt-on-the-Oder, thereby entering the service of the Prussian government.

With the scholar's dislike of textbooks, he rapidly acquired a thorough knowledge of the ancient historians, quickly passed on to mediaeval times, and determined to make a study of universal history. At Frankfurt he wrote his first work, *Geschichte der römischen und germanischen Völker 1494-1514* (1824), which included a critical dissertation on the historians of this period (*Zur Kritik neuerer Geschichtsschreiber*), exposing the untrustworthiness of much traditional history. This dissertation was as important for modern history as the critical work of B. G. Niebuhr had been in ancient history. A copy of the book was sent to the Prussian minister of education K. A. Kamptz, and Ranke was appointed supernumerary professor in the University of Berlin, and began his 50-year connection with the university. His *Fürsten und Völker von Südwesteuropa im 16 und 17 Jahrhundert* (1827) was based on the study of his records in the Berlin library. In later editions the book was called *Die Osmanen und die spanische Monarchie*. The Prussian government now provided him with means to prosecute his researches abroad. He visited Vienna, where the friendship of Friedrich von Gentz and the protection of Metternich opened to him the Venetian archives, of which many

were preserved in that city—then a virgin field. He wrote a short book on *Die serbische Revolution* (1829), afterward expanded into *Serbien und die Turkes im 19 Jahrhundert* (1879), from material supplied to him by Wuk Stephanovich, a Serbian who had himself been witness of the scenes he related. He spent three years (1828–31) in Italy. The recommendations of Metternich opened to him almost every library except the Vatican.

For a time Ranke was editor of a periodical in which Friedrich Perthes sought to defend the Prussian government against the democratic press. He failed, men desired not the scientific treatment of politics, but satire and invective. He earned the hatred and suspicion of the liberals and did not satisfy the Prussian conservatives, and after four years the *Historisch-Politische Zeitschrift* came to an end. Two-thirds of the matter had been contributed by the editor, and the two stout volumes in which the numbers were collected contained the best political thought which had for long appeared in Germany. For Ranke the failure was not to be regretted, the rest of his life was to be wholly devoted to history proper. *Die römischen Päpste, ihre Kirche und ihr Staat im 16 und 17 Jahrhundert* (3 vol., 1834–36, and many other editions), in form, as in matter, the greatest of his works, contains the results of his studies in Italy. The English translation by Mrs Austin was the occasion of one of Macaulay's most brilliant essays. Before it was completed Ranke had already begun the researches for the second of his masterpieces, his *Deutsche Geschichte im Zeitalter der Reformation* (1839–47), a necessary pendant to his book on the popes. In 1837 he became full professor at Berlin, in 1841 Frederick William IV appointed him Prussian historiographer. In this capacity he wrote the *Neun Bücher preussischer Geschichte* (1847–48), a work which makes severe demands on the attention of the reader—he is the "Dryasdust" of Carlyle's Frederick, but in it he laid the foundation for the modern appreciation of the founders of the Prussian state. The 9 books were subsequently expanded to 12 (Leipzig, 1874). His *Französische Geschichte, vornehmlich im 16 und 17 Jahrhundert* (Stuttgart, 1852–61) was followed by his *Englische Geschichte, vornehmlich im 16 und 17 Jahrhundert* (1859–68). This, the longest of his works, lacked something of the freshness of his earlier books; he was over 70 when it was completed, and he was never quiet at home in dealing with the foundations of English public life. In his 81st year he began to write the *Weltgeschichte* (9 vol., Leipzig, 1883–88). Drawing on the knowledge accumulated during 60 years, he had brought it down to the end of the 15th century before his death in Berlin on May 23, 1886.

Ranke's other writings include *Zur deutschen Geschichte vom Religionsfrieden bis zum 30-jährigen Kriege* (Leipzig, 1868); *Geschichte Wallensteins* (Leipzig, 1869; 5th ed., 1896); *Abhandlungen und Versuche* (Leipzig, 1877); a new collection of these writings was edited by A. Dove and T. Wiedemann, 1888; *Aus dem Briefwechsel Friedrich Wilhelms IV mit Bunsen* (Leipzig, 1873); *Die deutschen Mächte und der Fürstentum. Deutsche Geschichte 1780–90 (1871–72); Historisch-biographische Studien* (Leipzig, 1878); *Ursprung und Beginn der Revolutionskriege 1791–92* (Leipzig, 1875); and *Zur Geschichte von Oesterreich und Preussen zwischen den Friedensschlüssen zu Aachen und Hubertusberg* (Leipzig, 1875). He also wrote biographies of Frederick the Great and Frederick William IV for the *Allgemeine Deutsche Biographie*. Ranke married, at Windermere, in 1843, Clara Graves, daughter of an Irish barrister. She died in 1870, leaving two sons and one daughter.

At the time of his death Ranke was generally regarded as the first of modern historians. His reputation was due, in part, to his success as a teacher. In his more private classes, where he dealt with the technical work of a historian, he trained generations of scholars. No one since C. G. Heyne has had so great an influence on German academic life, and for a whole generation the Berlin school had no rival. Ranke's example and training has made it impossible for any one to attempt to write modern history except on the "narratives of eye-witnesses and the most genuine immediate documents" preserved in the archives. He was determined never to allow himself to be misled, in his search for truth, by those theories and prejudices by which nearly every

other historian was influenced—Hegelianism, Liberalism, Romanticism, religious and patriotic prejudice.

Many of Ranke's works have been translated into English. Among these are *Civil Wars and Monarchy in France*, by M. A. Garvey (1852), *History of England, principally in the 17th Century* (1875), *History of the Latin and Teutonic Nations, 1404–1514*, by P. A. Ashworth (1887), and again by S. R. Dennis (1909), *History of the Reformation in Germany*, by S. Austin (1845–47), *History of Serbia and the Serbian Revolution*, by Mrs A. Kerr (1847), *Ferdinand I and Maximilian II of Austria, State of Germany after the Reformation*, by Lady Duff Gordon (1883), *Memoirs of the House of Brandenburg, and History of Prussia during the 17th and 18th Centuries*, by Sir Alexander and Lady Duff Gordon (1849), and *History of the Popes during the 16th and 17th Centuries*, by S. Austin (1840, new ed., 1841 and 1847), W. K. Kelly (1843), and E. Foster (1843–53). A collected edition of Ranke's works in 54 volumes was issued at Leipzig (1868–90), but this does not contain the *Weltgeschichte*.

For details of Ranke's life and work see his own *Zur eigenen Lebensgeschichte*, edited by A. Dove (Leipzig, 1890), and the article by Dove in the *Allgemeine deutsche Biographie*. See also Guglia, *Leopold von Ranke's Leben und Werke* (Leipzig, 1893), M. Ritter, *Leopold von Ranke* (Stuttgart, 1895), H. F. Helmholtz, *L. Ranke's Leben und Wirken* (Leipzig, 1921) and H. Oncken, *Aus Ranke's Fruhzeit* (Gotha, 1922).

RANKIN, a borough of Allegheny county, Pennsylvania, U. S., on the Monongahela river, 9 mi SE of the centre of Pittsburgh, adjoining Braddock and North Braddock (qq v). It is served by the Baltimore and Ohio, the Pittsburgh and Lake Erie, the Pennsylvania and the Union railways. The population of Rankin in 1950 was 6,941; in 1940 it was 7,470, in 1920, 7,301. Rankin, Braddock and North Braddock form one community.

RANKINE, WILLIAM JOHN MACQUORN (1820–1872), Scottish engineer and physicist, was born at Edinburgh on July 5, 1820, and completed his education in its university. He was trained as an engineer under Sir J. B. Macneil, working chiefly on surveys, harbours and railroads, and was appointed in 1855 to the chair of civil engineering in Glasgow. Rankine was the earliest of the three founders of the modern science of thermodynamics (qq v) on the bases laid by Sadi Carnot and J. P. Joule respectively, and the author of the first formal treatise on the subject, *350 scientific papers* are credited to him in the Royal Society's *Catalogue*. The more important of these were collected and reprinted in *Rankine's Scientific Papers* (1881), which contains a memoir of the author by P. G. Tat. Rankine died at Glasgow on Dec. 24, 1872.

See also his *Civil Engineering; The Steam-Engine and other Prime Movers; Machinery and Millwork; and Applied Mechanics*.

RANNOCH, district of northwest Perthshire, Scotland, partly extending into Argyllshire. It measures 32 mi east and west and from 10 to 12 mi north and south and is surrounded by the districts of Badenoch, Atholl, Breadalbane, Lorne and Lochaber. Dugald Buchanan (1716–68), the Gaelic poet, was schoolmaster of Rannoch village, and a granite obelisk has been erected to his memory.

RANSOM, the price for which a captive in war redeemed his life or his freedom, a town secured immunity from sack and a ship was repurchased from its captors. The customs of feudal warfare recognized that captives of knightly rank had the right of buying their liberty from their captors. It was the duty of a feudal tenant to contribute toward his lord's ransom, and a king would often show his appreciation of a knight's services by redeeming him from captivity. The practice introduced a commercial element into mediaeval warfare, which became very prominent in the Hundred Years War between England and France and in the internal wars of Italy in the 15th century. In the former war, the ransom paid by John, king of France, and David II, king of Scotland, sensibly relieved the finances of Edward III's administration and at an earlier date the ransom paid by Richard I to the emperor led to the introduction of new financial devices which are important in the history of English taxation.

RANTERS, an antinomian and spiritualistic English sect in the time of the Commonwealth, who may be described as the dregs of the Seeker movement. Their central idea was pantheistic.

See Rufus M. Jones, *Studies in Mystical Religion*, 1909, ch. xix.

RANUNCULACEAE, a family of Dicotyledons belonging to the series Ranales, and containing 40 genera with about 700

species, which are distributed through temperate and cold regions but occur more especially in the northern hemisphere

It is generally regarded as a genetic family which gave rise to the higher Dicotyledons, as well as the Monocotyledons. It contains many well-known forms, such as buttercup, larkspur, anemone, columbine, clematis, marsh marigold, peony, etc. It is well represented in Britain, where 12 genera are native. In North America there are about 25 genera. The plants are mostly herbs, rarely shrubby, as in *Clematis*, which climbs by means of the leaf-stalks, with alternate leaves, opposite in *Clematis*, generally without stipules. The flowers, which show considerable variation in the number and development of parts, are characterized by free hypogynous sepals and petals, numerous free stamens, usually many free one-celled carpels and small seeds containing a minute straight embryo embedded in a copious endosperm. The parts of the flower are generally arranged spirally on a convex receptacle. The fruit is one-seeded, an achene or a many-seeded follicle, rarely, as in *Actaea*, a berry.

The family falls into several well-defined tribes which are distinguished by characters of the flower and fruit

Tribe I Paeonaeae, peony group, are mostly herbs with deeply cut leaves and large solitary showy flowers in which the parts are spirally arranged, the sepals, generally five in number, passing gradually into the large coloured petals. There are two to five free carpels which bear a double row of ovules along the ventral suture. There are no honey-leaves (nectaries) but honey is secreted by a ringlike swelling round the base of the carpels, which become fleshy in the fruit and dehisce along the ventral suture. There are only three genera, the largest of which, *Paeonia*, occurs in Europe, temperate Asia and western North America. *P. officinalis* is the common peony. *P. sufraginosa* is the so-called tree peony, native of China.

Tribe II Helleboreae are almost exclusively north temperate or subarctic. The plants are herbs, either annual, e.g., *Nigella* (love-in-a-mist), or perennial by means of a rhizome, as in *Aconitum* or *Eranthis* (winter aconite). The leaves are simple, as in *Caltha*, but more often palmately divided as in hellebore, aconite and larkspur. The flowers are solitary (*Eranthis*) or in cymes or racemes, and are generally regular as in *Caltha* (king-cup, marsh marigold), *Trollius* (globeflower), *Helleborus* (hellebore), *Aquilegia* (columbine), sometimes markedly irregular as in *Aconitum* (aconite) and *Delphinium* (larkspur). The carpels, generally three to five in number, form in the fruit a many-seeded follicle, except in *Actaea* (baneberry), where the single carpel develops to form a many-seeded berry, and in *Nigella*, where the five carpels unite to form a five-chambered ovary.

There is considerable variety in the form of the floral envelopes and the arrangement of the parts. The outer series, or sepals, generally five in number, is generally white or bright-coloured. Thus in *Caltha* and *Trollius* the sepals form a brilliant golden-yellow cup or globe, and in *Eranthis* a pale yellow star which contrasts with the green involucre of bracts immediately below it; in *Nigella* they are blue or yellow, and also coloured in *Aquilegia*. In *Helleborus* the greenish sepals persist till the fruit is ripe. *Aconitum* and *Delphinium* differ in the irregular development of the sepals, the posterior sepal being distinguished from the remaining four by its helmet shape (*Aconitum*) or spur shape (*Delphinium*). In *Caltha* there are no petals, but in the other genera there are honey-secreting and stinging structures varying in number and in form in the different genera. In *Trollius* they are long and narrow with a honey-secreting pit at the base, in *Nigella* and *Helleborus*

they form short-stalked pitchers, in *Aquilegia* they are large and coloured with a showy petal-like upper portion and a long basal spur in the tip of which is the nectary. In *Delphinium* they are also spurred, and in *Aconitum* form a spurlike sac on a long stalk. The parts of the flower are generally arranged in a spiral (acyclic), but are sometimes hemicyclic, the perianth forming a whorl as in winter aconite, rarely is the flower cyclic, as in *Aquilegia*, in which case the parts throughout are arranged in alternating whorls. In *Caltha*, where there are no petals, honey is secreted by two shallow depressions situated on the side of each carpel.

Tribe III Anemoneae, are chiefly north temperate, arctic and alpine plants, but also pass beyond the tropics to the southern hemisphere. They differ from the two preceding tribes in the numerous carpels, each with only one ovule, forming a fruit of numerous achenes. They are annual or perennial herbs, erect as in *Anemone*, *Thalictrum* (meadow rue) and many buttercups, or creeping as in *Ranunculus repens*, the section *Batrachium* of the genus *Ranunculus* (*q.v.*) contains aquatic plants with submerged or floating stems and leaves. The flowers are solitary, as in *Anemone pulsatilla* (pasqueflower), or cymose as in species of *Ranunculus*, or in racemes or panicles as in *Thalictrum*. The parts are spirally arranged throughout as in *Myosurus* (mouse-tail), where the very numerous carpels are borne on a much elongated receptacle, *Adonis* (pheasant's eye), or the perianth is whorled as in *Anemone* and *Ranunculus*. In *Anemone* and *Thalictrum* there is only one series of perianth leaves, which are petaloid and attractive in *Anemone* where honey is secreted by modified stamens, as in *A. pulsatilla*, or, as in *A. nemorosa* (wood anemone), there is no honey and the flower is visited by insects for the sake of the pollen, in *Thalictrum* the perianth is greenish or slightly coloured, and the flower is wind-pollinated (*T. minus*) or visited for its pollen. In *Ranunculus* and *Adonis* a calyx of green protective sepals is succeeded by a corolla of showy petals, in *Ranunculus* there is a basal honey-secreting gland which is absent in *Adonis*. In *Anemone* the achenes bear the persistent naked or bearded style which aids in dissemination, the same purpose is served by the prickles on the achenes of *Ranunculus arvensis*. *Clematis* (*q.v.*) is characterized by its shrubby, often climbing habit, opposite leaves and the valvate, not imbricate as in the other tribes, aestivation of the sepals. The usually four sepals are whorled and petaloid, the numerous stamens and carpels are spirally arranged, the flowers are visited by insects for the sake of the abundant pollen. The fruit consists of numerous achenes which are generally prolonged into the long feathery style, whence the popular name of the British species, old man's beard (*Clematis vitalba*).

There are special articles on the more important genera of Ranunculaceae, e.g., ACONITE, ADONIS, ANEMONE, BANEERRY, CLEMATIS, COLUMBINE, HELLEBORE, RANUNCULUS.

For further details see Engler and K. Prantl, *Die natürlichen Pflanzenfamilien* (Leipzig, 1887-1908); A. B. Rendle, *Classification of Flowering Plants* (Cambridge, 1925).

RANUNCULUS, familiarly known as buttercup, or crowfoot, a characteristic genus of the botanical family Ranunculaceae. The Latin name, which means a little frog or tadpole (*dim. of rana, frog*), was also given to a medicinal plant, which has been identified by some with the crowfoot. The members of the genus *Ranunculus* are more or less acid herbs, sometimes with fleshy root-fibres, or with the base of the stem dilated into a kind of tuber (*R. bulbosus*). They have tufted or alternate leaves, dilated into a sheath at the base, and very generally, but not universally, deeply divided above. The flowers are solitary, or in loose cymes, and are remarkable for the number and separation (freedom

FROM J. MOORE, "PHOTOGRAPHIC MEXICANA" (P. SCHUBERT & CO.)
GLOBEFLOWER (TROLLIUS EURO-PAEUS)

are found in Great Britain. *R. acris*, *R. repens*, *R. bulbosus* are

the common buttercups *R. arvensis*, which is found in cornfields, has smaller pale yellow flowers and the achenes covered with stout spines.

R. lingua and *R. flammula*, the spearwort, grow in marshes, ditches and wet places. *R. ficaria* is the piewort or lesser celandine, an early spring flower in pastures and waste places, characterized by having heart-shaped entire leaves and clusters of club-shaped roots. The section *Batrachium* comprises the water buttercups, denizens of pools and streams, which vary greatly in the character of the foliage according as it is submerged, floating or aërial, and when submerged varying in accordance with the depth and strength of the current.

Inclusive of the water buttercups, about 70 native species of *Ranunculus* occur in North America, widely distributed throughout the continent. Representative species are *R. septentrionalis*, *R. abortivus* and *R. recurvatus*, of the eastern states, and *R. californicus*, of the Pacific coast. The *Ranunculus* of the florist is a cultivated form of *R. asiaticus*, a native of the Levant, remarkable for the range of colour of the flowers (yellow to purplish black) and for the regularity with which the stamens and pistils are replaced by petals forming double flowers.

RANVIER, LOUIS ANTOINE (1835–1922), French histologist, born on Oct. 2, 1835, at Lyons, began his medical studies and worked in the hospitals there under such well-known clinicians as Charles-Jacques Bouchard and Raphaël Léprie. He was nominated interne in the Paris hospitals in 1860 and graduated M.D. five years later, presenting a thesis on the development and diseases of bone. By this time he had formed a close friendship with André-Victor Cornil (1837–1908), with whom he shared an intense interest in the rapidly developing science of histology. The two friends opened a private laboratory in the Rue Christine, where they gave special courses for students. Cornil soon obtained academic promotion and Ranvier, having attracted the attention of Claude Bernard, was appointed his assistant in 1867. In 1869–76 Cornil and Ranvier brought out their *Manuel d'histologie pathologique*, a revelation to their contemporaries and one of the landmarks in 19th-century medicine. In 1871 a special histological laboratory was opened for Ranvier at the Collège de France and in 1875 he became the first occupant of the chair of general anatomy.

Apart from the *Manuel* Ranvier's most important published works were his *Traité technique d'histologie* (1875 et seq.), *Leçons sur l'histologie du système nerveux* (1878) and *Leçons d'anatomie générale, faites au Collège de France* (1880–81). He also wrote many papers and edited seven volumes of the *Travaux* of his laboratory (1874–88). His own researches were concerned particularly with the histology of nerve fibres, the regeneration of nerves, the bipolar nature of ganglionic cells and the minute structure of the skin, conjunctival tissue and cornea. In 1878 he first described the constrictions seen in medullated nerve fibres which are known as the nodes of Ranvier. He was elected a member of the Académie de Médecine (1880) and of the Institut (1887). During his pioneer researches Ranvier had many pupils and disciples, but in the period 1880–85 the interest aroused by Louis Pasteur's discoveries in bacteriology led to a decline in histological studies. Ranvier's laboratory was no longer frequented, his courses lapsed and he made few further contributions to science. Thenceforth he spent most of his time on an ancestral estate at Vendrages (Loire), to which he finally retired c. 1900, occupying himself with country pursuits. He never married and in his later years was a solitary figure. He died on March 22, 1922, leaving part of his fortune to the town of Roanne for the erection of a sanatorium for tuberculous.

A master of technical methods and a true scientist, he ranks as one of the great French biologists. (W. J. Br.)

RAOUL DE CAMBRAL, the name of a French *chanson de geste*. The existing romance is a 13th-century recension of a poem by a trouvère of Laon called Bertholais, who professed to have witnessed the events he described. Raoul de Cambrai, the posthumous son of Raoul Taillefer, count of Cambrai, by his wife Alais, sister of King Louis (d'Outre-Mer), demanded the fief of Vermandois, which was the natural inheritance of the

four sons of Herbert, lord of Vermandois. On King Louis's refusal, he proceeded to war. Bernier, a grandson of Count Herbert, eventually won the terrible Raoul in single fight, but in his turn was slain, after an apparent reconciliation, and the blood-feud descended to his sons. The date of these events is exactly ascertainable. Flooard (*Annales*, Anno 943) states that Count Herbert died in that year, and was buried by his sons at St Quentin, that when they learned that Raoul, son of Raoul de Gouy, was about to invade their father's territory, they attacked him and put him to death.

See *Le Roman de Raoul de Cambrai* ed by E. le Glay (1840), "Raoul de Cambrai," ed by P. Meyer and A. Longnon (*Soc. des anc. textes fr.*, 1882), J. M. Ludlow, *Popular Epics of the Middle Ages* (1865), G. Grober, *Grundriss d. roman. Phil.* (ii, pp. 567 ff.).

RAOULT, FRANÇOIS MARIE (1830–1901), French chemist, was born at Fournes (Nord), on May 10, 1830. In 1862, after holding various teaching posts, he became professor of chemistry in the *lycée* at Sens, where he prepared the thesis which gained him his doctor's degree at Paris in the following year. In this investigation of the heat of reaction and electromotive force of galvanic cells, he noticed that the two did not correspond on the theory that heat is a measure of affinity. In 1867 he was put in charge of the chemistry classes at Grenoble, and three years later he succeeded to the chair of chemistry, which he held until his death on April 1, 1901. His name is best known in connection with the work on solutions (*q.v.*). His first paper on the depression of the freezing points of liquids by the presence of substances dissolved in them was published in 1878. In 1882 he published a table showing that the product obtained by multiplying the depression of the freezing point for a solution containing 1 g. of solute in 1,000 g. of water by the molecular weight of the solute is a constant. Another conclusion, made in 1886, was that the diminution in the vapour pressure of a solvent, caused by dissolving a substance in it, is proportional to the molecular weight of the substance dissolved—at least when the solution is dilute. These two generalizations not only afforded a new method of determining the molecular weights of substances but were also used by J. H. van't Hoff, S. Arrhenius and others in working out the theory of solutions. In 1884 Raoult himself found that "contrary to what I have believed up to now, the general law of congelation does not apply to salts dissolved in water . . . on the contrary it applies to the radicals constituting the salts, almost as though the radicals were simply mixed in the solution."

See J. H. van't Hoff, Raoult Memorial Lecture, *Journal of the Chemical Society*, 81, 969 (1902); F. Getman, *Chemical Education*, 13, 153 (1935). (R. E. O.)

RAPALLO, a seaport and winter resort of Liguria, Italy, in the province of Genoa. Pop. (1936) 6,766, town, 13,947, commune. It occupies a beautiful and well-sheltered situation on the east side of the Gulf of Rapallo, 18 km. E. by S. from Genoa by rail. The bridge, known as "Hannibal's Bridge," is mediaeval. To the south lies the small seaport of Portofino (the Roman *Portus Delphini*) on the southeast extremity of the promontory of Portofino (2,000 ft.) crowned by the remains of a castle. On the way from S. Margherita to Portofino is the suppressed monastery of Cervara, in which Francis I. of France was confined after the battle of Pavia on his way to Madrid. At all these places are beautiful villas.

On the south side of the promontory is the small village of S. Fruttuoso, with the tombs of some of the Doria family of Genoa (1275–1305).

RAPALLO, TREATY OF (April 16, 1922). During the Conference of Genoa (see GENOA, CONFERENCE OF), at which it was designed to consider the economic relations of the participating powers with Russia, the Russian delegates showed no great desire to resume relations with the Allied and Associated Powers, but to the consternation of the latter signed an agreement with Germany, after secret negotiations. The treaty was initiated on April 16, 1922 by M. Chicherin and M. Rathenau. Germany and Russia renounced reciprocally all claims to war indemnities of any sort, including payment for the maintenance of prisoners of war.

Germany renounced any compensation for losses incurred by German subjects in consequence of Russian socialisation of private property "provided that the Soviet Government does not satisfy similar claims of other States" Diplomatic and consular relations were resumed, the principle of the most favoured nation was to be mutually applied, with a Russian reservation in favour of States formerly belonging to the Russian empire Economic relations were to be regulated "with mutual feelings of goodwill" The treaty was made public immediately on signature On Nov 5, 1922, the treaty was extended to the Ukraine, White Russia, the Transcaucasian republics and the Far Eastern republic

RAPE, a territorial division of the county of Sussex, formerly used for various administrative purposes. There are now six of these divisions. Hastings, Pevensey, Lewes, Bramber, Arundel and Chichester

See the *Victoria County History, Sussex*, vol. 1, *New English Dictionary*, and M A Lower, *History of Sussex* (Lewes, 1870)

RAPE, in botany Several forms of plants included in the genus *Brassica* are known as rape and cultivated instead of a turnip crop or as a "catch crop" for food for sheep or for their oil-yielding seeds The nomenclature and relationship of these forms of *Brassica* are not clear as crosses are frequent. *B. Rapa* is grown in Great Britain as a green crop while *B. Napus* var. *oleifera* known as colza rape or coleseed is grown on the continent of Europe for oil Its seeds contain from 30 to 45% of oil

For further details see W W Robbins, *Botany of Crop Plants* (Philadelphia, 1924), R Percival, *Agricultural Botany* (1926)

RAPE, in law, the crime of having carnal knowledge of a woman by a man, not her husband, forcibly and unlawfully, against her will A felony at common law, it was reduced in England to a misdemeanour in 1275, but in 1285 was again declared a felony, with benefit of clergy This was the state of the law until 1575, when the punishment was made more severe Formerly a capital offence, by the Offences against the Person Act 1861, it is punishable by penal servitude for life

The law of England regards as immaterial whether the woman is chaste or unchaste, married or single, provided the offence has been committed forcibly and without her consent The offence is complete if consent is extorted by means of threats of death or immediate bodily harm, by fraud or by false pretences or representation (Criminal Law Amendment Act 1885)

In the United States the elements of the crime under statute are similar to those at common law The age when effective consent can be given by the female has commonly been set by the various States between 14 and 18 years Want of age on the part of the male is not a defence, as at common law, but simply presumptive evidence of lack of physical capacity Many States require the testimony of the female to be corroborated by other evidence as well as requiring the prosecution to be initiated within a year or less after the commission of the offense The punishment is imprisonment though a few southern States prescribe death as the penalty

RAPE OIL, an important fatty oil, known also as "sweet oil" either expressed or extracted from the crushed seeds of cultivated varieties of the cruciferous genus *Brassica*, the parent form of the whole apparently being the wild navel, *B. campestris* Under the general name "rape oil" is included the produce of several plants having distinct and fairly constant characters, and one of these oils—colza (*q v*)—as a very well-known commercial variety In Germany, where the production of rape oil centres, two principal oil-seeds—rape and Rubsen—are recognized (See **RAPE**)

The oil yielded by these seeds is, in physical and chemical properties, practically the same, the range of fluctuations not being greater than would be found in the oil of any specific seed under similar varying conditions of production; the winter varieties of all the seeds are more productive than the summer varieties Newly pressed rape oil has a dark sherry colour with, at first, scarcely any perceptible smell; but after resting a short time the oil deposits an abundant mucilaginous slime, and by taking up oxygen it acquires a peculiar disagreeable odour and an acid taste Refined by the ordinary processes (see **OILS**), the oil assumes a clear golden-yellow colour In specific gravity it ranges

between 0.9112 and 0.9117 (raw), and from 0.9127 to 0.9136 (refined), the solidifying point is from -4° to -6° Centigrade

The principal uses of rape oil are for lubrication and lighting; but since the introduction of mineral oils for both these purposes the importance of rape has considerably decreased It is but little employed in soap-making, as it saponifies with difficulty and yields only an indifferent product In Germany it is very considerably used as a salad oil under the name of *Schmalöl*, being for that purpose freed from its biting taste by being mixed with starch, heated till the starch is carbonized, and filtered after the oil has cooled The offensive taste of rape oil may also be removed by treatment with a small proportion of sweet spirits of nitre (nitrous ether) In the East Indies rape oil and its equivalents, known under various names, are the most important of oils for native use They are largely consumed as food instead of ghu under the name of "metah" or sweet oil, but for all other purposes the same substance is known as "kurwah" or bitter oil Most natives prefer it for the preparation of their curries, and other hot dishes Rape oil is the subject of extensive adulteration, principally with the cheaper hemp oil, rosin oil and mineral oils These sophistications can be most conveniently detected, first by taste and next by saponification, rosin oil and mineral oil remaining unsaponified, hemp oil giving a greenish soap, while rape oil yields a soap with a yellow tinge Rape oil and the other cruciferous oils are characterized by the presence of the unsaturated fatty acid *erucic acid*, $C_{22}H_{42}COOH$, the identification of which affords a means of detecting rape oil in admixture with other oils Lead plaster (*Emplastrum lithargyri*) boiled in rape oil dissolves, and, sulphide of lead being formed, the oil becomes brown or black Other lead compounds give the same black coloration from the formation of sulphide

RAPHAEL, in the Apocryphal Book of Tobit, the name of the angel who in human disguise and under the name of Azarias ("Yahweh helps") accompanied Tobias in his adventurous journey and conquered the demon Asmodeus (see **TOBIT**) He is said to be "one of the seven holy angels [archangels] which present the prayers of the saints and go in before the glory of the Holy One" (Tob xii 15). In the Book of Enoch (ch xx) Raphael is "the angel of the spirits of men," and it is his business to "heal the earth which the angels have defiled" His name means "God heals"

RAPHAEL SANZIO (1483-1520), the great Italian painter, was the son of Giovanni Sanzio or Santi, a painter in the ducal city of Urbino The house of Giovanni Santi, where Raphael was born (April 6, 1483) still exists at Urbino in the Contrada del Monte, and is now the property of the municipality For many years both before and after the birth of Raphael (April 6, 1483) Urbino was one of the chief centres in Italy of intellectual and artistic activity, thanks to its highly cultivated rulers, Duke Federico II of Montefeltro and his son Guidobaldo, who succeeded him in 1482 Giovanni Santi was a welcome guest at this miniature but splendid court, and the rich treasures which the palace contained, familiar to Raphael from his earliest years, helped to form and foster his early love for art Raphael's boyish admiration of the oil-paintings of Jan Van Eyck and Justus of Ghent may have had something to do with the miniature-like care and delicacy with which some of his earliest works, such as the "Apollo and Marsyas" were executed.

Though Raphael lost his father at the age of eleven, he certainly owed to him a great part of his early training The altarpiece painted by Giovanni for the church of Gradara, and a fresco, now preserved in the Santi house at Urbino, are clearly prototypes of some of Raphael's most graceful paintings of the Madonna and Child On the death of his father in 1494 Raphael was left in the care of his stepmother (his mother, Maria Ciarla, died in 1491) and of his uncle, a priest called Bartolomeo.

First or Perugian Period.—Vasari's statement that Raphael was sent to Perugia during his father's lifetime is certainly a mistake He probably did not enter Perugin's studio till the end of 1499. Of the thirty drawings contained in the so called Sketch Book of Raphael in the Venice Academy but two can be ascribed

to the master (See G. Morelli, *Italian Masters in German Galleries*, 1882.)

Before long Raphael appears to have shared in the execution of paintings by his master, and his touch may perhaps be traced in some of Perugino's panels which were executed about 1502, examples are the Resurrection of Christ in the Vatican and the Diotilevi Madonna in the Berlin Museum.

About 1500 Raphael began to execute independent works. The portrait of Tanguin in the Borghese Gallery, Rome, was probably painted about 1500. Four pictures for churches at Città di Castello appear to have been painted in the years 1502-04. The first is a grid-banner painted on one side with the Trinity, and below, kneeling figures of S. Sebastian and S. Rocco, on the reverse is a Creation of Eve, very like Perugino in style, but possessing more grace and breadth of treatment. These are still in the church of S. Trinità. Also for Città di Castello were the coronation of S. Niccolò Tolentino, now destroyed, though studies for it exist at Oxford and Lille (*Gaz. d. B. Arts*, 1878, 1 p. 48), and the Crucifixion, now in the National Gallery (Mond collection), painted for the church of S. Domenico and signed RAPHAEL VRBINAS P. It is a panel 8 ft. 6 in. high by 5 ft. 5 in. wide, and contains noble figures of the Virgin, St. John, St. Jerome and St. Mary Magdalene. The fourth painting executed for this town, for the church of S. Francesco, is the exquisitely beautiful and highly finished Spozalizio, now in the Brera at Milan, signed and dated RAPHAEL VRBINAS MDLIII. This is closely copied both in composition and detail from Perugino's painting of the same subject now at Caen, but is far superior to it in sweetness of expression and grace of attitude. The Temple of Jerusalem, a domed octagon with outer ambulatory in Perugino's picture, is reproduced with slight alterations by Raphael, and the attitudes and grouping of the figures are almost exactly the same in both. The Constestabile Madonna (sold to the tsar of Russia in 1871) is one of Raphael's finest works, painted during his Perugian period, it is a round panel. The motive, the Virgin reading a book of hours, is a favourite one with him, as it was with his father Giovanni.

Second or Florentine Period, 1504-1508.—In the first half of 1504 Raphael visited Urbino, where he painted two small panels for Duke Guidobaldo, the St. George and the St. Michael of the Louvre. His first visit to Florence was made towards the end of 1504, when he presented himself with a warm letter of recommendation from his patroness Joanna della Rovere to the gonfaloniere Pier Soderini. At the time of his arrival in Florence artistic Italy was excited over the cartoons of the battle of Anghiari and the war with Pisa, to which Leonardo da Vinci and Michelangelo were then devoting their energies. With astonishing rapidity Raphael shook off the mannerisms of Perugino and put one great artist in painting or sculpture after another under contribution for some special power of drawing, beauty of colour, or grace of composition in which each happened to excel. The Carmine frescoes of Masaccio and Masolino taught this eager student long-remembered lessons of methods of dramatic expression. (See his cartoon of St. Paul preaching at Athens [Victoria and Albert Museum].) Among his contemporaries it was especially Signorelli and Michelangelo who taught him the necessity of a thorough knowledge of the human form. From da Vinci he learnt subtleties of modelling and soft beauty of expression (see the portrait of Maddalena Doni in the Pitti), from Fra Bartolommeo nobility of composition and skilful treatment of drapery in dignified folds. (See the Madonna del Baldacchino in the Pitti.) The friendship between Raphael and the last of these was very close. The architect Baccio d'Agnolo was another of his friends, at whose house the young painter enjoyed social intercourse with the chief artists of Florence, and probably learnt from him much that was afterwards useful in his practice as an architect.

The transition in Raphael's style from his first or Perugian to his second or Florentine manner is shown in the large picture of the Coronation of the Virgin painted for Maddalena degli Oddi, now in the Vatican, one of the most beautiful that he ever produced, and especially remarkable for its strong religious senti-

ment—in this respect a great contrast to the paintings of his last or Roman manner which hang near it. The exquisite grace of the angel musicians shows signs of his short visit to Florence, while the formality of the composition and certain details, such as the fluttering ribbons of the angels, recall peculiarities of Perugino and of Pinturicchio, with whose fine picture of the same subject hung close by it is interesting to compare it. The predella of this masterpiece of Raphael is also in the Vatican, some of its small paintings, especially that of the Annunciation to the Virgin, display his careful study of the rules of perspective. Preparatory sketches for this picture exist at Lille and elsewhere. The Lille study is drawn from two youths in the ordinary dress of the time; and it is interesting to compare it with his later studies from the nude, many of which are for figures which in the future picture were to be draped. It was at Florence, as Vasari says, that Raphael began serious life studies, not only from nude models but also by making careful anatomical drawings from dissected corpses and from skeletons.

His first visit to Florence lasted only a few months, in 1505 he was again in Perugia painting his first fresco, the Trinity and Saints, for the Camaldoli monks of San Severo, now a mere wreck from injury and restorations. The date MDV and the signature were added later, probably in 1521. Part of this work was left incomplete by the painter, and the fresco was finished in 1521 (after his death) by his old master Perugino. It was probably earlier than this that Raphael visited Siena and assisted Pinturicchio with sketches for his Piccolomini frescoes. He probably had no hand in the actual execution of the paintings. The Madonna of S. Antonio (Metropolitan Museum of Art, New York) was also finished in 1505, but was probably begun before the Florentine visit. A record of his visit to Siena exists in a sketch of the antique marble group of the Three Graces, then in the cathedral library, from which, not long afterwards, he painted the small panel of the same subject now at Chantilly.

In 1506 Raphael was again in Urbino, where he painted for the duke another picture of St. George, which was borne to England as a present to Henry VII by Guidobaldo's ambassador, the accomplished Baldassare Castiglione (qv), a friend of Raphael, whose noble portrait of him is in the Louvre. At the court of Duke Guidobaldo the painter's ideas appear to have been led into a more secular direction, and to this stay in Urbino probably belong the Chantilly Graces and the miniature "Knight's Dream of Duty and Pleasure" in the National Gallery (London), which also possesses its cartoon in brown ink, pricked for transference.

Towards the end of 1506 Raphael returned to Florence, and there (before 1508) produced a large number of his finest works, carefully finished, and for the most part wholly the work of his own hand. The following is a list of some of his chief paintings of this period: the "Madonna del Gran Duca" (Pitti); "Madonna del Giardino," 1506 (Vienna), "Holy Family with the Lamb," 1506 or 1507 (Madrid); the "Ansidei Madonna," 1506 or 1507 (National Gallery), the Borghese "Entombment," 1507, The Panshanger "Madonna" (now in America), 1508; "La bella Giardiniera," 1508 (Louvre), the "Essestazy Madonna," probably the same year, as well as the "Madonna del Cardellino" (Uffizi), the "Tempi Madonna" (Munich), the "Colonna Madonna" (Berlin), the "Bridgewater Madonna" (Bridgewater House), and the "Orleans Madonna" (Chantilly). The "Ansidei Madonna" was bought in 1884 for the National Gallery from the duke of Marlborough. It was painted for the Ansidei family of Perugia as an altar-piece in the church of S. Fiorenzo, and is a work of the highest beauty in colour, well preserved. The Virgin with veiled head is seated on a throne, supporting the Infant with one hand and holding a book in the other. Below stands S. Niccolò Tolentino, for whose altar it was painted; he holds a book and a crozier, and is clad in jewelled mitre and green cope, under which appear the alb and cassock. On the other side is the Baptist, in red mantle and camel's-hair tunic, holding a crystal cross. The rich jewellery in this picture is painted with Flemish-like minuteness. A favourite method of grouping his Holy Families is that seen in the "Madonna del

Cardellino" and the "Bella Giardiniera," in which the main lines form a pyramid. This arrangement is also used in the "Madonna del Giardino" and in the larger group, including St. Joseph and St. Elizabeth, known as the "Cangiani Holy Family," now at Munich. The "Entombment of Christ," now in the Galleria Borghese in Rome, was painted during a visit to Perugia in 1507 for Lady Atalanta Baghioni, in memory of the death of her brave and handsome but treacherous son Graftonetto, who was killed in 1500 by his enemies the Oddi party. (See Symonds, *Sketches in Italy*, the chapter on Perugia, mainly taken from the contemporary chronicle of Matarazzo.) The many studies and preliminary sketches for this important picture which exist in various collections show that it cost Raphael an unusual amount of thought and labour in its composition. It is, however, much injured by repainting. The "Madonna del Baldacchino," owing much to Fra Bartolommeo, is also unsatisfactory in execution, being left unfinished by Raphael, it was completed by Ridolfo Ghirlandajo. It was painted for the Dei family as an altar-piece for their chapel in S. Spirito, Florence. The "St. Catherine" of the National Gallery was probably painted in 1507; its cartoon, pricked for transference, is in the Louvre. To the Florentine period belong some of his finest portraits, and it is especially in these that da Vinci's influence appears. The portraits of Angelo Doni and his wife Maddalena (Pitti) are vivid and carefully executed paintings, and the unknown lady with hard features (now in the Uffizi) is a masterpiece of noble realism and conscientious finish. A fine but much-restored portrait of Raphael by himself, painted at Florence, exists in the Uffizi; it represents him at a very early age, and was probably painted during the early part of his stay in Florence.

Third or Roman Period, 1508-1520.—In 1508 Raphael was painting several important pictures in Florence; in September of that year we find him settled in Rome, from a letter addressed in the warmest terms of affectionate admiration to Francia, to whom he sent a sketch for his "Adoration of the Shepherds," and promised to send his own portrait in return for that which Francia had given him. Raphael was invited to Rome by his fellow-citizen Bramante, who was then occupied in the erection of the new church of St. Peter, the foundation-stone of which had been laid by Julius II. on the 18th of April 1506. At this time the love of the popes for art had already attracted to Rome Michelangelo, Signorelli, Perugino, Pinturicchio, Lorenzo Lotto, Peruzzi, Sodoma and many others, and it was among this brilliant assembly that Raphael, almost at once, took a leading position. Thanks to Bramante's friendly intervention, Julius II. (Della Rovere) soon became Raphael's most zealous patron and friend, as did also the rich bankers Agostino Chigi and Bindo Altoviti, of whom a portrait, by Giulio Romano, is now in Munich.

A series of rooms in the Vatican, over the Appartamento Borgia, were already decorated with frescoes by Bonifigh, Perugino, Piero della Francesca, Andrea del Castagno, Signorelli and Sodoma; but so rapidly had the taste of the time changed that Julius II. decided to re-cover the walls with paintings in the more developed style of Raphael. It was not without regret that Raphael saw the destruction of this noble series of frescoes. One vault, that of the Stanza dell' Incendio, painted by his master Perugino, he saved from obliteration; it still exists, well preserved, a most skilful piece of decorative work; and he also set his pupils to copy a number of portrait-heads in the frescoes of Piero della Francesca before they were destroyed.

The Stanza della Segnatura (papal signature room) was painted in 1509-11. The first painting executed by Raphael in this room was the so-called *Disputa*, finished in 1509. In its religious sentiment it far exceeds any of the later stanze paintings, retaining much of the sacred character of earlier Florentine and Umbrian art. As a scheme of decoration it appears to have been suggested by some of the early apsidal mosaics. Gold is largely used, while the later purely pictorial frescoes have little or none. The subject is the hierarchy of the church on earth and its glory in heaven.

The painting on the vault of this room is the next in date, and shows further transition towards the "Roman manner." In his

treatment of the whole Raphael has been partly guided by the painting of Perugino's vault in the next room (the Stanza dell' Incendio). The pictures are kept subordinate to the lines of the vault. A great part of the ground is gilt, marked with mosaic-like squares, a common practice with decorative painters. The principal medallions in each cell of this quadripartite vault are very graceful female figures, representing Theology, Science, Justice and Poetry. Smaller subjects are arranged in the intermediate spaces, and each has some special meaning in reference to the medallion it adjoins, some of these are painted in warm monochrome to suggest bas-reliefs. The fine painting of the "Playing of Marsyas" is interesting as showing Raphael's study of antique sculpture: the figure of Marsyas is a copy of a Roman statue. The very beautiful little picture of the "Temptation of Eve" recalls Albert Durer's treatment of that subject, though only vaguely. Much mutual admiration existed between Raphael and Durer in 1515 Raphael sent the German artist a most masterly life study of two nude male figures (now at Vienna), on it is written in Albert Durer's beautiful hand the date and a record of its being a gift from Raphael. It is executed in red chalk, and was a study for two figures in the "Battle of Ostia."

On the wall opposite the *Disputa* is the so-called School of Athens. The subject of this noble fresco, in contrast to that opposite, is "Earthly Knowledge," represented by an assembly of the great philosophers, poets and men of science of ancient Greece. The central figures are Plato and Aristotle, while below and on each side are groups arranged with the most consummate skill, including the whole "filosofica famiglia" of Dante (*Infer.* iv. 133-144), and a number of other leaders of thought, selected in a way that shows no slight acquaintance with the history of philosophy and science among the ancient Greeks. Many interesting portraits are introduced—Bramante as the aged Archimedes, stooping over a geometrical diagram; a beautiful fair-haired youth on the left is Francesco Maria della Rovere, duke of Urbino; and on the extreme right figures of Raphael himself and Sodoma are introduced. The stately building in which these groups are arranged is taken with modifications from Bramante's first design for St. Peter's.

Over one window is a group of poets and musicians on Mount Parnassus, round a central figure of Apollo; it contains many heads of great beauty and fine portraits of Dante and Petrarch. Over the opposite window are graceful figures of the three chief Virtues, and at one side Gregory IX. (a portrait of Julius II.) presenting his volume of decretals to a jurist; on the other Justinian presents his code to Trebonianus.

The next room, the Stanza d'Elidoro, was painted in 1511-14. The room is so called from the fresco representing the expulsion of Heliodorus from the Temple (2 Macc. iii.), which is an allusion to the struggles between Louis XII. of France and Julius II. Its chief motive is the glorification of the pontificate, with insistence on the temporal power. The main incident of this picture is the angel visitant on the horse. The group of women and children on the left is very beautiful, and the figures of Julius II. and his attendants are nobly designed. This picture was completed in 1512. Over one window is shown the scene of the Miracle at Bolsena of 1263, when the real presence was proved to a doubting priest by the appearance of blood-stains on the Corporal. (See BOLSENA.) Julius II. is introduced kneeling before the altar; and the lower spaces on each side of the windows are filled with two groups, that on the left with women, that on the right with officers of the papal guard. The last group is one of the most masterly of all throughout the stanze. Each face is a marvel of expression and power, and of technical skill. The next fresco in date is that of the Repulse of Attila from the walls of Rome by Leo I., miraculously aided by the apparitions of St. Peter and St. Paul; it contains another allusion to the papal quarrels with France. It was begun in the lifetime of Julius II., but was only half finished at the time of his death in 1513; thus it happens that the portrait of his successor, the Medici pope Leo X., appears twice over, first as a cardinal riding behind the pope, painted before the death of Julius II., and again in the character of S. Leo, instead of the portrait of Julius which Raphael was about to paint. A pen sketch

in the Louvre by Raphael shows Julius II in the place afterwards occupied by Leo X. In 1514 he painted the "Deliverance of St. Peter from Prison," with a further political allusion. It is skillfully arranged to fit the awkward space round the window, and is remarkable for an attempt to combine and contrast the three different qualities of light coming from the room, the glory round the angel, and the torches of the sentinels.

For the so-called Stanza dell'Incendio Raphael designed and partly painted the "Incendio del Borgo," a fire in the Borgo or Leonine City, which was miraculously stopped by Leo IV appearing and making the sign of the cross at a window in the Vatican. On the background is shown the façade of the old basilica of St. Peter, not yet destroyed when this fresco was painted. One group on the left, in the foreground, is remarkable for its vigour and powerful drawing, the motive is taken from the burning of Troy; a fine nude figure of Aeneas issues from the burning houses bearing on his back the old Anchises and leading the boy Ascanius by the hand. Many studies for this picture exist. This is the last of the stanze frescoes on which Raphael himself worked. Others in this room designed by him and painted by Giulio Romano and other pupils were the "Battle of Ostia," and the "Oath of Leo III. before Charlemagne." The enormous fresco of the "Defeat of Maxentius by Constantine," in the Sala di Costantino, was painted by Giulio Romano, soon after Raphael's death, from a sketch by the latter.

The paintings in the stanze were only a small part of Raphael's work between 1509 and 1513. To this period belong the Madonna of Foligno (Vatican), painted in 1511 for Sigismondo Conti. Of about the same date are the gem-like Garvagh Madonna (National Gallery, once in the possession of the Aldobrandini family), the Diademed Virgin of the Louvre, and the Madonna del Pesce at Madrid. The last was executed in 1513 for S. Domenico in Naples. In addition to other easel pictures a number of his finest portraits belong to this period—that of Julius II, the original of which is lost (copies in the Uffizi and National Gallery, London), the Temmaso Inghirami in the Gardner Collection, Boston, the Baldassare Castiglione of the Louvre; and the portrait of a cardinal in the Prado, Madrid.

When Giovanni de' Medici became pope as Leo X., a period of splendour and magnificence succeeded the sterner rule of Julius II. Agostino Chigi, the Siennese financier, was the chief of those whose lavish expenditure contributed to enrich Rome with works of art. For him Raphael painted, in 1513-14, the very beautiful fresco of the Triumph of Galatea in his new palace by the Tiber, the Villa Farnesina, and also made a large series of magnificent designs from Apuleius's romance of Cupid and Psyche, which were carried out by a number of his pupils.¹ For the same patron he painted (also in 1513) his celebrated Sibyls in S. Maria della Pace—figures of exquisite grace, arranged with perfect skill over an arch in the nave. It is not without reason that Vasari gives these the highest position among his fresco-paintings. Agostino Chigi also employed Raphael to build for him a private chapel in S. Maria del Popolo, and to make a series of cartoons to be executed in mosaic on the inner dome. The central medallion has a figure of God among clouds and angel boys, surrounded by eight planets, each with its pagan deity and directing angel in accordance with Dante's scheme in the Paradiso. The execution of these brilliant mosaics was carried out in 1516 by the Venetian Luigi della Pace. Probably in the early years of Leo X.'s reign were painted the Madonna della Sedia (Pitti), the S. Cecilia at Bologna (not completed till 1516), the miniature Vision of Ezekiel (Pitti) and two important pictures at Madrid. The latest of these known as *Lo Sp. Santo* from the church at Palermo for which it was painted represents Christ bearing His Cross. The Madonna called *Della Perla*, "the pearl" of the Spanish royal collection, was originally painted for Bishop Louis of Calocasa. It was sold by Cromwell with the greater part of Charles I.'s collection at Hampton Court. The portrait of Leo X. with Cardinals de' Rossi and de' Medici, in the Pitti, is one of his finest portrait-pictures. Little is known about the Madonna di S. Sisto, the

glory of the Dresden Gallery; no studies or sketches for it exist.

One of Raphael's latest works is the large "St. Michael and the Devil," in the Louvre, signed "Raphael Urbinas pingebat. MDXVIII."

The tapestry cartoons, seven of which are in the Victoria and Albert Museum, were painted by pupils from Raphael's designs. They are part of a set of ten, with scenes from the Acts of the Apostles, intended, when copied in tapestry, to adorn the lower part of the walls of the Sistine chapel. The tapestries themselves, worked at Brussels, are now, after many vicissitudes, hung in a gallery in the Vatican, the set is complete, thus preserving the design of the three lost cartoons ("The Martyrdom of St. Stephen," "St. Paul's Conversion" and "St. Paul in Prison"). The existing seven, after being cut up into strips for use on the looms, were bought by Rubens for Charles I. The tapestry copies are executed with wonderful skill. The designs are reversed, and the colours far more brilliant than those of the cartoons, much gold and silver being introduced. The rich framework designed by Raphael's pupils, probably by Penni and Giovanni da Udine, exists in the tapestries and adds greatly to their decorative effect. The cartoons were executed in 1515 and 1516, and the finished tapestries were first exhibited in their place in the Sistine chapel on Dec. 26, 1519.

The "Transfiguration."—In 1519 Cardinal Giuliano de' Medici (afterwards Clement VII.), as bishop of Narbonne, ordered two altar-pieces for his cathedral—the one by Raphael, the other by Raphael's Venetian rival Sebastiano del Piombo. That by the latter painter is the Resurrection of Lazarus, now in the National Gallery. Several studies for Raphael's picture exist, showing that he at first intended to paint a Resurrection of Christ as a pendant to Sebastiano's subject, but soon altered his scheme into the Transfiguration. The eight or nine existing studies are scattered through the Oxford, Lille, Windsor and some private collections. A great part of the lower group was unfinished at the time of the painter's sudden death in 1520, and the heavy colouring of Giulio Romano is visible in it. On the death of Raphael the picture became too precious to send out of Rome, and Cardinal de' Medici contented himself with sending the Resurrection of Lazarus to Narbonne. The Transfiguration was bequeathed by him to the monks of S. Pietro in Montorio, in whose church it remained till it was stolen by Napoleon I. It now hangs in the Vatican Gallery.

Architectural Work.—Bramante, before his death in March 1514, requested that Raphael should be made his successor as chief architect of St. Peter's. To this important post he was appointed by Leo X., Aug. 1, 1514. The progress of St. Peter's was, however, too slow for him to leave much mark on its design. Another work of Bramante's, completed by Raphael, was the graceful Cortile di S. Damaso in the Vatican, including the loggia, which were decorated with stucco-reliefs and paintings of sacred subjects by his pupils under his own supervision, but only very partially from his designs. The Palazzo dell'Aquila, built for Giovanni Battista Branconio, and destroyed in the 17th century during the extension of St. Peter's, was one of Raphael's chief works as an architect. He also designed the little cross church, domed at the intersection like a miniature St. Peter's, called S. Eligio degli Orefici, which still exists near the Tiber, almost opposite the Farnesina gardens. According to M. Geymuller, *Raffaello come Architetto* (Milan, 1883), the Villa Farnesina of Agostino Chigi, usually attributed to Peruzzi, was, as well as its palace-like stables, designed by Raphael; but internal evidence makes this very difficult to believe. It has too much of the delicate and refined character of the 15th century for Raphael, whose taste seems to have been strongly inclined to the more developed classic style, of which Palladio afterwards became the chief exponent. Villa Madama, on the slopes of Monte Mario above Rome, was designed by Raphael, though its actual carrying out, and the unvalued stucco-reliefs, are due to Giulio Romano and Giovanni da Udine, as mentioned in Vasari's life of the latter.² The original design for this villa made by Raphael himself has been discovered by M. Geymuller. Another architectural work was the little Chigi chapel

¹ Chiefly by Giulio Romano, Gianfrancesco Penni and Giovanni da Udine, much injury has been done to these frescoes by repainting.

² See Gruner, *Fresco Decorations*, etc. (London, 1854), pls. 6-12, and Raffaele Santi, *Ornati della Villa Madama*, etc. (Rome, 1875).

in S Maria del Popolo, built in 1516. At the time of his death, Raphael was preparing to build himself a handsome palace near the church of S. Eligio, the deed for the purchase of its site was signed by him only a few days before his last short illness. Though not completed till 1530, the Palazzo Pandolfini at Florence was also designed by him.

Sculpture.—That Vasari is right in attributing to him the model for the beautiful statue of Jonah which is in the Chigi chapel is borne witness to by two important documents, though there is no evidence to show that he ever worked in marble. One of these is a letter written to Michelangelo to warn him that Raphael had been invading his province as a sculptor by modelling a boy, which had been executed in marble by a pupil, and was a work of much beauty. Again, after his death his friend Baldassare Castiglione, in a letter dated May 8, 1523, asks his steward in Rome "if Giulio Romano still possesses a certain boy in marble by Raphael and what his lowest price for it would be." The statue of Jonah was executed in marble by Lorenzetto, a Florentine, and it remained in his studio for many years after Raphael's death. The Victoria and Albert museum possesses a small clay sketch for this beautiful group, slightly different from the marble, it is probably the original design by the master's own hand. The whole feeling of the group—a beautiful youth seated on a sea monster—is classical, and the motive is probably taken from some antique statue representing Arion or Taras on a dolphin.

A large number of Raphael's designs were engraved by his pupils Marcantonio Raimondi and Agostino Veneziano. These valuable engravings are from Raphael's sketches, not from his finished pictures, and in some cases they show alterations made in the execution of the picture. Raimondi's engraving of the S. Cecilia of Bologna in design is very inferior to that of the actual painting. Several of Raphael's most important compositions are known to us only by these early engravings, e.g., the "Massacre of the Innocents" (engraved by Raimondi), which is one of his finest works. Another magnificent design is the "Judgment of Paris," containing a large number of figures, the nude figure of Minerva is a work of special force and beauty. A standing figure of Lucretia about to stab herself is also one of his most lovely figures. Many of Raphael's studies for Marcantonio's engravings still exist.

Archæology.—Raphael's report to Leo X. in 1518 is an eloquent plea for the preservation of ancient buildings. In 1515 he had been appointed by Leo X. inspector of all excavations in Rome and within ten miles round. His study of the antique is clearly shown in many of his frescoes, and especially in the graceful stucco reliefs and painted groteschi, in the Vatican loggia, the Villa Madama and elsewhere.

Raphael's Fame.—Among all the painters of the world, none has been so universally popular as Raphael, or has so steadily maintained his pre-eminent reputation throughout the many changes in taste which have taken place since his death. In the 17 or 18 years which composed his short working life he passed through stages of development for which a century would not have seemed too long, while other painters lived through the same changeable time with but little alteration in their manner of work. Perugino, who outlived his wonderful pupil, completed in 1521 Raphael's San Severo fresco in a style differing but little from his paintings executed in the previous century.

In versatility of power Raphael remains almost without a rival; whether painting an altar piece for a church, a large historical fresco, a portrait or decorative scenes from classical mythology, he seems to excel equally in each; and the widely different methods of painting in tempera, oil or fresco are employed by him with apparently equal facility. His range of scale is no less remarkable, varying from a miniature, finished like an illuminated manuscript, to colossal figures

of the lady to whom he had been betrothed. He desired to be buried in the Pantheon. His body is laid beside an altar, which he endowed with an annual chantry, and on the wall over it is a plain slab, with an inscription written by his friend Pietro Cardinal Bembo. (See *PAINTING*.)

RAPID CITY, a city of South Dakota, U.S., beautifully situated in the western part of the state, on Rapid river, at the foot of the Black hills, 3,229 ft above sea level, the county seat of Pennington county. It is on federal highways 14 and 16, and is served by the Chicago and North Western and the Chicago, Milwaukee, St. Paul and Pacific railways. The population in 1950 was 25,310 by the federal census, as compared with 13,844 in 1940. It is the centre of a wide agricultural and grazing region and of the mining district of the Black hills, which produces gold, silver, lead, copper, tin, antimony, tungsten and mica. Its manufactures include flour, lumber, meat, brick, stucco, cement, boxes and foundry and machine shop products. The South Dakota School of Mines was established here by the territorial legislature of Dakota in 1885. The city was founded in 1876 and incorporated in 1878.

RARE EARTHS, in chemistry the name originally given to a group of metallic oxides since they resemble the substances then known as earths (lime, magnesia, etc.). The corresponding elements comprising this group are unique in that they are so similar in chemical properties that they can be separated from one another only by taking advantage of the slight differences in their properties. Since there was no place for these elements in the older periodic tables they were grouped in the space allotted to lanthanum.

With a modern understanding of atomic structure it is now recognized that the rare earths include the elements with atomic numbers 58 to 71 and are now placed in a special group in the periodic table. The work of H. G. J. Moseley (1913) definitely established the maximum number of rare earths and set up procedures by which their purity and existence could be determined. The theories of Niels Bohr and subsequent workers have shown that the electron structure of the trivalent rare-earth ions is $1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 3d^{10}, 4s^2, 4p^6, 4d^1, 4f^7, 5s^2, 5p^6$. The neutral atoms contain three extra electrons which distribute themselves between the 6s, 5d and 4f subshells. These three electrons, however, are removed to the negative 10e in the rare-earth trivalent compounds and do not take a direct part in the electronic configuration of the rare-earth ions. The completed subshells

gested procedures for the separation of isotopes are often first tested with the rare earths. Lanthanum (57), yttrium (39) and scandium (21) have external atomic structures similar to and always occur in mixtures of the rare earths. Hence, lanthanum and yttrium, and sometimes scandium, are also included in discussions of the rare earths and with the possible exception of scandium are never found free from the rare earths.

The principal source of the rare earths is the mineral monazite found as an alluvial sand in India, Brazil and Idaho. This material is es-

francesco Penni, his newly bought land to Cardinal Bibbiena, the uncle

TABLE I—Properties of the Rare-Earth Ions and Salts

Atomic number	Name	Symbol	Atomic weight	d/ electrons	Effective Bohr magnetron numbers	Colors of trivalent ions
57	Lanthanum	La	138.91	0	0.00	Colorless
58	Cerium	Ce	140.13	2	2.55	Colorless
59	Praseodymium	Pr	140.92	3	3.62	Yellow-green
60	Neodymium	Nd	144.27	3	3.68	Red-violet
61	Samarium	Sm	150.43	5	1.53-1.65	Pale yellow
62	Europium	Eu	152.0	6	2.40-3.51	Pale pink
64	Gadolinium	Gd	157.25	7	7.04	Colorless
65	Terbium	Tb	158.9	8	9.7	Very pale pink

essentially a complex phosphate. Other important mineral sources are gadolinite (a silicate found in Norway, Sweden, Colorado and Texas), fergusonite (a columbite and tantalate found in Norway, Texas and Australia), samarskite (a tantalate and uranate found in the Urals and North Carolina), xenotime (a phosphate found in Brazil and Norway), ytrocene (a fluoride found in Scandinavia), cerite (a basic silicate found in Sweden) and allanite (a silicate found in Greenland and Scandinavia). The relative abundance of these elements in the earth's crust is summarized in Table III. It will be noted that the elements with even atomic numbers are much more abundant than those with odd atomic numbers. Contrary to the earlier ideas, these elements are not so rare as the name implies, for example, cerium is more common than cadmium, tin, mercury, antimony, molybdenum, silver, tungsten, bismuth, gold or platinum. The rare earths, however, are widely distributed in low concentration and are so difficult to separate from one another that, with the exception of cerium, lanthanum and neodymium, they were not available for commercial distribution until after 1946.

Methods for separating the mixed rare earths from their ores vary with the type of ore. Prior to 1945, with the exceptions of certain rare earths such as cerium, europium, samarium and ytterbium which can have valencies different from three, the individual rare earths were separated from one another by laborious processes such as fractional crystallization, fractional decomposition, etc. Since these procedures had to be repeated thousands of times, only a few chemists had the patience to devote the required time to this routine work. Hence, only limited amounts of the scarcer rare earths were prepared in the pure state. In order to carry out these processes it was convenient to place the elements in subgroups such as the ceria group (57 to 64) and the yttria group (64 to 71), another classification introduces the terbia group (63 to 65). Such groups are arbitrary since there are no clear-cut separations between successive members of the series, they are based on the solubility relationships of various compounds of the elements. The solubilities of some of the rare-earth trivalent compounds are summarized in Table II.

Some of the rare earths are always found among the fission products of plutonium, thorium and uranium, and a number of new radioactive isotopes of the rare earths have been obtained from this source. In addition, it is now possible to make artificial radioactive isotopes of any of the rare earths and a large number have been identified. For details concerning these isotopes see the article on RADIOACTIVITY, ARTIFICIAL. In 1945 a rapid method for separating the rare earths was developed in connection with the atomic bomb research program. The procedure involves the use of adsorption columns of

TABLE II—Solubilities of Several Rare-Earth Trivalent Compounds

Compound	Cerium group (57-64)	Yttrium group (63-71)
Carbonates	Insoluble in water and in (NH ₄) ₂ CO ₃ solution	Insoluble in water, soluble in (NH ₄) ₂ CO ₃ solution
Hydroxides	Somewhat soluble in water	Slightly soluble in water
Fluorides	Insoluble in water	Insoluble in water
Formates	Slightly soluble in water	Moderately soluble in water
Nitrates	Soluble in water, less soluble in HNO ₃	Soluble in water, less soluble in HNO ₃
Basic nitrates	Moderately soluble in water	Slightly soluble in water
Double nitrates (e.g., Mg ₂ Br ₂ (NO ₃) ₂ ·2H ₂ O)	Easily crystallized	Not easily crystallized
Oxalates	Very insoluble in water and in (NH ₄) ₂ C ₂ O ₄ solution	Very insoluble in water; soluble in (NH ₄) ₂ C ₂ O ₄ solution
Phosphates	Insoluble in water	Insoluble in water
Potassium sulphates (K ₂ SO ₄)	Insoluble in K ₂ SO ₄ solution	Soluble in K ₂ SO ₄ solution

From D. M. Yost, H. Russell and C. S. Garner, 1944.

organic resins and subsequent elution with complexing agents such as citric acid. The separations are based on the slight differences in the equilibrium constants. It is expected that, by use of such procedures, the pure rare-earth metals eventually will become more available and less expensive for detailed scientific studies and possible industrial use.

The common valence of the rare-earth elements is three and many of them possess no other valence in their compounds. Since their chemical properties differ so slightly from member to member, the customary methods of qualitative analysis for these elements are of no real value. All accurate analyses for their purity are therefore based on their physical properties. The five general criteria available are average atomic weight, magnetic susceptibilities, absorption spectra, X-ray spectra and arc spectra. Several of these properties are listed in Table I.

In Table III are listed some of the physical properties of the rare-earth elements as known at mid-20th century. Since the pure rare earths have been so difficult to obtain, many of the properties and

Adapted from D. M. Yost, H. Russell and C. S. Garner, 1944.

physical constants of the elements are probably inaccurate and may be altered considerably as better data become available through the use of new methods for their separation and purification. The metallic elements can be produced by electrolysis of the molten salts (such as the chloride or fluoride) or by chemical reduction of the oxides or halides by means of the alkali or alkaline-earth metals. All of them except promethium, formerly called ilumium, have been produced in small amounts by the above methods, but in many cases the salt was not pure and most of them undoubtedly contained various amounts of the neighbouring rare earths in solid solution.

As was so well stated by J. W. Mellor, "A large proportion of unconfirmed discoveries belongs to the rare earth series, and this may be taken as a tribute to the difficulties attending their isolation." A brief chronological summary of the isolation of the various rare earths follows. In 1794 J. Gadolin separated a new rare earth, yttria, from a black mineral found in Ytterby, Sweden. In 1803 J. J. Berzelius, M. H. Klaproth and W. Hisinger independently found ceria in a mineral from the Bastnäs mine in Sweden. C. G. Mosander, in 1826, showed that ceria also contained a new oxide, lanthana; in 1842 he found didymia in the lanthana fraction. In 1843 he found that yttria contained terbia (called erbia since 1860) and erbia (called terbia since 1877). Erbia was subsequently found to contain ytterbia (J. C. de Marignac, 1878), holmia (J. L. Soret, 1878) and thulia (P. T. Cleve, 1879). In 1879 L. de Boissaudran claimed the discovery of a new element in didymia which he called samarium, and in 1880 de Marignac found another element in samarium which he later called gadolinium. In 1885 C. A. von Welsbach split didymia into praseodymium and neodymium and in 1886 J. de Boissaudran obtained dysprosia from holmia. In 1896 E. Demarcay separated europia from samana and in 1906 G. Urbain found lutetia in ytterbia. In 1926 B. S. Hopkins announced the discovery of element 67 which he named ilumium. In the same year J. C. Corke, C. James and H. C. Fogg obtained 67 independently and measured the lines of its X-ray spectrum. This discovery was challenged. (See PROMETHIUM.)

RASHI (1040-1105), Jewish scholar. **RABBI SOLOMON ISHAK** (son of Isaac), usually cited as Rashi from the initials of those words, was born at Troyes in 1040 and died in the same town in 1105. He seems to have passed the decade beginning with 1055 in Worms, where a niche in a wall, where his mother was miraculously saved from death, was long shown. Within this, it is said, Rashi was wont to teach. A small edifice on the east of the synagogue is called the "Rashi chapel," and the "Rashi chair," raised on three steps in the niche, is one of the objects of the pious admiration of pilgrims. At Worms Rashi worked under Jacob ben Yaqar, and at Mainz under Isaac ben Judah, perhaps combining at the same time the functions of teacher and student.

Rashi was 25 years of age when he returned to Troyes, which became a recognized centre of Jewish learning. There he acted as rabbi and judge, he and his family worked in the vines of Troyes. His learning and character raised him to a position of high respect among the Jewries of Europe, though Spain and the east were long outside the range of his influence. As was said of him soon after his death: "His lips were the seat of wisdom, and thanks to him the Law, which he examined and interpreted, has come to life again." The latter part of his life was saddened by the massacres in the Rhineland at the time of the first crusade. Rashi died in Troyes in 1105.

Besides minor works, such as a recension of the prayer book (*Siddur*), the *Parades* and *ha-Orah*, Rashi wrote two great commentaries on the whole of the Hebrew Bible and on about 30 treatises of the Talmud. His commentary on the Pentateuch, in particular, has been printed in hundreds of editions, it is still to Jews the most beloved of all commentaries on the Mosiac books. More than a hundred supercommentaries have been written on it. His influence in Christian circles was great, especially because of the use made of the commentary by Nicolaus de Lyra (*q.v.*), who in his turn was one of the main sources of Luther's version. Even more important was his commentary on the Talmud, which became so much the definitive interpretation that Rashi is cited simply as "the commentator."

BIBLIOGRAPHY—M. Liber, *Rashi* (1906), published as a memorial of Rashi on the 800th anniversary of his death. Rashi's commentary on the Bible has been translated into Latin by Breithaupt (1710-14), and into German (Pentateuch) by Dukes (1833-38) and others. The foundation of recent investigation into Rashi's life is Zunz's *Solomon b. Isaac* (1822), to which I. H. Weiss added much in his (Hebrew) biography in *Beit Talmud* iv, nos. 2-10. See also Graetz, *History of the Jews*, Eng. trans., vol. iii, ch. ix. A critical edition of Rashi's Pentateuch commentary was published by A. Berliner (2nd ed., 1905).

RASHTRAKUTA, an Indian dynasty which ruled in the Deccan (*q.v.*) from about A.D. 754 to 973. The Rashtrakuta or Rattas clan are supposed to have held power during the historical blank before the 6th century; but they came to the front in A.D. 754, when Dantidurga overthrew the Chalukya dynasty and made himself ruler of the Deccan. He was succeeded by his uncle Krishna I (*c.* 768), who completed his conquests and whose reign is memorable for the execution of the Kailasa, the rock-cut temple at Ellora. His grandson Govinda III (793-814) extended the power of the family from the Vindhya mountains and Malwa on the north to Kanchi on the south. The next king, Amogavarsha, reigned for 62 years. The reign of Krishna III (939-968) was remarkable for a war with the Cholas, in which the Chola king was killed on the field of battle in 949. The last of the Rashtrakuta kings was Karka II, overthrown by the Chalukyas in 973.

See R. G. Bhandarkar, *Early History of the Deccan* (Bombay, 1884); A. S. Altekar, *The Rashtrakutas and their Times* (Poona, 1934).

RASIN, ALOIS (1867-1923), Czechoslovak statesman, was born at Nechanice. While at the university he took an active part in politics, and his abilities as an orator, journalist and organizer brought him into the forefront of the Czech progressive movement. His anti-Austrian activities brought him into conflict with the authorities; he was tried in connection with the "Omladina" affair in 1893 and condemned to two years' imprisonment and the loss of his doctorate. After serving his

sentence he gained a prominent position in the Czech Liberal ("Young Czech") party, which he represented both in the provincial diet of Bohemia and in the Austrian *reichsrat*. During the anti-Czech persecution in the World War I period, Rasin, together with Karel Kramar, was arrested in 1915, charged with treason and condemned to death. The sentence, however, was not carried out, and after the accession of the emperor Karl, Rasin, with other political prisoners, was amnestied. He then took part in the preparations for the revolutionary coup in 1918, which, as a member of the National committee, he helped to bring about. In the first Czechoslovak government he became finance minister. In Jan. 1923 he was attacked by a demented youth and died of his injuries six weeks afterward, on Feb. 16, 1923.

RASK, RASMUS CHRISTIAN (1787-1832), Danish scholar and philologist, was born at Brandekløbe, Funen, on Nov. 22, 1787. He studied at the University of Copenhagen, and in 1808 was appointed assistant keeper of the university library, and later professor of literary history. In 1811 he published, in Danish, his *Introduction to the Grammar of the Icelandic and other Ancient Northern Languages*, from printed and manuscript materials accumulated by his predecessors in the same field of research. The Arna-Magnaean institution then commissioned him to edit the manuscript of the Icelandic *Lexicon* (1814) of Björn Haldorsen. Rask spent ten years in Iceland, mastering the language and familiarizing himself with the literature, manners and customs of the Icelanders. He was the first president of the Icelandic Literary society, established at Copenhagen early in 1816. In Oct. 1816 Rask left Denmark on a literary expedition, at the cost of the king, to prosecute inquiries into the languages of the east, and collect manuscripts for the university library at Copenhagen. He went first to Sweden, making an excursion into Finland to study the language. There he published, in Swedish, his *Anglo-Saxon Grammar* in 1817. In his *Essay on the Origin of the Ancient Scandinavian or Icelandic Tongue* (Copenhagen, 1818) he traced the affinity of Icelandic to the other European languages, particularly Latin and Greek. In the same year he brought out the first complete editions of Snorri's *Edda* and Saemund's *Edda*. From Stockholm he went in 1819 to St. Petersburg, and thence through Tartary into Persia, and resided for some time at Tabriz, Tehran, Persepolis and Shiraz. From Persia he went to India and Ceylon. Rask returned to Copenhagen in May 1823, bringing a considerable number of oriental manuscripts, Persian, Zend, Pali, Sinhalese and others, with which he enriched the collections of the Danish capital. He died at Copenhagen on Nov. 14, 1832.

During the period between his return from the east and his death Rask published in his native language a *Spanish Grammar* (1824), a *Frisic Grammar* (1825), an *Essay on Danish Orthography* (1826), a *Treatise respecting the Ancient Egyptian Chronology and an Italian Grammar* (1827), and the *Ancient Jewish Chronology Previous to Moses* (1828). Rask's Anglo-Saxon, Danish and Icelandic grammars were brought out in English editions by Thorpe, Repp and Basset respectively.

See his collected essays, *Samlade Afhandlinger*, 3 vol. (Copenhagen, 1834-38).

RASMUSSEN, KNUD JOHAN VICTOR (1879-1933), Danish explorer, was born at Jakobshavn, Greenland, on June 7, 1879. In 1902 he made the first of several expeditions to Greenland and the northern polar regions. Between 1905 and 1924 Rasmussen visited all the extant Eskimo tribes and ascertained that they were originally red Indian tribes which had wandered east and west from the coast. Rasmussen, whose ancestors were maternal line Eskimos, gained a thorough knowledge of arctic peoples and customs and made them the subject of numerous tracts and publications, including *Nye Mennesker* (1905); *Myter og Sagt fra Grønland* (1921) and *Grønland Langs Polhavet* (1919, Eng. trans., *Greenland by the Polar Sea*, 1921).

RASPBERRY, an old and well-known fruit-bearing bush, was known to classic writers and was mentioned by Pliny as a wild fruit called *Idæa* from Mt. Ida in Asia Minor on which it grew. Parkinson (*Paradissus*, 1629) speaks of red, white and thornless varieties of raspberries, and its culture began about this time. The raspberries (of the genus *Rubus*) bear juicy red or black (rarely

orange, amber or pale yellow) berries which pull off the plant, leaving

came from *R. occidentalis*, purple varieties are hybrids of the black and red.

Related edible berries often called raspberries are the two flowering raspberries of the northern woodlands, *Rubus odoratus* and *R. parviflorus*, the Rocky Mountain flowering raspberry, *R. deliciosus*, the salmonberry, *R. spectabilis*, of the Pacific northwest, and the baked-apple berry, *R. chamaemorus*, of the northern bogs, a circumpolar species.

Three other raspberries are grown slightly for their fruit in other parts of the world—the Andes black raspberry, *R. glaucus*, in northern South America, the Southern Asian black raspberry, *R. niveus*, and the wineberry, *R. phoenicolasius*, introduced from northeastern Asia. *R. knizeianus* from China has been hybridized with the Cutbert to give the Van Fleet, and *Rubus biflorus*, also from China, has been hybridized with Latham to give the Dixie, both of these being varieties adapted to southern U.S.A.

The acreage of red raspberries in Great Britain was reported as 5,400 in 1937. In Scotland the Blairgowrie district is the centre of production, in England, Kent, the eastern counties and Worcestershire are important centres. It is grown in mixed plantings with other fruits, the plants being set 18 in apart in rows 6 or 7 ft distant. Lloyd George is the chief variety—having very large berries which are excellent for canning and jam. Red Cross and Pynes Royal are other good varieties.

The acreage of raspberries in the United States was 59,000 in 1939 with a crop value of \$7,416,000. Black raspberries are nearly as important as the red. The acreage of purple varieties is small. Important red-raspberry sections are western Maryland, southern New Jersey, the Hudson river valley, western Michigan, near Minneapolis, Minn., the Puget sound valley of Washington, the Willamette valley of Oregon, and the Santa Clara valley of California. The largest acreage of black raspberries is in western Michigan. Smaller sections are in western Maryland, western New York, and the Willamette valley of Oregon. Few plantings in the United States, except in the Hudson river valley, are mixed with other fruits. Good red varieties are Cutbert and Washington in the Pacific northwest, Ranee in California, Latham for eastern states, except for Sunrise for very early crop in New Jersey and southward, and Taylor and Milton in New York and New England. The Cumberland is the chief black variety. In eastern Canada, Viking and Newman red varieties are widely grown. Sodus and Potomac are desirable purple varieties. Ranee and Indian Summer are red sorts that also bear fruit on the young canes in late summer and fall.

Red raspberries are propagated by suckers which come from the roots of the parent plant. Root cuttings about 3 in long are also used for rapid increase of new varieties. Black and purple varieties have arched canes and are propagated by top layers, the tips of the shoots being buried about 2 in deep in August and the rooted tips being dug in early spring. Leaf-bud cuttings may be used for the rapid propagation of new black varieties. Red raspberries are usually planted 2½ ft apart in rows 6 to 9 ft distant, the black and purple being planted about 4 ft apart in rows also 6 to 8 ft distant. Shoots are produced by these plants in spring and summer which bear fruit the following year and then die. These old canes are cut away each year just after the harvest to make room for the new shoots. The new shoots of the black varieties are tipped or cut off at 12 in to induce branching; those of the purple are cut at 18 to 24 in. These branches are shortened the following winter to about 8 in for the black and 12 in for the purple. The canes of the red raspberries are either not pruned or are shortened to 3 to 5½ ft, depending on the variety and vigour. However, surplus suckers should be cut away early in the summer, leaving 7 or 8 of the strongest canes per plant or per 30 in of row. The stouter the canes of both black and red varieties the more productive they are. Stakes or trellises are commonly used to support the canes of the red raspberry. Two wire trellises with a wire each side of the row about 3 ft high or with one wire above the other at 30 in. and 54 in. are common types.

Virus diseases, leaf spot, anthracnose, crown gall, wilt and yellow rust are serious diseases, while the red spider mite, crown borer and fruit worms are serious insect pests. (G. M. D.)

RASPE, RUDOLF ERICH (1737–1794), the original author of the *Adventures of Baron Munchausen* (see *MUNCHHAUSEN*), was born in Hanover in 1737, and studied at Göttingen and Leipzig. In 1767 he was appointed professor in Cassel, and subsequently librarian. In 1775 he went to Italy to buy curios for the landgrave of Hesse, to whom he was keeper of the

gems, and sold the landgrave's valuables for his own profit. On orders being issued for his arrest, he decamped to England. Later, he found a patron in Sir John Sinclair of Ulbster, whom he deceived by pretending to discover valuable and workable veins on his estates, but Raspe had "salted" the ground himself, and on the verge of exposure he absconded. He betook himself to Ireland, and died at Muckross in 1794. His authorship of *Munchausen* was only revealed in 1824, by the biography of its translator Burger.

RASPUTIN, GREGORY EFIMOVITCH (1871–1916), Russian monk, was born in 1871 in the village of Pokrovskoe, near Tyumen, in the province of Tobolsk, Siberia. He was the son of a poor peasant whose disorderly behaviour resulted in his being given the name of Rasputin, meaning "debauchee." He received no education, and till the end of his life was unable to write properly. He spent the first part of his life till the age of 33 in his native village, he married in 1895 a well-to-do girl, Olga Chanigoff, and they had two daughters and a son. In 1904 Rasputin resolved to change his mode of living. He left his family and devoted himself to religious exercises, declaring to his people that he was inspired by God. His passionate nature, his great physical strength and the superstitious atmosphere in which he had been brought up, gave an unexpected direction to his religious exaltation. He adopted the view of the sect known under the name of "Khlysty," the leading idea of whose teaching was that salvation could be achieved only by repentance.

"Sin in order that you may obtain forgiveness"—was the practical rule which he drew from this doctrine. "A particle of the Supreme Being is incarnated in me"—he told his hearers. "Only through me you can hope to be saved, and the manner of your salvation is this: you must be united with me in soul and body. The virtue that goes out from me is the source of light, the destruction of sin" (E. J. Dillon, *The Eclipse of Russia*). This extravagant and dangerous teaching, which resulted in practice in the wildest orgies, not only created for Rasputin immense popularity and the reputation of a holy man among his fellow-peasants, but opened before him the doors of some of the most fashionable Russian houses, and even those of the Imperial palace. Looking for new experiences Rasputin left his native village, and made long pilgrimages to various holy places, and even went to Mount Athos and Jerusalem. He spent some time in different monasteries and applied himself to the study of holy books, but his lack of elementary education reduced the results of his labours almost to nothing. He only retained by heart some incomprehensible passages, and often used them in his prophecies. He had, however, a bitterest opponents.

In 1907, during a stay in St Petersburg (Leningrad), Rasputin was introduced to the archimandrite Feofan, rector of the theological academy and confessor to the empress, who took an interest in the story of his conversion. The archimandrite, with the assistance of the grand duchesses Militta and Anastasia, presented Rasputin at court, and he produced a deep impression on the empress and emperor. The mystic atmosphere which always prevailed at the Russian court and the constant fear for the health of the tsarevich created a favourable background for the appearance of such a man. The eventual improvement in the health of the grand duke Alexis procured for Rasputin a commanding influence over the empress.

For some time Rasputin was satisfied by his social success, and at first he did not interfere in politics. But his activity was felt in church questions. His friendship with the famous monk, Heliodor, and the bishop of Saratov, Hermogen, which resulted in a complete rupture between them and in a series of scandals, had a painful echo in the country. The appointment of Varnava, an illiterate peasant and a friend of Rasputin, to be bishop of Tobolsk in 1911, and the servility with which the Holy Synod followed the wishes of the favourite, provoked a strong opposition among all classes of society, and a successful attempt to kill him, made by a certain Guseva in 1914, incited by the monk Heliodor, only strengthened his influence. No important nomination was made without his approval, and the most unexpected people rose to the highest offices as the result of his influence. Rasputin was too ignorant to have any opinion on political questions; he was in most cases a mere instrument of the reactionaries. Numberless stories of the debauchery practised at the court, in which the name of Rasputin was coupled not only with some of the court ladies but even with that of the empress herself, became a common topic of conversation in all classes of Russian society. At length a small group of men of the highest social position, which included the grand duke Dmitri Pavlovich, Prince Yusupoff and Fyodorchev, determined to end the empire of Rasputin. He was invited to a supper at the Yusupoff palace on Dec. 17, 1916, and shot dead, after an attempt at poisoning him with a strong dose of potassium cyanide mixed with wine had not produced the desired effect. The empress had the body transferred to the park of Tsarskoe Selo, where a special chapel was erected, and she went every night to pray on his grave.

See *Letters of the Tsaritsa to the Tsar 1914–16* (1923), and further letters published in *The Manchester Guardian*, Jan. 12, and Feb. 1, 1924. Also Prince Yusupoff, *Rasputin: His Malignant Influence and*

his Assassination (Eng. ed. 1927), M. V. Rodnanko, *Reign of Rasputin* (1927), R. Filop-Müller, *Rasputin, the holy devil* (1928).

RASSAM, HORMUZD (1826-1910), Assyriologist and traveller, was born at Mosul of native Christian parents. His first work was done as assistant to Sir A. H. Layard in his first expedition (1845-47). He then studied at Oxford, and was again sent by the British Museum trustees to accompany Layard in his second expedition (1849-51). Rassam continued the work (1852-54) in Assyria under the direction of the British Museum and Sir Henry Rawlinson at Nimrud and Kuyunjik. In 1866 he was sent by the British government to Abyssinia, where, however, he was imprisoned for two years until freed by the victory of Sir Robert Napier. From 1876 to 1882 he was again in Assyria conducting important investigations, especially at Nineveh, and during the Russo-Turkish War he was sent on a mission of inquiry to report on the condition of the Christian communities of Asia Minor and Armenia. His archaeological work resulted in many important discoveries and the collection of valuable epigraphical evidence.

See *The Times*, Sept. 17, 1910.

RASSKAZOVO (formerly Belyaya Polyana and Arzhenka), the name of two settlements in the Russian SFSR, on the river Arzhenka, a tributary of the Tambov, and on the road and railway between Kirsanov and Tambov, in 52° 42' N, 41° 46' E. Population 25,168. One settlement, formerly called Belyaya Polyana, was noted for its fair in June. Both have cloth factories.

RAS TAFARI MAKONNEN: see MAKONNEN, RAS TAFARI.

RASTATT, a town of Germany, in the Land of Baden, on the Murz, 15 mi by rail S.W. of Karlsruhe. Pop. (1939) 17,503. The old palace of the margraves of Baden, a Renaissance edifice in red sandstone, contains a collection of pictures, antiquities and trophies from the Turkish wars. The chief manufactures are stoves, beer, paper, sugar, furniture and tobacco.

Rastatt has been the scene of two congresses. The first congress culminated in the treaty of Rastatt between France and Austria, signed on March 7, 1714. The second congress, opened in Dec. 1797, was intended to rearrange the map of Germany by providing compensation for those princes whose lands on the left bank of the Rhine had been seized by France but it had no result.

RASTELL (or RASTALL), **JOHN** (c. 1475-1536), an English printer and author, belonged to a Coventry family, and was educated for the law. He succeeded his father as coroner at Coventry in 1506. He was also M.P. for Dunheved, Cornwall, from 1529 to the time of his death. He began his printing business some time before 1516, for in his preface to the undated *Liber Assisarum* he announced the forthcoming publication of Sir A. Fitzherbert's *Abbreviametum librorum legum Anglorum*, dated 1516. In that year he undertook an expedition to America, but got no further than Ireland when his sailors left him. Among the works issued from the "sygne of the meremayd at Powlysgate," where he lived and worked from 1520 onwards, are *The XII Mery Gestys of the Wydow Edyth* (1525), and *A Dyaloge of Syr Thomas More* (1529). The last of his dated publications was *Fabyll's Ghoste* (1533), a poem. In 1530 he wrote, in defence of the Roman doctrine of Purgatory, *A New Boke of Purgatory* (1530), dialogues on the subject between "Comynghs and Almayn a Christen man, and one Gyngemyn a Turke." This was answered by John Frith in *A Disputacion of Purgatorie*. Rastell replied with an *Apology against John Frith*, also answered by the latter. Rastell had married, at some time before 1504, Elizabeth, sister of Sir Thomas More, with whose Catholic theology and political views he was in sympathy. More had begun the controversy with John Frith, and Rastell joined him in attacking the Protestant writer, who, says Foxe (*Actes and Monuments*, ed. G. Townsend, vol. v p. 9), did so "overthrow and confound" his adversaries that he converted Rastell to his side. Separated from his Catholic friends, Rastell does not seem to have been fully trusted by the opposite party, for in a letter to Cromwell, written probably in 1536, he says that he had spent his time in upholding the king's cause and opposing the pope, with the result that he had lost both his printing business and his legal practice, and

was reduced to poverty. He was imprisoned in 1536, perhaps because he had written against the payment of tithes. He probably died in prison, and his will was proved on July 18, 1536.

Rastell's best-known work is *The Pastyme of People, the Chronycles of dyvers Realmys and most specially of the Realme of England* (1529), a chronicle dealing with English history from the earliest times to the reign of Richard III., ed. T. F. Dibdin (1811). His *Expositiones terminorum legum Anglice* (in French, trans. into English, 1527, reprinted 1629, 1636, 1641, etc., as *Les Termes de la Ley*), and *The Abbreviacion of Statutes* (1519), of which 15 editions appeared before 1625, are the best known of his legal works.

To Rastell is generally attributed the morality play, *A New Interlude and a Mery of the 1111 Elements* (c. 1519). The fullest details available on John Rastell's life are in A. W. Reed, *Early Tudor Drama* (1926). For the books issued from his press see a catalogue by R. Proctor, in *Hand-Lists of English Printers* (Bibliographical Soc., 1896).

RASTELL, WILLIAM (c. 1508-1565), English printer and judge, son of the preceding, was born in London about 1508. At the age of 17 he went to the university of Oxford, but did not take a degree, being probably called home to superintend his father's business. The first work which bears his own imprint was *A Dyaloge of Syr Thomas More* (1531), a reprint of the edition published by his father in 1529. He also brought out a few law-books, some interludes ascribed to John Heywood (*q.v.*), an edition of *Fabyan's Cronycle* (1533), and *The Apology* (1533) and *The Supplicacyon of Soules* of his uncle Sir Thomas More. He became a student at Lincoln's Inn on Sept. 12, 1532, and gave up the printing business two years later. In 1547 he was appointed reader. On account of his Catholic convictions he left England for Louvain, but upon the accession of Mary he returned, and was made sergeant-at-law and treasurer of Lincoln's Inn in 1555. His patent as judge of the Queen's Bench was granted on Oct. 27, 1558. Rastell continued on the bench until 1562, when he retired to Louvain where he died on Aug. 27, 1565.

It is difficult to distinguish between the books written by William and those by his father. The following are believed to be his: *A Colleccion of all the Statutes* (1559), *A Table collected of the Yeares of the Kynges of Englande* (1561), both frequently reprinted with continuations, and *A Colleccion of Entrees, of Declarations, etc.* (1566), also frequently reprinted.

RASTENBURG, a town in the province of East Prussia, Germany, on the Guber, 64 mi S.E. of Königsberg by the railway to Lyck. Pop. (1939) 19,494. Its principal manufactures are flour, sugar, oil, beer and machinery.

RAT, probably in its original sense the designation of the rodent known as the black rat (*Rattus rattus*), but also applied to the brown or Norway rat (*R. norvegicus*), and in a wider sense to all the larger representatives of the family Muridae.

Rats have more rows of scales on the tail (reaching to 210 or more) than mice, in which the number does not exceed 180. For the distinctive characteristics of the family Muridae see ROENTHA. Of the two species the brown or Norway rat (*R. norvegicus*) is distinguished by its large size, brownish gray colour, short tail and ears, stout skull, and the possession of from 10 to 12 teats. It is fierce and cunning, and overcomes all allied species with which it is brought in contact. Its original home-world

seem to have been some part of Central Asia. Thence it has spread over much of the world, driving out the house-haunting species everywhere, as it has in England all but exterminated the black rat. The brown rat migrated westward from Central Asia early in the 18th century, and is believed to have first reached Great Britain about 1730. The black rat (*R. rattus*) is smaller in size than the brown rat, with longer ears and tail. It is typically glossy black in colour, but brownish varieties, which may be distinguished readily from the brown rat, are common, especially in southern lands. It frequents ships and on them

has reached most parts of the world. It is more common and more wide-spread in the tropics than the brown rat, which in these climes is often restricted to the coast or to ports. This long-tailed rat, originally a native of southern Asia, first penetrated to all parts of the world, in many places nearly exterminating the indigenous rats. After this followed the advance of the more powerful brown rat. The black rat first reached Europe in the 13th century. The Isle of Dogs and Yarmouth in Norfolk are chief English strongholds of the black rat. It is this species that is the chief disseminator of bubonic plague. Both species agree in their predaceous habits, omnivorous diet and great fecundity. They bear, four or five times in the year, from four to ten blind and naked young, which are in their turn able to breed at an age of about six months, the time of gestation being about 20 days.

See J. G. Millais, "The True Position of *Mus rattus* and its Allies," *Zoologist*, June 1906. M. A. C. Hinton, "Rats and Mice," *Brit. Mus. Pamphlets*, U.S. Fish and Wildlife Service, *Wild Life Circular* 6 (1947).

RATAFIA. A liqueur or cordial flavoured with peach or cherry kernels, bitter almonds, or other fruits, many different varieties are made. The same name is given to a flavouring essence resembling bitter almonds, and also to a light biscuit.

RATCHET AND PAWL is an important mechanical device in a great many machines and appliances, enabling a movement to be effected in one direction, with slip or freedom in the opposite direction. The mechanism is used to lock something so that it cannot slip or reverse, to hold a load as in a winch, or to give a positive feed. Some ratchets are straight, or with a moderate curve, but the majority are circular. The teeth are usually V-shaped, and the pawl is pivoted so that it drops against any tooth and remains without danger of jumping out. Where a continuous movement is desired, the objectionable clicking of the pawl may be checked by a leather facing, or by the use of a ball or roller, or a set of these, to catch in the teeth, with gravity or spring action to ensure engagement. In the case of a silent ratchet, the wheel has no teeth but an eccentrically-pivoted pawl works frictionally against the periphery.

Various drives and brake mechanisms are made safe by ratchet mechanism, the ship's capstan being one of the oldest examples. Screwdrivers and wrenches are operated by ratchet for access in difficult situations, or to help the worker in manipulative power. Braces and metal drills are actuated by ratchet when it is not possible to make the complete revolution of a handle. So also are jack screws for lifting loads rapidly. Ratchet feed, by which an arm holding the pawl is moved over, and the ratchet-wheel and a feed screw are turned, is utilized in many types of machines and is usually automatic in action. The finest example occurs in cylindrical grinding machines, in which by means of an automatic feed the grinding-wheel travels along a shaft or spindle, the ratchet mechanism setting the wheel to cut a very little smaller before each traverse takes place, this process being repeated as often as is necessary to bring the shaft to size.

RATE. In England the term is specially applied to the levying of public money contributions for local purposes, as distinguished from the "taxes" raised for what are treated as general State purposes. By the Rating and Valuation Acts of 1925 and 1928 the English system of rating has been amended and the law partially consolidated as also for Scotland by the Rating Act, 1926, and the Rating (Scotland) Amendment Act, 1928. In the United States the term "rate" does not signify a form of taxation, but is used to indicate the assessment percentage. (See further **POOR LAW; TAXATION; TAXATION, LOCAL**.)

RATEL or **HONEY BADGER**, the name of certain Indian and African small clumsy-looking creatures of the size and appearance of badgers, representing the genus *Mellivora* in the family Mustelidae (see **CARNIVORA**). Only one living species of ratel is known (*Mellivora capensis*), represented by several races in various parts of Africa, south of the Sahara and in India. Ratels are normally black with whitish crown and grizzled back, a style of coloration that is found also in the grison (*g v*). Pure black individuals are known. The body is stout and thickly built; the legs are short and strong, and armed, especially the ante-

rior pair, with long curved claws, the tail is short; and the ears are reduced to rudiments. The Indian ratel is found throughout India, chiefly in hilly districts, but also in the north of India in alluvial plains. It lives usually in pairs, and eats rats, birds, frogs, white ants, and various insects. Like its Cape congener it occasionally partakes of honey and is often destructive to poultry. In confinement the Indian ratel becomes tame and even playful.

(J. E. Ht.)

RATHENAU, WALTHER

(1867-1922), German states-

man and industrialist, was born in Berlin on Sept. 29, 1867, the son of Emil Rathenau, the founder

of the Allgemeine Elektrizitäts-Gesellschaft. After studying philosophy, physics and chemistry at Berlin and Strasbourg he graduated in 1889, and spent a year studying machine structure and chemistry at Munich. He was then engaged as a civil engineer by the Aluminum Industrie A.-G. of Neuhäusen, Switzerland.

In 1893 he became a director of the Electrochemische Werke (Limited) at Bitterfeld for the utilization of a process for making chlorine and alkalis by electrolysis. He also built large works at Rheinfelden, in Russian Poland, and in France, and elaborated processes for the production of ferrosilicate, chrome, soda and magnesite. In 1899 Rathenau became a director of the Allgemeine Elektrizitäts-Gesellschaft, and built power stations at Manchester, Amsterdam, Buenos Aires and Baku. In 1902 he belonged to the board of directors of about 100 enterprises. During 1907 Rathenau accompanied Dernburg, the Secretary of State of the Imperial Colonial Office, to German East and West Africa, and also visited the British Colonies in Africa. His *Reflexionen* (1908) contain his two final reports on those visits.

Even at the beginning of World War I Rathenau foresaw the threat to the German supply of raw materials involved by the British blockade. In an astonishingly short time, with the acquiescence of the War Minister von Falkenhayn, he established a huge organization for the administration of the war raw materials then at Germany's disposal. This Board of the War Ministry, called the *Kriegsrohstoff-Abteilung*, which he left in splendid working order to his successor on March 31, 1915, alone made it possible for Germany to hold out with raw material.

After his father's death in the summer of 1915 Rathenau was made president of the Allgemeine Elektrizitäts-Gesellschaft. He published *Von Kommenden Dingen* (Eng. trans. *In Days to Come*), *Eme Streitschrift vom Glauben und Vom Aktienwesen*. In 1918 his collected works were published. After the War Rathenau endeavoured to found a middle-class Democratic Party which should bridge the gulf between the middle classes and labour caused by the revolution, and in this way to restore national unity. In 1919 he participated in the preliminary preparations in Berlin for the Conference of Versailles. From April 1920 to May 30, 1921, Rathenau was a member of the so-called "Socialization Commission" convoked by the newly founded *Reichswirtschaftsrat* to discuss the question of nationalizing the coal-mines.

He was government expert at the Spa conference of July 1920, and in the spring of 1921 took part in the preliminaries to the London Conference. At the end of May 1921 he was asked by the chancellor, Wirth, to join the Government. The two leading men of the Cabinet thus formed, Wirth and Rathenau, were united by trust and friendship. The combination of the chancellor's original and impulsive nature, his courage and love of responsibility, was a happy blend with Rathenau's far-sighted and extraordinary capability. Rathenau co-operated in the final conclusion of the Peace Treaty with the United States of America in Aug. 1921. As Minister of Reconstruction he concluded with Loucheur, the French Minister of the Liberated Regions, the Wiesbaden agreement, securing to France the privileged supply of deliveries in kind as reparation payment, which helped to relax the tension between France and Germany. But the disruption of the Upper Silesian coal and iron district, quite contrary to the German teaching of

RATEL, OR HONEY BADGER (MELLIVORA CAPENSIS)

the Versailles Treaty and to the result of the plebiscite, provoked Rathenau to resign from the Cabinet by way of protest. He did not withdraw his support from the Cabinet, however, and went, in Nov. and Dec. 1921 to London, to enlist England's interest and understanding, and to secure a British loan for the next reparation instalment. This loan was refused on technical grounds but in England Rathenau came in touch with members of the British Government. Under his influence arose the famous Lloyd George "Chequers scheme," which gave a practical form to the idea of a "United States of Europe" by proposing the reconstruction of Russia through the united economic forces of the other great European Powers, including Germany. The ideas underlying the later Pact of Locarno (1925) were also discussed. In Paris Rathenau found less support. Nevertheless, the project discussed at Chequers led to the conference of Cannes (Jan. 1922), where Rathenau, in an eloquent speech, exposed the impossibility of the London reparation demands and secured an essential diminution of the reparation payment of 1922.

Meanwhile, at the wish of the chancellor, Wirth, Rathenau had re-entered the Cabinet, this time as Minister for Foreign Affairs. The Genoa negotiations did not, unfortunately, lead to a united European work of reconstruction. But separate negotiations between British and French representatives took place with Russia to the exclusion of Germany. Rathenau, fearing that German interests would suffer, accepted on April 16, 1922, at Rapallo the Treaty of Peace and Friendship offered by the Russians, cancelling all reciprocal demands which had accrued from the War.

The climax of his endeavour to replace blind hatred by reason was shown in his great speech in Genoa on May 19, 1922, which ended with the cry of Petrarch: "Pace—Pace—Pace!" The question of the alleged War guilt of Germany was one that Rathenau had greatly at heart. He furthered the publication of the pre-War documents.

The effects of the inflation of the currency on the impoverished middle classes caused him the greatest anxiety, and he secured many relief measures. Yet he fully realized that German industry, when inflation ceased, would be faced with extraordinary dangers; but that the development of reparation payment in kind and the treaty with Russia would at least ensure some work for industry in the impending hard times of recovery.

Rathenau, however, was not to see the fulfilment of his plans. On his usual morning drive from his house to the Foreign Office on June 24, 1922, he fell a victim to the bullets and hand-grenades of misguided young Germans, who by this deed robbed their country, not only of a great philosopher and industrialist, but of one of its most fervent patriots and of the best Foreign Ministers of that time.

In philosophy Rathenau was an idealist. Adopting the evolutionary theories of Leibniz and Darwin, he saw the development of man's purpose in three stages—first, prehistoric man wholly guided by instinct, then historical man led by intellect and conscious purpose, and lastly the man of the future whose fulfilment will be in the kingdom of the soul. "The soul is no weapon," says Rathenau. It thus stands in contrast to the whole spiritual world of instinct and purpose resulting from the struggle of life. In the social world, whilst believing in an aristocracy of the mind, he realized that democracy was necessary to consolidate the crumbling foundations of the society of his day. A capitalist by birth and training, he held without repudiating his creed, that in countries like Germany, carrying the burden of a dense population, "Consumption, like all enormous activities, is not an individual but a communal affair"; "The equalization of property and income is prescribed both by ethics and by economics"; "The extant sources of wealth are: monopolies in the widest sense, speculation and inheritance"; "The restriction of the right of inheritance, in conjunction with the equalization of popular education at a higher level, will throw down the barriers which now separate the economic classes of society, and will put an end to the hereditary enslavement of the lower classes."

Rathenau's collected works (5 vols.) were published in 1925. The following were not included and appeared separately: *Die Neue Wirtschaft* (1918); *Die Deutschlands Jugend* (1918); *Zeitliches* (1918); *Nach der Flut* (1919); *Der Kaiser* (1919); *Der Neue Staat* (1919).

(Eng. trans. *The New Society*), *Kritik der dreifachen Revolution* (1919), *Die neue Gesellschaft* (1919); *Autonome Wirtschaft* (1919); *Was wird werden?* (1920); *Demokratie, Entwicklung* (1920); *Albert Kollmann* (1921); *Reden* (1924); *Briefe* (1926); H. Kessler, *Walther Rathenau, sein Leben und sein Werk* (1928, English trans. *Walther Rathenau*, 1929) *The Rathenau Stiftung* (Berlin), founded after his death, collects all bibliographical material. (F. St.)

RATHENOW, a town in the Prussian province of Brandenburg, Germany, on the Havel, 45 mi. W.N.W. of Berlin. Pop. (1939) 33,531. Rathenow was incorporated as a town in 1295. In 1394 it was taken and partly destroyed by the archbishop of Magdeburg. It suffered much from the ravages of the Thirty Years' War. The Protestant church of St. Mary and St. Andrew, originally a basilica, was transformed to the Gothic style in 1517–89.

RATIBOR (Polish *Racibórz*), a town of Germany, in the Prussian province of Silesia, situated on the left bank of the Oder at the point where the river becomes navigable, 97 mi. S.E. of Breslau by rail, on the main line to Oederberg. Pop. (1939) 49,085. Ratibor, which received municipal privileges in 1217, was formerly the capital of an independent duchy, 380 sq.m. in extent, which existed from 1288 to 1532, and afterwards passed successively into the hands of Austria and Prussia. In 1821 a small mediate principality was formed and was conferred upon the landgrave of Hesse-Rotenburg, as compensation for some Hessian territory absorbed by Prussia. In the partition of Upper Silesia between Germany and Poland in 1921 (see *SILESIA*) Ratibor was retained by Germany. The most prominent buildings are the law-courts and the château on the right bank of the Oder.

RATIOCINATION, a term used in logic and psychology for those processes by which the mind proceeds from general to particular truths. The steps involved in ratiocination may perhaps be most clearly seen in the form of reasoning followed in the syllogism. (See *SYLLOGISM*.)

RATIONALISM is that trend of philosophy which intercedes for the rights of "natural reason" and sees in it the source of all truth. Common to all the historical forms of rationalism is the belief in the "autonomy of thought," i.e., the view that thought can discover by its own strength, without support from a supernatural revelation and without appeal to sense perception, a system of "eternal truths," a system presented to thought within its own realm and comprehended by thought as necessary.

In the theoretical field there are certain "innate ideas" which form the basis of all certainty and from which all specific proofs are derivable by logical inference. The same is true also of practical consciousness. Beside the theoretical, especially logical and mathematical, truths, there are ethical truths which can be comprehended with certainty as unconditional obligations or imperatives of action.

Early History.—This fundamental conviction found its clearest expression in the Stoic doctrine of the *koinal Ennoia* (notitia communes), as it is developed in the writings of Cicero. From here it exercised a lasting influence. In modern philosophy this influence first appears within the religious sphere, in which also the terms "rationalism" and "rationalist" seem to have originated, and where they designate the assumption that there cannot be an insurmountable conflict between the "natural" cognition of reason and the "supernatural" truth of revelation.

Thus, in English religious philosophy of the 16th and 17th centuries, for instance, those are called "rationalists" who consider reason the highest authority not only in science but also in matters relating to religion and society. (Cf. Lechler, *Geschichte des englischen Deismus*, p. 61.) Also in the Netherlands it was customary at that period to distinguish between "rational" and "non-rational" theologians. (Cf. Bayle, *Dictionnaire historique et critique*.) In the introduction to his *Théodicée*, in the "Discours de la conformité de la foi avec la raison," Leibniz gave an outline of the development and significance of "theological rationalism."

It was especially in England and through Herbert of Cherbury (1131–1148) that religious rationalism received its complete foundation and its clear formulation. In his two works *De veritate* (1142) and *De religione gentilitium* (1145), Herbert of Cherbury, starts from the assumption that reason possesses in itself the capacity for all truths, including religious and moral

ones. Beside reason, there is no other higher authority; for even revelation can claim validity only because its content harmonizes with the principles of rational knowledge. The dogma of original sin, or the corruption of reason through the fall of man, is unconsciously rejected by Herbert. In every healthy and reasonable person there are universal and innate truths, by which our earthly mind, implanted as it were, from heaven, is enabled to participate in the recognition of things of God and of moral good. From the sphere of religion this doctrine passes to the science of law (doctrine of "natural law"), to the theory of the State (doctrine of "raison d'état," of the foundations of international law, etc.), to ethics ("autonomy" of morals). In its totality it represents the new "natural system of the sciences of mind" which, since the Renaissance, unfolds itself steadily and supercedes the mediaeval view of the world, which was theological and hierarchic.

Modern Science.—The strongest support was given to this movement by the new achievements of natural knowledge through the great scientists of the 17th century, Copernicus, Galilei, Kepler and Descartes. The new science rests on the basis of mathematics, and it recognizes as "clear and distinct" only what can be expressed in mathematical form. All such cognitions have this in common that they go back to certain major premises, to "axioms" and "principles" which can be comprehended by reason as universal and necessary, as a priori propositions. Thus, according to Galilei, Truth is written in the great book of Nature, but "only he can read it who can decipher the letters in which it is written. These letters, however, are the terms of mathematics, especially of geometry, the concepts of the straight line, the circle, the sphere, etc. None of these concepts is derived from experience, the mind rather takes them "from itself" in order to apply them to sense-perceptions. In the same way, Kepler considers the ideas of *number* and *magnitude* as "innate ideas," not drawn from experience but required for the scientific investigation of nature. (Cf. Cassirer, *Das Erkenntnisproblem*, 3rd ed., I, p. 328 sqq.) Descartes enlarges this view by setting forth a system of universal concepts of reason which are obtained by mental analysis from a contemplation of certain fundamental, logical and mathematical, relationships, and which can be applied to all empirical data. These concepts are valid—as he expounds in *Le monde*—not alone for the actual world but for all possible worlds, so that, in understanding by means of them every effect from its cause, we can obtain a priori knowledge of the universe as a whole. As instances of such fundamental concepts, Descartes cites primarily the concept of *Being*, then also the ideas of *Number* and *Time*, of *Space*, *Figure* and *Motion* (*Oeuvres*, ed. Adam-Tannery, III, 665).

As a middle term for making the transition from the rational to the empirical, from the "possible" to the "actual," a *metaphysical* idea is used by Descartes as well as by Kepler. The actual world must correspond to the supreme laws of reason, because it is the work of an infinite mind, because it is a creation of the divine intellect. The applicability of pure mathematics to physics, to the concrete phenomena of nature, seems explainable only on this presupposition. It is valid because nature itself is the product of a "divine mathematics" *cum Deus calculat, fit mundus*.

For Leibniz, too, there is a continuous harmony between "truths of reason" and "truths of fact," between the empirical and the rational world. The pure laws of thought as exhibited in logic, arithmetic, geometry and abstract dynamics, apply to all objects in nature, and to all changes taking place therein.

This metaphysical rationalism is further developed by Leibniz so that the eternal truths of reason constitute the essence of the divine mind, and God, therefore, cannot desert them in his activity, in his creation. Creation consists in transition from "essence" to "existence," from the "possible" to the "actual."

Leibniz developed this view of rationalism in two directions. It determines, first of all, the entire structure of his metaphysics; it forms the logical and methodical basis of his *monadology*. The system of "monads," *i.e.*, of perceiving minds, is graded, according to Leibniz, in such a way that each monad resembles the others, as regards the content of its perception; for each of them

represents and reflects the total universe from a definite angle. Accordingly, the difference between the various minds can consist in nothing other than the *form* of perception, the greater or lesser degree of clarity. Hence a gradation from the dim and confused mode of perception, such as we must assume, for instance, in plant or animal consciousness, up to the divine cognition which consists in completely distinct and adequate ideas. Human knowledge lies in the middle between the two extremes, it knows "confused" ideas, *e.g.*, those of sense-qualities, as well as "distinct" ideas, *e.g.*, those of logic and mathematics.

However, its specific task consists in referring progressively the former to the latter, in transforming all data into pure objects of thought, all merely factual presentations into notions continuously connected by proof and thus conceived by reason. This task can be accomplished in detail only by presupposing a general system of the possible forms of thought and of the universal laws of connection which those forms obey. Leibniz attempted to satisfy this demand in the grandiose outline of his "general characteristic" in which the primary elements of all cognition were to be set forth in conjunction with the demonstration of a method by which all truths, however complex, could be exhibited as combinations of those primary elements. Through this outline of his "general characteristic," Leibniz became the founder of that "symbolic logic" which reached its complete development only in the nineteenth century through the works of Boole and Schroder, of Peirce and Peano, of Whitehead, Frege and Russell (Cf. Couturat, *La Logique de Leibniz*, 1901).

In the eighteenth century, on the other hand, philosophical rationalism became dominant only in that more limited form which it had received in the system of Christian Wolff (1679-1754). Wolff's doctrine, too, rests entirely on the distinction between contingent "truths of fact" and necessary "truths of reason," he, too, contends that the specific task of cognition, especially the task of philosophical knowledge, consists in transforming all contingent elements into rational ones by understanding them according to the principle of sufficient reason.

Consequently, we cannot claim a philosophic insight into a region of facts unless we succeed in bringing the factual details into a rational order so that each member can be completely understood from the context and from the necessary laws which determine this context. Accordingly, Wolff supplements each form of empirical cognition by a corresponding "rational" form. The propositions, for instance, which in the field of physics result directly from observation and from experiments, must be raised to the rank of genuine cognitions of reason by being deduced from the principles of general ontology and general cosmology. Specifically, Wolff's system is subdivided into *Logic* as the doctrine of the operations of the understanding in general, into *Ontology* as the doctrine of Being and its most universal determinations, *Cosmology* as the doctrine of the world, of the simple substances and their combination, *Psychology*, *Theology*, and, finally, universal *Teleology*, the doctrine of ends in general and of the end of human action in particular.

Kant.—It is against this rationalism of Wolff that the attack of Kant is directed in the *Critique of Pure Reason*. In the section on the "transcendental dialectic," he demonstrates the fact that, and the reason why, a rational psychology, a rational cosmology, a rational theology, such as Wolff had planned and developed, are impossible. The decisive ground for this impossibility lies, according to Kant, in the fact that mere reason does not suffice for the cognition of absolute Being, of God, Soul and World. Soul, God and World are transcendental "ideas"; but reason becomes involved in insoluble contradictions as soon as it tries to "hypostatize" these ideas; *i.e.*, as soon as it takes them for transcendent objects, for objects beyond all possible experience. All that reason can reach, lies within the boundaries of experience itself; it cannot recognize the nature of things in themselves, its sole task in theoretical cognition consists in "spelling phenomena in order to be able to read them as experiences."

The metaphysical rationalism of the dogmatic systems, as it is to be found in Descartes and Spinoza, Leibniz and Wolff, is thus opposed by the new attitude of *critical* rationalism. The

latter, too, retains the fundamental idea of the older rationalism, namely, that reason can recognize completely only that which it can produce according to its own design—"that we know a priori only so much of things as we ourselves put into them" (*Critique of Pure Reason*, 2nd ed., p. 18). But this kind of "construction" is possible only in so far as we deal not with things-in-themselves, independently of all possible experience, but with experience itself and the conditions of its possibility. The understanding is able to recognize a priori and, as it were, to anticipate the form of experience in so far as it constitutes this form. It is, itself, "the legislation for nature"—but only in so far as we understand by "nature" not the subsistence and constitution of absolute objects, but the order and regularity of empirical phenomena. Thus rational cognition becomes fruitful only where, instead of dwelling in the world of "noumena," it concerns itself with phenomena. The characteristic of these, however, is that they form a spatio-temporal manifold. All efficacy of the "pure concepts of understanding" is, therefore, necessarily confined to space and time, to the forms of "pure intuition." Only in connection with pure intuition does cognition by understanding or cognition by pure reason receive a real content.

This fundamental idea of Kant's critical rationalism is more explicitly developed in his doctrine of the "schematism of the pure concepts of understanding." The categories of thought are merely directions for establishing certain relationships; but these directions need to be referred to sensuousness. Thus, the concept of substance, for instance, does not mean the Being-in-itself as such (as conceived by Spinoza), but the persistence of an object in time, and it immediately loses all possibility of application when we abstract from the order of time. In general, the "schemata" of the pure concepts of understanding are nothing but "determinations a priori of time according to rules," and these schemata are "the true and only conditions for securing for our concepts of understanding a reference to objects, *s.e.*, significance. The categories are, therefore, only of empirical use, inasmuch as they merely serve to subject phenomena to general rules of synthesis and thus make them fit for coherent correlation in experience" (*Critique of Pure Reason*, 2nd ed., p. 185). Kantian rationalism, in other words, does not aim at the "existence of things," but at the form of experience itself, at the order and connection of phenomena. (*Cf.* TRANSCENDENTALISM.)

The mistake of Empiricism consists in overlooking the intellectual factor which is indispensable for any cognition of objects, the mistake of Rationalism consists in overestimating this factor, in isolating it from the sensuous conditions upon which its applicability depends. "Leibniz intellectualized the phenomena, just as Locke altogether sensualized the concepts of understanding, *s.e.*, regarded them as nothing but empirical or abstracted concepts of reflection" (*Critique of Pure Reason*, 2nd ed., p. 327.) In this form of critical rationalism, the original problem from which the scientific rationalism of the Renaissance had started, is restated, but it is now solved in a new sense. The scientific rationalism of Kepler and Galilei, too, asserted that "experience is possible only through the representation of a necessary connection between perceptions" (*Critique of Pure Reason*, 2nd ed., p. 218). But it was able to explain this necessity only by founding it on a metaphysical proposition, namely, the contention that the world itself is the work of an infinite intellect. Kant removes this dependence of rationalism upon a proposition of dogmatic metaphysics: he treats the truth of experience as self-sufficient, although its form and order are based on the general orderliness of the understanding, without which they would be impossible.

RATIONING, a term of military origin, meaning apportionment to each member of a group of his due share of supplies, was first applied to the nation-wide distribution of food in World War I. During World War II it was practised not only by belligerent governments, but also in neutral countries faced with shortages and high prices.

Rationing of consumers is carried out by supplying them with a card or booklet containing numbered and dated sections which have to be presented for cancellation or surrender when a purchase is made. Separate cards with detachable coupons may be issued, like the bread cards first used in Berlin, Germany, in the winter of 1914, or a number of cards with different colouring or pattern may be bound together in a single ration book, like that first introduced in Great Britain in July 1918. The issue of ration books and identity cards from the same office is helpful for checking fraud and recording movements of the population.

Out of straight rationing of a single commodity there was developed in World War II a new "points" system of rationing for a group of articles such as clothing and footwear or miscellaneous groceries. Distinction may be drawn between rationing based on tying consumers to a particular shop, in which case retailers receive buying permits corresponding with the number of their registered customers and have no need to detach coupons, and the alternative system whereby customers are free to buy at any shop, and retailers replenish their stocks against the surrender of coupons collected. The former system was applied in Great Britain to meat, bacon, sugar, fats, milk and eggs, the latter to clothing, gasoline and soap and among foods to tea, chocolate and sugar confectionery and miscellaneous groceries.

German and Continental Rationing.—When bread rationing was first introduced in Berlin a few months after the outbreak of World War I, it was wrongly interpreted abroad as a sign of serious shortage rather than as a precautionary measure designed to prevent maldistribution. From the outset the German system embodied the principle of differential rations. Manual workers, later divided into light, heavy and very heavy workers, received more than the normal consumer, children under ten years, less. Rationing was administered by local authorities, who enjoyed more independence than in World War II and sometimes competed with one another for supplies. Co-ordination of supply and distribution by state-controlled war companies was never complete, and this opened the door to illicit trade. Evasion of the regulations from 1917 onward grew to such an extent that maldistribution of food was one of the chief factors in the collapse of the home front in 1918.

Before the outbreak of World War II thorough preparations had been made for rationing as an integral part of war economy. The reich food estate (*Reichsministerium*) had already established centralized control over food supplies and distribution, and disciplinary action reduced illicit trade to the minimum. Rationing of bread, flour, sugar, meat and fats was introduced in Sept. 1939 and continued at a fairly adequate level until 1944. Further refinements were made in the system of differential rations to cover special categories of consumer and different age groups.

Rationing in occupied countries followed the German pattern but varied widely in efficiency and adequacy. Administration was left largely to local officials, and passive resistance by producers, traders and consumers led to an extensive black market.

Great Britain.—Rationing was unknown in Great Britain until toward the end of World War I. In Aug. 1914 a royal commission on sugar supplies had been set up to undertake bulk buying. Toward the end of 1916 sugar supplies fell short of demand, and distributors were allotted only half of their 1915 supplies. Retailers were left to share this out among their customers as best they could, but queues formed and discontent grew. After some months of hesitation the cabinet decided in June 1917 to introduce the first rationing scheme under which householders were invited to register with a particular shop, and

abolished, and sugar rationing ended in Nov 1920. Rationing had lasted for little more than two years.

By contrast in World War II rationing started early in 1940 and was still in force ten years later. Ration books, which had been printed in 1938, were issued by post from local food offices to every individual on the basis of a special census conducted for national registration on Sept 29, 1939. Five types of ration books were issued for children under 5, children 5 to 18, normal adults, travellers and seamen. Emergency cards valid for one week were issued to new arrivals or persons who had lost their books. Straight rationing, which entitled consumers to a fixed weekly amount of each food, was applied in 1940 to meat, bacon, sugar, fats and tea. In 1941 cheese and preserves were added, and milk and eggs came under a scheme of priority rationing. On Dec. 1, 1941, a new system of points rationing was put into force for miscellaneous groceries, under which each consumer received a number of points to spend in each four-week period on any food in the group, each food being given a points price varying according to the expected demand in relation to the supply; thus canned salmon and dried fruits had a high points price, and cereal foods, a low price. This system was adopted after the successful introduction of points rationing for clothing and footwear. In June 1941 everyone had been given a coupon currency of 66 points, roughly corresponding to 66% of prewar average consumption. Later the figure was reduced to 48 a year. Point prices for clothing were based on the amount of cloth used, but other garments were pointed to equate demand roughly to estimated supply. Rationing of expenditure by value coupons was rejected on the ground that it would have concentrated demand too much on the cheaper goods.

Soap rationing was introduced in Feb 1942 on the basis of 16 oz per four weeks for hard soap. Chocolate and sugar confectionery were first rationed in July 1942 under what was called the personal points scheme, distribution to retailers was based on coupons collected without consumer registration. Other foods subject to controlled distribution rather than strict rationing included milk, eggs, oranges and fish. Milk went first to priority consumers—mothers and children up to 5 years old were guaranteed a ration of seven pints a week; children of 5 to 18 years, three and one-half pints, and schools, hospitals and invalids also had priority supplies. The rest of the public got what was left with no definite guarantee of supply, the usual amount being two pints a week in the winter and three to four in the spring. Consumers were tied to one dairyman who received his share of the available supplies according to the number of priority and non-priority customers registered with him. Controlled distribution of shell eggs started in June 1941. Mothers and infants received priority supplies, and ordinary consumers got allocations as and when supplies permitted, varying from one a month in the winter to two or more a week in the spring. Up to the end of 1944 non-priority consumers received an average of 30 eggs a year, which was about one-fifth of prewar consumption. In June 1942 dried eggs, supplied by the United States under lend-lease, were distributed in packets containing an amount equivalent to 12 eggs at the rate of one packet or more per eight weeks; but later priority supplies were allotted to infants and nursing mothers, and the balance went on points. Oranges when available were sold to holders of children's ration books before other customers could be served. It was found impracticable to ration fish, but supplies to retailers were distributed as fairly as possible. Bread, flour and potatoes never had to be rationed during World War II. Bread rationing was introduced in July 1946 and lasted for two years, potatoes were rationed in 1947-48 when a poor potato harvest synchronized with world shortage of wheat.

In contrast with rationing schemes on the continent, differential rations for special categories of workers were kept to the minimum, and coupons did not have to be surrendered for meals in restaurants. The general principle was that everyone should be free to take meals out as a supplement to domestic rations, and caterers received an allocation of rationed foods on the basis of the number of meals served.

Food rationing in Great Britain was made easier by the fact

that half the total food supply was imported and did not have to be collected off farms, and also by the willing co-operation of food traders and the public. There was general assent to the principle of fair shares which, though it involved some levelling down in the consumption of the majority, also allowed some levelling up of the diet of the poorest by means of food subsidies and welfare food schemes.

(E. M. H. L.)

United States.—During World War I consumer rationing was never extended to the U.S. civilian population to the extent that it was in Britain and continental Europe. Diversion of ships from the Cuban trade toward the end of 1917 made it necessary to reduce supplies to confectioners and sweetmakers, and from July 1, 1918, shipments of sugar to retailers were made on the authority of certificates issued by the food administration on the basis of the number of their customers. Restrictions placed on the sale of wheat flour were at first voluntary, but compulsory regulations were issued in Jan 1918. These were dictated solely by the necessity of maintaining export to the European Allies.

World War II.—During World War II the U.S. economy was far more closely controlled, and as a result systems of rationing were imposed on industry and the civilian population alike. The rationing of materials, chiefly metals, to industrial producers was exercised through priorities and allocations. Priorities were largely relied upon until mid-1942, thereafter allocations became the principal instruments of production control.

The priorities system proved adequate only as long as the materials under control were not really scarce in relation to essential needs. Under such conditions, the priority ratings merely diverted materials from nonessential uses to essential uses. But as materials became scarcer and manufacturers and procurement officers found that their existing ratings could not get them needed materials, there was a steady cheapening of priorities "currency," because all producers and their government sponsors pressed for award of higher priority ratings.

Allocations were developed to cure the defects of the priorities system. Ideally, allocation of a material involved a periodic consideration of the total supply of the material for a given time period and the allocation of that supply among all essential users of the material, relative to the importance of the products being made. The two principal allocation plans for controlling the major output of U.S. industry during World War II were the Production Requirements plan and its successor after 1942, the Controlled Materials plan.

Consumer rationing was usually preceded by a consumer registration, to determine eligibility of each individual and to place in his hands an initial supply of ration stamps or coupons. Once a supply of ration currency of different kinds was distributed, additional rationing programs could be placed in effect without prior notice to the public. The first general consumer registration, which preceded sugar rationing, took place May 4-7, 1942.

Throughout the war years the Office of Price Administration was authorized by presidential order to ration items made scarce by the war. The delegation of this authority to OPA was first made experimentally on Dec 27, 1941, when hostilities in the Pacific choked off rubber imports from the far east, and it became clear that automobile tires would have to be equitably distributed to essential users. Automobiles and typewriters were other commodities upon which war's impact was felt early.

Three basic methods of consumer rationing were employed during and after World War II. These were unit or specific rationing, point rationing and certificate or purchase-permit rationing. Each placed in the hands of consumers "ration currency" in the form of stamps of coupons, tickets, certificates or purchase permits.

Unit rationing was generally used to distribute specific quantities of single commodities, like sugar, shoes or gasoline, or two or more substitutable commodities, like margarine and cooking fats.

Point rationing's essential feature was that it permitted the consumer to select any item he wished from items rationed under the same program. For example, a single "red-point" program, using red stamps, grouped meats, butter, margarine, edible fats and oils, cheese, canned milk and canned fish. A "blue-point" program, using blue stamps, included canned fruits and vegetables, fruit juices, soups, baby foods and, for a limited time, dried fruits, peas and beans and preserves.

Certificate rationing involved issuance of a ration certificate or purchase permit only to those who could prove their need for the rationed goods. Examples in the U.S. were automobiles and tires.

Ration coupons were usually issued in series, differentiated by design, colour, numerals or letters. Designated coupons were usually valid for stated periods. In this way the number of coupons currently valid, which in effect determined ration demand, could be adjusted to available supplies. For some commodities, retailers were required to detach ration coupons. For others, they cancelled coupons presented to them in exchange for rationed goods. When cancellation was required, the consumer was permitted to buy only from the retailer with whom he was registered. The retailer used his registration for obtaining replacement stocks. When coupons were detached, they were used as money is used for buying goods. Ration "currency" passed through trade channels to the producer, the manufacturer or primary suppliers, who in turn accounted for the currency to rationing authorities by showing a balance between goods sold and currency received. Banks handled ration currency, and one-point "tokens" were also issued to facilitate retail transactions and reduce the volume of paper stamps handled.

As indicated above, most basic foods in the U.S. diet eventually were rationed. Restaurant meals were unrationed, though restrictions were placed on the allowances of food served.

• Nothing rationing was considered in the spring of 1942, but optimism about the course of the war and resistance to additional economic controls caused the plan to be discarded. In consequence, clothing and textiles became increasingly scarce in the last two years of the war, and severe shortages developed when demobilized men began to put a heavy demand on already depleted stocks of suits, overcoats and shirts while production lagged. Heating and cooking stoves and mechanical refrigerators were the only household goods rationed in the U.S. Fuel oil was rationed in those parts of the U.S. heavily dependent on it for heating and cooking, and consumers were required to register with a single dealer. All automobile owners were provided with a basic gasoline ration, the amount fluctuating with the level of supply. Additional rations were provided for "home-to-work" driving, and preferential rations were given those with occupations considered essential to the war effort or to community health and welfare. Travel was subject to priorities.

At its peak, OPA administered 13 rationing programs. Reduced military demands, releasing large stores of supplies to the civilian population, made it possible for OPA to end its rationing programs for all but sugar and rubber tires before the close of Nov. 1945. Rationing of processed foods, gasoline, fuel oil and stoves was terminated immediately after the Japanese surrender, and rubber footwear, canned milk, cheese, automobiles, shoes and meats, fats and oils in the following two months. Rationing of rubber tires was ended at midnight Dec. 31, 1945. (See also WAR CONTROL OF FOOD.)

RAT KANGAROO or **POTOROO**, any member of the diprotodont marsupial subfamily Potoroidae (see MARSUPIALIA). None of them exceeds a rabbit in size. They inhabit Australia and Tasmania, are nocturnal and feed on leaves, roots and bulbs, which latter they dig up with their forepaws. About ten species are known. The members of the type genus (*Potorous*) run, rather than leap, and do not use the hind feet for kicking. In the genus *Bettongia* the tail is prehensile. (See KANGAROO.)

RATLAM, formerly a princely state within the Central India agency, but from 1948 a district of Madhya Bharat, Dominion (later Republic) of India—the maharaja (a Rathor Rajput of the Jodhpur family)—then ceasing to rule actively. Area, 687 sq mi; pop. (1957) 383,894. Chief town, Ratlam (pop. 1941, 37,675).

RATNAGIRI, a town and district of the Southern division of Bombay state, Republic of India. The town is on the coast 136 mi south of Bombay. Pop. (1951) 27,082. There is no railway, but there is steamer connection with Bombay.

The DISTRICT of RATNAGIRI has an area of 4,982.8 sq mi. It forms a strip between the Western Ghats and the sea. Nearly all the fertile land lies on the banks of the streams which intersect the country. Ratnagiri (pop. 1951, 1,711,964) formed part of the dominions of the Peshwa and was annexed by the British in 1818 on the overthrow of Baj Rao. The district is known for supplying men of outstanding quality to the Bombay police, to the army and to the intelligentsia.

RATNAPURA (i.e., "The City of Gems"), the chief town in the province of Sabaragamuwa, Ceylon. It is the centre of a long-established industry in digging for precious stones—rubies, sapphires, cat's-eyes, etc. There are important tea and rubber plantations in the district, and rice and fruit are cultivated. The town has good rail and road connections with Colombo. Pop. of town 8,497, of province (1946) 745,382.

RATON, a city of northeastern New Mexico, U.S., on the Raton range, spur of the Rockies, county seat of Colfax county. It is on federal highways 85, 87 and 64, is served by the Santa Fe railway system and by bus and air lines. Pop. (1950) 8,241. Its altitude is 6,666 ft., just south of the Raton pass, in the midst of forest and mountain scenery. Thirty miles southeast is the extinct volcano Capulin, 35 mi. N.E., the location of Folsom man, 60 mi. S.W., the Eagle Nest dam (keystone of an irrigation project) at the head of Cimarron canyon, and 30 mi. farther west, the Indian pueblo and artists' colony at Taos. The city lies in the richest coal-producing area of New Mexico. It has a municipal electric power plant and extensive railway shops and is a livestock and jobbing centre. Raton was a stage station on the Santa Fe trail, was established as a railway station in 1879 and was incorporated in 1891.

RATTAZZI, URBANO (1808-1873), Italian statesman, was born on June 29, 1808, at Alessandria, and from 1838 practised at the bar. In 1848 he was sent to the chamber of deputies in Turin as deputy of his native town. For a short time he held the portfolio of public instruction, afterward, in the Gioberti cabinet, he became minister of the interior, and on the retirement of Gioberti in 1849 he became practically the head of the government. The defeat at Novara compelled the resignation of Rattazzi in March 1849. His election as president of the chamber in 1852 was one of the earliest results of the so-called "connubio" with Cavour, i.e., the union of the moderate men of the right and of the left. Rattazzi resigned in 1858, but again entered the cabinet under La Marmora in 1859 as minister of the interior. He again retired in Jan. 1860. He was entrusted with the formation of a new ministry in March 1862, but his policy of repression toward Garibaldi at Aspromonte led to his fall in December. He was again prime minister in 1867, from April to October. He died at Frosinone on June 5, 1873.

See Madame Rattazzi, *Rattazzi et son temps* (1881), B. King, *History of Italian Unity* (1899).

RATTLESNAKE, any snake of the genera *Sistrurus* and *Crotalus*, American pit vipers with the tail terminating in a rattle. The "pit" characteristic of these snakes is a deep depression on each side of the snout between eye and nostril. (See PIT VIPERS.)

The rattle is developed as a modification of the single scale that covers the tip of the tail, instead of being a simple, conical sheath, as in ordinary snakes, it has two ringlike constriction so that it resembles three hollow bulbs, gradually diminishing in size and each one opening into its neighbour, the largest is also open at its free end, where the tail enters. All snakes shed the horny, epidermal covering of their scales periodically, a new one forming beneath the old one before the latter is sloughed; when, however, the new covering of the end of the tail is developed in the rattlesnakes, the middle ring of the new segment develops within the basal segment of the old rattle and, though the rest of the old skin is sloughed, the old tail sheath remains loosely fitting over the new one but prevented from slipping off by its shape.

Thus, newly born rattlesnakes have no rattle but with each succeeding moult a joint is added, the older joints, however, gradually wear away and are lost so that the number of joints on the rattle is not a criterion of a snake's age unless the rattle is complete with the original terminal button.

The characteristic noise is produced by rapid vibration of the whole tail, when the loosely fitting horny shells produce a shrill sound which may be audible 20 yd away. The majority of the species are dwellers of the plains and open spaces and it has been suggested that the development of the rattle was to give a warning audible at a distance, to keep the snake from being trodden upon by hoofed animals, or from molestation by carnivores.

The venom of the rattlesnakes is of the same general type as that of other pit vipers and all of the larger species inject sufficient venom to kill a man. They are, however, not easily provoked and will usually endeavour to escape or, if cornered, to frighten the aggressor by rattling and puffing themselves out as much as possible. In all species the eggs are retained within the body of the mother until the young are ready to emerge.

Sistrurus, with three species, is confined to the United States, southern Ontario and Mexico. *Sistrurus* may be distinguished from *Crotalus* by the presence of large, regularly arranged shields on the top of the head; all of the forms are small. *Crotalus*, with small irregular scales on the top of the head, contains about 20 species, most of which occur in North and Central America. The largest and most dangerous species is the diamondback (*C. adamanteus*) which reaches a length of about eight feet, it is confined to the southeastern United States. Other well-known species are the prairie rattler (*C. confluentus*), which occurs all over the great plains from Canada to Texas, the timber rattlesnake (*C. horridus*) of the eastern United States, and *C. terrificus*, which ranges from Mexico to the Argentine and is the only representative of the genus in South America. The sidewinder (*C. cerastes*) is a small, desert-dwelling form from southwestern North America and is characterized by the development of a blunt, hornlike process above each eye. (K P S)

RAU, KARL HEINRICH (1792-1870), German political economist, was born on Nov. 29, 1792, at Erlangen, where he studied at the university, of which he subsequently became a professor (1818). In 1822 he was called to the chair of political economy at Heidelberg where the rest of his life was spent in teaching and research. He took some part, however, in public affairs. In 1837 he was nominated a member of the first chamber of the duchy of Baden, in 1845 he became a privy councillor; and in 1851 he was one of the commissioners sent to England on the part of the Zollverein to study the Industrial exhibition. A result of this mission was his account of the agricultural implements exhibited at London (*Die landwirtschaftlichen Gerathe der Londoner Ausstellung*, 1853). He was elected a corresponding member of the French Institute in 1856. He died at Heidelberg on March 18, 1870.

His principal work is the *Lehrbuch der politischen Ökonomie* (1826-37), an encyclopaedia of the economic knowledge of his time, written with a special view to the guidance of practical men. The three volumes are respectively occupied with (1) political economy, properly so called, or the theory of wealth, (2) public administration science (*Volkswirtschaftspolitik*) and (3) finance. The two last he recognizes as admitting of variations in accordance with the special circumstances of different countries, while the first is more akin to the exact sciences, and is in many respects capable of being treated, or at least illustrated, mathematically. This threefold division marks his close relation to the older German cameralist writers. The book passed through many editions, in that of 1870 by Adolf Wagner it was transformed into a new book.

His most important works are his early prize essay, *Über das Zustandekommen* (1813), *Anschauungen der Volkswirtschaft* (1821); *Malthus*

and Say (1821), *Grundriss der Kameralwissenschaft oder Wirtschaftslehre* (1823), *Über die Kameralwissenschaft* (1825), *Über die Landwirtschaft der Rheinpfalz* (1830), and *Geschichte des Pfälzes* (1845). Rau founded in 1834 the *Archiv der politischen Ökonomie und Volkswirtschaft*, in which he wrote a number of articles, afterward issued in separate form.

RAVAILLAC, FRANÇOIS (1578-1610), the assassin of Henry IV of France, was born near Angoulême. He began life as a *valet de chambre*, but afterward became a lawyer and school-teacher. He failed to obtain admission either to the recently founded order of Feuillants or to the Society of Jesus. Rumours that the king was intending to make war upon the pope suggested to him the idea of assassination, which he carried out on May 14, 1610. He was executed on May 27, 1610.

RAVASSON-MOLLIEN, JEAN GASPARD FELIX (1813-1900), French philosopher and archaeologist, was born at Namur on Oct. 23, 1813. He attended the lectures of Friedrich Wilhelm Joseph von Schelling at Munich and in 1837 published the first volume of his *Essai sur la métaphysique d'Aristote*, to which in 1846 he added a supplementary volume. He was professor of philosophy at Rennes (1838), inspector-general of public libraries (1840), inspector-general in the department of higher education (1860) and curator of the department of antiquities at the Louvre (from 1870). He died in Paris on May 18, 1900. He belonged to the school of Victor Cousin, with whom, however, he was at issue in many important points. The act of

consciousness, according to him, is the basis of all knowledge. Ravasson's chief philosophical works are "Les Fragments philosophiques de Hamilton" (in the *Revue des Deux Mondes*, Nov. 1840), *Rapport sur le stoïcisme* (1851), *La Philosophie en France au dix-neuvième siècle* (1868, 3rd ed., 1889), *Morale et métaphysique* (1893).

See Charles Bernard Renouvier, *L'Année philosophique* (1868); Dawiac, "Ravasson philosophe et critique," *La Critique philosophique*, vol. 1 (1885).

THE RAVANASTROM, AN ANCESTOR OF THE VIOLIN

RAVEL, MAURICE (1875-1937), French musical composer, was born at Ciboure, near St. Jean de Luz, Basse-Pyrénées, March 7, 1875. He was the most outstanding figure in modern French music. More than that, he held an assured place in that line of composers beginning with the *clavichordists* of the 17th century, who had so powerful an influence on French instrumental music. Educated at the Conservatoire de Paris, where his master in composition was Gabriel Fauré, Ravel won the second prix de Rome for composition in 1901. But he was not awarded the grand prix de Rome, and the judges were severely criticized for thus refusing to recognize his talent, the resignation of F. C. T. Dubois from the directorship of the Conservatoire was in fact attributed to this cause. When Ravel's piano pieces began to be known, notably *Pavane pour une infante défunte* and *Jeu d'eau*, played in Paris by Ricardo Viñes in 1902, a comparison was made between him and C. A. Debussy, whose *Pelléas et Mélisande* (Opéra-Comique, 1902) was then arousing heated controversy.

It is true that such diverse minds as Fauré, A. E. Chabrier, and Erik Satie exercised an influence on Ravel during his formative years, but his personality showed itself from the first. This personality became more clearly defined in his subsequent works, which included the *String Quartet in F*, the three *Schéherazade* melodies for voice and orchestra or piano (both 1903); the

Histoires naturelles (1906); *Introduction et allegro* (septet for harp, strings, flute and clarinet) and the *Rapsodie espagnole* for orchestra (1907). For the piano he wrote *Miroirs*; and *Sonatine* (1905); *Gaspard de la nuit* (3 pieces) (1909); *Ma mère l'Oye* (suite of five pieces) (1908); and *Valses nobles et sentimentales* (1911). The last two of these are best known in England as orchestrated by the composer.

However daring Ravel's harmony may appear, he was never experimental. He had an unerring sense of direction and knew where he was going, even if he sometimes seemed to watch himself going there with a smile of amusement. The cynical wit of his one-act opera, *L'heure espagnole* (Opéra-Comique, 1911), and the conscious pose of the ballet *Daphnis et Chloé* (choreography by Michel Fokine and produced by Sergei Diaghilev, 1912), emphasize in different ways the detached attitude of Ravel toward his art. His later works include a sonata for violin and violoncello, and a trio for piano and strings (1915), *La Valse* for orchestra (1920) and *Tzigane*, for violin and piano (1924).

(H. C. C.)

RAVELLO, a village of Campania, Italy, in Salerno province, 3 mi NNE of Amalfi, 1,297 ft above sea level. It commands a magnificent view, especially from the Belvedere of Cimbrone. Pop. (1936) 703 (town); 5,237 (commune). The history of Ravello begins in the 9th century. In the 11th it was called Rebellum, because it rebelled against Amalfi, in the 13th, at the height of its prosperity, it had 36,000 inhabitants. The Palazzo Rufolo, begun in the 11th century, has two lofty towers and beautiful Saracenic decoration in the courtyard. The former cathedral of S. Pantaleo has a good campanile, fine bronze doors by Barisanus of Trani (1179) and two pulpits in Cosmatesque work. The larger, supported by six columns resting on the backs of lions, was made in 1272 by Nicolaus of Foggia, the bust over the entrance may be a portrait of Sigilgata Rufolo, or may symbolize the church. The smaller (c. 1130) has curious representations of Jonah and the whale. The parish church of S. Giovanni in Toro contains a splendid pulpit in Cosmatesque work, supported on four pillars, and the crypt some 14th-century frescoes. S. Maria Immacolata is another Romanesque church.

RAVEN, the largest bird of the order Passeres, and a member of the Corvidae. Quick-sighted, sagacious and bold, the raven preys on the spoils of fishers and hunters, also on weakly animals among flocks and herds. A sentiment of veneration or superstition has often been attached to it. Superstition has been generally succeeded by persecution, which in many districts has led to extermination.

The raven breeds early in the year, in England resorting to its nest, which is usually an ancient structure, toward the end of January. Therein are laid from five to seven eggs of the common corvine coloration (see CROW), and the young are hatched before the end of February. The young have bright crimson throats. In more northern countries the breeding season is naturally delayed, but everywhere this species is almost, if not quite, the earliest breeder. The raven measures about 26 in. in length and has an expanse of wing exceeding a yard. It is entirely black, the feathers having a purple iridescence. The common raven (*Corvus corax*) inhabits the whole of Europe, northern Asia and northern America. In Africa its place is taken by allied species, one of which (*Corvus umbrinus*) has a brown neck, farther south are species whose plumage is varied with white.

RAVEN-HILL, LEONARD (1867-1942), English artist and illustrator, was born on March 10, 1867. He studied art at the Lambeth school and afterward in Paris under A. W. Bouguereau and Aimé Morot. He began to exhibit at the Salon in 1887 and at the Royal Academy in 1889. In 1893 he founded, with Arnold Golsworthy, the humorous and artistic monthly *the Butterfly* (1893-94, revived in 1899-1900). He contributed to many illustrated magazines and was with *Punch* from 1896 until his retirement in 1935. He illustrated Sir Walter Besant's *East London*,

(1901) and J. H. Harris's *Cornish Saints and Sinners*. His impressions of his visit to India on the occasion of the tour of the prince and princess of Wales appeared as *An Indian Sketch-Book* (1903), other published sketchbooks include *Our Battalion* (1902) and *The Promenaders* (1894). He died March 31, 1942.

RAVENNA, a city and archiepiscopal see of Emilia, Italy, capital of the province of Ravenna, in a marshy plain 13 ft above sea level, 6 mi from the sea and 45 mi by rail east of Bologna. Pop. (1936) 31,251 (town); 81,086 (commune)—a considerable increase, as the population of 1881 was only 34,270 (commune). The town is a centre for agriculture, which has been much favoured by extensive drainage and reclamation works. There is also a sugar factory at Classe. The town is connected with the sea by the Corsini canal. Ravenna has railway communication with Bologna (via Castel Bolognese), Ferrara and Rimini, and by steam tram with Forlì. Though the external aspect of the town is not striking, no other in the world offers so many and such splendid examples of the ecclesiastical architecture of the centuries from the 5th to the 8th. The style is commonly called Byzantine, but the colonnades and the mosaics are not so much Byzantine as representative of early Christian art generally.

The cathedral of Ravenna, built by S. Ursus in 370-390, which had a nave and four aisles, was destroyed in 1734-44, only the (inaccessible) crypt and the round campanile remaining from the earlier structure, there are fragments of reliefs from a pulpit erected by Archbishop Agnellus (556-569) in the interior. The present cathedral contains several early Christian marble sarcophagi, a silver cross of the 11th century and the throne of the Archbishop Maximian (546-552), adorned with reliefs in ivory.

The period from the transference of the imperial residence to Ravenna to the death of Valentinian III (404-455) was the first period of great building activity in Ravenna, when the archiepiscopal see of Ravenna attained great importance. It was to it that is owed the erection of the Basilica Petrona at Classe (396-425), which has entirely disappeared, of the churches of S. Giovanni Evangelista (425), of S. Agata (425-432), of the chapel of S. Pier Cnsolago (433-449), of the mausoleum of Galla Placidia (440), the church of S. Pier Maggiore (now S. Francesco) (433-458), the bishopery of Neon (449-458), S. Giovanni Battista and S. Croce.

S. Giovanni Evangelista, erected by Galla Placidia in fulfilment of a vow made on her voyage from Constantinople, has been entirely rebuilt, though the columns are ancient. The Gothic portal is fine, and the church contains a mosaic pavement of 1213 with representations of the 4th crusade and some frescoes by Giotto, painted during a visit to Dante between 1317 and 1320. S. Agata was almost entirely rebuilt in 1476-94. The chapel of S. Pier Cnsolago in the archiepiscopal palace preserves its original mosaics; so also does the mausoleum of Galla Placidia (SS Nazario e Celso), a small structure in the form of a Latin cross with a dome (in which, as in the baptistry of Neon, the old cathedral, etc., the constructional use of amphorae is noteworthy), with a plain brick exterior, and rich mosaics on a dark blue ground.

S. Francesco has been modernized, except for the crypt and campanile (10th century). The baptistry adjacent to the cathedral was either originally part of the Roman baths, converted to a Christian baptistry by the Archbishop Neon (449-452), or a Christian building dating from before A.D. 396. It is an octagon, with a dome; in the interior are two arcades one above the other. The mosaics of the 5th century, in the dome, are the earliest and perhaps the finest at Ravenna.

Of S. Giovanni Battista, also erected in this period, hardly anything remains after the restoration of 1683, and S. Croce has been overtaken by a similar fate. Honorius and Galla Placidia built a palace about A.D. 402, remains of which have been found under S. Croce.

The reign of Theodoric (493-526) marks another era of magnificence. In the eastern part of the city he built for himself a large palace. There still remains fronting the Corso Garibaldi a high wall built of square Roman bricks, with pillars and arched recesses in the upper portion, which goes by the name of Palazzo di Theodoric, but is a guardhouse erected by the exarchs, recent-

explorations having made it clear that it was an addition to the palace, while mosaic pavements and a court once surrounded by colonnades and really belonging to the latter were found behind S Apollinare Nuovo and the so-called Palazzo at a lower level and a different orientation (See Ghirardini in *Monumenti dei Lincei*, xxiv, 737-838.) A mosaic in the church of S Apollinare Nuovo gives some faint idea of the palace. The massive mausoleum of Theodoric stands still perfect outside the walls near the northeast corner of the city. It is circular internally and decagonal externally, in two stories, built of marble blocks, and surmounted by an enormous monolith, brought from the quarries of Istria and weighing more than 300 tons. It has been converted into a church dedicated to the Virgin.

S Apollinare Nuovo, the most important basilica in the town, was built by Theodoric to be the largest of Arian churches. The exterior is uninteresting, and the church lost both atrium and apse in the 16th century. The interior has 24 columns of marble, with almost uniform capitals. The walls of the nave are adorned with mosaics of the 6th century, the scenes from the New Testament above the windows date from the time of Theodoric.

The campanile (850-878) is circular and has perhaps the earliest example of the use of disks of coloured majolica as a decoration. This, like the other campanili of Ravenna, is later than the church to which it belongs. Those of the cathedral of S Apollinare in Classe, S Maria Maggiore and S Agata, also circular, probably belong also to the 9th century, while the two square campanili of S Giovanni Evangelista and S Francesco probably belong to the 10th century. The other churches erected by Theodoric are S Teodoro (or S Spirito), erected by Theodoric for the Arian bishops, but entirely modified, the baptistry of this church (afterward the oratory of S Maria in Cosmedin), formed out of the octagonal hall of a Roman bath, with mosaics of the 6th century, S Maria Maggiore, founded by the Archbishop Ecclesius (521-534), but almost entirely rebuilt, and S Vitore, which has suffered a similar fate. To the same period probably belong a few columns of the so-called Basilica of Heracles in the Piazza Vittorio Emanuele, with capitals like those of S Apollinare in Classe.

The impulse given by Theodoric was continued by his successors, and during the regency of Amalasuntha and the reigns of Theodatus and Vitiges (526-539), S Vitale and S Apollinare in Classe were constructed by Julius Argentarius contemporaneously with S Lorenzo in Milan and the cathedral of Pavia—also S Michele in Africisco, little of the original structure of which now exists; the apse mosaic is in the Berlin museum. The former, well restored by Ricci (except for the dome with its baroque frescoes which has not been altered), is a regular octagon, with a vestibule, originally flanked by two towers on the west, a choir added on the east, triangular outside and circular within; it is surrounded within by two galleries interrupted at the presbytery, and supported by eight large pillars, the intervals between which are occupied by open exedrae. The mosaics of the choir (547) are due to Justinian, and, though inferior in style, are remarkable for their splendour of colouring and the gorgeous dresses of the persons represented, and also for their historical interest, especially the scenes representing the emperor and the empress Theodora presenting offerings. The marble screens of the altar are wonderfully finely carved. The marble mosaic pavement (11th century) is very effective. Remains of the original marble wall lining and stucco decoration also exist.

The architecture of S Vitale, according to Rivoira, was inspired not by Byzantium, where similar churches—S Sofia and SS Sergio and Bacco—are slightly later in date, but by the churches of Salonica (A.D. 495), while the plan is derived from a Christian baptistry, or from such a building as the so-called temple of Minerva Medica at Rome.

It has been ascertained that a 5th century building already occupied the site.

S Apollinare in Classe, erected at the same time outside the walls of Classe, and now standing by itself in the lonely marshes, is the largest basilica existing at Ravenna. It has a nave and aisles with a closed vestibule on the west, and a fine round cam-

panile of the 9th (?) century. The exterior brick walls are divided by shallow arches and pilasters, as in other churches of Ravenna. It has 24 columns of Caryatian (cipollino) marble, with capitals probably of Byzantine work with swelling acanthus leaves, but the rest of the church is the work of native architects. The lofty presbytery and the crypt under it belong to the 12th century. The walls of the interior were stripped of their marble panelling by Sigismondo Malatesta in 1449, for the adornment of his church at Rimini. The apse has mosaics of the 6th and 7th centuries. The 18th-century series of portraits of the archbishops of Ravenna is no doubt copied from an earlier original. There are a number of fine carved sarcophagi in the church (5th to 8th century). The building activity of the Gothic kings was continued by Justinian, to whose time we owe the completion of S Vitale and S Apollinare in Classe, and some of the mosaics in S Apollinare Nuovo.

The buildings of a subsequent period are of minor importance, but the Basilica of S Maria in Portofuori near the ancient harbour (1096 *segg.*), a basilica with open roof, with frescoes by masters of the Rimini school, may be noticed. The campanile dates from 1173-87. The tomb of Dante, who died at Ravenna in 1321, is close to S Francesco; it is a square domed structure, with a relief by Pietro Lombardo (1483) representing the poet, and a sarcophagus below, in an urn within which lie the poet's remains. Close by is a small court with early Christian sarcophagi, containing the remains of the Braccioforte family. The important museum near S Vitale has Roman and Byzantine antiquities, inscriptions, sculptures, jewelry, etc. The library has rare manuscripts (including the best extant manuscript of Aristophanes) and incunabula. The Accademia has pictures by local masters.

In the Piazza Vittorio Emanuele are two granite columns erected by the Venetians in 1483. The cloisters of S Maria *di Porto*, erected in the town in the 16th century (because of malaria, as in the case of those of Classe), and of S Vitale are pleasing 16th-century structures. The 15th-century castle in the northeast corner of the town erected by the Venetians is a picturesque brick building. The walls, 3 mi. long, which still surround the town, were also built by them.

History.—Strabo mentions a tradition that Ravenna was founded by Thessalians, who afterward called in the Umbrians and left the city to them. About 191 B.C., by the conquest of the Boni, the whole of this region passed definitely under the dominion of Rome. Under Augustus it rose into importance, when it was made the station for the fleet on "the upper sea." Two hundred and fifty ships could ride at anchor in its harbour. At the same time Augustus conducted a branch of the Po (the fossa Augusta) through the city into the sea. It also became important for the export of timber from the Alps. Strabo gives a description which corresponds closely with modern Venice.

On the other hand, good water was proverbially difficult to obtain at Ravenna—dearer than wine, says Martial. Trajan, however, built an aqueduct nearly 20 mi. long, which was restored by Theodoric in 503. Of this some traces still exist in the bed of the Ronco above Ravenna. Flies and frogs were also complained of, and Sidorius, writing in the 5th century, complains bitterly of the "feculent gruel" (*cloacalis pulis*) which filled the canals of the city and gave forth fetid odours when stirred by the poles of the bargemen. The port of Ravenna, situated about three miles from the city, was named *Classis*. A long line of houses called *Caesarea* connected it with Ravenna, and in process of time there was such a continuous series of buildings that the three towns seemed like one. It had large grids of *fabri* (smiths and carpenters) and *schonarii* (firemen).

A prehistoric station was found in 1894 at S Zaccaria near Ravenna, belonging to a Terramare. Of Roman Ravenna nothing remains above ground. It was connected with Ariminum, 33 mi. to the south, by the coast road, the Via Popilia, which ran on north to Hatra, and joined the road between Patavium and Altinum at Ad Portum.

Early in the 5th century, Honorius, alarmed by the progress of Alaric in the north of Italy, transferred his court there. From

this date (404) to the fall of the Western Empire in 476 Ravenna was the chief residence of the Roman emperors. There Stilicho was slain; there Honorius and his sister Placidia resided and quarrelled; there Valentinian III spent the greater part of his life, there Majorian was proclaimed; there the little Romulus donned his purple robe; there in the pinewoods outside the city his uncle Paulus received his decisive defeat from Odoacer. The great pinewoods to the east of the city, which is still one of the great glories of Ravenna, must therefore have been in existence in the 5th century. Odoacer made Ravenna his chief residence. Theodoric's siege of Ravenna lasted for three years (489-492); ten days after his entry into the city he slew his rival at a banquet in the palace of the Laurel Grove (March 15, 493). Ravenna was also Theodoric's chief residence (493-526).

In 535 Justinian sent an army to destroy the Gothic monarchy and restore Italy to the empire. The Goths at length, weary of the feebleness of Vitiges, offered to transfer their allegiance to Belisarius on condition of his assuming the diadem of the Western Empire. Belisarius dallied with the proposal until he had obtained an entrance within the walls of the capital, and proclaimed his inviolable fidelity to Justinian (539). Under the rule of Narses and his successors, the exarchs, Ravenna was the seat of Byzantine dominion in Italy. In 728 the Lombard king Liutprand took and destroyed the suburb Classis, about 752 the city itself fell into the hands of his successor, Astulf, from whom a few years later it was wrested by Pipin, king of the Franks.

It formed part of the Frankish king's donation to the pope in the middle of the 8th century, though the archbishops, as a fact, retained almost independent power. It was an independent republic, generally taking the Guelph side in the 13th century, subject to rulers of the house of Polesani in the 14th, Venetian in the 15th (1441) and papal again in the 16th. St. Romuald and St. Peter Damian were both natives of Ravenna. From this time (1509) down to 1860, except for the interruptions caused by the wars of the French Revolution, Ravenna continued subject to the papal see and was governed by a cardinal legate. In 1849 Garibaldi's wife, Anita, who had accompanied him on his retreat from Rome, succumbed to fatigue in the marshes near Ravenna.

Charles the Great carried off the bragen statue of Theodoric and the marble columns of his palace to his own palace at Aix-la-Chapelle. Lord Byron resided at Ravenna for 18 months in 1820-21, attracted by the charms of the Countess Guiccioli.

ΒΙΒΛΙΟΓΡΑΦΙΑ.—The most important authority for the history of Ravenna is Bishop Agnellus, who wrote, about 820, the *Liber Pontificalis Ecclesiae Ravennatis*. The best edition is that by Holder-Egger in the *Monumenta Germaniae Historica* (1878). See G. T. Rivora, *Lombard Architecture* (London, 1910), C. Ricci, *Ravenna* (Bergamo, 1902), Ravenna (London, 1913), E. Hutton, *The Story of Ravenna* (London, 1926). To the careful restorations of Ricci the buildings of Ravenna owe much. (2 H. V. A.)

BATTLE OF 1512

This battle, one of the principal events of the long Italian wars of Charles VIII, Louis XII and Francis I of France, is, like Marignan (q.v.), interesting in a tactical sense, from the fact that the feudalism of the past and the expert soldiery of the future were strangely mingled. It arose out of the attempt of the Spanish and Italian forces to relieve Ravenna, besieged by Gaston de Foix, duke of Nemours. The most celebrated captains of these wars were present on either side—under Gaston de Foix were Bayard, Yves d'Allegre, La Palisse, and under Cardona, the Spanish viceroy of Naples, Pedro Navarro, the great engineer, and Pescara, the originator of the Spanish tactical system. After some preliminary manoeuvres the two armies drew up face to face on the left bank of the Ronco, the Spanish left and the French right resting on this river. The Spaniards were entrenched, with their heavy artillery distributed along the front, but, thanks to Navarro, they had a more mobile artillery in the shape of 200 *arquebuses à croc* mounted in groups upon carts, after the German fashion. The battle opened with a prolonged cannonade from the Spanish lines. For three hours the professional regiments of all sorts in the French lines rivalled one another in enduring the fire unmoved, the forefathers of the military systems of to-day,

landsknechts, Picardie and Piedmont, showing the feudal gendarme that they too were men of honour. There was no lying down. The captains placed themselves in the front, and in the centre 38 out of 40 of them were struck down. Molart and Empser, drinking each other's health in the midst of the cannonade, were killed by the same shot. Sheltered behind the entrenchments, the Spaniards scarcely suffered, for they were little active troops accustomed to lie down and spring up from the ground. But after three hours, Pescara's light horse having meantime been driven in by the superior light horse of the enemy, the artillery-loving duke of Ferrara conceived the brilliant plan of taking his mobile field guns to the extreme right of the enemy. This he did, and so came in sight of the prone masses of the Spaniards. Disciplined troops as they were, they resisted the temptation to escape Ferrara's fire by breaking out to the front; but the whole Spanish line was enfiladed, and on the left of it the papal troops, who were by no means of the same quality, filled up the ditch in front of their breastworks and charged forward, followed by all the gendarmes. Once in the plain they were charged by the French gendarmes under Gaston himself, as well as by the landsknechts, and driven back. The advantage of position being thus lost, the Spanish infantry rose and flung itself on the attackers, the landsknechts and the French bands were disordered by the fury of the counterstroke, being unaccustomed to deal with the swift, leaping and crouching attack of swordsmen with bucklers. But La Palisse's reserve wheeled in upon the rear of the Spaniards, and they retreated to the entrenchments as fast as they had advanced. The papal infantry, the gendarmes and the light horse had already vanished from the field in disorder, but the Spanish regulars were of different mettle, and it was only after a long struggle that the landsknechts and the French bands broke into the trenches. The conflict continued, but at last La Palisse, with all the gendarmes still in hand, rode completely around the entrenchments and charged the Spaniards' rear again. This was the end, but the remnant of the Spanish infantry retreated in order along the river causeway, keeping the pursuers at bay with their arquebuses. Gaston de Foix, recklessly charging into the midst of them, was killed.

RAVENNA, a city of northeastern Ohio, U.S., 33 mi S.E. of Cleveland; the county seat of Portage county. It is served by the Baltimore and Ohio, the Erie and the Pennsylvania. Pop. (1950) 9,857. It has manufactures of structural steel, iron castings, rubber goods, power shovels and cranes, textiles and baby nursing units. It is the site of the Ravenna Ordnance plant. Ravenna was founded in 1852 and incorporated as a city in 1912.

RAVENNA, EXARCHATE OF, the official name of that part of Italy which remained in the allegiance of the Roman emperors at Constantinople from the closing years of the 6th to the middle of the 8th century. The civil and military head of these possessions, the exarch (q.v.), was stationed at Ravenna. The territory around the town, from the southern border of the modern Venetia to the beginning of the Pentapolis at Rimini, was under his direct administration and formed in a limited sense the exarchate. The other provinces were governed by dukes and *magistri militum*, titles which were generally, but not always, borne by the same person. But as all were subject to his authority, they were included in the exarchate of Ravenna, which was therefore another name for the province of Italy. Sicily formed a separate government. Corsica and Sardinia belonged to the exarchate of Africa. The organization of the exarchate is placed by modern investigators under the reign of Emperor Maurice (582-602), when the imperial government was confronted by the new problems created by the settlement of the Lombards (q.v.). At the end of the 6th century it included Istria; the maritime part of Venetia as distinct from the interior which was in the hands of the Lombard kings at Pavia, the exarchate proper, or territory around Ravenna on the eastern side of the Apennines, to which was added Calabria, which at that period meant the southeast and not the southwest of Italy; the Pentapolis, or coast from Rimini to Ancona with the interior as far as the mountains, the duchy of Rome, or belt of territory connecting the Pentapolis with the western coast, the coast of Naples, with Bruttium, the modern

Calabria, and Liguria, or the Riviera of Genoa. Piedmont, Lombardy, the mainland of Venetia, Tuscany and the interior of Naples belonged to the Lombards. The superior organization of the imperial government enabled it to regain lost territory and delay complete ruin. In 590 it recovered much of Venetia, but these reversals were not permanent. In 640 the Liguian seacoast fell under the power of the Lombards. About a century later the exarchate had been greatly reduced, though the imperial officials endeavoured to conceal the fact by retaining and transferring names when the reality of possession was lost. About 740 it consisted of Istria, Venetia, Ferrara, Ravenna (the exarchate in the limited sense), Pentapolis, Perugia, Rome, the coast of Naples and the southwest of Italy, which was being overrun by the Lombards of the duchy of Beneventum, which with Spoleto held the interior. In Rome the pope was the real master. These fragments of the "province of Italy" were almost all lost either to the Lombards, who finally conquered Ravenna itself about 750, or by the virtual independence of the papacy. Subsequent Frankish intervention (see ITALY) made a revival of the exarchate impossible. It disappeared, and the small remnants of the imperial possessions on the mainland, Naples and Calabria, passed under the authority of the "patricius" of Sicily, and when Sicily was conquered by the Arabs in the 10th century were erected into the themes of Calabria and Langobardia. Istria was attached to Dalmatia.

In its internal history the exarchate was subject to the influences which were everywhere, in central and western Europe at least, leading to the establishment of feudalism. The great imperial officials gradually became landowners, and conversely the great landowners intruded on the imperial administration. The local militias, organized under imperial authority for defense against the Lombards, tended to become independent. These bodies formed the *exercitus romanæ militiæ*, who were the forerunners of the free armed burghers of the Italian cities of the middle ages.

See C. Diehl, *Études sur l'administration byzantine dans l'exarchat de Ravenne (568-751)* (1888).

RAVENSBURG, a town in the state of Württemberg, Germany, on the Schussen, 12 mi N of Friedrichshafen on the lake of Constance. Pop (1939) 32,257. Ravensburg was founded in the 11th century by the Guelphs, and in their castle on the Veitsburg, Henry the Lion was born. In 1180 the town passed to the Hohenstaufens, and a century later it became a free town of the empire. It was ceded to Württemberg in 1810. It retains its walls and nine towers and its 15th century town hall.

RAVENSCROFT, THOMAS (c. 1590-c. 1633), English composer and musical editor, received his B Mus at Cambridge in 1607, and from 1618-22 was music master at Christ's hospital. He is best known by his *The Whole Booke of Psalmes* (1621), 48 of the harmonizings being his own. His other works, the first three of which show his appreciation of popular and humorous poems, are *Pammelia*, a collection of 100 rounds and catches (1609), *Deuteromelia*, a collection of 31 items, including "Three Blind Mice" (1609), *Melismata*, a collection of 21 items, chiefly short madrigals (1611); and *A Brieve Discourse of the True (but Neglected) use of Charactering the Degrees, by their Perfection, Imperfection and Diminution in Measurable Musicks*, etc. (1621).

RAVI, a river of Pakistan, one of the "Five Rivers" of the Punjab. It rises in the Kulu subdivision of Kangra district, flows through Chamba state and enters Gurdaspur district. Thence it flows through the plains of the Punjab, passing within a mile of Lahore, and finally falls into the Chenab after a course of about 450 mi. Its water is utilized for the Upper and Lower Bari Doab canals, with headworks at Madhupur, and the Sidhra canal. The Upper Bari Doab canal irrigates about 1,177,000 ac, and the Lower Bari Doab canal (opened 1913) about 345,000 ac. The Upper Chenab canal enters the Ravi at Balloki, where the Lower Bari Doab canal has its headworks on the opposite bank, thus providing a level crossing of the Ravi. The Sidhra canal, which starts a few miles above the Chenab junction, is frequently dry in winter, but the Haveli project, including a dam on the Chenab with a canal delivering water into the Ravi above the Sidhra weir, will ensure a perennial supply when completed.

RAWALPINDI, a town of Pakistan, which gives its name to a district and a division in the Punjab. The town is situated on the north bank of the little river Leh, 1,726 ft above the sea, 111 mi E by S of Peshawar, and 1,443 mi NW of Calcutta. Pop (1941) 181,169. It was chiefly notable as the largest military station in India and the key to the British system of defense upon the North-West Frontier. It is the starting point of the cart road to the hill station of Murree and of the route into Kashmir. It was the headquarters of the northern army with a strong force of all arms, and contained an arsenal. Besides the locomotive works of the North-Western railway, there are gas-works, a tent factory, an iron foundry, an oil refinery and a brewery. An annual horse fair is held in April.

The DISTRICT of RAWALPINDI has an area of 2,922 sq mi. It contains the Murree hills. The district is traversed by the main line of the North-Western railway, crossing the Indus at Attock, and also by a branch toward the Indus at Kushalgarh. The population in 1941 was 785,231.

RAWANDIS, a Persian sect (from Rāwand, a town near Isfahan). Its origin is unknown, but its members held ultra-Shah doctrines (see ISLAM). They maintained that the spirit that was in Jesus was in 'Alī, then in the imāms one after the other to Ibrahim ibn Muhammad, and that thus these were divine. They believed in metempsychosis, or the transmigration of souls, and asserted that the Lord who fed them and gave them drink was Manṣūr. In 759 they came to the palace of Manṣūr in Hashimīya and began to hail him as Lord. The Caliph, however, secured their chiefs and threw them into prison.

See E. G. Browne, *Literary History of Persia* (1902).

RAWLINS, a city of southern Wyoming, U.S., 6,755 ft above sea level, on federal highways 30 and 287 and the main line of the Union Pacific railroad, the county seat of Carbon county. The population in 1950 was 7,385, in 1940 it was 5,531 by federal census.

It is an important shipping point for livestock; a division point on the railroad, which maintains extensive shops and roundhouses there, and a centre of oil refining and producing, coal mining and agriculture.

RAWLINSON, SIR HENRY CRESWICKE (1810-1895), English soldier and orientalist, was born at Chadington, Oxfordshire, on April 11, 1810. In 1827 he went to India as cadet under the East India company, and after six years as a subaltern he was sent to Persia in company with other English officers to reorganize the Shah's troops. He became interested in the hitherto undeciphered cuneiform character. In two years he transcribed as much as he was able of the great cuneiform inscription at Behistun (q.v.); but the friction between the Persian court and the British government ended in the departure of the British officers. He became political agent at Kandahar in 1840. Then, at his own desire, he was sent as political agent to Turkish Arabia; thus he was enabled to settle in Baghdad, where he devoted much time to his cuneiform studies. He was now able to make a complete transcript of the Behistun inscription, which he deciphered and interpreted.

During two years' leave in England (1849-51) he prepared a memoir on the Behistun inscription. He disposed of his valuable collection of Babylonian, Sabaean and Sassanian antiquities to the trustees of the British museum, who made him a grant to enable him to carry on the Assyrian and Babylonian excavations initiated by Layard. In 1851 he returned to Baghdad. In 1855 he resigned his post in the East India company and he received the K C B and crown directorship of the East India company. The remaining 40 years of his life were mainly spent in London. In 1858 he was appointed a member of the first India council, but resigned in 1859 on being sent to Persia as envoy extraordinary and minister plenipotentiary. The latter post he held only for a year. Rawlinson rejoined the Council of India in 1868, and continued to serve upon it until his death. He was a strong advocate of the forward policy in Afghanistan. He died in London on March 5, 1895.

His published works include four volumes of cuneiform inscriptions, published under his direction between 1870 and 1884 by the trustees

RAWLINSON, HENRY SEYMOUR RAWLINSON—RAY

of the British museum, *The Persian Cuneiform Inscription at Behistun* (1846-51) and *Outline of the History of Assyria* (1852), both reprinted from the Asiatic Society's journals, *A Commentary on the Cuneiform Inscriptions of Babylon and Assyria* (1850), *Notes on the Early History of Babylonia* (1854), *England and Russia in the East* (1875). He contributed to the *Encyclopædia Britannica* (9th ed.) the articles *Babylon*, *Euphrates*, *Kurdistan*, and several other articles dealing with the east, and assisted in editing a translation of Herodotus by his brother, Canon George Rawlinson (1812-1892).

See G. Rawlinson, *Memoir of Henry Creswicke Rawlinson* (1898).

RAWLINSON, HENRY SEYMOUR RAWLINSON, 1st BARON (1864-1925). British soldier, was born on Feb. 20, 1864, son of Maj. Gen. Sir Henry Rawlinson, Bart. He joined the army in 1884 and a year later became aide-de-camp to Sir Frederick Roberts in India on whose staff he served intermittently for some years. He took part in the Burma operations in 1886-87 and on the Nile in 1898, he had succeeded to the baronetcy in 1891. He served throughout the South African War (1899-1902). Some months after his return to England he became commandant of the staff college and from 1910 to May 1914 commanded the 3rd division. Gen. Rawlinson was in charge of the forces sent to assist Antwerp in 1914, and took part in the first battles of Ypres and in the Neuve Chapelle and Loos offensives. He commanded the 4th army during the battle of the Somme (1916), achieving important successes. At the end of 1917 he was transferred temporarily to the command of the 9th army during Gen. Plumer's absence in Italy, and in February-March 1918 he acted for some weeks as British representative on the Supreme War Council. Resuming his command of the 4th army in April, his troops on Aug. 8, in conjunction with the trench, attacked the enemy near Amiens and gained a signal victory, which heralded the general advance of the Allies. After World War I he was raised to the peerage as Baron Rawlinson of Trent and received a grant of £30,000. In the latter part of 1919 he was sent to north Russia to conduct the withdrawal of the Allies from Archangel and Murmansk, and on his return he commanded Aldershot for a year. At the end of 1920 he went to India as commander in chief. He died at Delhi on March 28, 1925.

See Sir F. Maurice, *Life of General Lord Rawlinson of Trent*, from his Journals and Letters (1928).

RAWMARSH, an urban district in the West of Yorkshire, England, 7½ mi. N.E. of Sheffield on the L.N.E. and L.N.E. railways. Pop. (1938) 18,210. Area 4.1 sq. mi. It is 1½ mi. from the river Don, and is almost continuous with Rotham. Rawmarsh has large iron-works, steel rolling-mills, and Reteres.

RAW MATERIALS: see PHYSICAL RESOURCES.

RAWTESTALL, municipal borough in the parliamentary borough of Rossendale, Lancashire, England, 18 mi. north of Manchester by the L.M.S.R. Pop. (1938) 27,070. Area 14.9 sq. mi. Rawtestall, which was incorporated in 1891 manufactures cotton and woollen goods and shoes.

RAY (or WRAY, as he wrote his name till 1676) **JOHN** (1627-1705), sometimes called the father of English natural history, was the son of a blacksmith of Black Notch, Essex, where he was born on Nov. 29, 1627. Educated at Catharine Hall and Trinity College, Cambridge, Ray became a fellow of Trinity college in 1649. He held many college offices.

His first botanical tour was undertaken in 1658, and being compelled to give up his fellowship (1662), because he could not subscribe to the Act of Uniformity, Ray toured through France in 1663 with Francis Willughby (qv). From this tour Ray and Willughby returned with collections, on which they made complete systematic descriptions of the animal and vegetable kingdoms. Willughby undertook the former part, but, dying in 1672, left only an ornithology and ichthyology, for Ray to do, while the latter used the botanical collections for the grounds of his *Methodus plantarum nova* (1682), and his great *Hist. plantarum* (3 vol., 1686, 1688, 1704). The plants gathered on British tours had already been described in his *Catalogus plantarum Angliæ* (1670, 1677), which work is the basis of all the English floras. He published an account of his foreign travel 1673, entitled *Observations topographical, moral, and physical, made in a Journey through part of the Low Countries, Germany, Italy, and France*.

Ray's work shows signs of indebtedness to Joachim J. Hamburg and others. In his early work he classified his plants alphabetically but later he used the number of cotyledons as a basis of his classification. Ray also classified according to fruit but eventually he used the flower for purposes of classification. He distinguished several natural groups such as the grass Labiateae, Umbelliferae and Papilionaceae. He was involved in controversy with Rivinus upon Ray's indefensible separation of ligneous and herbaceous plants. In conjunction with Willughby Ray wrote a paper on his experiments on the motion of sap in trees. In 1667 Ray was elected F.R.S. He died on Jan. 17, 1705. The Ray society, for the publication of works on natural history was founded in his honour in 1844.

Ray was also the author of *Catalogus plantarum circa Cantabrigiam* (1660, appendixes in 1663 and 1685), written with John Nid, *Synopsis stirpium Britannicarum* (1690, etc.), *Stirpium Europæarum extr. Britannias nascentium Sylloge* (1694), *Synopsis methodica Animalium Quadrupedum et Serpentinum Generis* (1693), *Synopsis methodica Avium et Piscium* (1713), and *Historia Insectorum* (1710).

BIBLIOGRAPHY—*Memorials of Ray* (with the addition of a complete catalogue of his works) ed. by Edwin Lankester (Ray Society, 1846). *Correspondence* (with Willughby, Martin Lister, Robinson, Petiver, Derham, Sir Hans Sloane and others), ed. by Derham (1718), *Selections*, with additions, ed. by Lankester (Ray Society, 1848), C. E. Raven, *John Ray, Naturalist, His Life and Works* (1943). For accounts of Ray's system of classification, see Cuvier, *Leçons d'Hist. Nat.*, p. 488, Sprengel, *Gesch. d. Botanik*, II, p. 40, Sachs, *Gesch. d. Botanik*, also Whewell, *Hist. Ind. Sci.*, III, p. 332 (ed. 1847), and Wood, article "Classification" in Rees's *Cyclopædia*.

RAY, the name given to the short-snouted fish of the genus *Raja*, the skates and rays, and in a more general sense used for all the Selachians (q.v.) of the order Hypopterygia, which are distinguished from sharks by their depressed form and by the large pectoral fins, produced forwards and attached to the sides of the head above the gill-openings, which are ventral in position. Generally the nostrils and the transverse mouth are placed on the flat under surface of the head.

On the upper surface of the head, behind the eyes, are large holes leading to the pharynx, these are termed spiracles and serve for the intake of water for respiration. Rays are fitted, by their structure, for life at the bottom of the sea, most are viviparous, but the Raiaidae have eggs enclosed in oblong horny cases similar to those of dogfishes.

The Torpedinidae, or electric rays, form an isolated family, distinguished by possessing large paired electric organs, formed of vertical hexagonal columns, placed between the pectoral fins and the head, and capable of giving powerful shocks, either for defensive purposes or to kill prey. The electric rays have a smooth and naked skin, the head and trunk, with the pectoral fins, form a circular disc; the tail is short and stout.

About 30 species are known from warm seas, some reaching a weight of 200 lb.; one or two species of *Torpedo* occur in British waters.

SAW-FISH (PRISTIS PERROTTETI). THE SAW MAY REACH A LENGTH OF SIX FEET AND IS A FORMIDABLE WEAPON.

The other rays, without electric organs, generally have a rough skin, often bearing strong spines. The most sharklike are the Rhinobatidae, of which about 20 species are known, from tropical and subtropical seas; in most of them the pectoral fins are relatively small, and the trunk tapers gradually into the tail. The sawfishes, or sawrays (*Pristis*), differ from them in that the snout is produced into a long blade armed with a series of strong teeth on each side, five species are known from warm seas, frequenting

RAYMUND

ad him crowned, in defiance of the stipulation ad had become regent. Raymund, left in isolation and negotiated a truce for himself with a dubious position led contemporaries to accuse his correspondence with Saladin, but his loyalty was nobly shown in 1187, when he reconciled and aided him in the battle of Hattin, which was, against his earnest advice. He escaped from death and ultimately retired to Tripoli, where he

died. With the growth of faction which marked the reign of Baldwin IV, Raymund emerged as leader of the native baronage against the "court" party that included the Lusignans, the Courtenays and Raynald of Châtillon. He was the most able statesman among the Syrian Franks and might well have saved the Latin kingdom from its destruction by Saladin.

William of Tyre knew Raymund well and in his *Historia* left a first-rate account of him. Of modern writers, see R. Grousset, *Histoire des croisades*, vol. ii (Paris, 1935), M. W. Baldwin, *Raymond III of Tripoli and the Fall of Jerusalem (1140-1187)* (1936). (R. C. SMA)
